As the monk spoke in his quiet voice Angelica looked at him curiously with her blue eyes. They had come out upon one of the shady terraces. She was standing by a great tree that cast some faint aromatic incense from its many blossoms. Her hair was shining; her white gown glowed with prismatic colors. Then she suddenly remembered how the day was burning up, the last day of her old familiar life. Some sudden terror overwhelmed her. She looked at her old father, and could have cried; but that would have distressed him, and she only smiled as she turned and suddenly clung to his arm.

The three followed their guide with his straight robe, and came out to one of the terraces. The monk leaned for a minute, resting his arms on the wall.

"I do not envy your Venice," he said, reflectively. "It is too much in the world—too full of life, noise, and distraction."

Angelica looked at him, wondering and sympathetic. "I think I understand your feeling," she said, "and yet—" She did not finish the sentence. Her eyes must have finished her thought, for the brother walked on a little way. Antonio answered the look.

"It would not suit you to stay here, Angelica," he said. "You could not bear to spend your life peacefully watching the changes from the terrace."

"Would it suit me? Antonio, we are not all made alike." And she looked hard at him, trying to be clear, to explain her meaning. "Just now, at this minute," she said, "I feel as if I should like to wait and wait, to put off to-morrow, oh, for so long a time! But if I lived here always, one day I think something would come down like a cloud and hide all the glory, and a voice in my heart would cry out with reproach, 'Angelica, for shame! Go forth! Why have you missed your vocation?' I must take courage," she said, with a sigh; and she walked away from them for a little way.

Old John Joseph looked over the wall into the water. Antonio could hear his low sobs; but it was Angelica he followed after a moment's hesitation.

"Dear Angelica, don't be unhappy," he said. "You are quite right; you have decided wisely. You must forgive me for having troubled you. It was but prejudice and jealousy of those fine people—unworthy of me and of you. I dare say they are better than I think them. Trust me," he said, and his thin face gathered some color, and his pale looks flashed with earnestness; "I will take care of your father; and when I am with him you know that he has a son."

"I do know it, Antonio," said Angelica,

gratefully; and she put her hand into his, and then she picked a bit of the pomegranate flower and gave it to him, with another sigh.

They rowed home very quietly, watching a sumptuous panther-like cloud now floating across the sun. Nobody spoke. The ripples and gleams of the lagoon grew wider and more serene, reaching from the present into the coming night.

The gods seemed to be then invisible. Ariadne herself seemed translated into the heavens, and her crown of pale stars began to shine overhead.

Before they reached home a great red moon, splendid and sorrowful, the last glory of that long day, mounted quietly from beyond the islands.

Afterward, in later days, Angelica used to look back to these old times with a strange half-mournful longing. Hitherto to work had been the one great aim of her life. Now the strange new creed of feeling began in her heart.

LONGING.

I WOULD I were an unblown rose
Close shut in leaves of green—
So shut that none had ever guessed
The color hidden in its breast
By blush of pink between.

Then when your face but turned my way,
As now, the crumpled sheen
Of crimson hid so safe away
Would stir the livelong summer day
Within, unheard, unseen;

But, when your footstep nearer drew,
Would burst the green apart,
And petals glowing in the sun
Would chronicle to every one
The new life at my heart.

And tally sweet of all the leagues
You passed of sea or shore
The clasping calyx still should hold;
For every one, there would unfold
One velvet petal more.

So when at last, no space between,
Your own from stem you broke,
And in your hand my perfect grace
Perchance you lifted to your face,
Although no word you spoke—

Ah, then, indeed, the petals all
Down on the dewy sward might fall
Before you as you went;
And if perchance your eager feet
Might find for them the way more sweet,
Then I were all content.

For so methinks the one lost word
That mocks my various quest
Might uttered be, though never heard,
And that were Rest!

Editor's Easy Chair.

WHEN the Reverend Jeremy Collier denounced the English play-house at the close of the seventeenth century, decency and morality cried Amen, and those who know the plays of that period understand the reason. Even "glorious John"—Dryden himself—rolled in the mire to please the town; but he insisted that "the parson stretched a point too far" when he attributed the general immorality of the time to the theatre. It was due, he thought, to the debauchery of the Restoration brought from France. Colley Cibber says of those days: "I remember the Ladies were then observ'd to be decently afraid of venturing bare-fac'd to a new Comedy till they had been assur'd they might do it without the Risque of an Insult to their Modesty. Or, if their Curiosity were too strong for their Patience, they took Care, at least, to save Appearances, and rarely came upon the first Days of Acting but in Masks (then daily worn and admitted in the Pit, the side Boxes, and Gallery)." And Cibber says of the stage at that time: "Nothing that was loose could then be too low for it." But he objects to Collier's proposed remedy of destruction instead of reformation, and he says, gayly: "This puts me in mind of what the noted Jo Hains, the Comedian, a Fellow of a wicked Wit, said upon this Occasion, who being asked what could transport Mr. Collier into so blind a Zeal for a general Suppression of the Stage, when only some particular Authors had abus'd it; whereas the Stage, he could not but know, was generally allow'd, when rightly conducted, to be a delightful Method of mending our Morals. 'For that reason,' replied Hains, 'Collier is by Profession a Moral-mender himself, and two of a Trade, you know, can never agree.'"

What would Cibber and Jo Hains think of our theatres? And would the Reverend Jeremy denounce them so roundly? There was, indeed, a voice of denunciation in the autumn air, but it seemed the tone of Toots rather than of Collier, and despite the distinct affirmation that the play-house is the gate of—an exceedingly uncomfortable place, the Easy Chair ventured one Saturday afternoon to take the risk of seeing *Rip Van Winkle* once more. It was three or four years since it had seen the play or the poem before; but the pleasure was the same—and it would say the profit, if it had not been challenged upon the score of the immorality of the work. It was like turning from looking at one of the festive impossibilities of Claude, those soft and graceful pastorals which never were and never can be, and while it still glimmered in the eye and through the mind, being summoned to justify its morality. "What is *Rip Van Winkle*," said the austere moralist, "but a sot, a good-for-nothing lout and idler, who pours the welfare and happiness of his wife and child as a draught of selfish pleasure down his throat, yet who wins your sympathy as against a faithful and industrious wife who wears out her life to support him and his child? How does it essentially differ from the scene which is depicted upon any temperance tract showing the home and the family, the hapless victims of the brutish self-indulgence of a

drunkard? And how can you, *ex officio* a conservator of good morals and manners, justify the devotion of the undoubted genius of the player to the representation of such a worthless reprobate?"

This challenge, which might have proceeded from the Reverend Jeremy himself, was so confusing to the mood of mind in which the play left the Easy Chair that, awakening in the realm of moral judgment to which it had been so suddenly transported, it could only reply to the moralist in the words with which Rip addresses the awful Hendrick Hudson in the uncomfortable circumstances in which he finds himself upon the mountain-top: "You know'd I didn't wan' to come up here." It thought of that other tale of the delightful magician of the Hudson, the *Legend of Sleepy Hollow*, and it wondered how it would be able to respond to a challenge to expound that headless story in a satisfactory moral manner. There is no doubt that the child who reads *Rip Van Winkle* for the first time, as he emerges from the spell of summer drowsiness and dreamery (if the proper German *Träumerei* may be so rendered) which the tale casts upon him, has the same kindly regard for the hero rather than for his wife which all the noisy urchins of Catskill village had, and which is in the heart of the spectator in the play-house as the curtain descends upon the pensive drama.

Nor is it strange. For Rip is the type of that large class of people of whom the mild saying is that they are their own worst enemies. He is shiftless, lazy, drunken, and a very bad member of society. But he is simple, affectionate, and guileless. The children love him, the dogs are sure to follow him. He plays with them all, and loiters the day away by the stream or upon the mountain. His drunkenness is a weakness, but it is not necessarily a crime. Nick Vedder's dram-shop, with the red-faced George the Third for a swinging sign, stood there in his father's day, and the sins of the fathers may be in this visited upon the children. He is not therefore to be morally condemned for an inherited appetite and a native defect of will. And with all the weakness and the shiftlessness, his is the poetic temperament. He is a man who may be won and led, but who can not be driven, and he is mated with a virago. Gretchen is a comely, long-suffering, virtuous, toiling woman, who deserves a sober husband and a pleasant home, but who is nevertheless a virago. She has energy and industry and intelligence and beauty enough to attract an old lover, but she has not a good temper. Husband, child, dog, fly from her as all fly to him. Rip has squandered his property and stripped his house, and Gretchen makes home too hot for him. She is justified in her sorrow and indignation, but such a temperament as hers can not possibly correct his. The tragedy is radical, inevitable. At midnight, in the wildest storm, she turns him from her door, and he goes, still young, still hopeful—goes to sleep his youth away upon the mountain.

Sympathy goes with him because he is the weaker, and the spell of sadness comes from the consciousness of the necessary discord of such

temperaments. The moralist insists that she was justified, and that a drunken husband deserves to be thrust from the home which he degrades. Yet there is many a mother whose son, the idol and pride and glory of her love and youth, grows into a man too weak to save himself from that fatal passion which devastates more than any other. He is not bad, nor unkind, nor cold, but only irresolute and unhappy, wrestling in vain with an appetite for which, as in his blood, he may not be responsible. She has, as you say, every reason for being angry and impatient, and for telling him that as he has made his bed, he may lie in it. And yet somehow as she speaks of him she does not wring the clothes she is washing as if she had his neck in her clutches, nor does she seek him with a broomstick; and when night after night he comes reeling home, and after long and hopeless hours of watching she hears his unsteady step, she rises quietly and opens the door, and supports him as he staggers to his room, and having seen him safe in bed, steals silently to her own. He has taken all joy and hope and pride out of her heart. He has made her life one long sorrow. All is ruined, all is gone, except the infinitely forbearing and forgiving love of the mother—the only angel that can, and sometimes does, save the unhappy man. She has every reason, as you justly observe, to turn him off into the pitiless midnight, as Gretchen turns her Rip. But she does not. Love is not an accountant. It does not keep a ledger and accurately post it. It does not consider whether it is justified in denouncing the beloved. And when Gretchen sends her man away you do not deny that she has a perfect right to be angry, but your sympathy goes with him.

Really, however, this drama is "beyond the domain of conscience," as Charles Lamb said of the comedy that Collier condemned. The figure that we see is essentially poetic, born of the reverie of a summer afternoon among the Catskills, while the hot air sleeps over the glassy river, and the faint thunder rolls drowsily among the misty hills. It is curious that Jefferson throws upon the spectator—unless he is a very austere moralist—the same spell that he remembers when in youth he first read the story, the same spell which the opening words of the magician Hawthorne always cast upon his sympathetic reader. It is like the pass of the mesmerizer, and from that moment you are in his power. The value of this spectacle is that of all works of art, the mood of thought and feeling into which it throws you, and which is reflected upon character. What is the calculable advantage of looking at a beautiful sunset? of hearing "the mountain echo, solitary, clear, profound?" of studying the Transfiguration or the Medicean statues? The Medici were not very estimable people. Rip Van Winkle, indeed, was very much less of a reprobate than Lorenzo de' Medici. But the figure of the one in the statue and that of the other in the play are seen by the imagination, and they are so represented that life is sweeter for the seeing, and the character softened and enriched. There is, indeed, in the latter case no inspiring spectacle of high endeavor, of noble endurance, of sublime self-sacrifice. But there is a tragedy of conflicting and irreconcilable temperaments, of a fond, simple, harmless nature, bereft by unto-

ward circumstance of its fair development, and therefore the opening of a well-spring of charity that overflows the whole life.

THERE is a class of unrecognized public benefactors to which the Easy Chair wishes to offer a respectful tribute of gratitude. Their service is none the less because it is unconscious, and it is not confined to either sex. It is, besides, a very various service, as will be readily seen as we advance in the description. Let us, then, without delay, and to begin with, specify as benefactors of this kind the young and other gentlemen who do duty at club-house windows, and the ladies who kindly appear only in the latest fashions. Most men, intent upon the necessary industry wherewith they maintain their families, are content to live plainly, and can seldom escape their work. There is Sunday, indeed, and a happy hour in the Park, and perhaps a run in the summer for a week or two to Long Branch or the mountains. But black care generally attends as a body-servant, not always or immediately recognizable, but like that solemn waiter whom Mr. George Hodder describes at a dinner given by Leech, the artist, who announced the feast with the air of an undertaker, and who proved to be the clerk of the neighboring parish—a little story which may be found, with much other entertaining reading, in a handy volume of Mr. Stoddard's "Bric-à-Brac Series."

But the busy man's imagination is still at play, and he fancies a life which he does not know; a life of elegant and boundless leisure, which hovers above and around his weary routine; a life in which his home is spacious and splendid; where he is clad in handsome clothes and never troubled by his tailor's bill, because he has always a balance at the bank; a life in which he opens his eyes in the morning not to wonder if he has overslept himself, and to plunge out of bed and into his clothes and through his breakfast, to hurry to the car or the omnibus, dreading to be too late—opens his eyes, we say, not for this, but languidly to wonder, as he looks from under the lace hangings, how most easily and pleasantly to wile away the day. A wise author says that the beauty of the landscape is only a mirage seen from the windows of diligence. So is the life of leisure which the busy man sees in fancy and in the tales which in his hasty way he reads sometimes on a rainy Sunday or in the evening. Yet it would be mere fable to him except for the benevolent genii in the club window. As he hurries homeward when his day's work is done he lifts his eye as he passes upon the sidewalk, or he peers from the omnibus window, and lo! there stands the man to whom this leisure of his dreams is a daily reality.

The figure which, as making those dreams real, he can not but regard as a benefactor, stands in the spacious window—and there is often a group of such figures—always with the hat on, and generally with a cane in the hand, and such garments as are seen elsewhere only in the plates of the fashions and upon the tailor's lay figures. Why, being in a warm house, he should wear his hat, when he takes it off upon entering all other houses, doth not appear. But it is part of his office to wear it. For this representative of leisure models himself upon the habits of similar ministers in those tales which the busy

man sometimes reads; and as Fitz-Clarence Mortimer wears his hat in the club window upon Pall Mall, so must the hat be worn in our own club windows. Do not think that hatted figure gazing at the passing ladies and the carriages rolling to the Park is a useless dandy. Nature wastes nothing. Nature does not inspire him to pay tailors and shoe-makers and jewelers and hatters, and then to stand sucking the head of a cane in a club window, and in full view of the passing crowd, without a purpose. The brilliancy and perfume of flowers and the song of birds, as science shows, are not for our delight only; they serve the reproduction and perpetuity of life. The final cause of that hatted figure is not the advertising of a tailor; it is its effect upon the imagination. It serves the end of all art. It makes real to the busy citizen that life of leisure and of opportunity of which he reads and dreams.

Nor does it end with the suggestion. As the busy man goes by and beholds the apparition, he reflects upon the use of such opportunity as is revealed to him at the window. That man, he says, born to a fortune, or having by faithful industry and sagacity early amassed it, is now master of his life. He commands time and money, the two levers which are so powerful in heaving the world forward. He has but to devise how he will be of service to others, and obey the leading of his generous soul. Think of the hearths and the hearts that he cheers! Think of the knowledge that he acquires, the studies that he pursues, for the enlightenment of legislation and the practical advantage of government! Think how gladly he bears his part in the work of organized charities! He has what so few of us have—time and money. He can do so much—so much! What can he not do? So muses the busy man who must give all his day, and some of the night often, to earning the pittance by which he lives. And as he muses his good heart asks him why he should require every thing of the hatted figure of leisure in the club window, and discharge his own debt of duty by thinking how easily another can discharge his. Every thing in its degree, he says, as his steps quicken with the thought. One star differeth from another star in glory. Because that man, born in the purple or winning it, can do so much, can I do nothing? Because his whole life is that leisure of endless opportunity of which I can only dream, have I no minutes, no chances? Haunted by this thought, he finds even his full-stretched day elastic. He pulls it out until he too cheers some hearth and heart that would otherwise have been frozen; and the busy man is busier, indeed, but happier, and the amount of human suffering is a little less. In this light does not the hatted figure at the club window become a real benefactor? Nothing, indeed, is farther from its mind. It does not even see the busy citizen by whom it is seen. But nature has obtained the object for which she placed it in a club window with a hat on, and sucking the head of a cane.

THERE was a sudden chorus of poets during the autumn, and among them was a new note, which has been sometimes heard in the magazines, but now for the first time in a volume. It is Miss Nora Perry, who sings *After the Ball*,

and other Poems, and whose quick fancy and rippling melody are credentials which justify the neat form in which Messrs. Osgood and Company have preserved her verses, and which will make her readers wonder whether her music is prelusive only to higher strains, or to be accepted as a sweet refrain that catches the ear and heart for a moment and is heard no more. A poet and a severe critic once said, "If a beginner has music, I do not ask for more; the rest will follow." Precisely what he meant can be known only by knowing just what he meant by music. Perhaps he was thinking of the inner music which in great poets is not always heard until after close study and reflection. Yet had he turned the leaves of this little book of Miss Perry's he must have acknowledged the melody which is perhaps its most striking characteristic. They show a mind whose emotions naturally flow into verse, and a fancy which sees pictures every where, and finds histories in the little incidents of every day. They show the modern fondness for the suggestions of rich and costly objects, the associations of silks and satins and pearls, the kind of sensuousness which, with all his other wealth, is found in Keats, and which rustles and shines through Tennyson, although with him always subordinate. Many of the verses in this little volume are in a good sense true *vers de société*, but with a deeper feeling than is usual with such poems. An old Easy Chair which has seen so many of these tuneful ventures put to sea can but watch this with a half-pathetic interest. It knows so well that the fate of the little book is in itself. The loudest trumpeting, the most partial and friendly praises, can not save it if it is not freighted and trimmed for the voyage. Only the breath of heaven can swell the sails to port, and whether the venture commands that breath only the event will show. Go, then, little book! You have poetic feeling, fancy, delicate sentiment, grace, and music.

A FRIEND writes to the Easy Chair for the words "of a song which is familiar by its first line,

"When Bibbo went down to the regions below."

It was well known in the Century Club in the Thackeray era, and many of the habitués who see the words will recall those evenings when Thackeray himself trolled *Martin Luther* or *Little Billee*, and Paul Duggan crooned the *Widow Machree*; when a young exile of Erin sang the *Bells of Shandon* with a melodious pathos that still echoes in memory, and Mr. Sparrowgrass did justice to "St. Patrick was a gentleman." It was in the legendary and republican epoch of the club, before the magnificent imperial era in which it now basks; in the modest days of Clinton Place, when Mr. Verplanck used to talk of actors and the drama and the theatre, and the younger members dropped in after hearing Jenny Lind in Tripler Hall, and were told that they ought to have heard Malibran. Then Kane came back from the north pole, and the stories of the dapper little man were listened to as if he had been Robinson Crusoe just returned, or even Captain Gulliver. Darley was there, with quick nervous humor, and graphic imitative gesture which made the frog or the animal of which he spoke move before the eye. And once or twice, brought by some kindly admirer, old Vanderlyn, to whom

Napoleon Bonaparte had awarded a medal, which seemed to consume him, as the apparition of Jove consumed Semele, for he did afterward no more of note, and lived upon that great remembrance. It was pleasant to see the respect with which the younger artists treated the old man—old and poor and forlorn—and sad to think how swiftly his name fades from memory. "Did you ever see an engraving of Vanderlyn's Ariadne?" the Easy Chair asked a young traveler who had made the tour of the European galleries. "Oh, you mean the Dutchman Vanderwelde—yes; very pretty."

"Not so sweetly sang Plumer as thou sangest, mild, child-like, pastoral M——," says Charles Lamb, recalling the denizens of the old South Sea House; and even so tenderly and purely will always return the memory of John Kensett to a Centurion of twenty years ago. He was then, as indeed he was to the end, one of the most constant and faithful of attendants. On the old Wednesdays and Saturdays, which were the club evenings, he was always in the house, and sweetness and gentleness and smiling and calm went with him and left a benediction. Full of sympathy and attention, and with a deprecatory, modest, stammering, half-injured confusion if he were suddenly appealed to, he puffed great clouds of smoke and laughed with joy. Never but once in a quarter of a century of happy friendship did the Easy Chair know that serene temper to be ruffled, and that generous and noble nature to show impatience and anger. And that was when he thought that a poor and struggling fellow-artist had been seriously harmed by a sharp and, as Kensett thought, a wholly unjust and cruel criticism. For himself or for his own disturbance he had no such feeling.

Louis Lang, too, most cheerful and chirruping of comrades, with his bird-like step and smile of suavity, what would Twelfth-night have been without him!

Can we associate Bibbo with the bench? Under the grave brows of a Chief Justice shall we dare suspect that we see some evanescent gleam of intelligence when the song is named? Can we believe it the daily or nightly solace of a magistrate?—nightly or daily, which?

The sentiment of the song of Bibbo, if it has any, is at its own risk. Perhaps such strains are no longer heard in the Century; and indeed it belongs rather to the last than to this. It imports a two-bottle era, and might have been heard at Sir Jonah Barrington's banquets. It is preserved in the *Universal Songster*, of which a friend writes that it "was published in parts in London some thirty years ago, with wood-cuts designed and etched by Cruikshank, the whole being now embraced in three volumes octavo, and being the fullest collection I know of of English songs."

AIR—To Anacreon in Heaven.

When Bibbo went down to the regions below,
Where Lethe and Styx round eternity flow,
He awoke, and he bellowed, and would be rowed back,
For his soul it was thirsty and wanted some sack.

"You're drunk," Charon cried; "you were drunk when you died,
So you felt not the pain that to death is allied."
"Take me back," roared out Bibbo; "I mind not the pain,
For if I was drunk, let me die once again."

"Forget," replied Charon, "those regions of strife;
Drink of Lethe divine: 'tis the fountain of life,
Where the soul is new-born, and all past is a dream,
And the gods themselves sip of the care-drowning stream."

"Let the gods, then," he cried, "still drink water that will;
The maxims of mortals I always fulfill.
Prate, prate not to me of your Lethe divine;
Our Lethe on earth was a bumper of wine."

At length grim old Cerb'rus began a loud roar,
And the crazy old bark struck the Stygian shore;
When Bibbo arose, and he staggered to land,
But he jostled the ghosts as they stood on the strand.

Cried Charon, "I tell you 'tis vain to rebel,
For you're banished from earth, and you now are in hell."

"'Tis a truth," replied Bibbo, "I know by this sign—
'Tis a hell upon earth to be wanting of wine."

If public men could only die at the beginning instead of the end of their careers, said a voice, gravely, how much abuse they would be spared, how much more decent the newspapers would be, and how undisturbed the consciences of editors! The remark was suggested by the sudden death of the Mayor of New York. For two years he had sat in the chair of De Witt Clinton, lifted into it by the desire of reform, and how he was belabored and ridiculed and opposed by the press! If Dogberry had been the municipal chief, or if the testy old Peter Stuyvesant had stepped out of the history of Diedrich Knickerbocker and moved visibly before the eyes of the city, he would not have seemed very different from the figure which the press gave us of the sturdy Mayor. One cold, windy morning he was coming to town, and the train was delayed. Eager to be at his office and to do his duty, the Mayor walked against the chill blast for three miles, and had scarcely reached his desk when he sank upon the floor and was dead. Then we heard from the newspapers that in a time of suspicion and official knavery, when even Mr. Charles Francis Adams felt obliged to say of Mr. Seward in his eulogy that he did not sell himself, we heard that the Mayor was perfectly pure-handed, that no breath of doubt ever tarnished his integrity, that as a merchant and a man he was absolutely honest, however whimsical and wayward, and that if obstinate and antiquated, he was yet a strong, stalwart, upright magistrate and citizen.

Certainly when a conspicuous man lies suddenly dead it is not the moment to rehearse his defects, unless he be a man whose character and career are to serve as a warning and not as an example. Nor, on the other hand, while this is true, is it necessary to insist *de mortuis nil nisi bonum*. Death is not a sponge to wipe away the memory of a bad life. But shall we tell the truth only of dead men? The papers spoke truly of the Mayor, but it was a strain he was never permitted to hear. How it would have warmed his heart, had he lived, to arise the next morning and open his papers to read in them such kindly words! He would not have believed his eyes. He would have suspected some glamour. But as he saw that it was no trick of his spectacles, but was indeed true, how happy he would have been, and with what renewed zeal he would have undertaken his duties! Not to have felt himself at bay, to be sure that his sincerity was

conceded, however his acts might be criticised and regretted, would have so cheered his soul that those acts might very well have been different. A soft answer, says old wisdom, turneth away wrath.

The moral of this little sermon we hope is plain enough. It is not, as the mighty press might imagine—if it could ever be suspected of imagining a vain thing—that public men are not to be criticised and censured because they may die suddenly, nor because they may be honest and obstinate, but it is that criticism of a public man may be of such a kind that eulogies of his honesty and purity suddenly intervening may not seem ludicrous and half-remorseful. Public men are neither such symmetrical saints nor sinners as their portraits in the press would lead us to suppose. They are of very mixed materials, and act from very mixed motives. They may do things which seem selfish and inexcusable, and which upon the part of some are unprincipled, but they can not all be justly charged with degradation and depravity because they did the wrong thing. For instance, there is the salary grab, as it is called, which has been the subject of such sharp comment, and which was a great wrong. There were men of the best intentions, as far from thieves and swindlers even as the writers in the press who have so loftily denounced them, who voted for the wrong. They were thoughtless, or sophisticated, or ignorant, but they were not designing knaves. They were, however, "lumped" with those who were, and all were left for execution together. The press judgment in such cases is not unlike that of the tribunal of justice during the French terror. The prisoners were brought in, a general accusation

was read, the culprits were identified, and they were guillotined before sunset.

Criticism of public men may be made reasonably and honorably, or it may be made as Gifford wrote literary criticisms in the *Quarterly*, and as literary slaughter was done in *Blackwood* and *Fraser*. It can not be made, indeed, without a strong sense of justice and natural candor, and it may be as severe and incisive as Mr. Lecky's and Professor Cairnes's recent reviews of Mr. Froude's history of Ireland. The rule should be not to "speak him fair," but to speak him true. Indignation and severity are just as legitimate as praise. It is only affected wrath and rhetorical severity and a confusion of sincere error with dishonest intention that are to be condemned. A man, indeed, may do enormous mischief with his sincere error, and the Inquisition has been represented as the work of men of honest purpose. But that is no reason for implying that they are dishonest, nor for speaking of offenders infinitely smaller and unimportant as if they were idiots or mad.

There are those who think that we can not deal with public affairs except in a coarse and wholesale manner; that if you want people to hear, you must shout at the top of your lungs; and if you wish to persuade them that a man has made a mistake, you must vociferously accuse him of parricide. This is the same kind of feeling which made Haydon think that big pictures were high art, and which convinces a jaded *gourmand* that nothing which is not smothered in mustard and fiery with Cayenne has any flavor. It is a view not worth considering. But one which is well worth considering is that we should so speak of public men living that our words over their dead bodies shall not seem hollow or formal.

Editor's Literary Record.

THERE is nothing in the *Life of Samuel Morse, LL.D.* (D. Appleton and Co.), by SAMUEL IRENÆUS PRIME, that calls for the semi-apologetic preface which introduces it. If Dr. Prime had but scant materials for the work, the work itself does not indicate the fact. The volume, which is a goodly octavo of nearly 800 pages, has not an uninteresting page, not a letter or a document which we would wish omitted. The life of Professor Morse is divided into three parts: the first includes his career as an artist, which occupied just one-half of his life; the second was employed in the establishment of the telegraph; the last shows the rewards he received and the benefits he conferred upon mankind. The story of his life has been so recently told in the newspapers and the magazines that an epitome of it here would be superfluous. One fact in that life, which Dr. Prime brings out very clearly, renders the work worthy the study of all young men. The conception of the electric telegraph did not flash uncaused upon the mind of Professor Morse. Years of patient study were preparing him for it, though he knew it not—study devoted to science, first in college and subsequently in later manhood, and to practical mechanics in connection with his invention of what he humorously called "Morse's patent metallic double-headed ocean-drinker and deluge-

spouter valve pump-boxes;" and the lesson of his life is that which is taught by the lives of all truly great men, namely, that success is never the result of a lucky intuition, but always of patience, persistence, and assiduity.

The same lesson is not less eloquently enforced by the story of the *Life and Labors of Mr. Brassey* (Roberts Brothers), by Sir ARTHUR HELPS. If there is any profession in which the highest honor has been popularly supposed to be inconsistent with success, it is that of a railroad contractor. Mr. Brassey was one of the largest contractors, and is said to have accumulated the greatest wealth ever known to have been amassed by the direct and productive industry of a single man. His undertakings extended not only all over Great Britain and into Europe, but into the far East and into the American continent. His success was achieved not only without the violation of principles of commercial honor, but without leaving a stain upon a truly Christian character; and he demonstrated by his life that the highest success is not only consistent with an unstained integrity and an unsullied honor, but is built upon them. Sir Arthur has admirably told the story of an admirable life.

We can not too highly commend Mr. CHARLES NORDHOFF's *Politics for Young Americans* (Harper and Brothers). The author's scope and pur-

pose, his high moral and even religious tone, his thorough appreciation of free institutions, his comprehensive grasp of fundamental principles, his strong common-sense, and his clear and compact style, combine to render his work an exceptionally admirable one. "The book," says our author, "grew out of an attempt, in a few letters, to instruct my oldest son in the political knowledge which every American boy ought to possess to fit him for the duties of citizenship. I found my subject much larger than I at first imagined; but interest in the attempt led me on, and what was begun originally for one boy is here printed for the use of others." Its usefulness will not, however, be confined to boys. Mr. Nordhoff possesses the ability of writing in a style calculated to interest alike the thoughtful of all ages. The chapters on "labor and capital," on "strikes," and on "trades-unions" are worthy of being printed as tracts for general circulation; and those on "money," "bank-notes," and "more greenbacks" could be advantageously studied by the members of Congress. Mr. Nordhoff believes that religion is the basis of liberty; that "to be a good citizen of the United States one ought to be imbued with the spirit of Christianity, and to believe in and act upon the teachings of Jesus." He urges as a fundamental truth in American politics that "the course of life which is calculated to fit your immortal part for the future and spiritual life is also that course which will make you a good citizen of the United States." He urges as the first duty of good citizenship the maintenance of a high standard of virtue and intelligence in personal character. He flames out with a healthy vehemence against demagogism of every description. He is, in a philosophical, not a party sense, a thorough democrat. "Governments are necessary evils;" "laws should be few in number and simple in structure;" forcible interference in State affairs by the Federal government, "except for special, temporary, and extraordinary occasions, as to quell a sudden riot, is unwise and dangerous." He discountenances interference with the railroads or the management of telegraphs by the central government, or of markets by the city governments. He denies the power of government to create money; characterizes the legislation which made paper money a legal tender as a practical robbery; urges not only a specie basis, but a measurable return to specie payments, embracing the prohibition of all paper money less than five dollars in value; condemns all obstructions and impediments to free commerce; characterizes protection to home industry as simply "an interference with the right of free exchange;" explains very clearly the nature of capital, and shows the laborer's interest in its protection; and closes by describing in some detail the features of the American political system, including the rights and duties of citizenship, and the limits and the relations of the town, county, State, and Federal governments. In commending so cordially his book we do not signify our approval of all its political principles. It is not always even self-consistent. If "free government is a political application of the Christian theory of life," then governments are not "necessary evils;" and if the principles of freedom inculcated on page 19 are sound, it is difficult to see why the minority

should not have a right to carry paper currency if they prefer it to silver, nor why a father should not have the right to send his children to a private rather than a public school if he personally prefers to do so. But no man could have written with Mr. Nordhoff's vigor on political subjects and not have crossed the convictions of some of his readers, who will ask, and have a right to ask, of him only a clear and comprehensive statement of his own views.

There is enough of graphic description and romantic adventure in the *Remains of Lost Empires* (Harper and Brothers), by P. V. N. MYERS, to give it interest as a book of travels. A more substantial value attaches to it, however, because it carries us not merely into another world, but into the old world, to the land which both science and Scripture combine to indicate as the birth-place of civilization, if not of the human race, and to the cities, now in ruins, which were once all alive with the commercial and political conflicts, the scientific investigations, the domestic hopes and fears and loves, and the religious aspirations, which an inexplicable progress has transferred from those once populous but now deserted sites to Europe and America. The author and his brother—the latter sickened and died during the journey—after spending a summer in Europe and the fall in Egypt and Palestine, commenced the tour whose record constitutes this volume. His story begins with a description of the ruins of Palmyra, the Tadmor of Scripture, the site of which the reader may find on any map of Asiatic Turkey about 100 miles northeast of Damascus. Thence the brothers pursued their appointed course, getting some glimpses of the ruined cities of Northern Syria; traveling across the Mesopotamian plains; spending some time in studying the ruins of Nineveh; floating down the Tigris; visiting, in passing, Bagdad, the only living city of any note in a region filled with the entombed cities of dead monarchies; examining with greater interest the ruins of Babylon, which are described graphically; pursuing their course down the river Tigris to the Persian Gulf; disembarking at Bushire; thence traveling across Persia, through Shiraz, with its mosques; its beautiful gardens, its miserable mud walls, and its heaps of filth and rubbish; visiting the ruins of Persepolis, with the remains of its wonderful palatial edifices, the royal residences of Cyrus, Darius, Xerxes, and Artaxerxes; thence by a journey, long in fact, though short in the narrative, to the lovely Vale of Cashmere, in Northern India, among the mountains of the Himalayas, the description of which, with the city which bears its name, is too brief; and thence southeast to Calcutta, getting on the route a glimpse at the monuments of the great Mogul Empire in India, and the evidences of more recent progress in the East. If this rapid *résumé* of a book remarkably full of well-compacted information does not give our readers an appetizing idea of the volume, we have done it an injustice. The style is clear, the descriptions simple but life-like, and the author's judgment on disputed and doubtful questions always fair and generally sound. The book gives evidence of considerable research in the works of the ablest investigators, in connection with personal observation.

JOHN STUART MILL'S *System of Logic* (Harper and Brothers) is unquestionably his ablest work,

and that on which his future reputation will chiefly depend. As certainly his *Three Essays on Religion* (Henry Holt and Co.) is the one least likely to give satisfaction to his admirers, or to the advocates of that school of thought of which he is the most distinguished representative. Nevertheless, the second of these works is only the corollary of the first. The *Essays* are the application to the sphere of religion of the principles so clearly inculcated and so vigorously enforced in the *Logic*, and he only will fully understand either who reads the experiences out of which they were evolved, as they are recorded in Mr. Mill's autobiography. The essence of Mr. Mill's system of philosophy is that all our knowledge is derived from our observation, and all reasoning is inductive. According to him, there are no necessary truths. The definitions of geometry, for example, do not correspond to any thing we observe in nature, nor to any thing which we can conceive in our mind. "A line as defined by geometers is wholly inconceivable. We can reason about a line as if it had no breadth, because we have a power which is the foundation of all the control we can exercise over the operations of our minds—the power when a perception is present to our senses, or a conception to our intellects, of attending to a part only of that perception or conception instead of the whole. But we can not conceive a line without breadth; we can form no mental picture of such a line. All the lines which we have in our minds are lines possessing breadth. If any one doubts this, we may refer him to his own experience." Applying this principle to logic, Mr. Mill repudiates *in toto* the syllogistic method, or rather maintains that the major premise of the syllogism is never the starting-point of a logical process, but always a result which has been reached by induction. "All inference is from particulars to particulars; general propositions are merely registers of such inferences already made." Even the principle that every effect must have a cause is denied to be an original or necessary intuition, and is asserted to be a generalized belief which is gradually acquired as the result of extensive induction. He accordingly maintains, with that remorseless following out of his premises to their legitimate conclusions which is one of his eminent characteristics, that "in distant parts of the stellar regions, where the phenomena may be entirely unlike those with which we are acquainted, it would be folly to affirm that this general law prevails." Of this system of philosophy, which denies all intuitions, whether spiritual or intellectual, and refers all knowledge to observation, Mr. Mill's *System of Logic* must take rank as the clearest, the most comprehensive, and the most self-consistent exposition in the English language. Nor is its value confined to those who accept this philosophy, for they who deny it will still find in this treatise an invaluable presentation of those laws which govern in that domain of knowledge which is recognized only by or through the senses.

The *Three Essays on Religion*—the last of which, on *Theism*, is Mr. Mill's latest work, and the most important in the volume—are devoted to a consideration of the scientific evidences of religion, that is, the logical evidences, upon the assumption that all our knowledge is derived from observation of sensible phenomena. The

conclusions to which he arrives, by a process of reasoning which in the main it is difficult to resist, provided his fundamental assumption be granted, are those of a purely pagan philosophy. They are, in brief—and we state them as nearly as possible in his own words—that "in the present state of our knowledge the adaptations in nature afford a large balance of probability in favor of creation by intelligence," while "it is equally certain that this is no more than a probability;" that the God who is thus pointed out to us by a study of nature is certainly not omnipotent, probably not omniscient, and not at all to be regarded as all-benevolent; "a Being of great but limited power, how or by what limited we can not even conjecture; of great and perhaps unlimited intelligence, but perhaps also more narrowly limited than his power; who desires, and pays some regard to, the happiness of his creatures, but who seems to have other motives of action which he cares more for, and who can hardly be supposed to have created the universe for that purpose alone." This Great Unknown is, according to Mr. Mill, a Being whose benevolence is so uncertain that, after making all necessary deductions, "some may doubt whether there remains any balance," and who has allowed pain in the world not to subserve a higher purpose, but because "of a clumsiness in the contrivance employed." For the doctrine of immortality Mr. Mill finds no scientific, that is, no sensible, evidence, and our hope of a life beyond the grave, he rests wholly upon our imagination, "the whole domain of the supernatural being removed from the region of belief into that of simple hope." If our theologians could learn from the study of this treatise how utterly in vain is the endeavor to prove by a purely scientific process the truths of religion without appealing to the spiritual nature of man, and if our psychologists could learn that science alone—that is, the knowledge that is derived from and based on observation—can never satisfy the religious not even the social aspirations of mankind, Mr. Mill's *Three Essays on Religion* might safely be regarded as not the least valuable of his contributions to the sum of human knowledge.

B. L. FARJEON has written no better story than *Jessie Trim* (Harper and Brothers), none other, we are inclined to say, so good. It is simple and natural and true throughout. *Joshua Marvel* began as well, but *Jessie Trim* does not fall off from nature into the melodrama, as *Joshua Marvel* did. The life is not more true to nature than the life of *Blade-o'-Grass*, but it is a pleasanter, happier life. The story is a longer one, and so in some respects a truer test of the artist, than *Bread-and-Cheese and Kisses*, while it is certainly better sustained than *London's Heart*. Chris Carey takes his place among the shadow children of fiction, not exactly next to David Copperfield—there is nothing next to that wonderful picture of child life, and nothing in Chris Carey at all resembling it—but inferior to none else that we recall. And the dear mother, whose fidelity of love is the central feature of the book—a love that radiates poverty, and even makes beggary for her child's sake a sublime act of self-devotion—is a nobler portraiture of mother-love than any which Dickens has given to the world. The sacredness of the love between

mother and child, which gives its quaint title to *Bread-and-Cheese and Kisses*, is a favorite theme with Farjeon, and the very fact ought to make him, as he is, a favorite story-teller with those who find inspiration in a love which is not and can not be degraded by passion. How such a love makes sacred all life and radiant all experiences—this is the central and illuminating beauty of *Jessie Trim*. How at length this love, sanctifying sorrow, turns the misanthrope into a true lover of his kind, and gently takes from his hands Paine's *Age of Reason* to put a Bible in its place—this is the issue of *Jessie Trim*, which, to its portraiture of the highest forms of domestic affection, adds, not obtrusively, but with gentle suggestion, the yet more sacred love which finds in time of trouble a rest, a hope, and a strength in God. His previous stories prove Farjeon to be a humane and philanthropic writer. *Jessie Trim* gives a hint of a true religious power not yet, let us hope, fully put forth.

BRIEFER NOTICES.

D. APPLETON and Co. publish a new and revised edition of ALEXANDER BAIN'S *Logic, Deductive and Inductive*. Mr. Bain, without denying the existence of a spiritual principle in man, independent of a cerebral organization, may nevertheless be regarded as one of the ablest expositors of materialism, and rests nearly if not all his explanations of psychological phenomena upon materialistic analogies. Except for his larger use of the discoveries of modern physiology, his *Logic* does not materially differ from the greater work, founded upon the same system, of his master, John Stuart Mill.—*The Scottish Philosophy*, by JAMES M'COSSH, LL.D. (Robert Carter and Brothers), is a valuable contribution to the history of philosophy. No country, unless it be Germany, has made so great and so diverse contributions to mental science as Scotland, and even Kant, the greatest of German metaphysicians, was descended from Scottish parentage. Dr. M'Cosh traces the history of Scottish philosophy from the seventeenth to the nineteenth century in a series of sketches which contain at once biographies of the leading thinkers, a brief and fair exposition of their principles, and a clear but concise criticism upon them.

Dr. HOWARD CROSBY'S *Expository Notes on the Book of Joshua* (Robert Carter and Brothers) is a model of a practical and popular commentary for Sabbath-school teachers. The author gives succinctly such information as is necessary for an understanding of the sacred history, evades no difficulties, but does not enhance them by reporting multiform and conflicting explanations. He, however, scarcely makes sufficient allowance for the difficulties which really perplex many persons respecting the miracles recorded in the Book of Joshua and its representations of the Divine character and dealing.—*The Paraclete* (Scribner, Armstrong, and Co.) is in form an essay on the personality and ministry of the Holy Ghost, but is in reality a spiritual argument for the reality and spirituality of supernatural religion. The author is an original and independent thinker of the intuitive school.—Of all the various attempted classifications of the Scripture teaching, according to doctrine and ethical subjects, the best is the least

pretentious, *The Bible Text-Book* (American Tract Society). The new edition is a decided improvement over the old, and its value is enhanced by the maps and tables which accompany it.—*The Christian in the World* (Roberts Brothers), by Rev. B. W. FAUNCE, is a plain and practical setting forth of religion in its applications to daily life. Its characteristic power is not that of original thought, brilliant imagination, fervid feeling, or sensational rhetoric, but simple, plain, practical, American common-sense.—*LONGE'S Commentary on the Book of Job*, American edition (Scribner, Armstrong, and Co.), embraces a rhythmical version, with introduction and annotation by Professor TAYLER LEWIS, a commentary by OTTO ZÖCKLER, translated by Professor L. J. EVANS, with a general introduction to the poetical books of the Bible by PHILIP SCHAFF. It is unquestionably the most complete work on the Book of Job within the reach of the American student.—Harper and Brothers publish in a convenient form for reference, for those who desire to keep themselves acquainted with the progress of the controversy between ecclesiasticism and liberty, Mr. GLADSTONE'S pamphlet on *The Vatican Decrees*, with a history of the Vatican Council, and the English and Latin text of the Papal Syllabus and the Vatican Decrees themselves, by PHILIP SCHAFF, D.D.

Mr. CHARLES NORDHOFF'S work on the *Communist Societies of the United States* (Harper and Brothers) fills a gap in the history of the formation of our American society. The only analogous work in American literature is that of Mr. J. H. Noyes, who is himself the head of the Oneida Community, and therefore not one to whom the American public would naturally look for a fair and impartial account of American socialism. Mr. Nordhoff's keen observation, thorough intellectual integrity, purity of spirit, and inartificial style particularly fit him for the work which he has undertaken. The book is handsomely and elaborately illustrated.—*Ismailia* (Harper and Brothers) is the title of Sir SAMUEL BAKER'S narrative of his expedition to Central Africa for the suppression of the slave-trade, organized by Ismail, the Khedive of Egypt. Of this expedition, one of the remarkable events of the present decade, we have already given an account in the pages of this Magazine. We need here only add that the narrative, which in the English edition filled two volumes, is in the American edition comprised, without the omission of any material, in one handsome royal octavo of a little over five hundred pages, and is furnished with maps, portraits, and upwards of fifty full-page illustrations. It is one of the handsomest, as it is the most important, book of travels of the year, and is a worthy companion to Schweinfurth's *Heart of Africa*.

It must certainly be regarded as a somewhat singular fact that the two ablest writers on American institutions are of foreign extraction—De Tocqueville and FRANCIS LIEBER. The latter's treatise on *Civil Liberty and Self-Government* (J. B. Lippincott and Co.) has for many years been regarded, despite some natural inaccuracies in the first edition, as the ablest exposition of the principles of self-government in American literature, the more valuable because of its clear perception of some of the dangerous tendencies of our own times. It has been not only the text-book in

our colleges, but the instructor of some of our ablest public men, and its lessons have re-appeared in the rostrum, the pulpit, and the press, before audiences that knew not the source of the wisdom which they applauded. The present edition, prepared by THEODORE D. WOOLSEY, does not differ materially from the second edition, published in 1859.—The alterations made by Mr. GEORGE P. MARSH in *Man and Nature* render it really a new book, and entitle it to its new name, *The Earth as modified by Human Action* (Scribner, Armstrong, and Co.). Its character is indicated by the motto on its title-page, "Not all the winds and storms and earthquakes and seas and seasons of the world have done so much to revolutionize the earth as man, the power of an endless life, has done since the day he came forth upon it, and received dominion over it." This assertion of Dr. Bushnell receives abundant demonstration and illustration in the volume, which is, indeed, overcrowded with suggestive facts, grouped upon philosophical principles, however, and burdensome only because the most retentive memory fails to retain them, or even fully the principles which they illustrate. Modern science has taught so much the dominion of nature over man that it is healthful to get the opposing truth so clearly put and so well fortified.

Jack's Sister (Harper and Brothers) is a story of a woman's fidelity to her trust, somewhat complicated in plot, not altogether attractive in the characters portrayed, but more than redeemed from any defect in these respects by the singular sweetness and power of Enid's character.—*Atherstone Priory*, by L. N. COMYN (Estes and Lauriat), reverses the most common course of novels. Generally it is the woman's love and patience which redeem the fitful, the imperious, or the headstrong man; in this story it is the strong, patient, and faithful love of the man which transforms the imperious and willful woman. His one lapse sets in the stronger contrast the strength of his patient love that restrained a temper which could be hot and impetuous.—*The King of No-Land*, by B. L. FAR-

JEON (Harper and Brothers), is a Christmas story, full of queer, quaint fancies, woven into a fabric of sweet love. Its political moral does not indicate any inclination on the part of the author for the republican movement in Great Britain.—*The Treasure Hunters*, by the author of *Ship Ahoy* (Harper and Brothers), is of much the same character as its predecessor; its interest consists in the liveliness of its movement and the variety and rapid succession of its exciting incidents.—*Toinette*, by HENRY CHURTON (J. B. Ford and Co.), is a book of considerable power, but power not wisely employed, and turns too much on sensual passion to be a thoroughly healthy book. The scene is in the Southern States; the incidents grow out of the late war, and the relations between the freed people and the whites. The lesson, if we read it aright, is one which the power neither of philosophy nor of fiction can commend to the common sentiment of mankind.—*The Little Classics* (J. R. Osgood and Co.) comprise four little pocket volumes, each containing a number of selections of short stories, such as have become classical. The editor, ROSSITER JOHNSON, has exercised excellent discrimination in his selection; and the series is commendable especially to the traveler, who often wants a readable book in a convenient form for easy carriage.—*More Bedtime Stories*, by LOUISE CHANDLER MOULTON (Roberts Brothers), keeps up the reputation of its author. There are fifteen stories in the volume; they all appeal to the younger class of readers.—Equally good in a different way is SUSAN COOLIDGE's last volume, *Mischief's Thanksgiving* (Roberts Brothers). The first story gives title to the volume.—Mr. ROSSITER RAYMOND is in the habit of reading every Christmas a story, prepared for the occasion, to the Sabbath-school of Plymouth Church. If we mistake not, this is the genesis of *The Man in the Moon, and other People* (J. B. Ford and Co.). In that case Plymouth Sabbath-school is to be congratulated on its good fortune. Mr. Raymond is a rare story-teller, and in his best mood when he is telling stories to children.

Editor's Scientific Record.

SUMMARY OF SCIENTIFIC PROGRESS.

ASTRONOMICAL news has been remarkably uninteresting during the month of November, but we are happily able to announce that telegraphic dispatches from the Eastern hemisphere state that the observations of the transit of Venus on the 8th of December were completely successful. The partial failures at Nagasaki and Hobart-Town, caused by cloudiness, will, it is hoped, not appreciably affect the result.

The Hamburg Observatory, established over thirty years ago, has lately sent forth the first number of its official publications, in the shape of a memoir by Helmholtz on the stars of the cluster in Sobieski's Shield. The principal works of a similar character that have been published consist of Bessel's observations of the Pleiades, Hall's observations of the cluster in Perseus, and Lamont's observations of the same cluster that has been now studied a second time by Helmholtz.

Works of this class are considered by astronomers to be of great value in laying the foundation for the future study of the relative movements of the individual members of these groups of stars; and Professor Helmholtz has, by comparison of his own observations with those made in 1886 by Lamont, been able to develop any changes in the relative positions of the stars that may have occurred during the interval between 1886 and 1870. This comparison in general confirms the earlier observations of Lamont, and only a few discordances are to be noticed; and at some future time, when it becomes desirable to renew these observations, Helmholtz will be considered as having made a valuable contribution to the study, in that he has, with a large refractor, so closely examined the stars recorded in the present work.

A physical observatory is to be established in Paris, probably under the superintendence of Janssen. In the scope of its labors it will prob-

ably be similar to the new observatories in Germany and India.

Professor Ferrel has presented to the world the results of many years' investigation into the subject of the tides. This memoir, developed in part at the expense of the United States Coast Survey, will probably for a long time remain the most comprehensive and the most practically useful work on the subject. The whole subject has been treated concisely, and yet with the greatest generality, and the formulæ given by Professor Ferrel are of especial value in the discussion of the long series of accurate tidal observations accumulated by the Coast Survey. The whole subject of shallow-water tides is almost entirely new, and may be regarded as the most interesting and important part of the work. The careful consideration of the influence of friction has allowed Professor Ferrel to determine the moon's mass with an accuracy equal to that of any other method, and he has, on the other hand, been enabled by the same considerations to explain away a large part of the so-called secular acceleration of the moon's motion, his demonstration of which preceded by a year that of Delauney.

In connection with the same subject we notice a paper communicated to the Mathematical Society of London on tidal retardation, in which Mr. Rohrs discusses the problem of the maximum retardation on a globe covered entirely by a sea whose depth is constant for all points in the same latitude, but varies from the equator to the poles.

Mr. Schwendler, in some remarks before the Asiatic Society of Bengal, states that all telegraph lines in India are affected by natural or earth currents, which, in fact, permanently exist, their general drift, as shown by ten thousand observations, being from east to west, and that we are now justified in establishing a special system for the purpose of observing them according to a uniform plan and with improved methods of testing. Mr. Schwendler has for the past six years systematically tested the telegraph lines of India for the purpose of securing all the data necessary for the thorough investigation of the subject, in which he has been so much interested, and his labors constitute the first investigations of the subject at all worthy of its scientific and practical importance. It is intimated that in consequence of his earnest representations the Indian government will institute an improved system of measurement of earth currents.

The determination of altitudes by means of the barometer has always been subject to very serious uncertainties by reason of the periodical, and still more of the non-periodical, variations in the condition of the earth's atmosphere. Professor Whitney, State Geologist for California, has endeavored to diminish the uncertainties in the use of the barometer by preparing tables specially adapted to California which should give empirical corrections for each hour of the day and throughout the year. These are based upon observations taken at Sacramento, Colfax, and Summit; and the application of Whitney's tables to other stations situated under very different circumstances seems justified by the examples which he gives.

Dr. Hann calls attention to the fact that in the theory of the rain there is still needed some explanation of the fact that the greatest quantity

of rain often falls while the barometer is rising, and not when it is falling, as would necessarily be the case if certain theories were correct. In fact, he announces himself compelled to believe that the condensation of atmospheric vapor has no noticeable influence on the change of atmospheric pressure. In following up the investigations of Zeuner, Hirn, Reye, and Pealin, he then proceeds to show that the loss of heat sustained by ascending and descending currents of air suffices to explain the anomaly in question.

The careful study by Hildebrandsson of the movements of the upper or cirrus clouds over the surface of Europe has enabled him to conclude that these follow the law predicted by Ferrel in 1859, and confirmed by Abbe, 1871, and Ley, 1872, viz., that the higher currents of air are always directed toward points to the right hand of the lower currents.

The curious fact has been observed by Sevor that iron wire heated to redness and drawn out while immersed in dilute sulphuric acid absorbs a large quantity of some gas whose constitution has not yet been definitely ascertained.

A subject of special interest in connection with *Geography* is the fact that the British government has finally concluded to send out a naval expedition during the coming season for polar search, the Smith Sound route having been selected as decidedly the most promising and practicable. The expedition will not start, however, until quite late in the summer, so as to take advantage of the disappearance of the drift ice, which usually occurs after the middle of the summer. There will be two vessels, one of them probably a steam-whaler and the other taken from the British navy, both, of course, thoroughly equipped for the duty in question. It is stated that Captain Nares, of the *Challenger*, will be in charge of the expedition, and that it is probable Captain Alfred Markham will command one of the vessels. Captain Markham, it may be remembered, visited the arctic regions on board of a steam-whaler in 1873 for the purpose of familiarizing himself with the duties of arctic search and life, and in the vessel on which Dr. Bessel and some of his companions of the *Polaris* were brought back to Dundee after their rescue by the *Ravenstraig*. It is understood that every thing will be done by the British expedition to secure the amplest results in all branches of science, and it is hoped that enough facts in regard even to the pole itself may be brought away to warrant the outlay.

It is also stated that the Austrian government will send out one and perhaps two expeditions with the same object, but that their route will be either by way of Spitzbergen or of Behring Straits, or both.

It has been strongly urged upon the American government to take part in this scientific crusade by sending one or more vessels through Behring Straits. The condition of the ice in the arctic seas in that part of the world is said to warrant great expectations of interesting results, from the fact that the quantity of ice has been greatly diminished within the last few years, so much so, indeed, that a whaling captain in the summer of 1874 passed within two or three miles of Wrangell Land, and could readily have landed had he been so inclined, there being an entire absence of the barrier which has for many years past pre-

vented any near approach. Vessels also proceeded without interruption to the mouth of the Mackenzie—an almost unheard of event.

The latest news from the *Challenger* was in the form of a dispatch announcing her arrival at Hong-Kong, from which point she will probably proceed to Japan, in accordance with her published programme. What effect the transfer of Captain Nares from her command to that of the polar expedition will have remains to be seen.

The first series of operations of the American steamer *Tuscarora* in the way of soundings for a Pacific cable has been completed by her return to San Francisco, and the detachment of Commander Belknap on other duty. The vessel has, however, started out again to make a line of soundings direct from San Francisco to the Sandwich Islands, the first line having been drawn from San Diego to the same point. This new route is considered preferable for a Pacific cable to China and Japan, if practicable, as being so much the more direct.

The various expeditions that started out from different parts of the world to take observations of the transit of Venus reached their destinations in due season, with the exception of that for Crozet Island, the American party at least being unable to disembark, in consequence of the strong sea. Advices from the Kerguelen Island party, written a few days after their arrival, gave much promise of interesting results in the direction of collections of natural history, quite a number of species of birds having been met with, and their nesting period having just commenced. All of the American parties in the antarctic portion of the world are accompanied by gentlemen interested in natural history, and provided with the necessary apparatus and material for making collections, and a rich harvest is expected from their labors.

Telegraphic advices announce a satisfactory observation of the transit of Venus at most of the stations, at a few only the intervening cloudiness or other causes preventing full success. It is believed, however, that enough data have been gathered to permit the practical solution of all the astronomical problems involved, whenever they can be collated. According to Professor Newcomb, much depends upon the observations at Pekin, from which place no advices have yet been received.

The Palestine Exploration Societies of Great Britain and America appear to be meeting with much success in their labors, the reports recently made showing good progress in topographical and ethnological surveys of the country. Strenuous efforts are being made to secure funds for the expansion of observations by the American division, which it is hoped will be successful.

Among *Microscopical* notes we may mention that Mr. H. J. Carter contributes the first portion of a paper on the "Development of Marine Sponges" to the November number of *Annals and Magazine of Natural History*, in which he discusses at considerable length the following four periods of the sponge's developmental history, viz., 1, that from its earliest appearance to the commencement of the duplicative division of the yolk; 2, that from the duplicative division to the ultimate duplicative subdivision; 3, that from the formation of an embryo to its fixation or stationary position; 4, that from the station-

ary position of the embryo to the development of the perfect sponge. The first and second stages were taken from *Halisarca lobularis*, the third and fourth from *Halichondria simulans*.

Professor Betz publishes, according to the *Medical Times*, an able paper in *Centralblatt*, giving a *résumé* of the results of some preliminary investigations he has made into the structure of the superficial layers of the brain. The object of his research was to discover whether it is possible to determine from the quantity and quality of the histological elements whether similar parts are present or absent in men and animals. We recommend the paper to the attention of histological and physiological students.

The artificial production of silica films, with a view of adding to our knowledge of high power definition, and possibly throwing light upon questions of crystallization and organization, has received a new impulse in Mr. Slack's discovery that the gas escaping from a heated mixture of powdered glass, powdered fluor-spar, and sulphuric acid (and which, when received into pure water, deposits the silica suddenly and violently in amorphous particles), gives delicate films with definite forms, exhibiting remarkable regularity of size and arrangement when conducted through a mixture of glycerine and water. Some of the films produce the beautiful polychromatic effects so often noticed in beaded diatoms and scales.

In a very able paper on the "Embryology of the Ctenophora," by Alexander Agassiz, published in the *Memoirs of the American Academy of Arts and Sciences*, August, 1874, the author effectually disposes of Ernst Hæckel's gastrea theory. He says: "That the time for embryological classifications has not yet come the attempts of Hæckel plainly show, for they are in no ways in advance of the other embryological classifications which have preceded them. We get new names for somewhat different combinations, but a truly scientific basis for a classification, based upon the value of embryonic layers, is at present impossible. Such attempts can be only speculations, to be proved or disproved on the morrow."

An interesting contribution to *Ethnological* science will be found in an account of Lieutenant Wheeler's expedition of 1873 in Petermann's *Mittheilungen*, xi., 1874, by O. Löw, upon the Moquis, Apaches, and other tribes of New Mexico and Arizona.

Das Ausland, November 9, 1874, has a carefully prepared article on the linguistic researches of Dr. C. Herman Berendt in Central America. This gentleman has spent many years in these regions, and designs to publish a complete Maya grammar and dictionary.

Mr. Henry Hague has recently sent to the National Museum at Washington the instruments constituting the sarabanda, or band of music of the Tactic Indians of Central America, consisting of a drum, a mandoline, and a marimba or Indian piano. The latter consists of a rectangular frame four feet long by fourteen inches wide, on four legs about two feet high. On the under side of the frame hang sixteen oblong gourds of graded sizes. Immediately over the mouths of the gourds are bars of hard sonorous wood supported by tense cords. The music is produced by striking on these wooden keys with two drumsticks tipped with little India rubber balls. Chev-

alier Arthur Morelet says of this instrument: "Few days pass consecutively in Flores without the sound of the marimba inviting its inhabitants to some new festivity. No other form of invitation is extended. The door is open for all. There you see the alcalde or the corregidor alternating in the same fandango with the meanest citizen. Persons giving parties do the honors of the house in the most unpretentious manner possible. A dozen candles, a supply of chairs collected from a dozen neighboring houses, a few homely refreshments, and the engagement of one or two performers on the marimba constitute the entire preparation."

The Birmingham "National Museum of Arms," embracing objects of all times and lands, has been thrown open to the public.

The British survey of Palestine, interrupted by the heat of summer, by Lieutenant Conder's return to England, and by Mr. Tyrwhitt-Drake's death, has been resumed. Lieutenant H. H. Kitchener, R.E., has been added to the party.

The excavations now being carried on among the ruins of Anurâdhapura, in Ceylon, have brought to light a number of sculptures belonging to the best period of ancient Indian art.

The work of Dr. Gerhard Rohlfs, entitled *Quer durch Africa*, in which he conducts us across the African continent from coast to coast, will hold a prominent place among the contributions to ethnology for the year.

Dr. Hanny read a paper before the Geographical Society, London, October 21, upon the result of his researches on the geographical distribution of the human race in Eastern Melanesia. He showed that the penetration of the Papuan population by the Polynesians is much less exceptional than has been hitherto believed. It has long been known that there has been a considerable immigration of Tongans into Viti. Ouvéi, in the Loyalty Islands, was invaded at the beginning of this century by the Kanakas from the Wallis Island, the eastern coast of New Caledonia containing a very large number of Melano-Polynesians, the yellow variety of Bongaul, who perhaps found them on Isabella Island, in the Solomon group.

Among items of general anthropological interest, we may mention the recent discovery near Athens of an extensive heap of refuse shells, which was at first supposed to be a true kitchen-midden, but upon further investigation was shown to consist almost entirely of a species of murex, and other shells furnishing coloring matters, and it was therefore concluded that the shell heap in question is the site of an ancient manufactory of the celebrated Tyrian purple dye. The dyes obtained from these mollusks are remarkably constant, several different tints being readily procurable.

Several wells have lately been discovered near Ashill, in England, partly filled with earthen Roman vases of very great beauty, some of them supposed to have contained the ashes of the dead.

An international congress of "Americanists" has been called by the American Society of Paris, to be held during the coming spring in that city, the object being to bring together all persons who are interested in the ante-Columbian history of America and the character and distribution of its modern native tribes. A museum

of American antiquities will also be opened on the occasion.

Considerable amusement has been excited among scholars in the United States by the attention which has lately been paid to the subject of the Cardiff Giant in Germany, Dr. Schlottmann, an eminent Orientalist, having announced his belief in its being of true Phœnician origin, and intended to represent Adonis!

The younger Sars is, in *Zoological* science, fully sustaining the high estimation placed on the works of Norwegian zoologists, especially of his father, the late distinguished Professor Michael Sars. In a paper just received on the hydroid polyps of Norway he enumerates all the known species, gives a list of those common to the Norwegian and Northeastern American coasts, and in addition describes some remarkable forms dredged by himself on the coast of Norway, and which are likely to occur on our coast. In another paper he describes and figures some remarkable polyzoa.

But the most important contribution made by Mr. Sars is a short paper on a dimorphic form, with alternation of generation, in a fresh-water flea, or entomostracan, a species of *Leptodora*. He shows that while the young born from the normal summer eggs attain their full growth without any metamorphosis, as had been previously stated by P. E. Müller, of Denmark, the young hatched from the winter eggs are in the nauplius stage, and are provided with a set of provisional organs wholly wanting in the adult. On the other hand, the simple cyclopean eye of the nauplius-like young persists in the adult.

The brilliant researches and results of Professor E. S. Morse on the position in nature of the Brachiopods tend to show that they are not shellfish, but really worms. In striking confirmation of this position assumed by Professor Morse is a series of similar researches by Koualevsky, of Russia, on the Brachiopods belonging to a different genus from the one studied by Morse. Mr. A. Agassiz publishes a note in the *American Journal of Science and Arts* indorsing this novel view, that the Brachiopods are worms. It is also held by the leading Scandinavian naturalists.

Lacaze-Duthier's *Archives* contain two papers of very high interest, one by Villot on the embryology of the hair-worm, or Gordius, and the other by the editor, on the anatomy of the simple ascidians of the coast of France. There are also two short communications of much interest on the acoustic nerve in the dentalium, by the editor, and a note on the differences in dentition presented by the two sexes of the skates of the coast of Denmark, by Dr. Lütken.

The *Fourth Annual Report on the Noxious and Beneficial Insects of Illinois*, by Dr. Le Baron, is a bulky pamphlet, replete with information and illustrations regarding the beetles. Its dissemination among the farmers and youth of the State of Illinois will do great good in awakening the attention of the people to the interest and value of the study of the habits and structure of insects. A brief report by Professor A. J. Cook on the injurious insects of Michigan points in the same direction.

Complaints against and advocacy of the good done by the English sparrow appear in the *American Naturalist*. It seems, on the whole, that these birds are very useful.

Remarks on the ornithology of Northern Norway, by Robert Collett, written in English, though published in the proceedings of the Natural History Society of Christiania, will greatly interest the American student, so many of these birds are common to Norway and arctic and boreal America. One would have supposed that the subject of Norwegian ornithology was worn threadbare, but Collett shows how much remains still to be done. He finds that in the valley of the Maalselv and in Alten not a few species of the Central European fauna occur, "which, owing to the influence of the Gulf Stream on the climate, are enabled to range to a latitude in Norway far exceeding their limits in the eastern interior portions of the European continent." The total number of species actually belonging to the Norwegian fauna is 250. Of these 174 have been observed within the polar circle, and of this number 160 have ranged as far north as within the limits of Tromsøe Amt, while 150 species belong to the fauna of Finmark proper.

The anatomy of the doves is treated of in the Proceedings of the Zoological Society of London, in a paper by Mr. Garrod.

Professor A. Newton publishes in the same Proceedings copies of two interesting letters relative to a dodo shipped for England in the year 1628.

In the same journal Dr. Murie gives an illustrated paper on the skeleton and lineage of a supposed extinct bird of Madagascar, the *Fregilupus varius*. While resembling several groups of birds, as the starling family, the orioles, and *Sternus*, it seems more closely related to the genus *Pastor*.

In a note on the animals of Savage Island Dr. Günther states that the fauna and flora are of peculiar interest from the isolated position of this coral island. The only mammals as yet found on it are a bat and a small rodent "of a size between a water-rat and a mouse." There are also a few birds, some lizards and insects, and three species of land snails.

Dr. Günther, in some researches upon the fossil tortoises of the Mauritius, draws attention to the very great resemblance of certain of the species to the giant land tortoises of other parts of the world, especially of the Galapagos, and he is quite at a loss to explain their close connection, separated as they are by so many miles of space and by many forms of this group of reptiles.

The subject of the migration of birds has lately attracted considerable attention in England, quite a lively correspondence having sprung up in regard to certain hypotheses on the subject. Professor Alfred Newton, one of our best authorities, frankly confesses ignorance of the causes of this migration, and invites a series of critical investigations that may tend to throw some light on the question. One of the most plausible views is that of Middendorf, who maintains that migrations take place to a considerable extent along the magnetic meridian, and thinks that the magnetism of the earth may have somewhat to do in the matter.

The existence of barnacles on marine animals, especially whales and tortoises, has been frequently adverted to in our articles. It is somewhat surprising, however, to learn that they not unfrequently exist on oceanic birds, such as the

albatross, the petrel, and the like, specimens having been lately obtained by Italian explorers.

Dareste has lately published a paper on the eels, in which he greatly reduces the number of species heretofore supposed to exist. Thus he allows but four species of the *Anguilla* or true eel, one of them being common to both Europe and America. Of the conger, too, he admits but four species, two of them found associated in both continents. No new light has been thrown on the natural history of the reproduction of the eel, though the theory of some naturalists that this animal is hermaphrodite, and lays its eggs in the winter season, has been accepted, in the absence of any absolute proof to the contrary.

In *Agricultural* science the most interesting event in this country which we have to record for the month is the appearance of the third part of the first Bulletin of the Bussey Institution. This pamphlet of one hundred pages contains three articles by Professor F. H. Storer. The first is on "The Valuation of the Soluble Phosphoric Acid in Superphosphate of Lime." The second is an account of investigations "On the Average Amounts of Potash and Phosphoric Acid contained in Wood Ashes from Household Fires." The third describes experiments "On the Importance as Plant Food of the Nitrogen in Vegetable Mould."

Professor Storer concludes that the value assumed by many chemists of this country of sixteen and a quarter cents per pound for soluble phosphoric acid in fertilizers is too high. He is led to this opinion from some estimates of the "Cost of importing Superphosphates from Europe," published in a former part of the *Bulletin*, "whence it appears that soluble phosphoric acid may be imported into Boston from England at a cost of twelve and a half cents per pound currency;" from the offer of a responsible dealer to sell superphosphate at such rates as to make the price of soluble phosphoric acid the same; and from practical experience as to the cost of making superphosphate on a farm twelve miles from Boston, which makes it plain that with spent bone-black at twenty-five dollars per ton and sulphuric acid at two and three-eighths cents per pound, soluble phosphoric acid may be made at a cost per pound of thirteen cents or less on any farm to which the cost of transportation would be no greater than to the one referred to.

Professor Storer's analyses of wood ashes from domestic fires reveal a fact of considerable importance to farmers, namely, that these contain considerably less phosphoric acid than has ordinarily been supposed. As wood is commonly burned, a portion of the phosphoric acid is lost. This loss is explained in part by the escape of phosphates with the draught, and in part by the formation of an insoluble phosphide of iron or other metal in the ash. The analyses from which calculations of the percentage of phosphoric acid in wood ashes have usually been based were made, for the most part, from ashes carefully prepared in the laboratory, so that this loss did not occur.

The experiments on the nitrogen of vegetable mould are believed by Professor Storer to show conclusively that the soil nitrogen is useful to plants under certain conditions such as are found in nature, and to illustrate the fact, which Wolff had proved before, that soils devoid of vegetable

mould or some other compound of nitrogen can not compare in power of supporting crops with soils which contain peat or loam or some other nitrogenous material.

Bente has lately performed some experiments in water-culture, on the effect of asparagin and acetamide as sources of supply of nitrogen to maize. He concludes that they are capable of furnishing the nitrogen needful for the growth of the plant, though whether they are capable of doing so directly, or must be previously decomposed, is not yet decided.

Dr. Märcker, of the experiment station at Halle, announces a very interesting observation upon the necessity of carefulness in selecting samples of fertilizers for analyses. A portion was taken from a bag before and another after two hours' transport, during which some of the finer particles had settled downward, while the coarser had worked to the top. Analysis showed a difference of two per cent. in the amount of soluble phosphoric acid in the two samples.

Dr. Wagner, director of the station at Darmstadt, has reported a case of poisoning a grain field by an ammoniated superphosphate. This was found to be due to the sulpho-cyanide of ammonium. The ammonia salts used for ammoniating the superphosphate were doubtless a by-product from the manufacture of coal gas, which would account for the presence of the sulpho-cyanide. This latter is very seldom found in fertilizers. It can be easily detected by the red color imparted to its solution on addition of sesquichloride of iron.

The Russian black earth called *Tschernosjom*, which is so celebrated for its fertility, and covers about one-third of the territory of European Russia, has been lately investigated by Dr. Reichardt, of Jena. Ten samples were examined. They contained large percentages of sand and humus, and were quite rich in potash, phosphoric acid, and nitrogen, the substances most apt to be lacking in ordinary soils. The large content of these and of humus, whose value for the growth of crops has been shown by Storer, Johnson, and others, accounts for the great and lasting fertility of this soil.

The subject of *Fish-culture* continues to attract the public attention, and especially in view of the success of the operations on the part of the United States in the introduction of salmon into its waters. The United States establishment on the Sacramento River, under the charge of Mr. Livingston Stone, has yielded this season 6,000,000 eggs, and the number collected at Bucksport, on the Penobscot, by Mr. Charles G. Atkins, is over 8,000,000, or more than 9,000,000 in all. If half of these be hatched and placed in the streams of the country, it will make a large addition to the population of the waters, especially when we bear in mind the fact that these are planted after the yolk-bag is absorbed, and when the fish is able to feed and care for itself. According to the estimates of reliable fish-culturists, in the case of natural spawning not more than one fish of the age referred to is obtained from 1000 eggs; so that the number supposed to be derived from the labors of the Fish Commission during the year would be equivalent to the yield from five thousand millions of eggs.

The California eggs were sent as soon as suffi-

ciently ripe to the fish-hatching stations throughout the Middle and Eastern United States. Such of them as were hatched successfully and reared are now being distributed in appropriate waters. All the Northern and Eastern States have shared in this distribution, as well as Texas, North Carolina, Virginia, West Virginia, Kentucky, etc. The eggs from the Bucksport establishment are not sufficiently mature for distribution.

An ample warrant for the introduction of fish into localities strange to them is seen in the success of the attempts to supply Tasmania and New Zealand with species of British trout and perch, these having already become more abundant than the native fish, the perch being now captured by the ton in their new abode, and of very large size.

So far there is no satisfactory evidence of a successful experiment with the salmon sent to New Zealand, and the effort is to be renewed during the coming winter by sending the eggs from Great Britain.

As a contribution to the subject of the effect of pollution of water upon the life of the fish therein we may refer to the experiments of Professor Wagner, of Munich, upon the influence of gas tar, in which he ascertained that a very slight percentage in the water, even unappreciable to the taste, is sufficient to produce great distress to the fish and ultimate death.

In *Engineering* we may record little save the progress of work upon certain important enterprises familiar to our readers.

On the East River Bridge the engineers have prepared plans and specifications of the massive iron saddles upon which the cables are to rest, and bids for their construction will soon be called for. Each of these saddles will weigh about 25,000 pounds, and will be provided at its summit with a rounded groove nineteen and a half inches wide, through which the cable will pass. It is estimated that it will require four years to complete the bridge.

The twin steamer, *Castalia*, designed by Captain Dicey for the Channel traffic, and which was expected to prove a formidable rival to Bessemer's swinging saloon vessel, has proved a failure upon her trial trip. She is now undergoing alterations of her machinery preparatory to a second experiment. The Bessemer steamer has not yet made her trial trip. In the same connection it may be of interest to note the fact that M. Tellier has advanced a new plan for the same purpose. Instead of two, M. Tellier joins together four large vessels, united by a common deck. He proposes even to lay a line of rails on the deck, so that a whole train may be run upon it and be transported across the Channel.

The exhibition fever appears to be widening its boundaries. The Dutch colony of Java announces the second "Exhibition of the Works of certain Industries of all Nations," to be opened at Diocjakarta in April, 1875. It is the desire of the promoters of this scheme to introduce to the teeming population of this and neighboring islands labor-saving tools and machinery of every description. It may be worthy of mention that books, machinery, and metals (raw and manufactured) are admitted to these islands free of duty. Mr. L. W. Morris, of 50 Broadway, New York, is named as the agent of the enterprise for the United States.

The Centennial authorities have just announced the following allotments of space among the thirty-four nations and their colonies:

	Square feet.
Siam	8,946
Persia	7,776
Egypt	7,776
Turkey	7,776
Russia	10,044
Sweden and Norway	10,044
Austria	28,328
German Empire	27,264
Netherlands and Denmark	7,776
Switzerland	6,156
Italy	11,664
Spain and colonies	15,552
France, Algeria, and other colonies	27,264
Great Britain, Canada, India, Australia, and other colonies	46,748
United States	128,160
Reserved space	21,408
Mexico	11,664
Honduras	8,888
Guatemala	5,508
San Salvador	4,536
Nicaragua	4,536
Venezuela	5,508
Ecuador	8,888
United States of Colombia	7,776
Peru	11,664
Chili	9,744
Brazil	17,520
Argentine Republic	15,552
Hayti	8,888
Sandwich Islands	8,888
Liberia	2,268
Japan	7,290
China	7,290
Total	484,090

The total area of the building will be twenty acres, and that appropriated to exhibitors about eleven acres.

From the annual report of the late Commissioner of Patents, for the period extending from October 1, 1873, to September 30, 1874, we extract the following statements:

Number of applications for patents from Octo- ber 1, 1873, to September 30, 1874	21,077
Number of patents issued, including re-issues and designs	18,545
Applications for extensions of patents	229
Patents extended	308
Caveats filed	8,129
Patents expired	5,287
Patents allowed, but not issued for want of the final fee	2,680
Applications for registration of trade-marks ..	589
Trade-marks registered	524
Applications for registration of labels	107
Labels registered (since August, 1874)	50

The number of applications and of patents granted shows a slight increase upon the figures of the preceding twelvemonth.

The number of miles of new railroad completed in this country during the year 1874 to date (November 28) is 1664, as compared with 3276 miles in 1873 and 6202 in 1872.

Among the *Mechanical* novelties an "air-brake" for steam-ships is worthy of notice. Its object is to prevent the "racing" of the engines when, in a heavy sea, the propeller of a steamer is lifted out of the water, and its revolutions, for want of a resisting medium, are greatly increased, to the imminent danger of breaking the working parts of the machinery. This engine governor is automatic in its operation, and cuts off the steam from the engines the instant a heavy sea lifts the propeller from the water.

Mr. Robert W. Newbery, of New York, has lately patented an improvement consisting in the construction of the rails of vessels in sections,

and of such materials that such sections when detached will answer for life-rafts. He has likewise devised a simple and efficient method of detaching the rail sections in case of sudden emergency. The invention appears eminently simple and practical.

In the direction of *Domestic Economy* we may refer to the practice now coming into vogue of accelerating the drying of plaster walls by burning charcoal in the open air of the room. It is known that this lime dressing of walls is a hydrate, containing a certain amount of water, and that as this lime is changed into a carbonate by the carbonic acid of the air the water is evolved, which causes continual dampness for a considerable period. By keeping up a continuous supply of carbonic acid in the atmosphere of the room this process is accelerated, so that what might otherwise require several months is brought about in a few days.

The regulation of the time of the hatching out of silk-worms' eggs, so as to make it more convenient for the manufacturer, is now carried on in France on a large scale, the large store-houses being kept cool by artificial means, so that the eggs are kept unhatched until a convenient season. They are then removed and hatched out in the ordinary way. Incidentally, this new method is a great security against destruction by parasitic fungi and insects.

The very rapid expansion of the manufacture of olive-oil in Tunis threatens to greatly depreciate the price of this substance, and will probably extend its use considerably, especially in the preparation of fish, such as sardines, small mackerel, etc., as put up in oil. It is well known that America abounds in species of herring equally fitted with the European sardine for the purpose referred to, but that competition is scarcely possible in view of the cost of the oil required for their treatment. Should the California enterprise be successful, or the price be reduced by the great production from abroad, it will be possible to use olive-oil to a much greater degree than at present.

In *Technology* we notice the fact of the invention of a new explosive by Captain Björkman. The inventor names it Vigorite. Extraordinary accounts of its energy are made from some experimental trials recently made with it at Stockholm. A charge of about eight ounces, in five cartridges, and deposited in a drill hole five feet deep, removed, on its explosion, a mass of rock over one hundred cubic feet in volume. It was estimated that nearly double the weight (fifteen ounces) of dynamite would have been necessary to produce the same effect.

At one of the recent meetings of the French Academy of Sciences, Professor Hofmann announced that two of his pupils, Messrs. Tiemann and Haarmann, had succeeded in producing vanilline (the aromatic principle of the vanilla bean) from pine sap, and stated furthermore that they proposed to manufacture this substance on a large scale. The sap of a tree of medium height furnishes vanilline to the amount of twenty dollars.

Miss Kate Crane proposes to test the purity of various oils by examining the cohesion figures produced by permitting a single drop of the oil to be tested to fall from a burette on a clean surface of water. She has experimentally determined quite a variety of such figures, and

finds them to be quite constant with the same oil.

Nothing especially new has presented itself in the department of *Therapeutics and Hygiene* since our last report, although considerable stress is laid upon the value of intra-venous injection of chloral for the purpose of producing anæsthesia. It is said that it is practicable, without the slightest injury to the patient, to produce absolute unconsciousness for a period of even twenty-four hours without any of the ill effects which some-

times follow when anæsthesia is only maintained during the limited period of a surgical operation.

Among the *Deaths* that have been announced since the last report we may mention those of Leger de Libessant, of France; Dr. F. Hesseberg and Dr. E. M. Dingler, of Germany; Mr. Bryce M. Wright, Mr. John Grantham, Dr. Thomas Anderson, Dr. Edwin Lankester, Rev. W. H. Hawker, Commander R. M. Sperling, R. N., and Mr. C. F. Tyrwhitt-Drake, of England; and of the veteran Dr. Gideon Lincecum, of Texas.

Editor's Historical Record.

OUR Record is closed on the 22d of December.—The final session of the Forty-third Congress was opened December 7, 1874. In the House four new members took their seats, viz., Richard Schell, vice D. B. Mellish, deceased; S. B. Chittenden, vice Stewart L. Woodford, resigned; Wm. E. Finck, of Ohio, vice H. J. Jewett, resigned; and L. Cass Carpenter, of South Carolina, vice R. B. Elliott, recently elected Speaker of the State House of Representatives. The standing committees of the Senate were announced December 9, and those of the House on the 10th. No material changes were made in either.

On the 7th the President sent to the Senate the nomination of Hon. Marshall Jewell to be Postmaster-General. The choice was confirmed on the 15th. S. B. Axtell was confirmed as Governor of Utah Territory December 21.

The bill to amend the customs laws, known as the "Little Tariff Bill," which comes over from the last session, was taken up in the Senate December 14, and a committee of conference was appointed. It provides for a commission of seven—one Senator, two Representatives in the next House, two officers of the customs service, and two citizens familiar with the customs laws—to report to Congress before December, 1875, a revised system of customs laws. The commissioners are to be allowed necessary traveling expenses, but no compensation.

Several financial bills were introduced into the House and referred to committee. Mr. Kelley, of Pennsylvania, on the 8th offered a bill for the exchange of greenbacks into 3.65 convertible bonds. The proposition was discussed on the 10th, when Mr. Willard offered an amendment to the effect that greenbacks should not be a legal tender in payment of debts contracted after July 1, 1875. No definite action was taken. Mr. Roberts, of New York, proposed to amend the Constitution so that Congress shall not make any thing but gold and silver coin a tender in payment of individual debts, and shall pass no law impairing the obligations of contracts. Mr. Farwell introduced a bill removing all limitations on the number and circulation of national banks, and allowing bank-notes to be issued to the extent of ninety per cent. of the full value of bonds deposited, that from the 1st of July next a million a month of greenbacks shall be withdrawn and canceled, to continue until the greenback is at par with gold, and that the Secretary of the Treasury may sell bonds to get funds for retiring the greenbacks. On December 21 Senator Sher-

man from the Finance Committee introduced a bill for the resumption of specie payments. It provides for the redemption of legal-tender notes, beginning January 1, 1879, silver coin being meanwhile substituted for fractional currency. Free banking is authorized and legal tenders retired to the amount of eighty per cent. of the new bank-notes issued till the legal-tender circulation is reduced to \$300,000,000. The Secretary of the Treasury may sell bonds in 1879 for gold if he has not enough of a surplus to meet demands for specie. Bill read twice, and placed on calendar.

The House Committee on Appropriations reported, December 7, in favor of the following sums: Legislative, \$19,653,434; Navy, \$16,976,000; Army, \$27,701,500; Indians, \$4,881,507; Fortifications, \$850,000. The first item was passed by the House on the 18th.

The postal telegraph scheme came up before the House on the 8th in a new form. Mr. West introduced a bill for the construction of a government telegraph line from Washington to Boston, via Baltimore, Philadelphia, New York, and Hartford, to be operated in the post-offices of those cities, under the charge of the Postmaster-General, and to be open to all at a uniform rate. The bill was ordered to be printed.

A supplementary Civil Rights Bill was reported by the House Judiciary Committee on the 16th, and recommitted. It is substantially the bill passed by the Senate at the last session, but with a compromise clause striking out the mixed school section and substituting a requirement for equal school facilities for the children of both races. The penalty may be enforced by either civil or criminal suit.

Representative M'Crary on the 8th presented a bill to extinguish the Indian title to the Black Hills reservation in Dakota.

The first step taken this year toward increasing the public revenues was the introduction of a bill into the House by Mr. Dawes on the 8th restoring the duties on tea and coffee to the old rates existing before the repeal of March, 1872.

The Senate on the 14th, and the House on the 18th, passed a bill for the relief of settlers on the public lands who were obliged by the ravages of the grasshoppers to leave their homes in 1874, and those who may be obliged to vacate in 1875 for the same reason.

Senator Conkling proposed an amendment to the Geneva Award Bill, December 14, allowing insurance claimants excluded by the present law to present and prove their claims.

The fourth annual report of the Southern War Claims Commission was sent to the House on the 15th. It embraces 2407 cases, claiming \$5,242,706 46, of which 1244 are wholly disallowed, and 1163 allowed in whole or part, to the extent of \$770,711 87.

The commission appointed to investigate the affairs of the Freedman's Bank report liabilities \$2,879,081, and assets at face value \$2,693,095. Thus far only four per cent. of the amount of deposits has been realized in cash.

On the 15th Senator Wright submitted a joint resolution for the amendment of the Constitution, providing for the election of President and Vice-President by the direct vote of the people, the election returns to be canvassed by the United States Supreme Court. Referred to the Civil Service Committee.

The Railroad Committee of the House on the 18th reported a bill as a substitute for the Hurlbut bill of last winter, chartering a double-track freight railway from tide-water on the Atlantic coast to the Missouri River. It must transport all cars and any freight offered on equal terms for all persons or corporations, at rates which are minutely prescribed. Bulk freight, such as grain, coal, timber, etc., received in cars without handling by the company, must be transported at the following rates: Five mills per ton per mile for all distances exceeding 750 miles, six mills for distances between 400 and 750 miles, seven mills for distances between 300 and 400 miles, seven and a half mills for distances between 150 and 300 miles, and eight mills per ton per mile for less distances, provided that in the winter months, from November 1 to May 1, these rates may be increased one mill per ton per mile. A commission of five members, of whom three shall be appointed by the President and confirmed by the Senate, and two by the company, are to have power to classify freight and fix the maximum rates for such classes as are not specifically described or named in this bill, and who are also required to proportionately reduce all rates whenever the net earnings of the road exceed eight per cent. per annum on its actual cost. The bill proposes in return for these considerations that the United States government shall guarantee five per cent. interest on thirty-year construction bonds of the company to the extent of \$20,000 per mile of equivalent single track, or about \$60,000,000 in all. The House, December 21, rejected a sweeping resolution against the granting of subsidies during the present session. The vote on its adoption was 149 to 75, less than the required two-thirds.

The House resolved to take a recess from December 28 to January 5.

The President's annual Message is an important document of unusual length. Special attention is called to the desirability of an early return to specie payments, and the duty of Congress to legislate in that direction. To this end the legal-tender clause in the law authorizing the issue of currency by the national government should be repealed, to take effect as to all contracts entered into after a day fixed in the repealing act, except as to government salaries or for other expenditures now provided for by law to be paid in currency. In the interval pending between the repeal and final resumption pro-

vision should be made by which the Secretary of the Treasury can obtain gold as it may become necessary from time to time from the date when specie redemption commences. To this should be added a revenue sufficiently in excess of expenses to insure an accumulation of gold in the Treasury to sustain redemption. With resumption free banking may be authorized with safety; this would give proper elasticity to the currency. The experience and judgment of the people can best decide just how much currency is required for the transaction of the business of the country, and it is unsafe to leave the settlement of this question to Congress, the Secretary of the Treasury, or the Executive. Congress should make the regulation under which banks may exist, but should not make banking a monopoly by limiting the amount of redeemable paper currency that shall be authorized. During the year nothing has occurred to disturb our friendly relations with foreign governments. In view of the payment of the Geneva award by the British government, the President renews his recommendation, made at the opening of the previous session of Congress, that a special court be created to hear and determine all claims of aliens against the United States arising from acts committed against their persons or property during the rebellion. The commission for the survey of the boundary between the United States and the British possessions from the Lake of the Woods to the summit of the Rocky Mountains has completed its work, and the line is now definitely marked. Attention is called to the failure of the Spanish government to put down the insurrection in Cuba after a six years' war, and it is suggested that the other powers should take some steps in the matter, on the ground of self-necessity. The settlement of the *Virginias* difficulty with Spain has been delayed by the unhappy civil war in that country, but an early adjustment is hoped for. The expatriation laws are in a very unsatisfactory condition, requiring immediate action. On the tariff question a re-adjustment is suggested, so as to increase the revenue, and at the same time decrease the number of articles on which duties are levied. In reviewing the report of the Postmaster-General the President remarks that "next to the public school the Post-office is the great agent of education over our vast territory. The education of the people entitled to the exercise of the right of franchise I regard as essential to general prosperity every where, and especially so in republics, where education or previous condition does not enter into account in giving suffrage."

Considerable space is devoted in the Message to the unsettled condition of affairs in the Southern States. The President defends his action with reference to the Louisiana election, and repeats what he said in his special message of February 18, 1873, that in the event of non-interference by Congress he must continue to recognize the existing government. He has declined to take any action in the Arkansas trouble, leaving that to Congress to settle. Referring to the Ku-Klux and White League outrages upon the negroes before the recent elections, the President declares that he felt it to be his duty under the Fifteenth Amendment and the Act of May 31, 1870, to protect colored citizens in the exercise of their right to vote. Complaints are made of

this interference by Federal authority, but if said amendment and act do not provide for such interference under the circumstances stated, then they are without meaning, force, or effect, and the whole scheme of colored enfranchisement is worse than mockery and little better than a crime. "While I remain Executive," continues the President, "all the laws of Congress and the provisions of the Constitution, including the recent amendments added thereto, will be enforced with rigor, but with regret that they have added one jot or tittle to the Executive duties or powers." Referring to Indian affairs, the Message upholds the "peace policy," declaring its results to be most beneficial, and confidently hoping that in a few more years depredations on the frontiers will cease. The Homestead laws should be extended to the Indians, and a Territorial government established in the Indian Territory.

Speaking of civil service reform, the President announces that if Congress adjourns without positive legislation on the subject, he will regard their non-action as a disapproval of the system, and will abandon it. To encourage American ship-building he suggests not a direct subsidy to home lines, but "ample compensation for carrying the mails between Atlantic sea-board cities and the Continent on American owned and American built steamers, and would extend this liberality to vessels carrying the mails to South American states and to Central America and Mexico, and would pursue the same policy from our Pacific sea-ports to foreign sea-ports on the Pacific."

The department reports accompanying the Message are very full. The Treasury exhibit is as follows: The total net receipts of the government for the last fiscal year were \$289,478,756, and the expenditures \$287,133,873. The reduction of the public debt during the year amounted to \$5,762,447 65. It is estimated that there will be a deficiency of \$11,920,914 in the revenues of the current fiscal year. The Secretary of the Treasury strongly urges an early return to specie payments; recommends economy in appropriations; calls attention to the loss of revenue from repealing the tax on tea and coffee without benefit to the consumer; recommends an increase of ten cents a gallon on whiskey; and further, that no modification be made in the Banking and Currency Bill passed at the last session, unless modification should become necessary by reason of the adoption of measures for returning to specie payments.

The Commissioner of Internal Revenue reports a decrease in the revenues of 1874, as compared with the previous year, of \$11,430,709 10. Over \$5,000,000 of this decrease is in the single item of past-due taxes, under repealed statutes, which are constantly lessening. The number of brewers engaged in the production of fermented liquors was, in 1873, 3554, and in 1874, 2524—a decrease of 1030.

The Life-saving Service reports eighty-two stations in operation during the year. Forty-eight vessels were driven ashore during the season of 1873-74, with cargoes valued at \$2,231,606, and having on board 1166 persons. Of the amount of property jeopardized only \$457,282 worth was lost, and only two persons perished.

The Secretary of War estimates the expenses of the military establishment for the next fiscal year at \$58,144,499, or a reduction of \$7,036,424

compared with the previous year. He condemns the reduction of the army to 25,000 men, and shows that nothing was saved by it during the year. The Secretary indorses the suggestion of the Inspector-General of the Army that desertion be constituted by legislative enactment as a felony, cognizable by our civil courts of criminal jurisdiction, the offenders to be arrested like other criminals, but this jurisdiction to be concurrent with that of military courts.

The Secretary of the Navy reports 160 vessels now in the service, with 1254 guns, or two vessels and fifteen guns less than the previous year. During the last two years the whole fleet of our single-turreted monitors has been thoroughly overhauled and repaired, their sides raised up, their rotten wooden beams and decks replaced by iron, and their turrets and machinery put in complete order, so that they are now efficient to their utmost capacity, and ready to go to sea at any time, as soon as crews can be put on board and organized. These, with the *Dictator* and *Roanoke*, also in good order, make a fleet of sixteen iron-clads, efficient for any naval purpose which does not require long voyages or great speed. Two powerful iron torpedo vessels have also been completed, and are ready for service, fully equipped with this most effective weapon of modern warfare. Four of our double-turreted monitors, viz., the *Terror*, *Miantonomoh*, *Monadnock*, and the *Amphitrite*, by far the most formidable vessels ever in our navy, are now in hand undergoing repairs, and the plans are also being matured for the repair of the *Puritan*, the only one of our efficient iron-clads which remains untouched.

The appropriations applicable to the fiscal year ending June 30, 1874, including the unexpended balance of the appropriations for the building of new sloops, and the special appropriations to reimburse the bureaus for their extraordinary expenditures during the threatened complications with Spain, amounted, in the aggregate, to \$27,147,857 68; and the actual expenditures for the same period, to wit, from July 1, 1873, to June 30, 1874, from these appropriations, amounted to \$26,254,155 82, or about \$900,000 less than the whole amount. The appropriations made available for the current year commencing July 1, 1874, amount, in the aggregate, to \$19,263,731 27. The amount of these appropriations for the current year drawn for the five months since July 1 up to December 1, 1874, is \$11,854,446 87, which, reduced by the amount refunded during the period, and that remaining in the hands of the paymasters and agents of the government, will leave a little less than \$9,000,000 as the sum actually expended from the current appropriations during the five working summer months of this year.

The Postmaster-General estimates the total expenditures for the fiscal year ending June 30, 1876, at \$36,964,034, and the revenue of the Post-office Department at \$29,148,156, leaving a deficiency to be supplied from the general Treasury of \$7,815,878. In addition to this sum \$1,112,500 are required for mail steam-ship service, and \$986,000 for official postage stamps. The number of ordinary postage stamps issued during the year was 632,733,420, valued at \$17,275,242; of stamped envelopes, 117,047,750, value \$3,661,690 70; postal cards, 91,079,000,

value \$910,790; official stamps, 32,320,085, value \$1,415,845 20; official envelopes and wrappers, 12,900,300, value \$353,456 66. The number of letters received at the dead-letter office was 4,348,473 domestic, and 253,800 foreign. Of these 1,392,224 were delivered, and 2,622,619, containing circulars, or failing in delivery, and being worthless, were destroyed. The reduction of the registration fee from fifteen to eight cents has considerably increased the registered-letter business of the year. The number of post-offices in operation is 34,294, an increase of 1050. The number of domestic money orders issued was 4,420,638, value \$74,424,854 71. Among the foreign money orders were 32,542, value \$701,634 73, issued to Germany, and 20,607, value \$535,216 72, issued in Germany and paid here; orders issued on Great Britain, 77,351, value \$1,491,820 31, and from Great Britain, paid here, 15,992, value \$308,773 66; orders issued on Switzerland, 2721, value \$72,287 28, and orders from that country, paid here, 798, amounting to \$21,222 16. It is suggested that the money-order fees be increased so as to cover the expenses. It is expected that the revenues of the department from postage on printed matter will be increased by the operation of the new act, notwithstanding that the rates are cheaper than before, as now the postage will be prepaid, while heretofore much loss has been occasioned to the department on account of the non-collection of postage at the point of delivery. The Postmaster-General concludes his report with the promise to guard expenditures with strict vigilance, and so to conduct affairs generally that the interests of the public shall be paramount to those of any individual, corporation, or party.

President Grant issued a proclamation December 21 commanding the disturbers of the peace at Vicksburg, Mississippi, to disperse within five days.

The Count von Arnim, ex-minister of the German Empire to France, was tried and convicted in Berlin, and sentenced December 19 to three months' imprisonment, for concealing certain ecclesiastical and political documents intrusted to his official custody while in the diplomatic service of the empire.

In the Prussian Parliament, December 16, a resolution was adopted declaring that in order to uphold the dignity of that body an amendment to the constitution is necessary forbidding the arrest of a deputy during the session. On the 18th a motion was made to strike out the appropriation for the secret service, but it was defeated by 71 to 199.

The whole number of granges in the United States December 1 was 21,472, an increase of 364 during November. There are 266 lodges in New York State.

King Kalakaua of the Sandwich Islands visited the United States, reaching Washington on December 12. He was formally presented to the President on the 15th, and welcomed by Congress on the 18th.

The Italian Parliament was opened by the king November 23.

President M'Mahon presented his message to the French Assembly December 3. He strongly insisted on the necessity of definite legislation with regard to the constitutional powers, and concluded by saying, "It is my duty not to de-

sert the post in which you have placed me—to occupy it up to the last day with unshaken and scrupulous respect for law."

DISASTERS.

November 28.—Nearly half the town of Tusculumbia, Alabama, was destroyed by a storm of wind and rain. Twelve persons were killed.

November 29.—The steamer *La Plata*, from Gravesend for Rio Grande do Sul, foundered at sea. The captain and sixty others were lost.

Eleven persons perished in the snow on the Great St. Bernard, in the Alps, in November.

December 9.—A terrific gale swept the British coast, wrecking several vessels and destroying many lives.

The Pacific mail steamer *Japan*, bound from San Francisco to Yokohama, took fire at sea December 17, and was totally destroyed. One hundred and twenty-three persons are known to have been saved, but a large number of others are missing.

December 21.—Powder magazine in Scutari, West Turkey, struck by lightning and exploded. A portion of the city walls was thrown down, many houses demolished, and two hundred persons killed or injured.

OBITUARY.

November 25.—In New York, Brevet Brigadier-General Thomas J. Leslie, of the United States army, aged seventy-nine years.

November 27.—In Chicago, Sherwood C. Campbell, the vocalist, in his forty-fifth year.

November 28.—In New York city, Jonathan Sturges, merchant, aged seventy-three years.

November 29.—In Philadelphia, ex-Justice John Meredith Read, of the Supreme Court of Pennsylvania, in his seventy-eighth year.

November 30.—In his office in the City Hall, New York, Hon. William F. Havemeyer, in his seventy-first year.

December 2.—In Chicago, ex-Judge Edward P. Cowles, formerly of the Supreme Court of this State, aged fifty-nine years.

December 8.—In Jersey City, Hon. Dudley S. Gregory, ex-Mayor of that city and ex-member of Congress, aged seventy-five years.

December 9.—At Ithaca, New York, Ezra Cornell, founder of the Cornell University, in his sixty-eighth year.

December 17.—In Norfolk, Virginia, Hon. John B. Rice, member of Congress from the First District of Illinois, aged sixty-five years.—In Washington, D. C., Commander William B. Cushing, U.S.N., in his thirty-second year. In *Harper's Magazine* for July, 1874, under the title of "One of Many," an account was given of this brilliant young officer's naval exploits during the war.

December 20.—In Washington, D. C., Jefferson Rives, one of the publishers of the *Congressional Globe*, aged twenty-seven years.

November 9.—In Edinburgh, Scotland, James Gall, publisher, aged ninety-one years.

November 11.—In Paris, M. Taschereau, formerly director of the National Library of France, and author of a life of Molière, aged seventy-three years.

November 25.—A dispatch from Kingston, Jamaica, announces the death of Sir Joshua Rowe, ex-Chief Justice of Jamaica, nearly eighty years of age.

Editor's Drawer.

were formed into a corporation, and in the year 1258 obtained various statutes from Philip Augustus, some of which were very curious. Thus it was ordained that—

Whoever is a crier in Paris may go to any tavern he likes and cry its wine, provided they sell wine from the wood, and that there is no other crier employed for that tavern; and the tavern-keeper can not prohibit him.

If a crier finds people drinking in a tavern, he may ask what they pay for the wine they drink; and he may go out and cry the wine at the prices they pay, whether the tavern-keeper wishes it or not, provided always that there be no other crier employed for that tavern.

If a tavern-keeper sells wine in Paris and employs no crier, and closes his door against the criers, the crier may proclaim that tavern-keeper's wine at the same price as the king's wine (the current price), that is to say, if it be a good wine year, at seven denarii, and if it be a bad wine year, at twelve denarii.

THE BELLMAN OF ENGLAND.

MR. HENRY SAMPSON'S *History of Advertising*, just published in England, is full of good things in its way. One of the most ancient modes of attracting the public patronage seems to have been by means of the public criers, who perambulated the streets shouting until they were hoarse. The mediæval crier used to carry a horn with which to call the attention of the people when about to make a proclamation or publication. Public criers appear to have formed a well-organized body in France as early as the twelfth century; for by a charter of Louis VII., granted in the year 1141 to the inhabitants of the province of Berry, the old custom of the country was confirmed, according to which there were to be only twelve criers, five of whom should go about the taverns crying with their usual cry, and carrying with them samples of the wine they called, in order that the people might taste. For the first time they blew the horn they were entitled to a penny, and the same every time after, according to custom. A quaint and significant story is told in an old chronicle in connection with this system of advertising. An old woman named Adelheid was possessed of a strong desire to proclaim the Gospel, but not having lungs sufficiently powerful for the noisy propagation contemplated by her, she paid a wine-crier to go about the town, and, instead of proclaiming the prices of wine, to proclaim the words: "God is righteous! God is merciful! God is good and excellent!" And as the man went about shouting these words, she followed him, exclaiming, "He speaks well! He speaks truly!" The end of it all was that the poor old woman was arrested and tried, and as it was believed that she had been prompted by vanity in what she had done, she was burned alive.

The public criers in France at an early period

For this service the crier could claim four denarii a day.

In England public criers appear to have been a national institution at an early period. They proclaimed the cause of the condemnation of criminals, and all other matters of public concern, except ecclesiastical. They also cried all kinds of goods, and were sworn to tell truly and well to the best of their ability and power. After a while the bellman or town-crier was appointed for the benefit of the community at large. In an old engraving of the seventeenth century we see him represented with a bunch of keys in his hand, which he no doubt proclaims as "found." Underneath is the following "notice":

O yes. Any man or woman that
Can tell any tidings of a little
Mayden-child of the age of 24
Yeares. Bring word to the cryer
And you shall be pleased for
your labour
And God's blessing.

This was an old joke, which, in varied forms, is always found under the prints of the town-crier.

In most of the country towns of Great Britain, and even in London, there are still bellmen and parish criers, though their offices are little more than sinecures. The provincial crier's duties are of the most varied description, and relate to objects lost or found, sales by public auction or private contract, weddings, christenings, or funerals. Not much more than a century ago the borough of Lanark was so poor that there was only one butcher in the whole district, and even he never dared venture on killing a sheep till every part of the animal was ordered beforehand. When he felt disposed to engage in such an enterprise he usually prevailed upon the minister, the provost, and the members of the town council to take a joint each; but when shares were

THE LAST OF THE LOTTERIES.

not subscribed for readily the sheep received a respite. On such occasion the services of the bellman, or "skelligman," as he was there named, were called into request, and that official would go about the streets calling the following rhyme:

 Bell-ell-ell !
 There's a fat sheep to
 A leg for the provost
 Another for the pri
 The bailles and the c
 They'll tak' the nk
 And if the fourth leg we c
 The sheep it maun loave, a
 to the hill !

But the bellman has seen his best days. The newspaper, the street poster, the traveling wagon with its big bell and showy signs, and a thousand other means of advertising have taken the crier's place. More than fifty years ago, in England, wagons were driven through the streets surmounted by revolving turrets, on which were painted flaming announcements of coming events, and men on horseback rode up and down the principal thoroughfares with great bill-boards strapped on either side of them, to attract the public attention.

In the year 1826 the last state lottery ever held in England was advertised after this fashion. The drawing was set down for July 18, but the tickets sold slowly, and the wheel was not turned till Oc-

tober 18. Every thing was done to arouse public enthusiasm. Besides advertising the scheme in the papers, the agents got up a magnificent procession headed by a band of music, which played to attract attention, and then a man stepped forward, and ringing a bell, announced the death of the lottery. Cart-loads of bills were showered down areas and thrust under doors, and no effort was spared to insure success. As the eventful day approached the handbills were multiplied, and people were provided with waste paper for an indefinite time. Chief among the agents of the lottery was a man named Bish, whose rosy prospectuses and doggerel verses made him famous throughout the kingdom. Here is a specimen of his handbills :

THE AMBULATOR'S GUIDE

TO THE LAND OF PLENTY.

BY PURCHASING A TICKET
 in the present Lottery

You may reap a golden harvest in Cornhill, and pick up the bullion in Silver-street, have an interest in Bank-buildings, possess a Mansion-house in Golden-square, and an estate like a *Little Britain*; never be in Hungerford-market, but all your life continue a *May-fair*.

BY PURCHASING A HALF,

You need never be confined within *London Wall*, but become the proprietor of many a *Long Acre*; represent

a *Borough* or an *Aldermanbury*, and have a share in *Threadneedle-street*.

BY PURCHASING A QUARTER,

Your affairs need never be in *Crooked-lane*, nor your legs in *Fetter-lane*; you may avoid *Paper-buildings*, steer clear of the *King's Bench*, and defy the *Marshalsea*; if your heart is in *Love-lane* you may soon get into *Sweeting's Alley*, obtain your lover's consent for *Matrimony-place*, and always live in a *High-street*.

BY PURCHASING AN EIGHTH,

You may secure plenty of provision for *Swallow-street*; finger the *Cole* in *Coleman-street*; and may never be troubled with *Chancery-lane*. You may cast anchor in *Cable-street*; set up business in *Fors-street*; and need never be confined within a *Narrow-wall*.

BY PURCHASING A SIXTEENTH,

You may live frugal in *Cheapside*; get merry in *Liquorpond-street*; soak your hide in *Leather-lane*; be a wet sole in *Shoe-lane*; turn maltster in *Beer-lane*, or hammer away in *Smithfield*.

In short, life must indeed be a *Long-lane* if it's without a turning. Therefore, if you are wise, without *Mincing* the matter, go *Pall-mall* to *Cornhill* or *Charing-cross*, and enroll your name in the *Temple of Fortune*,

BISH'S.

In 1798, a house in Stanhope Street having been broken open and robbed, the following singular announcement was issued by the proprietor, and appeared in the *Daily Advertiser*:

Mr. R—, of Stanhope Street, presents his most respectful Compliments to the Gentlemen who did him the honour of eating a couple of roasted Chickens, drinking sundry tankards of ale, and three bottles of old Madeira at his house, on Monday night.

In their haste they took away the Tankard, to which they are heartily welcome; to the Table-spoons and the light Guineas which were in an old red morocco pocket-book, they are also heartily welcome; but in the said Pocket-book there were several loose papers, which consisted of private Memorandums, Receipts, etc., which can be of no use to his kind and friendly visitors, but are important to him: he therefore hopes and trusts they will be so polite as to take some opportunity of returning them.

For an old family Watch, which was in the same Drawer, he can not ask on the same terms, but if any way could be pointed out by which he could replace it with twice as many heavy Guineas as they can get for it, he would gladly be the Purchaser. W. R.

A few nights after a packet, with the following letter inclosed, was dropped into the area of the house:

SIR,—You are quite a gemman. Not being used to your Madeira, it got into our upper works, or we should never have cribbed your papers. They be all marched back again with the red book. Your ale was mortal good. The tankard and spoons were made into a white soup, in Duke's Place, two hours afore daylite. The old family watch cases were at the same time made into a brown gravy, and the guts, new christened, are on their voyage to Holland. If they had not been transported, you should have them again, for you are quite the gemman; but you know, as they have been christened and got a new name, they would no longer be of your old family. And soe, Sir, we have nothing more to say, but that we are much obligated to you, and shall be glad to sarve and visit you, by nite or by day, and are your humble sarvants to command.

Honor had then, it would appear, not quite departed from among thieves.

EVEN in our day the seeker for amusement can find abundance of it in the advertising columns of our daily papers. The store of fun in them is very great. The grammatical blunders are exceedingly droll. Imagine, for example, the feelings of the lady who advertised her desire to obtain a husband with "a Roman nose having strong religious tendencies;" or the solicitude of

the chemist who requested that "the gentleman who left his stomach for analysis will please call and get it, together with the result." And how full of promise the following:

The advertiser, having made an advantageous purchase, offers for sale on very low terms about six dozen of prime port-wine, late the property of a gentleman forty years of age, full in the body and with a high bouquet.

And how enticing to the musical amateur this:

To be sold, an Erard grand piano, the property of a lady, about to travel in a walnut-wood case with carved legs.

Among the odd advertisements is the following from the *London Times*, and is clear as mud:

From Undergrad, Perjured fowl. No. 6 of the "Sho-tover Papers" is out of print, and the page is missing in every copy they show me. Joe will have to die, but ah, he is tough. Have mercy! Give me three weeks to find it. Proctors fade.

In the *Bristol Gazette* of August 8, 1788, is the following notice from the father of Robert Southey, the poet:

R. Southey thanks his friends in particular and the public in general for the kind support he has hitherto experienced, and begs leave to inform them that he is just returned from London with a large assortment of goods, particularly fine printed calicoes, muslins, and lace, which he is determined to sell on as low terms as any person in the trade, and solicits the early inspection of his friends. N.B.—Part of the old stock to be sold very cheap.

THE following instance of youthful exactness comes to us from a friend in Hingham, Massachusetts, where it recently occurred:

An exhibition was given here some two months since by Tom Thumb, at which the prices were twenty-five cents for those over ten years of age and twelve and a half cents for those under.

It was Johnny's tenth birthday, and his cousin May, aged thirteen, thought it to be her duty to celebrate it by taking him in the afternoon to see the dwarf. Arriving at the door, she put down thirty-eight cents, and asked for two tickets.

"How old is the boy?" asked the ticket-seller.

"Well," replied Miss May, "this is his tenth birthday; but he was not born until late in the afternoon."

The vendor of tickets accepted the accuracy of the averment, and handed her the proper certificates for admission. But it was a close fit.

A FRENCH quotation often serves to point an English epigram. A literary lady who hoped to become the mother of a son thus philosophically consoles herself for her disappointment:

Ah, well! 'tis over. Should I not resign
My weaker will to Fate's imperious shall?
'Tis not a boy—yet such as 'tis, 'tis mine:
Then let me thankful murmur, *C'est égal!*

THE last steamer brings the following fresh anecdote of Alexandre Dumas, and explains how this prolific writer, who earned such large sums of money by his pen, died a poor man. An old comrade came to ask him for some pecuniary assistance. "All right," said Dumas. "Look on the chimney-piece; I received two hundred pounds from my publisher this morning. Several people have already helped themselves to a little; you take the rest." But there was not a napoleon left. "How foolish you have been,"

said Dumas, seeing his friend's disappointment, "to put off coming till mid-day!"

THE "colored wedding" mentioned in the Drawer for November last reminds a correspondent of a similar occurrence that he witnessed a few months since in Elizabeth City, North Carolina:

Sam and Rose were standing at the chancel undergoing the transition from single to double blessedness, when Sam turned to some of his friends in the audience and tipped them a knowing wink. Rose observed the action, and remarked,

"Oh yes, you ken wink and you ken blink, but you got t' do jes wha' de min'ster sez."

She had him at that juncture.

A MICHIGAN friend sends this:

A lumberman out here being poorly provided with materials of sustenance for his men, fed them with pork cooked with the rind upon it. A young man of the company, not liking that outer portion of the food, was observed by the host to be carefully removing the outside covering, whereupon mine host said,

"Young man, we eat rind and all here."

To which the youth replied, "All right, old man, I'm cutting it off for you."

In the postscript of a letter of a clergyman who had been recruiting his health at Saratoga last summer is the following: "The belle of the season wore a dress valued at the amount of my salary for two years, and a set of diamonds equal in value to the cost of a comfortable mission church, with infant room attached, gas fixtures and cabinet organ included."

"PIKE County, Missouri," writes a missionary of the American Sunday-school Union, "has been immortalized, or rather rendered notorious, by John Hay's poem, *Little Breeches*. Pikers are an independent, rather lawless class of people, some of them, who would rather lynch a man for horse-stealing than for murder. Last Sunday I had quite an argument with a leading professor of religion as to whether it is right to hang a horse-thief, which he closed by saying, 'Well, if it isn't in the Scripser, it ought to be thar; it's a mercy to the miserable cuss to hang him.' Much whisky and tobacco are used here, but the moral tone of the county has been much elevated by Union Sunday-schools, some of which have grown into churches. Even the 'Salt River Tigers' will throng to hear 'preachin', and have begun to get the idea of Sunday-schools; but they must be Union schools. 'We don't want none of your sectaran, one-sided schools, but one every body can go to.' A class in Plymouth Church, Brooklyn, lately sent a library for their school, and they are very proud of it, and it is to be hoped that the 'tigers' will be changed into lambs."

MARSHALL JEWELL, our new Postmaster-General, has in various ways made it apparent that he "means business," and does not propose to tolerate any unbusiness-like proceedings in the department under his charge. For instance, he issued a short time ago an order discontinuing the rather loose practice which had obtained of

allowing the department clerks to draw "advance pay" under certain circumstances. Unfortunately one of those gentlemen, who had postponed until December his usual summer vacation—which he then proposed to enjoy as his honey-moon—found the new rule likely to seriously interfere with his visions of bliss, and the chief of his bureau undertook the task of endeavoring to induce the Postmaster-General to make an exception in so peculiar and interesting a case. Governor Jewell, however, declined to grant the request. "The Post-office Department can not insure Mr. ———'s life," he observed, "and the Postmaster-General can not violate his own orders; but," he added, "the young man's word must be kept, and the young lady must not be disappointed, so I'll take the risk myself;" and drawing his individual check in favor of the clerk for the amount of the latter's monthly salary, he thereby cut the Gordian, and rendered feasible the tying of the hymeneal knot. When that happy couple have the right and occasion to make choice of a name for a male member of the human race, if that of Marshall Jewell does not occur to them as a highly appropriate one, the fact will certainly prove them lacking in gratitude and in appreciation of the everlasting fitness of things.

A FEW more old epitaphs have come to us:

The body underneath this stone is
Of my late husband, Jacob Jonas,
Who when alive was an Adonia.

Ah, well-a-day!

O Death! thou spoller of fair faces,
Why took'st thou him from my embraces?
How could'st thou mar so many graces?
Say, tyrant, say!

Another:

Hic jacet Walter Gunn,
Sometime landlord of the Sun—
Sic transit gloria mundi!
He drank hard upon Friday,
That being a high day,
Then took to his bed, and died upon Sunday.

And another:

His net old fisher George long drew;
Shoals upon shoals he caught,
Till Death came hauling for his due,
And made poor George his draught.
Death fishes on through various shapes;
In vain it is to fret;
Nor fish nor fisherman escapes
Death's all-inclosing net.

ONE of the latest of Mr. J. Billings's orphic utterances is so pertinent to the pleasant mission of this department of the Magazine that we give it place:

"Fun is the cheapest fisick that haz bin discovered yet, and the eazyest to take. Fun pills are sugar-coated, and no change ov diet iz necessary while taking them. A little fun will sum-times go a grate ways; i hav known men to liv to a good old age on one joke, which they managed to tell az often az once a day, and do all the laffing themselves besides that waz done. But thare iz lots ov pholks who kant see enny phun in enny thing; yu couldn't fire a joke into them with a double-barrell gun 10 paces off; they go thru life az sollum az a cow. Menny people think it iz beneath their dignity to relish a joke; sutch people are simply fools, and dont seem to kno it. The Billings family are allwuss on the look-out for fun. It iz sed ov Dexter Billings, one ov our pristines, that he had to be kept

under 500-dollar bonds all the time to keep him from laffing in church. Fun iz the pepper and salt ov every-day life, and all the really wiz men who hav ever lived hav used it freely for seasoning."

In the number of *Blackwood's Magazine* for November last is a clever hit in rhyme at the "President's Address, British Association, 1874." Since the late Professor Aytoun's verses on "Monads" there has been nothing better. The solemn pomp of the lines is delicious, and the vivid funniness of the final drop from the sublime to the ridiculous is nearly as good as the savage humor of Bret Harte's summary of the consequences to the learned geologist when, "a chunk of old red sandstone" having "caught in the abdomen," "the subsequent proceedings interested him no more." Professor Tyndall's eloquent description of the emancipation of science from the trammels of creeds is cleverly paraphrased in six lines:

In the very beginnings of science, the parsons, who
managed things then,
Being handy with hammer and chisel, made gods in
the likeness of men,
Till commerce arose, and at length some men of
exceptional power
Supplanted both demons and gods by the atoms,
which last to this hour.
Yet they did not abolish the gods, but they sent them
well out of the way,
With the rarest of nectar to drink, and blue fields of
nothing to sway.

The atomic theory is delightfully put from the comic point of view, and the *jew d'esprit* ends with the following version of the professor's pyrotechnical peroration:

First, let us honor the atom, so lively, so wise, and
so small;
The atomists next let us praise, Epicurus, Lucretius,
and all;
Let us damn with faint praise Bishop Butler, in whom
many atoms combined
To form that remarkable structure which it pleased
him to call—his mind;
Last, praise we the noble body to which, for the time,
we belong,
Ere yet the swift whirl of the atoms has hurried us,
ruthless, along,
The British Association—like Leviathan worshiped
by Hobbes,
The incarnation of wisdom, built up of our witless
nobs,
Which will carry on endless discussions when I, and
probably you,
Have melted in infinite azure—and, in short, till all
is blue.

THIS from a correspondent at Springfield, Massachusetts:

Having been a steady reader of the *Monthly* from the first, I have very much enjoyed the wise and witty quips and oddities of the Drawer. Although I well knew that it requires grist to keep any mill running, I have never contributed to keep the hopper supplied, until at this late day I am resolved to offer my mite, one of its merits being the fact that the story is literally true of my own knowledge.

When I was a boy living at home on a farm in Western New York one of the laborers employed by my father was a man by the name of Lacey. He was past middle life, and of a heavy, sluggish mould, which to a stranger would indicate any thing but keen and ready wit, yet if any attempted to tax its temper, they soon found that under his uncouth exterior there was a sarcasm

as ready and keen as a Damascus blade. One instance, I think, is worthy a place in the Drawer.

His wife was a wiry little woman, all right angles and activity, and withal something of a Xantippe, who had little patience with his slow and ponderous ways, and often took him to task pretty severely. On one occasion, after having exhausted her vocabulary of invective, which he bore with the most perfect good nature, she wound up with the following:

"When I was a young woman I had as good a *written recommend* as any girl in the whole country, and I wish I had left you alone and kept that till I die."

"Humph!" responded the old man, with the most imperturbable quietness, "what good ud that done ye?—*the devil can't read writin'.*"

GENERAL O'NEILL, a gentleman of some means, having come over from "the ould sod" to settle in Nebraska, sent to various parties a sheet of printed questions to which he desired answers. We give a few of the general's questions, and the answers of one of those frank, simple men of the vicinage:

Q. "Name of county, and when organized?"

A. "Kass Kounty. Organized when fellows started building."

Q. "Have you good water? How deep do you have to dig for it?"

A. "Yes. You can dig as deep as you want."

Q. "Is the land principally owned by residents or non-residents?"

A. "Some this way, some that way; principally neither."

Q. "Where do you get your lumber? What do you pay for it?"

A. "Generally at the lumber-yard, occasionally at the saw-mills. Sometimes cash, sometimes notes."

Q. "How is the climate as to health?"

A. "Have never heard the climate complain."

Q. "How are the roads?"

A. "The roads are very well, thank you; how are you?"

Q. "Is there fish or game of any kind?"

A. "Yes. Fish—gudgeons and flats. Game—seven-up, poker, euchre, etc."

WHEN Zebulon Vance was Governor of North Carolina he was talking with an English gentleman in reference to legal formalities in English and American courts, and while there was less red-tapeism with us, there were certain forms that were adhered to with great tenacity. In illustration, he said, jocosely, "Don't go away with the notion that we discard forms. Judge —, Sir, is as great a stickler for forms as any man in your country. One day a soldier who had been battered considerably in the war was brought in as a witness. The judge told him to hold up his right hand.

"'Can't do it, Sir,' said the man.

"'Why not?"

"'Got a shot in that arm, Sir.'

"'Then hold up your left.'

"The man said he had got a shot in that arm too.

"'Then,' said the judge, sternly, 'you must hold up your leg. No man can be sworn, Sir, in this court by law unless he holds up something.'"

HARPER'S NEW MONTHLY MAGAZINE.

No. CCXCVIII.—MARCH, 1875.—Vol. L.

THE ISLE OF MAN.

CASTLE BUSHEN, ISLE OF MAN.

THERE is a patch of land in the stormy Irish Sea called the Isle of Man, about which many traveled and untraveled Americans know scarcely more than its name. On a sunny day the highlands of Ulster, in Ireland, and of Galloway, in Scotland, are visible from its western shore, and from the summit of Snaefell Mountain busy little England is seen fretting in the golden haze far across the sea. It is not much greater than Staten Island in area, and an ambitious Californian might look upon it as a fair-sized ranch. But small as it is—a mere speck on the map of Great Britain—it has a government of its own, with a House of Parliament, a people infused with noble blood, and a thrilling and eventful history. Hawthorne found it out while he was a consul at Liverpool, and has praised it in the

delicious prose of his *English Note-Books*; Scott gathered material for *Pereril of the Peak* from its romantic scenery and legends; and Wordsworth commemorated a visit to it in a sonnet. But it is not in these few literary associations that its chief interest lies. The history of its varied fortunes and the ancestry of its superstitious people have a peculiar interest, dating as they do from the thrilling age when the Norsemen were mighty in the West.

In its greatest length the island measures about thirty-three miles, and in its greatest breadth about thirteen. Its circumference is seventy-five miles, excluding the sinuosities of the bays; and it contains a superficial area of about one hundred and thirty thousand acres, or two hundred and three square miles. Enjoying the benefits of the

MANX ARMS.

Gulf Stream, the climate is singularly mild and genial, and there are few other places in the world where the difference between winter and summer is so slight. The mean temperature of summer is usually about 56.17°; of autumn, 46.97°

of spring, 44.70°. There but very little snow or frost to the height of ten or twelve inches, and are found, as in some, in the poorest of healthfulness of the climate the native girls, rosy-cheeked, and gleeful, and the stalwart, muscular, and ever breathed sea-air.

For the most part the wild, hoar with the foam sea that surrounds it, and spacious harbors and inlets but in the north the land pasturage, and meets the tenebrous pebbles of a smothered interior includes nearly every rural scenery—heather hills, plains as richly cultivated as the downs of Surrey, wide reaches of prickly gorse as drear as Yorkshire moors, and the prettiest of cascades. The enchantment of Northern land dwells in its subdued light and on its mist-crowned heights.

An old statute-book relates how a wizard king first ruled in the island, and enshrouded it in vapor. An Irish

glossary written by an old king of Munster corroborates the statement, adding that the wizard was also the best pilot in the west of Europe, and was called Mannan MacLleirr, or the Son of the Sea—a name which he extended, in part, to his kingdom. Caesar called the island Mona; Pliny, Monabia; Orosius, Menavia; Bede, Menavia Secunda; the Saxons, Mannie; the Welsh, Monan; the Irish, Menand; the Scandinavians, Mon; and the natives still call it Mannin. From all that these eminent ancients have said only one thing is certain, and that has no reference to MacLleirr. The Scots inhabited the island at an early date, and in 520 A.D. a nephew of King Arthur came from Wales and conquered it. Then for many years it was in a tumultuous state, and was successively held by the Scots again, the Welsh, the Northumbrians, and other of the Anglo-Saxon nations.

In 870, when Roderic the Great was King of Mercia, he conferred the sovereignty of the island upon his son Anaraut, and it was during the term of the latter that the Vikings included it among their conquests.

MALLURE NEDDER.

These old heroes were the victims of lawless and blood-thirsty dispositions, and had withdrawn from their allegiance to Harold Haarfager. The more peaceful and penitently inclined emigrated to Iceland, out of the reach of the offended king, where they established themselves in prosperity and honor. But the others settled nearer home, and occupied the Isle of Man, from which vantage-ground they continued to make things lively for their father-land. Harold was not long in following them. "But when he had come westward as far as Man," says his saga, "the report of his exploits on the land had gone before him; for all the inhabitants had fled over to Scotland, and the island was left entirely bare both of people and goods, so that he and his men made no booty when they landed."

As soon as Harold had retired the vikings returned to the island, and killed an earl to whom he had intrusted the government. A second earl whom the king sent to subdue them was also killed, and his wife and daughter were sold as slaves. The island then became a pirates' lair, and the children of Harold, by condoning the vices of the vikings, managed to hold the throne of Mona for several generations.

In 1263 the island was tributary to Norway, and as the mother country was unable to protect it, it was ceded to Alexander III. of Scotland. Thereupon the ancient armorial bearings of the Kings of Man were erased, and the three armed legs were substituted, with the appropriate motto, Quo-

cunque jecuris stabit—"Howsoever you throw it, it will stand."

The Scots had not the strength to hold the island, however, and at the request of the inhabitants Edward I. of England took possession. Edward II. gave it to his favorite, Piers Gaveston, Earl of Cornwall, and afterward it fell under the rule of Henry Beaumont. But the warlike Scots were impatient to regain it; and in 1313 an army under Robert Bruce invaded the island, occupying it for the thirteen years following. The Earl of Shaftesbury wrested it from them in 1340, and sold it to the Earl of Wiltshire, whose life and property were sacrificed in high treason committed against his sovereign majesty the king. Henry IV. granted it to the Earl of Northumberland, and it next passed into the hands of the Stanleys (Earls of Derby), who retained it until 1651. In that year the sixth earl was beheaded at Bolton for his adherence to Charles I., and Lord Fairfax was appointed a ruler in Mona. Charles II. restored the island to the Stanleys on his accession, and by them it was transferred to the Dukes of Athol, who voluntarily disposed of the sovereignty to Great Britain one hundred and ten years ago.

The vikings are fishermen now, and all the great treasure steamers from Liverpool sail into the West without a thought or wish of evil toward them. Sleepy villages are perched on the cliffs where once the beacon-fires of the wreckers allured many a goodly ship to her doom. In the bays where the pirates hid themselves fly the white sails of pleasure-boats. So great are the changes wrought by time that even the spell of mist worked by the wizard king has been broken, and the summer has its share of cloudless days. The invaders are not Romans, Picts, Scots, or Scandinavians, but aggressive tourists bearing knapsacks instead of eagles, and walking-sticks instead of javelins. These confront you in nearly every part of the island, and the primitive character of the natives is fast changing under the influence of the town manners which the visitors bring with them. Many of the superstitions have been laughed away, and hospitality has acquired a fair money value. I do not mean to say that there are no more generous hearts and simple minds in Mona. An old fisherman's wife entertained me with flour bread, salt fish, and tea in her hut at Cregg-neesh, and indignantly thrust me out of the only door in the house when the meal was ended because I offered her a shilling. There are not a few honest folks, too, who yet have a steadfast faith in mermaids and fairies.

The island is reached by a line of yacht-like steamers, each with two bright red funnels and two very slanting masts, which sail from Liverpool every afternoon during the

ENTRANCE TO DOUGLAS HARBOR.

summer. The distance is about seventy-five miles, and the somewhat perilous passage across the Channel is usually made in five or six hours. But the sea is persistently boisterous, and has that eminently offensive motion which old travelers call "chopping." It almost invariably rains in the Channel, moreover, and as the saloon will not shelter more than half the passengers, the other half are drenched and made miserable on deck. No land is in sight. The Welsh hills are lost in haze near the estuary of the Mersey, and the drear beach which reaches a little farther is also left behind before the voyage is well begun. Then for five hours there are only the wintry sea and the sullen sky.

The cry of "Land, ho!" at last awakens the passengers from their sickly languor, and brings a ray of hope to many pale faces. Yonder it is—a faint outline on the mist. The steamer tosses for another hour before it is clearly seen, and the rain continues to fall with unabated force. But occasionally a stray shaft of gold pierces the clouds, fringing them with its lustre, and soon the sun struggles through, revealing Mona to us in the glory of her autumn robes. The mist, now whitened to a silvery sheen, drifts in wreaths and masses, resting a while on the uplands, and then gathering densely in some ravine, or soaring toward the highest peaks. Half the island is bathed in the enchanted vapor that steals over it as a pleasant dream over the human sense. The sun falls aslant the nearer land with undimmed effulgence, bringing into clearer view the rich fields of mature wheat, the cool reaches of unparched

verdure, and at length the gray and red walls of the bold coast.

The steamer then glances between two bold promontories into the sapphire water of Douglas Bay, at the head of which is Douglas itself, the principal town, with a canopy of blue smoke lazily floating over its gray houses. The arrival is an affair of no little importance. It brings her Majesty's mails, the Liverpool and London newspapers, and a fresh crowd of visitors to the hotels and boarding-houses. The magnificent stone wharf is thronged with eager faces. Some venturesome ones pull out in small row-boats to greet the new-comers, and a more formal honor is paid to them in a good-will salute fired from a little cannon on the cliff. It is only because Douglas is on an island that this fuss is made over an event that occurs three hundred and thirteen days in the year. Otherwise it would be almost unnoticed.

The old town is on the low ground nearest the shore, and is intersected by incoherent little streets, which are so narrow that two vehicles approaching from opposite directions can not pass, and the occupants of the solid-looking houses might almost shake hands out of their bedroom windows with their neighbors over the way. The houses are as much alike as a row of nine-pins, as uniform as the streets are erratic. They were built for a simple people, earning a frugal living from the sea, and no vain architectural fancies have been lavished upon them. The walls are thick and the roofs warm. They were looking out on the bay and trembling in the wintry blast long before a new town had crept above them on the hill, and these very dormer-windows that stare in perpetual reverie from the deep roofs have often been filled with the anxious faces of fishermen's wives as the herring boats have sailed far out to sea. A chilly effect is produced by their white fronts and dark roofs in the gray light of the afternoon, and they look all the better in the evening, when the lamps glow through the bits of red curtains in the windows.

Compared with its tributaries, the principal thoroughfare is magnificent. It runs across the town from one side of the bay to the other, and is nearest of all to the water. Once its buildings were like those on the other streets, and its only claim to superiority rested in its possession of a few shops. But it has since advanced to the glory of plate-glass show windows, with as fine displays of fashionable millinery and clothing as an ambitious little city could desire. There are also extensive bazars and arcades for the allurement of those tourists who have a weakness for giving inscribed mementoes of the places they have visited to their friends. But Duke Street, with all its fine stores, still remains a mere alley,

is flooded with light from the shops and thronged with loungers. The trade done in pictorial note-paper and wooden spoons marked "A present from the Isle of Man" is enormous. All the purchasers seem to be strangers, and occasionally you may see a salty-looking native, dressed in a pea-jacket and a sou'wester cap, watching them with an expression of mingled contempt and approval.

The southern end emerges in the old Market Square—a lively and interesting scene at all times. On one side stands the Church of St. Matthew, which has been frowning on the vanity of the passing crowd for more than one hundred and fifty years. It was consecrated by Bishop Wilson, whose life was written by Keble, and age has only slightly impaired the strength of its substantial walls. Close by there are several old-fashioned taverns, with cozy bar-parlors, which invite the carnal man to drowse away an hour or two over a long clay pipe and a glass of steaming toddy. A little further on you come to the harbor, which is formed by the embouchure of the river Douglas, and is partly separate from the bay. Two great hills flank it, the one on the farther side covered with the brightest verdure, the other graded into streets and occupied by houses. At low water the pebbly bottom is visible, with the river, white from the flour mills, running through a deeper channel in the middle. A few fishing boats are moored to the wharf, their red sails hanging limply about the masts, and

their weather-beaten crews enjoying an industrious idleness on deck. A schooner or bark from England or Ireland is sometimes moored among others, and under the lighthouse at the end a gallant fleet of row-boats and yachts dazzle the water with the surpassing brilliancy of their paints.

At night the market-place reminds you of Flemish pictures. Its space is filled with stands and lighted with flaring yellow lamps. Here you may see a comely woman—with such a color and such a breadth!—planted before a stall loaded with the most glittering and most richly colored mackerel in the world. Her bright eyes, clear complexion, and picturesque dress—the red shawl jauntily thrown across her magnificent shoulders, the clean blue check apron and homespun brown gown—realize the ideal of a modern viking's daughter. Next to her, before a stand of oysters, is a gray-haired old fellow in sailor's attire calling out his stock in the most persuasive tone. "Fine oysters, fresh oysters, oysters all alive, oy-y-stars kicking! Try them, ladies; try them, gents; a shilling a dozen. Oysters, oysta-r-r-s!" Only a few of the tourists who throng the narrow passage are able to resist the appeal, augmented as it is by the tempting samples which are open within their pearly clasps, all ready for the pepper and the vinegar. On another stall a lot of crimson lobsters and crabs invite purchasers; and the next dealer, a fair-haired girl, displays some tender-looking mushrooms, gathered by her own chubby

watch the sea rolling in on the low beach, not in thundering waves, as at Long Branch, but in playful ripples that chase each other like children; an ornamental iron pier reaching several hundred yards in the water of the bay, water of such purity and exquisite colors as you will not see elsewhere on the English coast; handsome boarding-houses and hotels perched on the cliffs among the shady foliage; and the street entertainments of negro minstrels, ballad singers, and acrobats, which form one of the distinctive features of all English watering-places.

A pleasant lane leads to Douglas Head, one of the promontories guarding the entrance to the bay, from which elevation a superb reach of land and water is in view.

MANK OYSTERMAN.

lands that same afternoon. In the background stands the old church, the flickering lamps throwing gigantic shadows on its yellow walls, and the taverns, their windows beaming with a hospitable warmth.

When other visitors than occasional officials of the English government and the captains of small coasters began to come to the island, the first stones of the new town were laid on Prospect Hill. Soon afterward terraces of stucco villas, with carriage-drives and gardens in front, dawned on the astonished minds of the old town folk, and yet greater wonders in the shape of modern hotels, with hundreds of rooms and princely furniture. A steamer came from Liverpool daily, bringing an increasing number of passengers each succeeding summer, until the fame of Douglas was spread through the kingdom.

Douglas is the starting-point for tourists to all parts of the island, which can be reached within a day, and it has all the essentials of a fashionable resort. There is a splendid concrete parade, where you may

It is over three hundred feet above the sea-level, and rises almost precipitously from the water. Lovers have made it a favorite tryst, and dainty parasols blossom unexpectedly out of the secluded nooks torn in the rock. On the opposite headland a smoky chaplet hovers above Onchan village, with its romantic little church—fair Onchan,

"Studding the hill above the glassy bay,
A tiny hamlet boomed in the skies."

Inland there are the mountain ranges, and the fertile valley that cleaves the island between Douglas and Peel. A foot-path down the hill brings you to the lighthouse on another commanding eminence, and then, by flights of stairs hewn out of the layers of greenish rock, you come to Port Skillion. I never saw a more romantic bathing-place than this is, nor one where a bath could be enjoyed with greater luxury. It is a cool recess in the rocks, cool on the warmest days in summer. The water is intensely green, and so clear with-

al that a small object can be seen fifteen feet below the surface. In the rear there is a row of comfortable dressing-rooms, with neat exteriors, and a wall of concrete partly incloses a bit of shelving beach evenly strewn with lustrous pebbles. Near the middle of the bay is the "tower of refuge" established on Conister Rock for the succor of the shipwrecked by Sir William Hillery, founder of the National Life-boat Institution. Above you impend the frowning cliffs.

But with all its attractions Douglas is not fashionable. A wealthy iron-master from Barrow, or a mill-owner from Manchester, sometimes builds a summer residence there, and in times past it was a little Siberia for profligate sons of gentlemen, who could not behave themselves in England. Families with limited incomes have chosen it as a retreat where they may practice economy without being debarred from social distinctions. But the crowd of visitors who fill the hotels and boarding-houses to overflowing during the summer mostly belong to the lower middle classes. They are foremen mechanics, clerks, and salesmen from Liverpool, Manchester, and the manufacturing districts of North Lancashire and Cumberland, out for a holiday. Their wives, daughters, and sweethearts are quite as pretty as the women of the better classes, with rosier cheeks, I think, and handsomer forms. Full of health and mirth, tasting the pleasure of relaxation from toil for only

one or two weeks out of the whole year's round, their exuberance is sometimes loud to the degree of vulgarity. But what an incomparably jolly, sociable, song-singing, picnicking set they are!

Their day began with an early morning dip in the water, no matter how cold the temperature or how heavy the rain, and then came a prodigious breakfast of mutton-chops, beefsteak, and "kippered" herrings, which were eaten in abundance with immense relish by men and women. There were no headaches or complaints of bad nights' rest among them. All were jolly, talkative, and full of health. After breakfast they divided into fishing and driving parties, taking with them plethoric lunch baskets; and when they returned in the evening they all settled down to rubbers at whist, song-singing, and story-telling until midnight.

About three miles from Douglas there is an antiquated little village which Hawthorne has celebrated. "I never saw any thing prettier," he has written in his *English Note-Books*, "than the little church at Kirk Braddan. It stands in a perfect seclusion of shadowy trees—a plain little church that would not be remarkable in any other situation, but is most picturesque in its solitude and bowery environment." The road lies over the bridge above the market-place, and through a turnstile path which leads you across some luxuriant fields to the ruins of a nunnery of which St. Bridget was

beams in the ceiling; the common wooden chairs and tables, rounded and smoothed with age; the old Dutch clock complaining in a corner; the deft little curtains strung across the windows; the grandam seated at the threshold, knitting a pair of thick woolen stockings, and nodding a good-afternoon to the passers-by — what fascination and inspiration there are in these homely

EXTERIOR OF A MANX COTTAGE.

priores. The only part of the building remaining is a wall of the chapel, with Gothic windows and an old bell smothered in ivy; but an ancient writer describes it as one of the finest monastic establishments of Great Britain. The prioress was baroness of the isle, held courts in her own name, and possessed great powers, both temporal and spiritual. Among the grave-stones found on the grounds was one inscribed, "Illustrissima Matilda Filia Rex Mercie," which is supposed to have commemorated the daughter of Ethelbert the Saxon, who died a recluse. Another one was inscribed, "Cartemunda Virgo Immaculata, A.D. MCCXXX," which is supposed to refer to Cartemunda, "the fair nun of Winchester," who, flying from King John, here found an asylum, and died in peace. The grounds are now included in the estate of a gentleman who has converted them into a paradise, and the ashes of the pious Sisters blossom again in sweet-smelling beds of the choicest flowers.

After passing the nunnery you reach a bit of a village called Ballaughton. It consists of about half a dozen cottages, with little gardens in front flaming with the prodigal fuchsias that carry their clusters of blossom as high as the bedroom windows. The profuseness of this plant imparts a warmth of color to these small homes which I have never seen equaled. The cottages have that peculiarly English appearance of rusticity the charm of which is plainly felt and not easily explained. It is not found in any refined details of architecture, in which they are far excelled by the villages of France. As nearly as I can come to it, it consists in what a clever American writer has called their mellow tone and homely sincerity. They are not merely shelters for men and women; they impress one as being active participants in human life. The open doors revealing the clean kitchens, with their crockery ranged on shelves reaching to the

sights! A little farther along the road you come to a stone, hollowed on the upper side, which projects about two feet from the wall in which it is set. This is the "fairy's saddle," and granny will tell you that on moonlight nights it is mounted by a dashing sprite who rides a fiery steed over the moor.

A walk of a few hundred yards under an umbrageous canopy of leaves then brings you to the old kirk. It is set back from the road in a mossy church-yard on the brow of a hill; and as you stand at the gateway, looking at it in its nest of oak and beech, I think that you will agree with Hawthorne, who declared that no description could do justice to its quaint beauty. It has every requisite for an ideal country church. It

is exceedingly Lilliputian, and is absolutely without other decorations than those that age and time have given. The roof slants so low that a tall man can reach it with his hand, and the mellow walls are broken only by a few narrow arched windows. At the west end there is a square tower, on which are two small bells in open arches, with the date of erection, 1774. The ivy and the lichen have lovingly thrown a decent velvet pall over it, and on one side the humble little sanctuary has sunk below the level of the oozy ground, as though inclined to follow the generation of worshipers that are buried around. A silent company of grave-stones crowd out the living and mark the full harvest of a hundred years. Among these simple monuments

of fishermen and yeomen—most of them thin squares of slate a few feet high—there is a lofty obelisk in memory of the son of John, Duke of Athol; and near to this Henry Hutchinson, Wordsworth's brother-in-law, lies buried, his virtues extolled in an epitaph written by the poet.

The objects of the greatest interest in the church-yard, however, are the ancient sculptured monumental crosses with Scandinavian legends, which are more numerous in the Isle of Man than in any other part of the kingdom. Readers of Mr. Conway's articles on Ilkley are already familiar with their general character. They are vertical stones of a considerable height, decorated with elaborate scroll-work and representations of serpents and various fanciful animals—evidently borrowed from Northern mythology—which are graven on the surface. Most of them are also inscribed with Runic letters; and it is to be supposed from the amount of labor which must have been spent upon them that they were built only to the memory of Norsemen of high degree.

RUNIC STONES, KIRK BRADDAN.

There are seven of these curious stones at Kirk Braddan, and one of them is described by a learned author as being the most thoroughly Scandinavian of all in the island. It is a rectangular pillar cross decorated on three sides with serpents and knot-work. The fourth side bears the inscription, "THURLABR-NEAKI-RISTI-KRUS-THANA-AFT-FIAK-SUN-SIN-BRUTHUR-SUN-EABRS," which, interpreted, means, "Thorlaf Neaki erected this cross to Fiack his son, the nephew (brother's son) of Jabr."* A fragment of another cross, ornamented in the same fashion, stands close by. Upon one of its sides the dragon and serpent device is engraved, and on the other there is a beautiful design of knot-work in panels. The edge is inscribed with Runic characters to the effect that "Ottar erected this cross to his father, Fraka, but Thornborn, the son." A third

* For these facts and much other valuable information the writer is indebted to Mr. James Shimmin and Mr. William Kneale, of Douglas, the latter the author of a popular *Account of the Island*, and an antiquarian noted for his painstaking researches.

stone, less ornate than the others, and in a poorer state of preservation, is inscribed, "Thorstein erected this cross to Ofeig Kli-naisön."

When we consider how old these monuments are, the centuries they have carried their stories of paternal and filial love between fathers and sons, I think we will admit them a little nearer to our sympathies than ashy antiquities are wont to come. It is only of late years that any care has been bestowed upon them. One of them long occupied the place of a door-step at the entrance of the church. Another was used as the stepping-stone of a stile. Yet they survived this vandal desecration, as they survived the storms and changes of seven hundred years. The waves of time have scarcely worn a knot out of the intricate tracery of their panels, and the warm hearts of the rugged old Norsemen, so long ago extinct, are vindicated in the simple Runic letters.

The church is dedicated to St. Brandon (Brandinus, or Brandanns), an abbot and confessor, who died in the Isle of Man in the eleventh century. He was created a bishop in 1025, and was also much honored in the Hebrides. The present edifice is only a year older than the Declaration of Independence, but the site has been occupied by a church since 1291, in which year thirty-six canons were enacted by a synod there assembled.

There are three ways of seeing the island. The quickest and cheapest is by the recently constructed narrow-gauge railroad. The most popular is by wagonette, a sort of civilized jaunting-car, accommodating from four to eight persons, which can be hired, with the driver, for twenty shillings (five dollars) a day. The best is by walking, and the occasional use of the railroad between unimportant points. The requisites are a fair degree of endurance, a stout pair of boots, and a water-proof overcoat, the latter being especially indispensable, as scarcely a day passes without the blessing of rain. It was thus that I traveled, and I think I saw much that the ordinary tourist misses.

I started out in a northwesterly direction from Douglas to Peel, following for two miles the road leading to Kirk Braddan. Thence we were in a valley of small farms for the rest of our journey. Prior to the re-investment of the sovereignty in the British crown, agriculture was greatly neglected, and the exertions of the peasantry were devoted to smuggling and the herring fisheries. But since that event a decided improvement has taken place, and the best methods of cultivating lands have been adopted. The holdings are very small, and though some include two hundred acres, the greater number consist of not more than a hundred, or a hundred and fifty. About

two-thirds of the whole island are productive; the remainder is sterile and neglected. Some of the land in the south resting on limestone is said to be equal to the best in England, and in the north large quantities of marl are found, which possesses highly valuable chemical properties.

Mines of lead, iron, and copper are worked extensively at four places, and the export of these minerals affords a considerable part of the insular income. The lead mines in general yield a mixed ore, two-thirds *blende*, and one-third lead, in a ton of which there are from seventy-five to one hundred ounces of silver. Quarries of lime, marble, and granite are also worked on a moderate scale at Foxdale, Scarlett, and Ballasalla.

At the beginning of the eighth century the population consisted of about three hundred families, and in 1861 it had increased to fifty-two thousand. Not a few of the people are descended from the Scotch and Irish immigrants of centuries ago; but the pure-blooded Manx are in a majority. They are jealous of foreigners, and in some remote villages in the mountains and on the coast they intermarry among themselves. In manner they are stolid and reserved, suspicious of questionings, and more disposed to listen than to answer. They are very temperate in the use of strong drinks, and are well-educated and intelligent. Since the year 1703 they have had a complete system of compulsory education.

One of the earliest written laws was directed against drunkenness. "At the Tinwald Court holden on the 24th June, 1610. It is by general consent proclaimed that as oft as any man or woman shall be found drunk hereafter, the party soe offending, if not of ability to pay a fine, shall for the first time be punished in the stockes, the second time to be tyed to the whipping-stockes, and the third time to be whipped therein."

The Manx jealousy of alien settlers is shown in a law which enacts "that all Scotts avoid the land with the next vessell that goeth into Scotland, upon paine of forfeiture of their goods, and their bodies to prison." This spirit of *clannishness* even went so far as to proscribe the emigration from the island of all unmarried men and women, under twenty-five years of age, who had not served seven years at labor. But except in this instance the Manx community enjoyed the utmost political freedom under the most effective and least burdensome restraints of morality.

The language, which is used in conversation by the peasantry and in some of the legal formulas, is one of the six dialects of the Celtic, expanded by the Icelandic and old Norse. Manx scholars are fond of expatiating on its melody, harmony, and copiousness; but Bishop Shirley did not think so much of it, and declared it to be "an

ST. TRINIAN'S CHURCH.

unmitigated portion of the curse of Babel." The native literature is meagre, consisting of several legendary ballads of considerable length, political and satirical songs and carols or carols, translations of the Bible, the Book of Common Prayer, portions of *Paradise Lost*, several theological works by Bishop Wilson, and hymns by Watts and Wesley.

English is generally understood, and is spoken with a dialect something like that of the characters in *A Princess of Thule*. Was is pronounced wass; indeed, 'teet; far, fair; great, grade; mother, mawther; and devil, tivvil. A visitor was told by a native scholar that in the translation of *Paradise Lost* all the nonsense of the original had been suppressed. "'Teet there's a dale of nonsense in the English pome," he added. "I maue the foolish tales about Adam and Eve coortin', and such like. There's none of that nonsense in Manx pote-ry—no, in-teet. A dale of Milton's *Paradise Lost* is nauthin' in the world but thrash. The Manx translation is far shoo-pay-re-er—per-tickerly those parts of the pome telling about the fights between the tivvils and the an-chels—yes, in-teet. Ay, man, it's ray-ly wun-thir-ful—it's graud—its grand uncommon!"

The island does not form part of the realm of Great Britain, and has its own legislature, laws, and courts of justice; but it is a part of the dominions of the Crown. Its government is composed of the Queen in

Council, a Lieutenant-Governor, and the House of Keyes. The Lieutenant-Governor is appointed by the Queen, and members of the House of Keyes are elected by the people. The principal courts of law are the Chancery, the General Jail Delivery, the Exchequer, the Common Law, the Seneschal's, the Consistorial, and the High Bailiff's. The staff of government and the Queen in Council possess appellate jurisdiction, and for judicial purposes the island is divided into two districts, with a deemster or judge appointed by the Crown for each. These districts are subdivided into sheadings, over each of which is a coroner, who unites in his person the duties of an English constable and sheriff.

To come back to the road, from which I did not intend to wander so far. The day fulfilled the promise of the morning, and I think I was overtaken by only four separate showers in course of two hours. Several wagonettes dashed past, loaded with merry-makers, who seemed indifferent to the rain, as, indeed, all must be who would see the Isle of Man.

Four miles from Douglas I came to Crosby, a road-side village of picturesque cottages, with gardens in front of each. A bevy of barefooted little maidens advanced, offering baskets of mushrooms for sale. Not disposing of which, they modestly retired, without even asking for a penny. It was surprising how few beggars I encountered, and how few signs of poverty. The small-

est cottages were in an excellent state of repair, and the inmates were dressed in substantial and comfortable woollens.

In a grassy field on the right-hand side of the road are the remains of St. Trinion's Church, which was built to the memory of a Pictish bishop hundreds of years ago. I have lost faith in ruins as a general thing, and think them rather disappointing; but St. Trinion's realizes all one's ideas of what a storm-battered, time-eaten old sanctuary should be. It is in a meadow, as I have said—a meadow sprinkled with drops of golden buttercups and snow-flake daisies, and the meadow is at the foot of a mountain. When it was perfect it was about seventy feet long by twenty-five feet broad, but it has not such magnificent proportions now, and the ghosts of all those worshipers who have been baptized and married in it, and are dead, must be crowded for room. The walls at the eastern side are crumbled out of sight, and their dust is cloaked in moss, ivy, and ferns. Only the moist stones at the western end and a part of the northern wall remain, with a voiceless little bell-fry above them. The roof went long ago, and the story of some marvel-lovers is that there never was a roof at all; in fact, that a mischievous fairy, called the buggane, amused himself with tossing it to the ground, with a loud laugh of satisfaction, as often as it was put on. The circumstances are related so minutely that they are almost to be believed, and whether the story is true or false, it is a matter of fact that there never has been a roof during the lifetime of the oldest villagers, and that two crusty trees have been growing out of the nave so long that they would not pass for middle-aged.

The work of the buggane was all the wickeder as the church was built by a pious soul in fulfillment of a vow made during a storm at sea, and it is well for the credit of fairy-land that his sins were atoned for by the good deeds of another spirit, who lives in the traditions of an adjacent field. The field is called Ye Cheance Rhunt, and the fairy is the Phynnoddere, which means in Manx the "hairy satyr." At one time he was a favorite elfin knight, but he was banished from the court and transformed to a satyr on account of his love for a mortal. His reverses did not sour the native sweetness of his temper, and he haunted the meadow at the foot of the mountain for many years, endearing himself to the people by constant acts of kindness. On retiring for the night the mistress of the house would leave a bowl of provisions on the table for him, and when the family were asleep he would enter the kitchen and quietly eat the food, afterward mending all the broken furniture in the house, and chopping wood for the morning's fire.

One day a gentleman wished to show his gratitude to the Phynnoddere, and left a few garments for him in the meadow; but instead of pleasing him, they wounded his feelings by reminding him of his condition. He took up the things, one by one, muttering the while:

"Cap for the head—alas, poor head!
Coat for the back—alas, poor back!
Breeches for the breech—alas, poor breech!"

And throwing them over the mountains into the sea, he disappeared, with a sad cry, never to cross the threshold of man again.

As I made my way back to the road I called for some milk in one of the cottages,

PEEL CASTLE AND TOWN.

where an old lady was seated at her spinning-wheel. I asked her whether the fairies had been about lately, and she looked at me suspiciously for a few minutes before gravely answering no. "But," she quickly added, "I ton't mane to say that there be none; no, inteet. But it is terrible long cinct wan came anear to me; yes, inteet; ant ta boggane it is in the mountain under the gorge it is." She blessed me as I left her, and fell to crooning an old Maux love-song, as the silky wool sped into the strong fabric:

"For Jurly plain, O Mylechavane,
You left me alone in the glen;
For better or worse there is gold in your purse—
Gold pieces, two hundred times ten."

Two miles further on I entered Glen Helen, walking as far as the Rhinneas Waterfall, which tumbles thirty feet over a rocky ledge; and then I came back to the main road, and continued my journey to St. John's. On a greensward there is an artificial mound of earth called Tinwald Hill,* from which the Norwegians proclaimed the law of the land a thousand years ago. It is about ten feet in height, eighty yards in circumference, and is encircled by three receding terraces cut in the sides, with a small flight of steps leading to the summit at the eastern point. The old custom is still in force, and all new acts passed by the legislature are there promulgated on the 5th of July in each year. The day is a general holiday, and the people come in thousands from all parts of the island. Divine services are

first held in an adjacent church, and the Lieutenant-Governor then occupies a chair within a tent on the summit of the mound, the members of the House of Keyes being seated on the terraces around. The ceremonies are thus prescribed by statute:

"Our Doughtfull and Gracious Lord, this is the Constitution of Old Time, the which we have given in our Days, how ye should be governed on your Tinwald Day. First, you shall come thither in your Royall Array, as a King ought to do, by the Prerogatives and Royalties of the Land of Mann. And upon the hill of Tinwald sitt in a Chaire, covered with Royall Cloath and Cushions, and your Visage to the East, and your Sword before you, holden with the point upward: your Barrons in the third degree sitting beside you, and your beneficed Men and your Deemsters before you sitting; and your Cleark, your Knights, Esquires, and Yeomen about you in the third Degree; and the Worthiest Men in your Land to be called in before your Deemsters, if you will ask any thing of them, and to hear the Government of your Land and your Will; and the Commons to stand without the Circle of the Hill, and the 3 Reliques of Mann there to be Before you in Your Presence by three Clearks in their Surpliseses. And your Deemsters shall make call in the Coroner of Glanfaba; and he shall call in all the Coroners of Mann, and their Yards in their Hands, with their weapons upon them, either Sword or Axe. And the Moares, that is, to witt, of every Sheading. Then the Chief Corouer, that is, the Coroner of Glanfaba, shall make affence upon Paine of Life and Lyme, that noe Man make any Disturbance or Stirr, in the Time of Tinwald, or any Murmer or Rising in the

* The word Tinwald is derived from *Thing*, signifying in the ancient language of the North a popular assembly; and similar mounds exist in Scotland and Iceland.

King's Presence, upon Paine of Hanging and Drawing. And then shall let your Barrons and all others know you to be their King and Lord, and what Time you were here you received the Land as Heir-Apparent in your Father's Days."

One part of the above is no longer observed, that of the clerks bearing the "Reliques," and there is no positive information as to what the Reliques were. Two battles have been fought on the surrounding ground, and a cone-shaped mountain to the south is stained crimson with the blood of witches who were rolled down its steep sides in spiked barrels.

The next town in my itineracy was Peel, which is on the western coast, a few miles north of Douglas. When the contraband trade flourished it was a place of some importance, but all its little wealth is now derived from the herring fishery, which employs four thousand men and boys. Like Douglas, it is sheltered in a semicircular bay, and the coast to the north and south is pitilessly stormy. Red sandstone from the cliffs has been largely used in building, and it imparts a warm tone to the quaint houses in the straggling streets. About half a mile distant there are some sea-worn caves, near a beach strewn with agates, jaspers, and carnelians. But the prettiest and most romantic part of Peel is its little harbor. You read about the morbid impulse of people to throw themselves from the highest gallery of St. Paul's Cathedral, so fascinating is the awful height. I fancy that a young or an old boy strolling here from day to day would succumb to an impulse to run away to sea. Sitting on one of the mooring-posts, I caught myself furtively watching the captain of a fishing boat, and waiting for a chance to steal on board and stow myself away. It is like the harbors that I pictured in my mind's eye when I read the stories of Captain Marryat and W. H. G. Kingston. There is activity without dust or fretting, or noisy teams or sweating men. It is the illimitable sea itself, with its briny scent, not the flavorless water of a mountain stream, that undulates against the bulkheads. The men are chatting about wind and weather, watching the clouds and the barometers in a good old-fashioned way, instead of putting their trust in blatant steamboats. There is no telegraph to herald the approach of vessels twenty-four hours before they can arrive. The women go to the headlands to look for their husbands' boats, and when the clouds are black their hearts sink with the sun.

They are all fishermen in Peel. The old wharf is speckled with their blue Guernsey shirts. Their bearded faces are ruddy with the tint of the west wind. I saw, too, a baby maiden, not more than five summers old, in the full bloom of a fisherwoman—a dainty

FISHERMAN'S DAUGHTER.

little thing, dressed in a striped petticoat, a woolen gown and hood, coming from her father's boat with a basket of herrings for dinner. All the children are as fresh and as wild as water-sprites. As I sat by the beach I saw three four-year-olders in a crazy old dory capsizing themselves for fun, and swimming to the shore. Two others were trying with all their might to lose themselves in a pair of sea-boots.

The event of the afternoon is the departure of the boats. They are stanch-looking sloops, of great beam, painted black, and numbered. One by one they glide from their moorings in the harbor into the bay. The brown sails are loosely spread until they pass the breakwater, when the breeze nestles in the folds, and they sweep into the gray space beyond Contrary Head. At sunrise they come home again, their decks glistening with loads of herring and mackerel. As the morning sun, breaking between the hills, strikes them, they are transformed into fairy craft, with purple sails, masts of gold, and hulls of silver.

From the end of the wharf a boat ferries you to St. Patrick's Isle, once separate but now connected with the main-land. Here stand the ruins of Peel Castle, which was one of the oldest combined military and ecclesiastical establishments in Great Britain. From the landing you mount some steps hewn out of solid rock leading to a portcullis door, and the guide-book tells you that you ought at once to be moved to "some melancholy reflections by the proofs of former pomp and power and present desertion, decay, and desolation"—well-meaning advice, but impracticable. I was not moved in the least, and I don't think you would be. You are among a crowd of boisterous tour-

i
t
f
t
t

the person who is immediately impressed with an old red sandstone building in the last stage of decay. You look at the low, tottering walls, the stones loosely put together, the crumbling arches, and the narrow stairways. The ivy crown that gives to age its greatest lustre has not fallen upon them. They appear freshly and hastily

PEEL CASTLE.

ily put together. You listen to the rambling record of mixed history and tradition told by the old army pensioner who conducts you through the apartments. You can not

had gone back to Douglas, I visited the castle again, and in the quiet I found all that I had missed in the crowd. The walls were full of mystery, and the dark passages inspired a superstitious dread of every echo; a chill ran through my frame as I sat alone in the prison chamber where the poor lady of Gloucester suffered and died. The tilting-yard rang with the clashing of armor, and the spectre of the guard-room seemed at least a possibility. I sought the damp cathedral again, and saw the light streaming between the transept arches on to a broken tombstone. It did not seem so very many ages ago since the vespers were sung in the choir, and the little altar blazed with warmth in the chilly Northern twilights; not so very many ages ago since

GLEN MAYE WATER-FALL.

fail to be interested, but you are not impressed. In the bowels of the rock is the barrel-vaulted cell where Eleanor, Duchess of Gloucester, was confined fourteen years for sorcery; and to the east of a haunted guard-room is the cathedral church of St. Germanus, founded by Bishop Simon eight hundred years ago. This is more like a ruin. It is a small cross church, with a central tower, but without aisles or porches. One of the walls is on the edge of a precipice, and looking through the crevices you can see and hear the waves beating on the rocks beneath. Hence you are taken to Fenella's Tower, and here those who have read Walter Scott's *Peril of the Peak* are likely to be impressed for the first time. You listlessly follow the crowd through the tilting-yard, the armorer's forge, the grand armory, the round tower, and the sally-port. I confess to the keen sense of disappointment I experienced. The ancient magnificence seemed departed, and the place was like an immense enlargement of a house loosely put together by children at play.

But toward evening, when the tourists

the bishops resting in this moist ground were robed, and speaking benedictions, while the hoarse challenge of the sentry in the court-yard warned off the temporal foes of his august majesty the King of Man and Earl of Derby.

After rambling through the apartments I came to a high point in the inclosure of the castle walls which was carpeted with soft grass; and here I sat to watch the sun set. The air was very clear, and I could see a cloudy ridge of mountains in Ireland beyond the channel. The water in the near distance was a light green, farther off, a blue, and still farther, subdued to a gray. The high coast of the island was visible as far as Contrary Head, where it turned off to the north. The sandstone and slate cliffs were red, yellow, and purple—the perfect colors themselves without any intermediate tints. Two or three boats were cruising in the offing, and away at sea a steamer bound from Liverpool to Dublin was laboring in the trough. The town lay quietly under the arms of the castle, a puff of hot smoke hovering above it; and presently I could see the outer lines of

SUGAR-LOAF ROCK, NEAR THE CAUL OF MAN.

the little sandstone houses rimmed with fiery gold. As the sun came nearer the western horizon a flood of the ruby light poured through the narrow streets and over the roofs, spreading at last to the old fortress and breathing its passion on the smitten walls. The night came down with a frosty wind, and the water moaned sadly against the precipice. A few lamps flickered on the wharf, and the cliffs loomed nearer, until they inclosed the town and the castle in the awful blackness of their mantle.

From Peel I went to the south of the island, visiting the cascade in Glen Maye en route, and following the line of the coast, which increases in rugged grandeur. A walk of about ten miles brought me to Port Erin, a romantic fishing village set back in an extensive bay, and guarded by two magnificent promontories, called the Cassels and Bradda Head. From the latter a fine view is obtained of the "Calf," a tiny islet separated from the main-land at the southernmost point by a narrow channel, through which the sea surges with tremendous force in the calmest weather. It is about five miles in circumference, and is girt by a belt of dislocated rocks tumbled together in savage confusion. The cliffs on the southern side rise four hundred feet above the sea-level, and are surmounted by a double light-house, which

is usually sighted by the steamers sailing between Liverpool and America.

Descending from the headland I crossed the pebbly beach, and climbed the steep hill at the opposite side of the bay. For a short distance there were some shabby cottages near the foot-path. But as I mounted higher I entered a desolate tract of bristling gorse, only inhabited as far as I could see by an idiot girl and some mountain goats. During a shower I sought shelter in a deserted house situated in a field of stunted oats, which lived to shame the land. As soon as the blue came through the clouds again I continued to ascend until I reached the crest of the hill, and could glance down on the wondrous beauties of the pastoral valley and the rock-bound coast. I sat for a while within a circle of white stones, supposed to have been formed by the Druids, and then I went down on the opposite slope to the village of Creg-y-neesh.

It is in the valley of a foot-hill, and is the most primitive settlement in the island. The population consists of about six pure-blooded Manx families, with longer pedigree than many English nobles can boast. Their homes are in six rude huts standing within detached fences, and looking down upon the sea. The outer walls are covered with fish in process of curing, which also fill several rows of barrels, and impart an unsavory pungency to the atmosphere. All the men were at sea when I arrived, and the women were washing and spinning. In one of the cottages I staid to tea with a brawny fisherman's wife over six feet high. There was only one room in the house. The fire-place was several feet high and wide, with a little mound of peat smouldering in the grate. The floor was the earth without any covering. A deal table was laid out in the simplest style for my entertainment; and as I sat by the fire, fondling one of the tailless Manx cats, and watching my hostess blowing the slow fuel into a blaze, it seemed as if I had got back into another age. The sunken window was so small that it kept the room in perpetual twilight. The tick of the old clock on the shelf, the purr of the

cat, and the splutter of the fire as the bellows sighed upon it, were the only sounds that broke the silence.

The food consisted of bread without leaven, salt fish, and tea. While I was eating, the woman brought out her spinning-wheel and showed me a pair of trowsers of her own weaving. They could afford to buy few new clothes, she told me, and all the things her husband wore, cloth included, were of her own making.

Near Creg-y-neesh the grandeur of the coast culminates. The cliffs are torn into chaotic forms, and the sea breaks upon them in a white fury. At the "Chasms" they are separated by six wide vertical fissures, nearly three hundred feet deep, extending about one hundred feet inland. If you have a good head, you may clamber down to one of the ledges, and listen to the sea and the wind booming in the rock-groined caverns below you. Some of the smaller masses of rock appear suspended in the very act of falling, and even the larger ones are so nicely poised that a touch of the hand might be expected to upset them. Under the lee of the "Chasms" there is a pinnacle rising

from the water, called the "Sugar-loaf," on which countless marine birds rest, and add their shrill cries to the general clamor, and beyond this there is a world of sea and sky without a boundary.

I must leave the reader here. My space will not allow me to ask him to follow me farther; but if what I have written induces him to spend a few days in the Isle of Man during his next vacation abroad, I can promise him that he will find more of the picturesque element than I have had the power to embody in this article. He will find in Castletown and Castle Rushen one of the quaintest towns and one of the noblest fortresses that have survived modern improvements. A drive through Sulley Glen and over Snaefell Mountain will lead him to Ramsey, a pleasant little watering-place; and a few miles from Ramsey he will pass over the Ballure Bridge to the Ballaglass Falls. The scenery, as I have said, is of the most varied kind. The rivers offer abundant sport, and from an antiquarian point of view there is not a richer spot in the United Kingdom than this fair little island in the Irish Sea.

CARICATURE IN THE MIDDLE AGES.

MR. ROBERT TOMES, American consul, a few years ago, at the French city of Rheims, describes very agreeably the impression made upon his mind by the grand historic cathedral of that ancient place.* Filled with a sense of the majestic presence of the edifice, he approached one of the chief portals, to find it crusted with a most uncouth semi-burlesque representation, cut in stone, of the Last Judgment. The trump has sounded, and the Lord from a lofty throne is pronouncing doom upon the risen as they are brought up to the judgment-seat by the angels. Below him are two rows of the dead just rising from their graves, extending to the full width of the great door. Upon many of the faces there is an expression of amazement, which the artist apparently designed to be comic, and several of the attitudes are extremely absurd and ludicrous. Some have managed to push off the lid of their tombs a little way, and are peeping out through the narrow aperture, others have just got their heads above the surface of the ground, and others are sitting up in their graves; some have one leg out, some are springing into the air, and some are running, as if in wild fright, for their lives. Though the usual expression upon the faces is one of astonishment, yet this is varied. Some are rubbing their eyes as if

startled from a deep sleep, but not yet aware of the cause of alarm, others are utterly bewildered, and hesitate to leave their resting-place; some leap out in mad excitement, and others hurry off as if fearing to be again consigned to the tomb. An angel is leading a cheerful company of popes, bishops, and kings toward the Saviour, while a hideous demon with a mouth stretching from ear to ear is dragging off a number of the condemned toward the devil, who is seen stirring up a huge caldron boiling and bubbling with naked babies, dead before baptism. On another part of the wall is a carved representation of the vices which led to the destruction of Sodom and Gomorrah. These were so monstrously obscene that the authorities of the cathedral, in deference to the modern sense of decency, have caused them to be partly cut away by the chisel.

The first cut on the next page is an example of burlesque ornament. The artist apparently intended to indicate another termination of the interview than the one recorded by Æsop between the wolf and the stork. The old cathedral at Strasburg, destroyed a hundred years ago, was long renowned for its sculptured burlesques. On the next page we give two of several capitals exhibiting the sacred rites of the church travestied by animals.

It marks the change in the feelings and manners of men that, three hundred years

* *The Champagne Country*. By ROBERT TOMES. London: 1867. Page 34.

CAPITAL IN THE AUTUN CATHEDRAL.

after those Strasburg capitals were carved, with the sanction of the chapter, a bookseller for only exhibiting an engraving of some of them in his shop window was convicted of having committed a crime "most scandalous and injurious to religion." His sentence was "to make the *amende honorable*, naked to his shirt, a rope round his neck, holding in his hand a lighted wax-candle weighing two pounds, before the principal door of the cathedral, whither he will be conducted by the executioner, and there, on his knees, with uncovered head," confess his fault and ask pardon of God and the king. The pictures were to be burned before his eyes, and then, after paying all the costs of the prosecution, he was to go into eternal banishment.

Other American consuls besides Mr. Tomes, and multitudes of American citizens not so fortunate as to study mediæval art at their country's expense, have been profoundly puzzled by this crust of crude burlesque on ecclesiastical architecture. The objects in Europe which usually give to a susceptible American his first and his last rapture are the cathedrals, those venerable enigmas, the glory and shame of the Middle Ages, which present so complete a contrast to the toy temples, new, cabinet-finished, upholstered, sofa-seated, of American cities, not to mention the consecrated barns, white-painted and treeless, of the rural districts. And the cathedrals are a contrast to every thing in Europe also, if only from their prodigious magnitude. A cathedral town generally stands in a valley, through which a small river winds. When the visitor from any of the encompassing hills gets his first view of the compact little city, the cathedral looms up in the midst thereof so vast, so tall, that the disproportion to the surrounding structures is sometimes even ludicrous, like a huge black elephant with a flock of small brown sheep huddling about

its feet. But when at last the stranger stands in its shadow, he finds the spell of its presence irresistible; and it is a spell which the lapse of time not unfrequently strengthens, till he is conscious of a tender, strong attachment to the edifice, which leads him to visit it at unusual times, to try the effect upon it of moonlight, of storm, of dawn and twilight, of mist, rain, and snow. He finds himself going to it for solace and rest. On setting out upon a journey he makes a detour to get another last look, and, returning, goes valise in hand to see his cathedral before he sees his family. Many American consuls have had this experience, have truly fallen in love with the cathedral of their station, and remained faithful to it for years after their return, like Mr. Howells, whose heart and pen still return to Venice and San Carlo, so much to the delight of his readers.

This charm appears to lie in the mere grandeur of the edifice as a work of art, for

CAPITAL IN THE STRASBURG CATHEDRAL, A.D. 1800.

we observe it to be most potent over persons who are least in sympathy with the feeling which cathedrals embody. Very religious people are as likely to be repelled as at-

CAPITAL IN THE STRASBURG CATHEDRAL, A.D. 1800.

ENGRAVED UPON A STALL IN DUTHURCH'S CHURCH, ENGLAND.

tracted by them; and indeed in England and Scotland there are large numbers of Dissenters who have avoided entering them all their lives on principle. It is Americans who enjoy them most; for they see in them a most captivating assemblage of novelties—vast magnitude, solidity of structure only inferior to nature's own work, venerable age, harmonious and solemn magnificence—all combined in an edifice which can not on any principle of utility justify its existence, and does not pay the least fraction of its expenses. Little do they know personally of the state of feeling which made successive generations of human beings willing to live in hovels and inhale pollution in order that they might erect these wondrous piles. The cost of maintaining them—of which cost the annual expenditure in money is the least important part—does not come home to us. We abandon ourselves without reserve to the enjoyment of stupendous works wholly new to our experience.

It is Americans also who are most baffled with the attempt to explain the contradiction between the noble proportions of these edifices and the decorations upon some of their walls. How could it have been, we ask in amazement, that minds capable of conceiving the harmonies of these fretted roofs, these majestic colonnades, these symmetrical towers, could also have permitted their surfaces to be profaned by sculptures so absurd and so abominable that by no artifice of circumlocution can an idea of some of them be conveyed in printable words? In close proximity to statues of the Virgin, and in chapels whose every line is a line of beauty, we know not how to interpret what M. Champfleury truly styles "deviltries and obscenities unnamable, vice and passion depicted with gross brutality, luxury which has thrown off every disguise, and shows itself naked, bestial, and shameless." And these mediæval artists availed themselves of the accumulated buffoon-

eries and monstrosities of all the previous ages. The gross conceptions of India, Egypt, Greece, and Rome appear in the ornamentation of Christian temples along with shapes hideous or grotesque which may have been original. Even the oaken stalls in which the officiating priests rested during the prolonged ceremonials of festive days are in many

cathedrals covered with comic carving, some of which is pure caricature. A rather favorite subject was the one annexed, a whipping scene in a school, carved upon an ancient stall in an English cathedral.

It is not certain, however, that the artist had any comic intention in engraving this picture of retributive justice, with which the children of former ages were so familiar. It was a standard subject. The troops of Flemish carvers who roamed over Europe in the twelfth and thirteenth centuries, offering their services wherever a church was to be decorated, carried with them portfolios of stock subjects, of which this was one. Other carvings are unmistakable caricatures: a monk caught making love to a nun, a wife beating her husband, an aged philosopher ridden by a woman, monkeys wearing bishops' mitres, barbers drawing teeth in ludicrous attitudes, and others less describable. In the huge cathedral of English Winchester, which abounds in curious relics of the Middle Ages, there is a series of painted panels in the chapel of Our Lady, one of which is an evident caricature of the devil. He is having his portrait painted, and the Virgin Mary is near the artist, urging him to paint him blacker and uglier than usual. The devil does not like this, and wears an expression similar to that of a rogue in a modern police station who objects to being photographed. Often, however, in these old pictures the devil is master of the situation, and exhibits contempt for his adversaries in indecorous ways.

If we turn from the sacred edifices to the sacred books used in them—those richly il-

FROM A MANUSCRIPT MASS-BOOK OF THE FOURTEENTH CENTURY.

illuminated missals, the books of "Hours," the psalters, and other works of devotion—we are amazed beyond expression to discover upon their brilliant pages a similar taste in ornamentation. The school scene on the previous page, in which monkey-headed children are playing school, dates back to the thirteenth century.

Burlesque tournaments, in the same taste, often figure in the prayer-books among representations of the Madonna, the crucifixion, and scenes in the lives of the patriarchs. The gallant hare tilts at the fierce cock of the barn-yard, or sly Reynard parries the thrust of the clumsy bear.

One of the most curious relics of those religious centuries is a French prayer-book preserved in the British Museum, where it was discovered and described by Mr. Malcolm, one of the first persons who ever attempted to elucidate the subject of caricature. Besides the "Hours of the Blessed Virgin," it contains various prayers and collects, the office for the dead, and some psalms, all in Latin. It is illustrated by several brilliantly colored, well-drawn, but most grotesque and incomprehensible figures, designed, as has been conjectured, to "expose the wicked and inordinate lives of the clergy, who were hated by the manuscript writers as taking away

much of their business." This was the explanation given of these remarkable pictures to the trustees of the Museum by the collector of whom they bought the volume. Several of them are here submitted to the reader's ingenuity.

Besides the specimens given there is a wolf growling at a snake twisting itself round its hind-leg; there is "a grinning match" between a human head on an animal's body and a boar's head on a monkey's body; there is a creature like a pea-hen, with two bodies, one neck, and two dogs' heads;

FROM A FRENCH PRAYER-BOOK OF THE THIRTEENTH CENTURY, IN THE BRITISH MUSEUM.

FROM QUEEN MARY'S PRAYER-BOOK, A.D. 1552.

there is an animal with four bodies and one head; there is a bearded man's face and a woman's on one neck, and the body has no limbs, but an enormous tail; there is a turret, on the top of which a monkey sits, and a savage below is aiming an arrow at him. In the British Museum—that unequalled repository of all that is curious and rare—there is the famous and splendid psalter of Richard II., containing many strange pictures in the taste of the period. On the second page, for example, along with two pictures of the kind usual in Catholic works of devotion, there is a third which represents an absurd combat within lists between the court fool and the court giant. The fool, who is also a dwarf, is belaboring the giant with an instrument like those hollow clubs used in our pantomimes when the clown is to be whacked with great violence. The giant shrinks from the blow, and the king, pointing at the dwarf, seems to say, "Go it, little one; I bet upon you."

Mr. Malcolm, who copied this picture from the original, where, he says, it is most superbly finished, interprets it to be a caricature of the famous combat between David and Goliath in the presence of King Saul and his court. In the same mass-book there is a highly ridiculous representation of Jonah on board ship, with a blue Boreas with cheeks puffed out raising the tempest, and a black devil clawing the sail from the yard. In selecting a few of the more innocent pictures from the prayer-book of Queen Mary, daughter of Henry VIII. of England, Mr. Malcolm gives expression to his amazement at the character of the drawings, which he dared not exhibit to a British public! Was this book, he asks, made on purpose for the queen? Was it a gift or a purchase? But whether she bought or whether she accepted it, he thinks she must have "delighted in ludicrous and improper ideas," or else "her inclination for absurdity and caricature conquered even her relig-

ion, in defense of which she spread ruin and desolation through her kingdom."

As the reader has now before his eyes a sufficient number of specimens of the grotesque ecclesiastical ornamentation of the period under consideration, he is prepared to consider the question which has perplexed so many students besides Mr. Malcolm: How are we to account for these indecencies in places and books consecrated to devotion? A voice from the church of the fifth century gives us the hint of the true answer. "You ask me," writes St. Nilus to Olympiodorus of Alexandria, "if it is becoming in us to cover the walls of the sanctuary with representations of animals of all kinds, so that we see upon them anæres set, hares, goats, and other beasts in full flight before hunters exhausting themselves in taking and pursuing them with their dogs; and again, upon the bank of a river, all kinds of fish caught by fishermen. I answer you that this is a *puerility with which to amuse the eyes of the faithful*."* To one who is acquainted with the history and genius of the Roman Catholic Church this very simple explanation of the incongruity is sufficient. The policy of that wonderful organization in every age has been to make every possible concession to ignorance that is compatible with the continuance of ignorance. It has sought always to amuse, to edify, to moralize, and console ignorance, but never to enlighten it. The mind that planned the magnificent cathedral at Rheims, of which Mr. Tomes was so much enamored, and the artists who designed the glorious San Carlo that kindled rapture in the poetical mind of Mr. Howells, did indeed permit the scandalous burlesques that disfigure their walls; but they only permitted them. It was a concession which they had to grant to the ignorant multitude whose unquestioning

* Quoted in Champfleury, p. 7, from *Maxims Bibliothecæ Patrum*, vol. xxvii., p. 320.

faith alone made these enormous structures possible.

We touch here the question insinuated by Gibbon in his first volume, where he plainly enough intimates his belief that Christianity was a lapse into barbarism rather than a deliverance from it. Plausible arguments in the same direction have been frequently made since Gibbon's time by comparing the best of Roman civilization with the worst of the self-torturing monkery of the early Christian centuries. In a debate on this subject in New York a few months since between a member of the bar and a doctor of divinity, both of them gentlemen of learning, ability, and candor, the lawyer pointed to the famous picture of St. Jerome (A.D. 375), naked, grasping a human skull, his magnificent head showing vast capacity paralyzed by an absorbing terror, and exclaimed, "Behold the lapse from Virgil, Horace, Cicero, Seneca, the Plinys, and the Antonines!" The answer made by the clergyman was, "That is *not* Christianity! In the Christian books no hint of that, no utterance justifying that, can be found." Perhaps neither of the disputants succeeded in expressing the whole truth on this point. The vaunted Roman civilization was, in truth, only a thin crust upon the surface of the empire, embracing but one small class in each province, the people every where being ignorant slaves. Into that inert mass of servile ignorance Christianity enters, and receives from it the interpretation which ignorance always puts upon ideas advanced or new, interpreting it as hungry French peasants in 1792 and South Carolina negroes in 1870 interpreted modern ideas of human rights. The new leaven set the mass heaving and swelling until the crust was broken to pieces. The civilization of Marcus Aurelius was lost. From parchment scrolls poetry and philosophy were obliterated that the sheets might be used for prayers and meditations. The system of which St. Jerome was the product and representative was a baleful mixture, of which nine-tenths were Hindoo and the remaining tenth was half Christian and half Plato.

The true inference to be drawn is that no civilization is safe nor even genuine until it embraces all classes of the community, and the promulgation of Christianity was the first step toward that.

As the centuries wore on the best of the clergy grew restive under this monstrous style of ornamentation. "What purpose," wrote St. Bernard, about A.D. 1140, "serve in our cloisters, under the eyes of the brothers and during their pious readings, those ridiculous monstrosities, those prodigies of beauties deformed or deformities made beautiful? Why those nasty monkeys, those furious lions, those monstrous centaurs, those animals half human, those spotted tigers,

those soldiers in combat, those huntsmen sounding the horn? Here a single head is fitted to several bodies, there upon a single body there are several heads; now a quadruped has a serpent's tail, and now a quadruped's head figures upon a fish's body. Sometimes it is a monster with the fore parts of a horse and the hinder parts of a goat; again an animal with horns ends with the hind quarters of a horse. Every where is seen a variety of strange forms, so numerous and so odd that the brothers occupy themselves more in deciphering the marbles than their books, and pass whole days in studying all those figures much more attentively than the divine law. Great God! if you are not ashamed of such useless things, how, at least, can you avoid regretting the enormity of their cost?"

How, indeed! The honest abbé was far from seeing the symbolical meaning in those odd figures which modern investigators have imagined. He was simply ashamed of the ecclesiastical caricatures; but a century or two later ingenious writers began to cover them with the fig-leaves of a symbolical interpretation. According to the ingenious M. Durand, who wrote (A.D. 1459) thirty years before Luther was born, every part of a cathedral has its spiritual meaning. The stones of which it is built represent the faithful, the lime that forms part of the cement is an emblem of fervent charity, the sand mingled with it signifies the actions undertaken by us for the good of our brethren, and the water in which these ingredients blend is the symbol of the Holy Ghost. The hideous shapes sculptured upon the portals are, of course, *malign spirits flying from the temple of the Lord, and seeking refuge in the very substance of the walls!* The great length of the temple signifies the tireless patience with which the faithful support the ills of this life in expectation of their celestial home; its breadth symbolizes that large and noble love which embraces both the friends and the enemies of God; its height typifies the hope of final pardon; the roof beams are the prelates, who by the labor of preaching exhibit the truth in all its clearness; the windows are the Scriptures, which receive the light from the sun of truth, and keep out the winds, snows, and hail of heresy and false doctrine devised by the father of schism and falsehood; the iron bars and pins that sustain the windows are the general councils, œcumenical and orthodox, which have sustained the holy and canonical Scriptures; the two perpendicular stone columns which support the windows are the two precepts of Christian charity, to love God and our neighbor; the length of the windows shows the profundity and obscurity of Scripture, and their roundness indicates that the church is always in harmony with itself.

GOG AND MAGOG, THE GIANTS IN THE GUILDHALL OF LONDON.

This is simple enough. But M. Jérôme Bugeaud, in his collection of *Chansons Populaires* of the western provinces of France, gives part of a catechism still taught to children, though coming down from the Middle Ages, which carries this quaint symbolizing to a point of the highest absurdity. The catechism turns upon the sacred character of the lowly animal that most needed any protection which priestly ingenuity could afford. Here are a few of the questions and answers:

PRIEST. "What signify the two ears of the ass?"

CHILD. "The two ears of the ass signify the two great patron saints of our city."

PRIEST. "What signifies the head of the ass?"

CHILD. "The head of the ass signifies the great bell, and the halter the clapper of the great bell, which is in the tower of the cathedral of the patron saints of our city."

PRIEST. "What signifies the ass's mouth?"

CHILD. "The ass's mouth signifies the great door of the cathedral of the patron saints of our city."

PRIEST. "What signify the four feet of the ass?"

CHILD. "The four feet of the ass signify the four great pillars of the cathedral of the patron saints of our city."

PRIEST. "What signifies the paunch of the ass?"

CHILD. "The paunch of the ass signifies the great chest wherein Christians put their offerings to the patron saints of our cathedral."

PRIEST. "What signifies the tail of the ass?"

CHILD. "The tail of the ass signifies the holy-water brush of the good dean of the cathedral of the patron saints of our city."

The priest does not stop at the tail, but pursues the symbolism with a simplicity and innocence which do not bear translating into our blunt English words. As late as 1750 Bishop Burnet saw in a church at Worms an altarpiece of a crudity almost incredible. It represented the Virgin Mary throwing Christ into the hopper of a wind-mill, from the spout of which he was issuing in the form of sacramental wafers, and priests were about to distribute them among the people. The unquestionable purpose of this picture was to assist the faith and animate the piety of the people of Worms.

If we turn from the sacred to the secular, we find the ornamentation not less barbarous. Many readers have seen the two giants that stand in the Guildhall of London, where they, or ugly images like them, have stood from time immemorial. A little book sold near by used to inform a credulous public that Gog and Magog were two gigantic brothers taken prisoners in Cornwall fighting against the Trojan invaders, who brought them in triumph to the site of London, where their chief chained them to the gate of his palace as porters. But, unfortunately for this romantic tale, Mr. Fairholt, in his work upon the giants,* makes it

* *Gog and Magog: the Giants in Guildhall.* By F. W. FAIRHOLT, F.S.A. London: 1859.

HEAD OF THE GREAT DRAGON OF NORWICH.

known that many other towns and cities of Europe cherish from a remote antiquity similar images. He gives pictures of the Salisbury giant, the huge helmeted giant in Antwerp, the family of giants at Douai, the giant and giantess of Ath, the giants of Brussels, as well as of the mighty dragon of Norwich, with practicable iron jaw.

We may therefore discard learned theories and sage conjectures concerning Gog and Magog, and attribute them to the poverty of invention and the barbarity of taste which prevailed in the ages of faith.

One of the subjects most frequently chosen for caricature during this period was that cunning and audacious enemy of God and man, the devil—a composite being, made up of the Satan who tested Job, the devil who tempted Jesus, and the Egyptian Osiris who weighed souls in the balance, and claimed as his own those found wanting. The theory of the universe then generally accepted was that the world was merely a field of strife between God and this malignant spirit; on the side of God were ranged archangels, angels, the countless host of celestial beings, and all the saints on earth and in heaven, while on the devil's side were a vast army of fallen spirits and all the depraved portion of the human race. The simple souls of that period did not accept this explanation in an allegorical sense, but as the most literal statement of facts familiarly known, concerning which no one in Christendom had any doubt whatever. The devil was as composite in his external form as he was in his traditional character. All the mythologies appear to have contributed something to his make-up, until he had acquired many of the most repulsive features and members of which animated nature gives the suggestion. He was hairy, hoofed, and horned; he had a forked tail; he had a countenance which expressed the fox's cunning, the serpent's malice, the pig's appetite, the monkey's grin. As to his body, it varied according to the design of the artist, but it usually resembled creatures base or loathsome.

In one picture there is a very rude but

curious representation of the weighing of souls, superintended by the devil and an archangel. The devil, in the form of a hog, has won a prize in the soul of a wicked woman, which he is carrying off in a highly disrespectful manner, while casting a backward glance to see that he has fair play in the next weighing. This was an exceedingly favorite subject with the artists of the eleventh and twelfth centuries. They delighted to picture the devil in their crude uncompromising way as an insatiate miser of human souls, eager to seize them, demanding a thousand, a million, a billion, all; and when one appeared in the scales so void of guilt that the good angel must needs possess it, he may be seen slyly putting a finger upon the opposite scale to weigh it down, and this sometimes in spite of the angel's remonstrance. In one picture, described by M. Mérimée in his *Voyage en Auvergne*, the devil plays this trick at a moment when the archangel Michael has turned to look another way.

It is a strange circumstance that in a large number of these representations the devil is exhibited triumphant, and in others the victory is at least doubtful. In a splendid psalter preserved in the British Museum there is a large picture of a Soul climbing an extremely steep and high mountain, on the summit of which a winged archangel stands with outstretched arms to receive him. The Soul has nearly reached the top; another step will bring him within the arch-

LOST SOULS CAST INTO HELL—FROM QUEEN MARY'S PSALTER.

angel's reach; but behind him is the devil with a long three-pronged clawing instrument, which he is about to thrust into the hair of the ascending saint; and no man can tell which is to finally have that Soul, the angel or the devil. M. Champfleury describes a capital in a French church which represents one of the minions of the devil carrying a lizard, symbol of evil, which he is about to add to the scale containing the sins; and the spectator is left to infer that fraud of this kind is likely to be successful, for underneath is written, "*Ecce Diabolus!*" It is as if the artist had said, "Such is the devil, and this is one of his modes of entrapping his natural prey of human souls!" From a large number of similar pictures the inference is fair that, let a man lead a spotless life from the cradle to the grave, the devil by a mere trick may get his soul at last. Some of the artists might be suspected of sympathizing with the devil in his triumphs over the weakness of man. Observe, for example, the comic exuberance of the above picture, in which devils are seen tumbling their immortal booty into the jaws of perdition.

It is difficult to look at this picture without feeling that the artist must have been alive to the humor of the situation. It is, however, the opinion of students of these quaint relics that the authors of such designs honestly intended to excite horror, not hilarity, in the minds of those who might look upon them. Queen Mary probably saw in this picture, as she turned the page of her sumptuous psalter, an argument to inflame her bloody zeal for the

ancient faith. In the writings of some of the early fathers we observe the same appearance of joyous exultation at the sufferings of the lost, if not a sense of the comic absurdity of their doom. Readers may remember the passage from Tertullian (A.D. 200) quoted so effectively by Gibbon:

"You are fond of all spectacles," exclaims this truly ferocious Christian; "expect the greatest of all spectacles, the last and eternal judgment of the universe. How shall

I rejoice, how laugh, how exult, when I behold so many proud monarchs and fancied gods groaning in the lowest abysses of darkness; so many magistrates who persecuted the name of the Lord liquefying in fiercer fires than they ever kindled against Christians; so many sage philosophers blushing in red-hot flames with their deluded scholars; so many celebrated poets trembling before the tribunal; so many tragedians more tuneful in the expression of their own sufferings; so many dancers—"

This is assuredly not the utterance of compassion, but rather of the fierce and contemptuous delight of an unregenerate Roman, when at the amphitheatre he doomed a rival's defeated gladiator to death by pointing downward with his thumb. In a similar spirit such pictures were conceived as the one given below.

The sculptor, it is apparent, is "with" the adversary of mankind in the present case. Kings and bishops carried things with a high hand during their mortal career, but the devils have them at last with a rope

round their necks, crown and mitre notwithstanding!

The devil was not always victor. There was One whom neither his low cunning nor his bland address nor his blunt audacity could beguile—the Son of God, his predestined conqueror. The passages in the gospels which relate the attempts made by Satan to tempt the Lord furnished congenial subjects to the illuminators of the Middle Ages, and they treated those subjects with their usual enormous crudity. In one very ancient Saxon psalter, in manuscript, preserved at the British Museum, there is a colossal Christ, with one foot upon a devil, the other foot about to fall upon a second devil, and with his hands delivering from the open mouth of a third devil human souls, who hold up to him their hands clasped as in prayer. In this picture the sympathies of the artist are evidently not on the side of the evil spirits. Their malevolence is apparent, and their attitude is ignominious. The rescued souls are, indeed, a pigmy crew, of woe-begone aspect; but their resistless Deliverer towers aloft in such imposing altitude that the tallest of the saints hardly reaches above his knees. In another picture of very early date the Lord upon a high place is rescuing a soul from three scoffing devils, who are endeavoring to pull him down to perdition by cords twisted round his legs. This soul we are permitted to consider safe, but below, in a corner of the spacious drawing, a winged archangel is spearing a lost soul into the flames of hell, using the spear in the manner of a farmer handling a pitchfork.

These ancient attempts to exhibit the endless conflict between good and evil are too rude even to be interesting. The specimen annexed, of later date, about 1475, occurs in a Poor People's Bible (*Biblia Pauperum*), block-printed, in which it forms part of an extensive frontispiece. The book was once the property of George III., at the sale of whose personal effects it was bought for the British Museum, where it now is. It has the additional interest of being one of the oldest specimens of wood-engraving yet discovered.

The mountain in the background adorned by a single tree is the height to which the Lord was taken by the tempter, and from which the devil urged him to cast himself down.

A very frequent object of caricature during the ages when terror ruled the minds of men, was human life itself—its brevity, its uncertainty, and the absurd, ill-timed suddenness with which inexorable death sometimes cuts it short. Herodotus records that at the banquets of the Egyptians it was customary for a person to carry about the table the figure of a corpse lying upon a coffin, and to cry out, "Behold this image of

THE TEMPTATION.

what yourselves shall be; therefore eat, drink, and be merry." There are traces of a similar custom in the records of other ancient nations, among whom it was regarded as a self-evident truth that the shortness of life was a reason for making the most of it while it lasted. And their notion of making the most of it was to get from it the greatest amount of pleasure. This vulgar scheme of existence vanished at the promulgation of the doctrine that the condition of every soul was fixed unalterably at the moment of its severance from the body, or, at best, after a short period of purgation, and that the only way to avoid unending anguish was to do what the church commanded and to avoid what the church forbade. Terror from that time ruled Christendom. Terror covered the earth with ecclesiastical structures, gave the church a tenth of all revenues, and two-fifths of all property. By every possible device death was clothed with new and vivid terrors, and in every possible way the truth was brought home to the mind that the coming of death could be as unexpected as it was inevitable and unwelcome. The tolling of the church-bell spread the gloom of the death-chamber over the whole town; and the death-crier, with bell and lantern, wearing a garment made terrible by a skull and cross-bones, went his rounds, by day or night, crying to all good people to pray for the soul just departed.*

* *Essai sur les Dances des Morts.* Par E. H. LANGLOIS. Paris: 1852. Vol. I., p. 161.

FRENCH DEATH-CRIER—"PRAY FOR THE SOUL JUST DEPARTED."

These criers did not cease to perambulate the streets of Paris until about the year 1690, and M. Langlois informs us that in remote provinces of France their doleful cry was heard as recently as 1850.

Blessed gift of humor! Against the most complicated and effective apparatus of terror ever contrived, worked by the most powerful organization that ever existed, the sense of the ludicrous asserted itself, and saved the human mind from being crushed down into abject and hopeless idiocy. The readers of *Don Quixote* can not have forgotten the colloquy in the highway between the Knight of the Sorrowful Countenance and the head of the company of strollers.

"'Sir,' replied the Devil, politely, stopping his cart, 'we are the actors of the company of the Evil Spirit. This morning, which is the octave of Corpus Christi, we have represented the play of the Empire of Death. This young man played Death, and this one an Angel. This woman, who is the wife of the author of the comedy, is the Queen. Over there is one who played the part of an Emperor, and the other man that of a Soldier. As to myself, I am the Devil, at your service, and one of the principal actors.'"

For centuries the comedy of Death was a standard play at high festivals, the main interest being the rude sudden interruption of human lives and joys and schemes by the grim messenger. Art adopted the theme, and the Dance of Death began to figure among the decorations of ecclesiastical structures and on the vellum of illumi-

nated prayer-books. No sculptor but executed his Dance of Death; no painter but tried his skill upon it; and by whomsoever the subject was treated, the element of humor was seldom wanting.

So numerous are the pictures and series of pictures usually styled Dances of Death that a descriptive catalogue of them would fill the space assigned to this article, and the literature to which they have given rise forms an important class of the works relating to the Middle Ages. Two phases of the subject were especially attractive to artists. One was the impartiality of Death, noted by Horace in the familiar passage; and the other the incongruity between the summons to depart and the condition of the person summoned. When these two aspects of the subject had become hackneyed, artists pleased themselves sometimes with a treatment precisely the opposite, and represented Death dancing gayly away with the most battered, ancient, and forlorn of human kind, who had least reason to love life, but did not the less shrink from the skeleton's icy touch. Every one feels the comic absurdity of gay and sprightly Death hurrying off to the tomb a cripple as dilapidated as the one in the picture below. In another engraving we see Death with exaggerated courtesy handing to an open tomb an extremely old man just able to totter.

Another subject in the same series is Death dragging at the garment of a peddler, who is so heavily laden as he trudges along the highway that one would imagine even the rest of the grave welcome. But

DEATH AND THE OLD MAN.

the peddler too makes a very wry face when he recognizes who it is that has interrupted his weary tramp. The triumphant gayety of Death in this picture is in humorous contrast with the lugubrious expression on the countenance of his victim.

In other series we have Death dressed as a beau seizing a young maiden, Death taking from a house-maid her broom, Death laying hold of a washer-woman, Death taking apples from an apple stand, Death beckoning away a bar-maid, Death summoning a female mourner at a funeral, and Death plundering a tinker's basket. Death, standing in a grave, pulls the grave-digger in by the leg; seated on a plow, he seizes the farmer; with an ale-pot at his back, he throttles an innkeeper who is adulterating his liquors; he strikes with a bone the irksome chain of matrimony, and thus sets free a couple bound by it; he mows down a philosopher holding a clock; upon a miser who has thrust his body deep down into a massive chest he shuts the heavy lid; he shows himself in the mirror in which a young beauty

is looking; to a philosopher seated in his study he enters and presents an hour-glass. A pope on his throne is crowning an emperor kneeling at his feet, with princes, cardinals, and bishops in attendance, when a Death appears at his side, and another in his retinue dressed as a cardinal. Death lays his hand upon an emperor's crown at the moment when he is doing justice to a poor man against a rich; but in another picture of the same series Death seizes a duke while he is disdainfully turning from a poor woman with her child who has asked alms of him. The dignitaries of the church were not spared. Fat abbots, gorgeous cardinals, and vehement preachers all figure in these series in circumstances of honor and of dishonor. In most of them the person summoned yields to King Death without a struggle; but in one a knight makes a furious resistance, laying about him with a broadsword most energetically. It is of no avail.

DEATH AND THE KNIGHT.

Death runs him through the body with his own lance, though in the other picture the weapon in Death's hand was only a long thigh-bone.

Mr. Longfellow, in his *Golden Legend*, has availed himself of the Dance of Death painted on the walls of the covered bridge at Lucerne to give naturalness and charm to the conversation of Elsie and Prince Henry while they are crossing the river. The strange pictures excite the curiosity of Elsie, and the Prince explains them to her as they walk:

Elsie. What is this picture?

Prince. It is a young man singing to a nun, Who kneels at her devotions, but in kneeling Turns round to look at him; and Death meanwhile Is putting out the candles on the altar!

Elsie. Ah, what a pity 'tis that she should listen Unto such songs, when in her orisons She might have heard in heaven the angels singing!

Prince. Here he has stolen a jester's cap and bells, And dances with the queen.

Elsie.

A foolish jest!

DEATH AND THE PEDDLER.

Prince. And here the heart of the new-wedded wife,
Coming from church with her beloved lord,
He startles with the rattle of his drum.

Elsie. Ah, that is sad! And yet perhaps 'tis best
That she should die with all the sunshine on her
And all the benedictions of the morning,
Before this affluence of golden light
Shall fade into a cold and clouded gray,
Then into darkness!

Prince. Under it is written,
"Nothing but death shall separate thee and me!"
Elsie. And what is this that follows close upon it?
Prince. Death playing on a dulcimer.

And so the lovers converse on the bridge,
all covered from end to end with these caricatures of human existence, until the girl hurries with afright from what she calls "this great picture-gallery of death."

Tournaments were among the usual subjects of caricature during the century or two preceding the Reformation, as they were afterward, until they became too ridiculous to be continued. Some specimens have been given above from the illuminated prayer-books. The device, however, seldom rises above the ancient one of investing animals with the gifts and qualities of men. Monkeys mounted upon the backs of dogs tilt at one another with long lances, or monsters utterly nondescript charge upon other monsters more ridiculous than themselves.

All the ordinary foibles of human nature received attention. These never change. There are always gluttons, misers, and spendthrifts. There are always weak men and vain women. There are always husbands whose wives deceive and worry them, as there are always wives whom husbands worry and deceive; and the artists of the Middle Ages, in their own direct rude fashion, turned both into caricature. The mere list of subjects treated in Brandt's *Ship of Fools*, written when Luther was a school-boy, shows us that men were men and women were women in 1490. That quaint reformer of manners dealt mild rebuke to men who gathered great store of books and put them to no good use; to women who were ever changing the fashion of their dress; to men who began to build without counting the cost; to "great borrowers and slack payers;" to fools who "will serve two lords both together;" to them who correct others while themselves are "culpable in the same fault;" to "fools who can not keep secret their own counsel;" to people who believe in "predestinacyon;" to men who attend closely to other people's business, leaving their own undone; to "old folks that give example of vice to youth;" and so on through the long catalogue of human follies. His homely and wise ditties are illustrated by pictures of curious simplicity. Observe the one subjoined, in which "a foule" is weighing the transitory things of this world against things everlasting, one being represented by a scale full of castles and towers, and the other by a scale full of stars—the earthly

HEAVEN AND EARTH WEIGHED IN THE BALANCE—FROM
"THE SHIP OF FOOLS."

castles outweighing the heavenly bodies in the balance of this "foule."

One of the quaint poems of the gentle priest descants upon the bad behavior of people at church. This poem has a historical interest, for it throws light upon the manners of the time. We learn from it that while the Christian people of Europe were on their knees praying in church they were liable to be disturbed by the "mad noise and shout" of a loitering crowd, by knights coming in from the field, falcon upon wrist, with their dogs yelping at their heels, by men chaffering and bargaining as they walked up and down, by the wanton laughter of girls ogled by young men, by lawyers conferring with clients, and by all the usual noises of a crowd at a fair. The author wonders

"That the false paynims within theyr Temples be
To theyr ydols moche more devout than we."

The worthy Brandt was not the only satirist of church manners. The "Usurer's Paternoster," given by M. Champfleury, is more incisive than Brandt's amiable remonstrance. The usurer, hurrying away to church, tells his wife that if any one comes to borrow money while he is gone, some one must be sent in all haste for him. On his way he says his paternoster thus:

"Our Father. Blessed Lord God (Beau Sire Dieu), be favorable to me, and give me grace to prosper exceedingly. Let me become the richest money-lender in the world. Who art in heaven. I am sorry I wasn't at home the day that woman came to borrow.

Really I am a fool to go to church, where I can gain nothing. *Hallowed be Thy name.* It's too bad I have a servant so expert in pilfering my money. *Thy kingdom come.* I have a mind to go home to see what my wife is about. I'll bet she sells a chicken while I am away, and keeps the money. *Thy will be done.* It pops into my mind that the chevalier who owed me fifty francs paid me only half. *In heaven.* Those damned Jews do a rushing business in lending to every one. I should like very much to do as they do. *As on earth.* The king plagues me to death in raising taxes so often."

Arrived at church, the money-lender goes through part of the service as best he may, but as soon as sermon time comes, off he goes, saying to himself, "I must get away home: the priest is going to preach a sermon to draw money out of our purses." Doubtless the priest in those times of ignorance had to deal with many most profane and unspiritual people, who could only be restrained by fear, and to whose "puerility" much had to be conceded. In touching upon the church manners of the Middle Ages, M. Champfleury makes a remark that startles a Protestant mind accustomed only to the most exact decorum in churches. "Old men of to-day" (1850), he says, speaking of France, "will recall to mind the *gayety* of the midnight masses, when buffoons from the country waited impatiently to send down showers of small torpedoes upon the pavement of the nave, to barricade the alcoves with mountains of chairs, to fill with ink the holy-water basins, and to steal kisses in out-of-the-way corners from girls who would not give them." These proceedings, which M. Champfleury styles "the pleasures of our fathers," were among the concessions made by a worldly-wise old church to the "puerility" of the people, or rather to the absolute necessity of occasional hilarious fun to healthy existence.

ENGLISH CARICATURE OF AN IRISHMAN, A.D. 1280.

Amusing and even valuable caricatures six and seven centuries old have been discovered upon parchment documents in the English record offices, executed apparently by idle clerks for their amusement when they had nothing else to do. One of these, copied by Mr. Wright, gives us the popular English conception of an Irish warrior of the thirteenth century.

The broad-axes of the Irish were held in great terror by the English. A historian

of Edward I.'s time, while discoursing on that supreme perplexity of British kings and ministers, how Ireland should be governed *after* being quite reduced to subjection, expresses the opinion that the Irish ought not to be allowed in time of peace to use "that detestable instrument of destruction which by an ancient but accursed custom they constantly carry in their hands instead of a staff." The modern Irish shillalah, then, is only the residuum of the ancient Irish broad-axe—the broad-axe with its head taken off. The humanized Irishman of to-day is content with the handle of "the detestable instrument." Other pen-and-ink sketches of England's dreaded foes, the Irish and the Welsh, have been found upon ancient vellum rolls, but none better than the specimen given has yet been copied.

The last object of caricature which can be mentioned in the present number is the Jew—the odious Jew—accursed by the clergy as a Jew, despised by good citizens as a usurer, and dreaded by many a profligate Christian as the holder of mortgages upon his estate. When the ruling class of a country loses its hold upon virtue, becomes profuse in expenditure, ceases to comply with natural law, comes to regard licentious living as something to be expected of young blood, and makes a jest of a decorous and moral conversation, then there is usually in that country a less refined, stronger class, who *do* comply with natural law, who *do* live in that virtuous, frugal, and orderly manner by which alone families can be perpetuated and states established. In several communities during the centuries preceding the Reformation, when the nobles and great merchants wasted their substance in riotous living or in insensate pilgrimages and crusades, the Jew was the virtuous, sensible, and solvent man. He did not escape the evil influence wrought into the texture of the character by living in an atmosphere of hatred and contempt, nor the narrowness of mind caused by his being excluded from all the more generous and high avocations. But he remained through all those dismal ages temperate, chaste, industrious, and saving, as well as heroically faithful to the best light on high things that he had. Hence he always had money to lend, and he could only lend it to men who were too glad to think he had no rights which they were bound to respect.

The caricature on the next page was also discovered upon a vellum roll in the Public Record Office in London, the work of some idle clerk 642 years ago, and recently transferred to an English work* of much interest, in which it serves as a frontispiece.

The ridicule is aimed at the famous Jew,

* *History of Crime in England.* By LUKE OWEN PIKE. London: 1873. Vol. I.

CARICATURE OF THE JEWS IN ENGLAND, A.D. 1292.

Isaac of Norwich, a rich money-lender and merchant, to whom abbots, bishops, and wealthy vicars were heavily indebted. At Norwich he had a wharf at which his vessels could receive and discharge their freights, and whole districts were mortgaged to him at once. He lent money to the king's exchequer. He was the Rothschild of his day. In the picture, which represents the outside of a castle—his own castle, wrested from some lavish Christian by a money-lender's wiles—the Jew Isaac stands above all the other figures, and is blessed with four faces and a crown, which imply, as Mr. Pike conjectures, that let him look whichever way he will, he beholds possessions over which he holds kingly sway. Lower down and nearer the centre are Mosse Mokke, another Jewish money-lender of Norwich, and Madame Avegay, one of many Jewesses who lent money, between whom is a horned devil pointing to their noses. The nose of the Jewish countenance was a peculiarly offensive feature to Christians, and was usually exaggerated by caricaturists. The figure holding up scales heaped with coin is, so far as we can guess, merely a taunt; and the seating of Dagon, the god of the Philistines, upon the turret seems to be an intimation that the Jews in their dispersion had abandoned the God of their fathers, and taken up with the deity of his inveterate foes.

So far as the records of those ages disclose, there was no one enlightened enough to judge the long-suffering Jews with just allowance. Luther's aversion to them was morbid and violent. He confesses, in his *Table-Talk*, that if it had fallen to his lot to have much to do with Jews, his patience would have given way; and when, one day, Dr. Menius asked him how a Jew ought to be baptized, he replied, "You must fill a large tub with water, and having divested a Jew of his clothes, cover him with a white garment. He must then sit down in the tub, and you must baptize him quite under the water." He said further to Dr. Menius that if a Jew, not converted at heart, were to ask baptism at his hands, he would take

him to the bridge, tie a stone round his neck, and hurl him into the river, such an obstinate and scoffing race were they. If Luther felt thus toward them, we can not wonder that the luxurious dignitaries of the church, two centuries before his time, should have had qualms of conscience with regard to paying Isaac of Norwich interest upon money borrowed.

A CHARMING WOMAN.

A CHARMING WOMAN, I've heard it said
By other women as light as she;
But all in vain I puzzle my head
To find wherein the charm may be.
Her face, indeed, is pretty enough,
And her form is quite as good as the best,
Where nature has given the bony stuff,
And a clever milliner all the rest.

Intelligent? Yes—in a certain way;
With the feminine gift of ready speech;
And knows very well what not to say
Whenever the theme transcends her reach.
But turn the topic on things to wear,
From an opera cloak to a robe de nuit—
Hats, basques, or bonnets—'twill make you stare
To see how fluent the lady can be.

Her laugh is hardly a thing to please;
For an honest laugh must always start
From a gleesome mood, like a sudden breeze,
And here is purely a matter of art—
A muscular motion made to show
What nature designed to lie beneath
The finer mouth; but what can she do,
If that is ruined to show the teeth?

To her seat in church—a good half mile—
When the day is fine she is sure to go,
Arrayed, of course, in the latest style
La mode de Paris has got to show;
And she puts her hands on the velvet pew
(Can hands so white have a taint of sin?),
And thinks—how her prayer-book's tint of blue
Must harmonize with her milky skin!

Ah! what shall we say of one who walks
In fields of flowers to choose the weeds?
Reads authors of whom she never talks,
And talks of authors she never reads?
She's a charming woman, I've heard it said
By other women as light as she;
But all in vain I puzzle my head
To find wherein the charm may be.

REMAINS OF LOST EMPIRES.*

RUINS OF ATAMBA.

ONE turns naturally to the East for the ruins of ancient cities and lost empires, and the plains of Mesopotamia and the Syrian deserts offer a long list of fallen marts of commerce and early centres of civilization, hidden beneath their sands, or marked only by a few tall and shattered columns. The Chicagos and Cincinnati of the past once lined the banks of the Tigris and the Euphrates, or sprang up in the track of the caravan, and wanting chiefly the mental elements of later progress, perished wholly in the midst of their greatness. No modern city has ever met with so complete a ruin as Babylon and Tyre; all the great centres of modern commerce seem gifted with a civic immortality. The printing-press and the school-house, the telegraph and the steam-car, unite to shield London and Paris from decay; and New York and Philadelphia, in nearly the hundredth anniversary of their freedom, are menaced by few of the perils that surround-

ed Carthage and Rome. Men have become somewhat more discreet since the world was governed by Sennacherib and Nebuchadnezzar. Yet a tour over the ruins of the Eastern capitals, and down those famous rivers where Semiramis labored and Israel sang its immortal lament, has always a strange interest, and no one treads the Mesopotamian plains or speculates upon the site of Babylon without feeling that the deft fingers of the Assyrian weavers have instructed the modern artist, and that the inventions and devices of the merchants and mechanics of Mesopotamia were not lost to the factories of New York. Cities perish, but knowledge never; and the flowered muslins and painted vases of the East live again in the looms of Lyons and the furnaces of Sèvres.

Our travelers set out to visit the fallen cities of the East. They land in Syria, cross the desert, visit Palmyra, sail on a raft down the Tigris, and from Babylon and Nineveh cross the sea in a steamer from Bushire to Bombay; rush swiftly in the heat of the Indian summer in the rail-car up the blazing plain to the mountains, find shelter in the fair vale of Cashmere, and at last survey the marvelous architecture, the richest pro-

* *Remains of Lost Empires: Sketches of the Ruins of Palmyra, Nineveh, Babylon, and Persepolis, with some Notes on India and the Cashmerian Himalayas.* By P. V. N. Myers, A.M. Illustrations. New York: Harper and Brothers.

ductions of ornamental building, at Delhi, and meditate amidst its endless ruins. Their path was from Western to Eastern Asia; the contrast between the two sections is striking; the fate of the former is written in neglect, desolation, and decay. While India is covered with the traits of modern prosperity and progress, the Tigris and the Euphrates flow through the saddest region of the world, and by their side sleep the enormous mounds that mark the scene of former empires, and cities whose buried streets are known only to some ardent explorer.

In Western Asia there is little yet but desolation. Crossing the Syrian deserts, the travelers first explored Palmyra, the City of Palms. Midway between Damascus and the Euphrates, where a few abundant springs awake life in the arid plains, a camp of merchants arose in an early period, and on its site sprang up one of the fairest of the cities of the East. In our Western towns the first traits of progress are the school-house and the church, the railway station, the newspaper, and the telegraph; but the Palmyrenes evidently aimed at a splendor that was chiefly material, and expended their gains in the lavish decoration of their bare and desolate waste. A street lined with columns immense and splendid led up to the magnificent Temple of the Sun. A hundred tall and fluted pillars still remain to tell the traveler of the grandeur of the scene. An infinite throng of porticoes, tombs, forums, temples, lie around his path, and as he wanders down the long colonnade of the Broadway of Palmyra he sees the homes of its merchants lining the narrow streets at its side, and the remains of houses more spacious and substantial than the palaces of Paris or New York. Lost amidst the desert for ages, the memory of Palmyra was preserved by the fame and the misfortunes of Longinus and Zenobia; and the prince of critics still seems to wander through its porticoes and teach in its halls. It was found again toward the close of the sixteenth century. But if there is still danger in visiting the wonderful ruins without a Turkish escort, it will not be long before the railway and the telegraph may span the Syrian desert, and Tadmor become familiar to the people of the West.

It was in January, the air was soft, the sky magnificent, as our travelers pursued their search in the desert for lost cities, and saw the cloud-capped Lebanon, the vale of Coele-syria, the ruins of Emesa, and the lonely streets of Apamea: a thousand prostrate pillars lay around them; a city leveled to the ground by the shock of an earthquake. All northern Syria is strewn with fallen capitals, and the wrecks of three hundred towns stretch away unknown, and tenant-ed only by a few idle Arabs. From Aleppo, covered with its roofs of turf and its grass-

grown terraces, they came to the Euphrates, the fourth river that watered the sacred garden; they tasted the strong black coffee of the Arabs, and visited the evangelical missions; they would gladly have lingered longer at the pleasant mission home, but the emerald tint that began now to creep over the Mesopotamian plain warned them that they had yet to reach the cool retreats of the Himalayas before the rigors of the Indian summer. Accordingly they began a ten days' journey through the heart of Mesopotamia to Mosul, and here saw opposite to them, on the banks of the Tigris, the ruins of Nineveh. The vast city still lies covered with its heap of sand and debris, nor would one suspect that beneath the huge mounds of earth lay the wonderful monuments of Assyrian civilization. It is only when the traveler enters the huge excavations and descends below the surface that he distinguishes the remains of vast palaces and stately buildings, the winged lions or bulls of enormous size, and the walls sculptured with the records of the Assyrian kings. Their annals are told with a fidelity that discloses their singular barbarity. The captives are flayed alive, their eyes torn out, their hands and feet cut off. The civilization of Assyria was the cruel barbarism of the Aztec, and the respect for human life which has slowly made its way among men had no place in the culture of Sennacherib. Yet no one can tread the solemn precincts of these palaces of Assyria, amidst their winged bulls with human heads that still keep watch at the doors in the silent chambers, pictured, vast, solitary, without a thrill of strange excitement. In a series of small apartments are laid away clay tablets a few inches long, inscribed with cuneiform characters, relating, perhaps, the history of Assyria, and from one of them Mr. George Smith, of the British Museum, has translated that account of the Noachic deluge which confirms the Scriptural narrative.

The navigation of the Tigris from Mosul to Bagdad is conducted in the same kind of vessels in which Herodotus must have pursued his travels eastward, and thirty centuries have made no improvement in the sluggish habits of the conservative Assyrians. The raft on which our author set sail on the broad and rapid river was formed of a light frame-work thirty feet square, constructed of poles, beneath which were placed three hundred inflated goat-skins. The buoyancy of the raft enabled it to support twenty tons of wheat and nuts, besides several passengers. A pair of immense sweeps impelled the *kellic*, as it was called, down the wide stream. Nine Arabs and the captain, Mohammed, formed the crew of this strange vessel. Lazily and almost imperceptibly it glided down the stream;

THE DELUGE TABLET.

the Arab crew lay half asleep on the top of the cargo; at night they moored their raft to the shore, and the travelers slept in their little tent on the *kellie*. "Floating down the Tigris," our author relates, "naturally recalled our canoe voyages upon the Rio Napo and the Rio Negro, northern affluents of the Amazon. Drifting along the treeless shores of the Mesopotamian rivers is very different from floating through the tropical forests of South America. There is verdure along the upper Tigris in spring, it is true, covering not only the *hawsis*, or alluvial deposits, but even at times hiding the baldness of the usually barren sun-burned hills; but there is no tree vegetation—low bushes alone fringe in places the river-banks. Very different is all this from the wild, prodigal luxuriance displayed by the tropical forests that hem the streams of the Amazonian valley with their stately walls of trunk and foliage." But the Tigris is richer in historical memories; it is the river of Darius and Alexander, Chaldean, Babylonian, Roman, Turk; nor can it be long before the railroad spans the valley of the Euphrates, and brings the palaces of Nineveh within reach of the winter travel. Floating down the

Tigris, the travelers saw over its low banks a succession of huge mounds and buried cities. It is easy to conceive what great stores of winged bulls and carved tablets, of gems, vases, and bronzes, await the future explorers of these solitary scenes, and how the modern cabinets and drawing-rooms will be decorated with the spoils of the contemporaries of Sennacherib.

But a voyage down the Tigris on a float of skins is not without its dangers. At midnight, as the raft was carelessly moored to the shore, its crew on the land and the travelers asleep in their tents, a strong wind arose, the river swelled and heaved, and the current tore the raft from its moorings, and bore it swiftly onward. Two of the Arabs sprang aboard, and with the captain strove to fasten it again; but it broke loose, and went dashing down the river, striking against the rocks and the shore. The skins exploded with a dull sound, the water rose over the raft, and even the captain leaped into the river and fled to the shore. The night was dark, the rain fell heavily, the jackals howled upon the land, and in the deep gloom the frail float plunged over a rocky pass in the river, and was nearly torn

to pieces. Danger and death hung over the explorers. The raft spun like a top in the turbid waters; but happily it soon drifted into a smoother current, and hurried swiftly onward toward Bagdad. The captain at last came in sight, having followed his lost vessel on a pair of inflated skins, and crew and passengers once more gathered on their dangerous float. They paused to repair their sinking craft, and then once more sailed onward amidst a range of ruins to the city of the caliphs. The Tigris spread out sometimes a mile in width, a fair, majestic river, and at length was heard the welcome cry, "Bagdad! Allah be praised!" Beautiful as a vision in the soft moonlight the dark palms and the silent groves waved over the glittering river, and an Arabian night of rare loveliness welcomed the author to the land of Scheherazade. Of Bagdad it can only be said that it is fair without and adorned with minarets and mosques, that its bazars abound with all the wares of the East and the West, and that cleanliness and decency avoid its narrow and crowded streets. But the hand of modern improvement must at last sweep away its untidy conservatism. A fleet of steamers already visit its harbor. In the age of Haroun, Bagdad taught Europe and Charlemagne

the wonders of mechanics, but the Western world has long outstripped its early leader, and the intelligent and cruel caliph would have studied with rare interest the curious productions of the modern engineer. The steam-engine and the steamer are already arousing the venerable capital from its Oriental slumbers.

We next reach Babylon, and amidst a network of canals and traces of ancient agricultural skill find on the banks of the Euphrates a huge heap of earth-covered ruins. The Temple of Belus, the Hanging Gardens, the Tower of Babel, the palaces and the tombs, are hidden in monstrous mounds that cast their shadows over the solitary plain. No one would suppose that here Cyrus reigned and Alexander feasted, that the most populous of earthly cities once occupied the desolate scene before him. Cities have been built from the ruins of Babylon, and generations have pilfered its remains, yet modern discoverers still find it full of objects of interest and value. Even the Babylonian brick is a work of art, and the Babylonian lion, discovered in one of the mounds, standing over a man, is by some supposed to be commemorative of Daniel's deliverance. It is impossible to fix with certainty the site of the various buildings. They were all

RIDGE OF MOUNT BABEL.

marked by immense height and a succession of terraces. One lofty red-tinted mound is thought to be the site of the Hanging Gardens. In the mound of Mujelibee, "the overturned," some see the remains of the Tower of Babel; the Birs Nimroud, ten miles south of Mujelibee, is also endowed with various fanciful names and uses. But the immense size and singular prosperity of the parent of cities are attested by the unparalleled grandeur of its ruins. Mountains have sprung up from its ashes, and the Temple of Belus has been transformed into an everlasting hill. From the vitrified top of Birs Nimroud, blasted and melted by fire, opens a dreary view over the wild and solemn plain. Yet the marshes are covered with the reed huts of the Arabs who have fled hither from the terrors of the Turkish rule, and the Birs is no longer solitary. Our travelers vainly sought for some trace of the enormous walls of Babylon. The Euphrates has already awakened a new verdure on its banks as it glides

BABYLONIAN BRIDGE.

through the city. Date groves fringe the famous river. The foliage recalls the gardens and the parks of the ancient capital, and Arab tents and villages hide beneath the trees. Yet when a storm broke by night over the Mujelibee, and the lightning flashed over the waste of Babel, and the jackal howled on the troubled air, the travelers discovered the depth of the desolation foretold in the age of prophecy.

A steamer carried them down from Bagdad to Bushire. Still on every side rose heaps of ruins. The White Palace of Khosran, the Persian capitals Seleucia, Ctesiphon, and Maydayn, lay desolate and fallen, the haunts of the wild beasts of the desert. Once here had been the richest and fairest provinces of the Persian realm. Parks, pleasure-grounds, and palaces had filled the neighborhood of the Tigris with the fairest of human labors. Every where the hand of art had adorned the banks of the ample stream. It was now a desert. All trace of cultivation was lost. Their little steamer dashed its waves over the brimming banks. They saw a telegraph line running through what was once thought the Garden of Eden, and came to the point of union where the Tigris mingles with the Euphrates, and the abode of our first parents is usually located. They ventured into one of the narrow canals at the side of the river, and found themselves covered in a thick screen of willows, palms, peach, and pomegranate, a boundless richness of vegetation that recalled the animated landscapes of the South American rivers. Canoes were seen paddling down the stream, birds of rich plumage glittered overhead, and the vast and swelling waters of the Euphrates seemed not unfit to be compared with the Amazon or the Orinoco. At Bushire they landed in the poetic realm of Persia, but saw only ruinous, uncleanly, and narrow streets, and a throng of indolent Orientals. The Persians have forgotten, it seems, one of their ancient lessons, and no

longer tell the truth. "Yea," said one of them to the Rev. Mr. Southgate, "we lie every time we can," and the clergyman, for the first time almost, believed a Persian. There was famine over the country when our travelers came there. Death hovered over millions. Hundreds of the dead had lain unburied in the streets of Bushire. And when they penetrated into the interior they came to lands wholly depopulated and rural districts covered with the stillness of death. Kauserun, which before the famine had a population of eighteen thousand, was now occupied by two thousand miserable paupers. Its streets were empty, its bazars aban-

doned, the mosque without worshippers, and fine houses, hidden amidst flowers and foliage, had not a tenant. It resembled one of those deserted cities described in the Arabian tales. At Shiraz, the seat of Persian romance and song, seated on a plain four thousand feet above the sea, they saw the famous gardens, now fallen into decay, where the orange-tree, the cypress, and the rose still lend a soft enchantment to the scene. The roses, pink and white, the nightingale, and the memories of the poets are still there. They visited the tomb of Hafiz, and saw the copy of his poems preserved at its side. It is used by the Persians as a *sortes Virgilianæ*, and even Nadir Shah, in the midst of his triumphs, consulted the national oracle. A mile or more from the tomb of Hafiz, in a beautiful garden shaded with pines, cypress, and mulberry-trees, is that of Saadi, the author of *Gulistan*. Its grounds are neglected and fallen to decay, but the rich fancy of the "Garden of Roses" still delights the West and the East. Shiraz, the land of flowers, was unhappily filled with five thousand famishing beggars. Famine in all its horrors had swept over the home of poets, nightingales, and roses, and the lonely and isolated situation of Persia, shut out by its own folly from a close union with other nations, left it no means of drawing upon that common stock of food which provident nature offers in more fortunate regions to all who need.

THE RUINS OF PERSEPOLIS.

The ruins of Persepolis, most magnificent of all the Persian remains, next won their admiration, and they mused amidst the fallen palaces of Cyrus, Xerxes, and Alexander. It is said that the latter set fire to the city in a bacchanalian frolic. A gigantic platform of stone, the largest in the world, drew their attention. A magnificent stairway leads to the top, so gentle of access that they rode on horseback to its summit. Several colossal bulls remain of the ancient palace, a magnificent hall of fluted columns, a propylæum of rare beauty, and volumes of sculptured history on the falling walls. The Hall of Xerxes is covered with sculptures representing processions of priests, warriors, kings, and captives. Black marble is used profusely in decorating the doorways. The "hall of audience," we are told, surpasses all that human architects have devised, and in the ruins of four grand palaces we are pointed to the homes of Cyrus or Cambyses, Darius, Xerxes, and Artaxerxes Ochus. The Persian palace seems to have been the grandest and the most comfortable of its kind, and these gigantic doorways and endless lines of sculptured columns surpass the costliness and the useless splendors of Versailles. Yet our travelers, in the month of roses—for it was May—felt that they must hasten away from the land of Hafiz and the gardens of Shiraz to reach the object of their summer

tour, the valley of Cashmere. They took the steamer from Bushire, coasted along the burning sands of Beloochistan, where Alexander's soldiers had made their terrible march, and in twelve days found themselves embayed amidst the verdant shores and picturesque islands of the harbor of Bombay. But they could not pause in the midst of its charms, for the hot season was near, and they had yet to ride over thousands of miles of blazing plains to reach the frozen mountains. A fine rail-car received them in its pleasant compartments, and they rose slowly up the western slope of the Ghauts, winding in a tortuous way, hot, thirsty, and disconsolate, in the famous land of the Bram, until a triumphant scream of the steam-whistle warned them that they had reached the summit of the Indian plain. Here for two days, over a perfect level, they swept by beautiful Allahabad, up the crowded valley of the Ganges, whose immense population exhibited itself in a throng of powerful cities, passed Cawnpore and Agra, Delhi and Lucknow, and paused at last at Lahore, in the hot, parched district of the Punjab. The heat was fierce and constant, but far above they could discern the dim peaks of the Himalayæ, and knew that the fair vale of Cashmere would welcome the wanderers from the fiery, blasted plains with perpetual freshness. In a *dak* or a wagon, or in

a palanquin, amidst intolerable heat, they climbed the mountain land, and at the end of a beautiful cleft in the rocks saw open upon them their first glimpse of the lovely scene. It was almost like a New England landscape. The trees and shrubs they had known at home rose around them, meadows and pasture lands. A Swiss village seemed to stand at the entrance, and between huge walls of rock, that opened like the portals of paradise, they looked down upon Cashmere.

It is only eighty miles in length and twenty or thirty in breadth, and forms a kind of upland park surrounded by tall and snow-clad mountains. Fifteen thousand feet high on one side of the valley the gigantic rampart rises like a wall of stone, scarcely broken by a ravine; the other side is lined with clusters of peaks billowy like the snowy Alps. Through the copses and forests of the valley the river Jhelum enters at one end, passes through its whole length, widens into a lovely lake, and at last bursts away down the declivities to join the distant Indus. On its banks are situated the city of Cashmere and several others less renowned, and the bright clear waters of the lakes and rivers lend to the landscape an unequalled charm. On each side of the valley lesser vales open into the mountains, beginning in the bright vegetation of a temperate climate, and rising at last, herbless and treeless, to regions of perpetual snow. But to the rare natural beauties of the happy vale art has added its most graceful decorations. The Great Moguls from age to age have made it their favorite summer retreat. Shah Jehan and Aurungzebe lavished their treasures to

complete its perfection. Stately avenues of trees, noble groves and graceful gardens, palaces, summer-houses, and pleasant paths, mark the rural tastes of the lords of Delhi, and the city of Cashmere springs from the waters of the Jhelum like another Venice covered by the foliage of its ancient trees. The climate is temperate, we are told, like that of Central New York; the fruits and flowers like our own; wheat, tobacco, the peach, apricot, apple, grape, flourish in the happy valley; the sides of its hills in June are white with a profusion of roses, and their perfume fills the air; some rise like great pillars of blossoms, and others, creeping from tree to tree, festoon the woods with garlands of the queen of flowers. The roses of Cashmere are usually white. The valley forms the natural *santarium* of Hindostan, and in the summer months is filled with throngs of English, who encamp in tents upon its grassy lawns, since hotels are unknown to the Cashmerians, and having worn away the hot season in various pastimes, are required by the Maharajah to leave his dominions at its close. No foreigner is permitted to stay all winter in the valley. It seems the English sold Cashmere to a native chief for no large sum, and have now to lament that they so imprudently parted with the most healthful and fairest of their possessions, and an easy pathway to the uplands of Thibet.

The people of Cashmere are not altogether unworthy of the bright scene around them. Children of the mountains and of a temperate climate, they have preserved an energy unknown to the people of the hot plains below. Ages of tyranny, exactions,

AVENUE OF POPLARS, CASHMERE.

and plunder have not destroyed their industry or their intelligence, and various ruins of ancient temples scattered through the vale recall the labors of a happier age. One of them, the Martund, grand, massive, magnificent, rises on a rock, like the Parthenon, in the midst of one of the fairest of earthly scenes, and looks down upon the whole length and breadth of the valley. The city of Cashmere is pierced, like Venice, with numerous canals; its buildings overhang the water; the fronts of the best houses line the Jhelum on both sides; and one floats in a Cashmerian gondola down the Grand Canal, beneath its seven bridges, amidst a spectacle of singular beauty. At night the lights flash along the river, and its surface gleams with varied illuminations. The boats used on it are fifty or more feet long, and many of the people live altogether on the water. In one part of the river all fishing is forbidden, because the people believe that Gholab Singh, one of their former kings, has been changed into a fish, and haunts the place forever. Floating in their boats along the Grand Canal, a throng of strangers and natives meet one another, greetings are exchanged, friendly words spoken, the gay

scene is a summer carnival, and the vale of Cashmere rings with the echoes of mirthful voices. Yet the gardens planted by its early rulers are among its chief attractions; they line the fair Wolmar Lake, and glow with fruit and flowers; cascades break out on every side; terraces and kiosks fill the view; and in Shalimar Bagh, one of these later Edeas, Moore's Georgian maid exclaims,

"If there be an Elysium on earth,
It is this, it is this."

On another fair lake, the Dul, floating gardens cover the surface, and produce abundant crops of cucumbers and melons. The men of Cashmere are tall, fair, and well-proportioned, but the ladies are profanely described as exceedingly ugly; its Nourmahals and Lalla Rookhs live only in the poet's fancy.

The fame of the happy vale might possibly have faded with the flight of years had not the productions of its looms given it a renown in every Western land. Its shawls are dear to the gentler sex in every clime. They are made from the softer wool of the wild goats of Laasa and Ladakh, which is chiefly spun by the women of the vale. The

India the home of a teeming population. The parched desert was now covered with leaves and flowers, with the life and beauty of spring. They hastened to study the ruins and the architecture of Delhi. It bore traces of that stern retribution which the English had inflicted on its guilty princes. Its famous palace had been torn down, except the Audience Hall, the Dewani Khass, where Shah Jehan had kept his court, or Aurungzebe shone in the most beautiful of Oriental halls. A pillared, massive, arched pavilion, about one hundred and fifty feet long and fifty wide, it is constructed of pure white marble, lustrous as the blocks of the Parthenon. Such graceful shafts, such wonderful carving, so inimitable the ornaments of the columns and the arches, that the modern fancy is lost in wonder at the results and the waste of human toil. Flowers and fruits are inlaid in the stone with gold and precious jewels, and so perfectly imitated as to exceed the finest painting. Beneath the central arch of the pavilion once stood the Peacock Throne, gleaming with gems and gold, and valued at \$150,000,000, and among the regalia of the Mogul was the Koh-i-noor,

RUINS OF THE TEMPLE OF MANTUNG.

skins are dyed of the richest tints. The weavers, who are usually men and boys, work crowded together in small rooms. Their skill is unsurpassed. Many of the shawls are woven in separate pieces, yet so carefully joined together that the seams are scarcely seen, and from three months to two years is required to finish one of the finest patterns, and sometimes even longer. The price of the plainer shawls varies from \$200 to \$800, but the trade of Cashmere is no longer active, since European factories have so successfully imitated its finest products.

When the heavy rains had lowered the temperature of the Indian plains to 80° or 90°, our travelers in July left the happy valley and descended boldly into the hot lands below. They found a wonderful transformation. The copious showers had awakened the scorched and blighted plains into that abundance of vegetation that has made

the most useless and the most costly of the spoils that England has found in the East. The mosques and palaces of Delhi point to an age of barbaric extravagance, and one of its marvels is a tall pillar, the Kutub Minar, the loftiest in the world, that overlooks a desolate plain, and surveys the long waste of ruins that line the banks of the Jumna for fifteen miles. For two thousand years the labors of man have been building and destroying city after city beside the placid river; the fair capital rises amidst a circle of crumbling mosques and palaces; the English soldiers bivouac in the audience chamber of Aurungzebe; yet it may be hoped that the cunning fingers of the Hindoo workmen will be employed in future to plant a higher civilization among the scenes of their ancient grandeur, and toil rather for themselves than others. Famine, disease, tyranny, despair, have too often

been the lot of the real builders of cities. The wealth that raised a succession of Delhis and purchased the Koh-i-noor was wrung from infinite cottages and the toil of suffering millions. And it was the chief aim of the founders of our republic, we remember with more than classic satisfaction, to found a state in which labor should be the source of honor, and barbaric castes no longer prey upon their fellows.

A hundred miles from Delhi, at Agra, rises one of the fairest monuments of selfish love and of a cruel promise. The beautiful and beloved wife of Shah Jehan, the mightiest of earthly kings, died in 1631, nor could the wealth of India or the power

of an absolute rule save the life of the being most dear to the Grand Mogul, the fair Moon-taj-i-Mahal. As she died she uttered the request that her husband would provide for her a suitable monument. Thoughtless and full of the common vanities of life, she scarcely reflected that the execution of her wish must be paid for from the poor earnings of the mothers and daughters of Hindostan, that tears would be shed in thousands of cottages, that children would be pinched and starved, and the aged harassed and disheartened, to provide for the cost of her marvelous tomb. Too seldom, indeed, do any of us look to the results of our actions, or are more careful than the dying queen to limit our wishes by a philanthropic rule. In his passionate grief Shah Jehan pressed on the building of a mausoleum to his consort with a barbaric indifference to the sufferings of his people. Twenty thousand laborers, it is said, were employed upon the work for twenty years. All India groaned with toil and taxation. The Taj Mahal, for so the tomb is called, rose at last to a wonderful perfection. It is the most beautiful and the richest of all the testimonials of a selfish affection to its lost object, the finest architectural device of sorrow, love, and death.

VIEW OF THE JHELUM ABOVE CASHMERE.

A garden, as is usual in most Oriental palaces and tombs, surrounds the spot where sleeps the Eastern queen; the cypress waves, the orange, the lemon, the banyan, and the palm spread their foliage around; fountains play along every avenue, and glitter in the air; and all the charms of Shiraz and Cashmere are said to be imitated if not surpassed in the gardens of Taj Mahal. In the midst of the solemn beauty of the natural decorations, in front of the great gate, and looking down upon the sacred Jumna, springs up the mausoleum itself. A platform of shining marble, one minaret at each corner of wonderful loveliness, and the central shrine crowned with its glittering crescent two hundred and sixty feet high, are wrought into that rare perfection of form and decoration to which only Hindoo craftsmen could attain. The marble, the gold, the precious stones, are melted into fruits and flowers, and woven into designs that surpass the labors of the pencil or the dreams of poetry. Yet it is within, beneath the central minaret, in a chamber richer and grander than royal palace ever knew, that the Oriental fancy finds its chief display. The marble-latticed windows lend a pensive light, the floors are sown with jewels, and

the cenotaph of the fair and feeble mortal for whom all this wasteful toil was given rises like an apparition of beauty behind the lace-work of a marble screen. Yet in all this rich effect of Oriental fancy one misses perhaps the stronger traits of Western genius. A single figure on the mausoleum of Halicarnassus, cloven by the powerful chisel of Scopas, must surpass it all, and all the wealth and power of Shah Jehan could not awake the immortal fire that glows in the friezes of Phidias.

Such are the sights and scenes that await the traveler who penetrates into the heart of the forgotten East, and surveys the wrecks of its fallen empires. From Damascus to Delhi one wanders amidst a ceaseless desolation and decay. Around him are the foot-prints of emperors and conquerors, and the storied ruins of three thousand years. He passes over the mounds of Babylon, through the palaces of Cyrus, Xerxes, and Alexander, amidst the gardens of Persia and the unrivaled landscapes of Cashmere.

When all Europe was a savage waste, and all America unknown, before Rome and Athens had sprung up in the Western wilderness, the human race began its career of progress in the hot plains of India and on the banks of the Euphrates and the Tigris. The builders of Babylon and Nineveh were almost alone upon the earth. They were laboring unconsciously to found the central source from which all Western civilization was to take its rise. It is this that must ever give a lasting interest to that land of ruin and decay. We can not sever ourselves from its silent influence, or forget that but for Babylon and Nineveh, Persia and Assyria, our European ancestors might never have left their caves, and been transformed from savages into men. Nor can San Francisco or New York fail to trace its origin to the shapeless mounds that sleep on the Mesopotamian plain. Already the stir of West-

ern invention is awakening the slumbers of the fallen cities. A railroad must soon penetrate the valley of the Euphrates; we may soon rush with furious speed along the track of Alexander's armies, or where Xenophon paints the slow march of the invincible ten thousand. The *keltic* will no longer float on the Tigris, as in the days of Herodotus. The mounds on its banks will be rifled by avaricious explorers; the rose-gardens of Persia and the vale of Cashmere will become familiar to tourists from Oregon and the farmers of New Zealand. Yet the free races of the West, as they survey the total decay of early despotism and meditate upon its doom, will read the moral of the story, and learn amidst the ruins of Babylon or Persepolis that liberty alone is immortal, and independence and self-control the source of the lasting prosperity of nations.

RAPE OF THE GAMP.

CHAPTER XIX.

CARE KILLS A CAT.

BEFORE the boys dispersed for their Christmas holidays the head-master of the school at Pedlington again talked with his colleague on the painful subject of the distance which had been allowed to separate them. Being thrown so much together, as they had been now every day during terms for two years and a half, and closely allied in the common interest which existed between them and their pupils, being also on terms of old intimacy and proved friendship, it seemed always increasingly strange to Dr. Phelps that Mr. Lane should show such a persistent resolution to live alone, and to retire to his solitude whenever acknowledged duty did not summon him from it. Phelps, although a childless widower bordering on middle age, who in more than one sense of the expression might seem "to have done with the world," and so much occupied with a literary undertaking, in addition to his scholastic cares, as to have little time for general society (though general society in Pedlington was willing enough to incorporate the Doctor into its community), was yet of that social and genial temperament that he would have liked to sit with his old friend over their private studies and pursuits, and to have shared the hours of recreation with Mr. Lane, instead of sitting and working alone, as he now too often for a widower did, in the long winter nights after the boys had gone to bed, and instead of depending for daily intercourse on his relations with the boys, and with his third master, who was only a gentlemanly Senior boy. Still these scholastic relations were

so pleasant and intimate, and especially in summer Mr. Phelps partook so frequently of the games and sports which rivaled intellectual attainments in the youthful aspirations, that he felt himself to be less lonely and less in danger of giving way to melancholy than he had reason to believe was the case with his friend.

Was religion, or were the differences arising out of religious convictions, the cause of the partial estrangement between them? Dr. Phelps feared that it was so. Each year, as he grew older and found himself less and less in accord with religious people of any school or sect, he took refuge in a callous indifference to any prevailing set of opinions; outwardly, and more than outwardly in some philosophical and subjective sense, conforming to the creed of the universal church, as a body of doctrine generally beneficial to society, if people would only observe the law of charity, and not attempt to enforce any limited interpretation of this code upon their neighbors.

With those who did so Phelps had little patience. And although moderate persons esteemed him a fit and proper guardian of youth in a school where all shades of religious opinion were represented, yet the more zealous pietists of Pedlington, whether High-Church, Low-Church, or of any non-conforming sect, considered him a dangerous guide to the young in a perverse and stiff-necked generation, and prayed over him (somewhat despondently, it must be owned) in their secret council-chambers. He was, they said, upright and highly intellectual. His character was truly amiable. But these qualities of Dr. Phelps only made it (probably meaning "his case") all

the more sad, and *him* all the more dangerous. His good works would recommend his unbelief, so they said. The new rector of the mother parish had been urged to express an opinion reprobating the Doctor's equivocal orthodoxy. But privately that divine would have been far more distressed at the presence of a Calvinist in that influential position, and wisely threw oil upon the agitated waters. He professed to believe that the school-master's theology was only defective in positive or dogmatic vigor, and declared, as he verily believed, that Phelps's sympathies were all in the right direction.

Whatever the real cause, if, indeed, any one operated alone as the source of Mr. Lane's tenacious exclusiveness, Mr. Phelps was still unable to overcome it. His friend even declined now to entertain him for a fortnight at the abbey, as he had done during several previous vacations, pleading a particular wish to go into strict retirement for a while in a clergy-house at the East End of London, after what he was pleased to call "the dissipations of the half year," and the necessity of preparing immediately afterward for his impending move. This was none the less sad to Mr. Phelps from the intimacy which he had seen rapidly growing up between his friend and their new rector, and an evident inclination on the part of Mr. Lane to take the ecclesiastic into his closer confidence.

So the Doctor wended his solitary way to town, where he had to meet Mr. Lane's contemplated successor. He also had work to do among his authorities at the British Museum, and intended to make a flying visit to a German university to procure assistance from one of its professors. On the evening of his third day in London, Phelps, returning by way of Chancery Lane from Bloomsbury to the Inner Temple, where he was quartered on a friend, encountered Mr. Lane, who in the wintry twilight passed him without recognition. The Doctor did not fail to notice the gloom of his friend's aspect, and turning to look after him, saw Mr. Lane striding along grimly, apparently perceiving no one, but wrapt in his own solitary mood. The spot where they met was not far from the door of Messrs. Baily, Blythe, and Baily's offices. Not many minutes had elapsed since Mr. Lane had been made acquainted with the loss of his reversionary interest, and had burned his grandfather's last will and testament, as we have already learned through the humble instrumentality of Joseph Foot.

Only a few days after this encounter a telegraphic message followed Mr. Phelps from the Temple to the British Museum, which caused him promptly to desert some interesting black-letter folios, and take the train for Pedlington. The summons was

from the Rev. Cyprian Key, imploring Phelps to return without an hour's delay. It stated that his friend was gravely ill, in mind or body, or both; that Key was alarmed, and anxious for the presence of the only person whom he thought capable of supporting their afflicted brother.

What new affliction could have befallen Mr. Lane? Mr. Phelps knew of none, nor of those which had overtaken the Brownes. A fine moral could be drawn from the situation. But it would be flat and stale, if not unprofitable. Do not afflictions happen to all men? Do our absent friends foresee them? Is not the prodigal son waltzing with a scheming coquette while a fond mother is calling upon him with her dying breath? Will the drowning moan of a sailor husband interrupt the warbling of Mademoiselle Patti to which the fond wife listens with a rapturous smile?

"Is he in bed?" asked Phelps of Mr. Key, whom he found in possession of Mr. Lane's sitting-room.

"Hush!" Key whispered. "He is in there," and pointed to the secret door of the apartment which the birds inhabited. "I slept here last night," he continued; "but he would not speak. He has not even a chair in the room, and must have been standing at the window or sitting on the floor for three days and nights, without eating or drinking."

"What has happened?" Phelps asked.

"I think *he* had better tell you, for his own sake," replied Key. "The only word he would speak is your name. He shouted to me last night to go away; but I staid; and every hour or two I heard him groaning out for you, as if he was in agony."

"Thank you for sending to me," said the layman, wringing the parson's hand. Then without more parley he knocked at the secret door, and called aloud, "Bedford! Let me come in. You know my voice."

"Who else is there?" asked a hollow voice within.

"Key."

From within: "Beg him to go away."

"I thought so," said the parson, sadly. "I must go my rounds now, Phelps; but I shall be at home in the evening if you want me. I shall not come unless you send for me."

Turning on the threshold, he added, "It is too severe, much too severe. He is too hard on himself. *I did not prescribe it.*"

And so the confessor departed. And in this brief story, which is but a chapter in the lives of a few humble and every-day persons, we shall see him no more.

Before the sound of the door closing upon him had ceased to echo through the long chambers and empty corridors of the abbey, the secret door opened to admit Phelps; and the latter could see that the occupant of the chamber had been leaning with his elbows

on the window-ledge, looking out across the garden and river and the overhanging mist, through which the shouts of barge-men at the lock came with a strange weird sound.

It has been formerly said that this approach to the town had the air of a decayed city. This was especially the case on the river-side. The mouldering abbey with its long range of ruinous walls and offices, the antiquated Gothic church, the quaintly terraced cliff with its gable ends of the old episcopal palace and its pollarded willow fringe, the very canalized river, itself a relic of the old water highways of England, formed a group of objects which belonged less to the present than the past. And while the town not half a mile distant was singularly busy for an English county town, this suburb was almost always silent and solitary.

The chamber in which Mr. Phelps now found himself for a second time was part of an ancient passage, opened by Mr. Lane himself with the assistance of Tobias Graves, in the ponderous outer wall of the ancient refectory, a part of which formed the sitting and sleeping apartments of the present occupier. From the lattice window you saw merely the ruin of an out-house at hand, a broken parapet along the lower edge of a terrace walk, and the misty sheet of water with a small lock-house dimly looming on the farther bank. The narrow space was littered with books and papers. On the deep window-ledge lay a number of time-worn crumpled letters and a faded old copy of a German newspaper. Among these the end of a pistol-barrel caught Phelps's observant eye. The favorite tomtit stood disconsolately among this litter, despising the social charms of the fishing-rods and ram-rods upon which the other birds clustered, doubtless comparing notes on their master's behavior. A strong aroma of some obnoxious drug loaded the scanty supply of air in the room. But the long arm which opened the door closed it at once. Not a word was spoken while the two men studied each other's faces, one eager and anxious, but resolute; the other gaunt and terrible, glaring at the intruder. His eyes gleamed with a strange lustre in great hollows under his rugged brows. He wore no coat. His arms, brown and sinewy, were bared to the elbow, and his open shirt, from which the studs had fallen, exposed his broad massive breast. If it had come to a life and death struggle between those two, Mr. Phelps knew that his moments were numbered. But he discerned no symptoms of madness in those "sad eyes;" and as soon as this became clear to his perception a great load seemed to be lifted from his own mind and body. He must have expected to make that terrible discovery, or the relief could not have been so great. No; that was not a madman's gaze. It was a strong man, racked and torn with grief and

goaded with remorse, brooding amidst the ruins of a life. Key had called him Pontius Pilate; Phelps now silently compared him to Saul, and perhaps the layman's simile was not less apt than the priest's.

A curious characteristic of this meeting between two tried and approved friends was that the usual forms of greeting did not even seem to occur to either of their minds. "How d'ye do?" or "How are you, old fellow?" would have been a contemptible mockery. The Doctor's keen, eager glance searched Mr. Lane's agonized eyes, which in their turn sought the meaning of his almost nervously. The little bird, with its head on one side, also watched Mr. Phelps with narrow scrutiny. When he appeared to be relieved of his first terrible apprehension, and looked toward the litter of papers, the bird gave a sympathetic chirrup, jumped a few little paces, and alighted on the muzzle of the pistol.

"What is this?" said Phelps, displacing the bird and taking up the weapon.

The bird at once fluttered on to its master's shoulder, and eyed the intruder attentively.

"A pistol," said Mr. Lane.

"Yes, I see," Mr. Phelps rejoined; "but what for?"

"Why are you come here?" Mr. Lane retorted.

Phelps hesitated for a moment. He doubted whether he should seem to have come by chance, but had never deceived his friend, and would not do so now.

"I am come," he said, "to save you from yourself—to save my friend of old days from this hard fellow, Mr. Lane."

"Hard, yes, hard," said the other, slowly, and speaking to himself. Then again, "Hard, yes, hard indeed! Poor child!"

Phelps was not slow to catch the last words. He knew nothing of what had happened between his friend and Janet Browne, but had seen that some little tenderness or friendship was springing up between them, and had from the first ardently hoped that it might be so, and that (though he had signally failed in his own attempt on Mr. Browne) Janet and his friend might ultimately become man and wife, so that half the fortune which was to have been Bedford Lyte's might still become his, and with it something worth the other half twice told; for Mr. Phelps was not one of your philosophers who make light of the treasure of a woman's heart. For Bedford's secret, as a moral obstacle, he cared little and feared less, though it might present material difficulties. His confidence in one whom he had never proved to be unworthy of it was unbounded. For the change of name he did feel sorry, and had strongly dissuaded his friend from persevering in it on his return to England. But Bedford had made

it the condition of his alliance, and Phelps had yielded the point.

To the new head-master of the Pedlington School it had seemed almost unendurable that an honest man, his friend and colleague, should take shelter in an *alias* from some old opprobrium. But to Bedford Lyte, the naturally proud and sensitive man, the reputation of Bedford Lyte, the reputed libertine, would have been quite unendurable. Besides which, though Phelps in his generous confidence and in his consummate reliance upon his own approval of his own acts, would have ventured upon opening the school with a coadjutor whose former ill repute might soon get noised abroad, yet his friend had felt sure that such a step would be a false one, and that the moral timidity of the Pedlingtonians would have ill requited Phelps's moral courage. Beyond these two abundant reasons, why need we seek? Yet there was another reason, which of itself would have been sufficient to make Mr. Lane adhere to the *alias* which it had caused him to adopt in Germany.

"Hard indeed! Poor child!" he now repeated to himself, speaking slowly and abstractedly, as though he had been alone; Phelps watching him meanwhile with eager eyes and ears, desiring greatly to know and share the whole burden of his friend's experience, that he might, as he said, in the face of his present danger, "save him from himself." This was doubly urgent now. Mr. Phelps liked not the look of that pistol; and if this moment of anguish were tided over, was not Mr. Lane leaving Pedlington, and again about to cast his lot among strangers?

Could our eyes penetrate those thick walls, it would be strange to see these two men standing together in that narrow dark space, one so intent on the other, that other so careless of his presence. As Frank had ingenuously intimated in their last interview, it was not easy to see the charm about Mr. Lane which attracted people so strongly to him. But the attraction, whatever it was, acted quite as powerfully on the rude as on the gentle sex. Dr. Phelps thought it no more hardship that he should have left his black-letter folios and be here exerting his thankless efforts of friendship in behalf of this man than the Rev. Cyprian Key had grudged his last night's rest in keeping a weary vigil outside Mr. Lane's chamber door. But perhaps the latter may have had some little misgiving of undue severity in the counsel which he had tendered to Mr. Lane. Seeing how fast a hold this love for Janet had gained upon her reluctant admirer, and feeling in his conscience that to indulge it ever so little would be a sin, and wishing for his friend above all things a triumph over the enemy of his soul, he had reminded his penitent that it

was better to enter into life maimed than having a sound body to be cast in hell fire. "Tear it out by the roots," he had urged. "Count not the cost. Spare not yourself; rather inflict wounds the rankling of which shall destroy this vice of your blood." And then when old Ada had informed him of the severities which Mr. Lane was practicing upon himself, and when he reflected how terrible might be this fight between a master-passion which had intrenched itself in the citadel and a stern, loyal man resolved to oust and vanquish it, he became alarmed. He thought this man quite capable of destroying himself if the enemy would not yield. He would expect to carry the fortress by a coup de main, and would chafe at the slightest repulse. So Mr. Key had watched and prayed throughout the night, and in the early morning had telegraphed for Phelps.

"Hard, hard; yes, indeed, hard!" Mr. Lane continued to mutter. "Poor child!"

Phelps was quite at a loss. Did Bedford mean Eleanor Baily? or had something happened in Pedlington during his absence, and was Janet Browne the subject of this lament? Mr. Lane's presence in the neighborhood of Baily's office in Chancery Lane, which Phelps had so recently witnessed, inclined him to think that some circumstance had lately revived the misery concerning Miss Baily, whatever that misery might be. The old, frayed, soiled letters and newspaper in the window indicated the same source of grief and remorse. But some secret power of divination suggested another name, and Mr. Phelps went at once to the point. "Do you mean pretty Janet Browne?" he asked.

Mr. Lane nodded, still gazing intently at his friend, who saw a faint clearing of the brow, as if the confidence were a relief to the sufferer.

"You have formed an attachment for her?" Phelps continued.

Again he nodded. An unbidden tear suffused each of those dark, deep-sunken eyes.

"And she has returned it?" resumed Mr. Phelps.

But now Mr. Lane's glance faltered and failed. His whole figure relaxed its bold posture, trembled, cowered, and finally fell upon its knees at the window-ledge, planting its elbows thereon, lowering the face into the upturned palms, and shaken with convulsive sobs.

Then Mr. Phelps knew that his friend's love had been returned, and that this mutual attachment was not to enjoy a blissful sequel, but that, for some reason as yet unknown to him, it was an unfortunate passion, and Mr. Lane thought he had done wrong in allowing it to take root.

Phelps had never seen his friend overcome by such violent grief before. Yet he

esteemed it to be a breaking up of the ice, and a blessed tenderness succeeding the sterner sorrow of the last few days.

It was about four o'clock in the winter afternoon, and the room was almost dark; but still the figure of the strong man knelt in its weakness, and from time to time a shudder passed over it, and at each of these spasms the little bird on his shoulder partly opened its wings and closed them again with a gentle chirrup, as though it approved of nature's sweet and spontaneous relief. On a sudden a faint glimmer of light, soft and radiant, lit up the bowed head and kneeling form, and threw into bold relief that of the small bird, which uttered a melodious trill, half sad, half joyous, in its minor key. Mr. Lane lifted his head, upon which a golden radiance fell; and presently without, in the space where previously the gray mist had blurred the landscape, a glorious rainbow now appeared. The canaries came fluttering to a perch in the embrasure of the window, and all this little company gazed with rapture at the changing splendors of the bow, which seemed placed there by the beneficent Father in token of His abiding goodness and watchful care over His erring children.

Doubtless this thought crossed the minds of these two men at the same time; for as the bow faded out of the heavens, two gently spoken words were uttered by the kneeling man, and Mr. Phelps (having quickly stooped to catch) now fervently repeated them:

"LAUS DEO!"

Mr. Phelps was sincerely rejoiced that any thing should have evoked on the part of his friend the feeling which must have prompted these words. For they were the first he had spoken since his monotonous reiteration of the words, "Hard, hard!" and "Poor child!"

"May I open the window?" asked Phelps. And Mr. Lane, rising, opened it himself. It was secured inside by a wire-worked frame, which prevented the birds from going out or their enemies from coming in when the lattice was open.

As the fresh air greeted their nostrils, Mr. Phelps, wishing to speak on indifferent subjects, said, "What drug is it the smell of which filled this quaint little room?"

"*Hyoscyamus*."

"Do you take much of it?" he asked.

"Very seldom."

Suddenly the place was shaken with a great shock, accompanied by a loud report. A great smell of gunpowder and cloud of smoke succeeded to the fumes of *hyoscyamus*, and as these cleared away before the draught of air coming up from the river, Mr. Lane appeared with an air of exultation in face and mien, pointing with a pistol through the shattered wire-work. Mr. Phelps first

looked at the weapon in his own hand, to make sure that he had not relinquished it, then following with his eye the line of Mr. Lane's, discovered with some difficulty in the fading daylight the body of a large white cat, lying motionless at the foot of a broken wall.

"At last!" cried the marksman.

"Was it an old offender, then?" Phelps inquired.

Mr. Lane reminded him of his old superstition about his guardian angel or good genius inhabiting the humble form of the tomtit, and told him that a feud existed between the cat and the bird, which puzzled him much, and had made him resolve to take the cat's life. It seems the offending animal would sit in a point of vantage and watch the window for hours, to the great terror of the other birds, his little favorite manifesting no fear at all, which he attributed to the superior nature with which it was marvelously endowed. But he had noticed the bird to ail after each of these feline visits, and one evening, when pussy had been on guard during his absence, Tommy almost committed *felo-de-se*. The affectionate little creature had a habit of sitting for hours on the rail of the fender at his feet, and even roosting there during some of his long winter-night watches. On the evening in question, when he opened the secret door as usual on his return for the night, the bird had flown directly from the lattice window across the room, into the fiery space underneath the grate, where it was confused and dazzled and almost roasted alive. He saved it with difficulty, and was much disturbed when (going to the small window) he saw the ghostly form of the white cat stealing away in the darkness.

Beyond this narrative Phelps could learn nothing as to Mr. Lane's strange antipathy to this creature. Afterward he alluded to the period of his seclusion as "an ambuscade;" but Phelps could not believe that he was really lying in wait for a cat all that time, nor that its appearance and forfeiting its life at the present time were more than a coincidence. However, the occurrence was most serviceable. When a man's mind is almost unhinged with a lever of unrelenting anguish, some old familiar turn will sometimes restore its balance. And probably the sudden revival of Mr. Lane's former anger with the cat, and the triumph of his successful shot, may have served to distract his mind from its one intolerable care. Certainly from this time he began to realize his friend's presence. The necessity of fully confiding the past to this faithful ally had been urged upon him by Key, and now presented itself to his mind. The old fear of losing Phelps's regard by this confidence revived within him. In short, he began to be himself again after a period of unnatural

"OATS KILLS A CAT."

abstraction and morbid abandonment to a single idea.

"Now the enemy is fairly repulsed. Let us move out of our intrenchments, and give the dead sepulture," he said, quite manfully.

"*Mitte supervacuos honores,*" Mr. Phelps rejoined, with a smile; and added, "I am very hungry. Let us order some supper as we go."

The faithful Ada was hovering about the door of the sitting-room nervously. "We have killed the white cat at last. Let us have some supper at once," the master said to her. And the good creature gave vent

to a great sigh of relief, for she had been tortured with vague apprehensions.

Phelps accompanied him into the old terraced garden, where Mr. Lane persisted in digging a hole and burying his foe, during which operation the bird fluttered to and fro with every appearance of joy, though it was the hour only for bats and owls to be on the wing. Then turning upon Phelps, who was smoking a short wooden pipe, he said, "Let me have that;" with which request the other silently complied. A breeze was coming up from the west, and the stars twinkled out one by one. They paced to

and fro on the long broad terrace walk, where in old times many a monk had told his beads and many an abbot planned the aggrandizement of his house and order, or perchance the very culture of this garden, now infested with kex and other stubborn weeds, the home of rabbits, moles, and rats.

"Why did you come to-day, Henry?" asked Mr. Lane, after they had walked a while in silence.

"I told you truly," the other answered; "to save you from yourself. Key telegraphed me."

"You did well to come," Mr. Lane rejoined; "well, as far as I am concerned. It is an ignoble act, a rash, impatient folly; but I should have done it."

"I believe you would," Phelps said.

"I shall have to bear your contempt when you know all," Mr. Lane pleaded.

"You wouldn't have escaped it so, however fast old Charon had paddled you over."

"If you had only prevented me from coming here with an *alias*!" Mr. Lane urged.

"Ah!" cried Phelps, "that is how the mischief has occurred, is it?" He was too generous to remind the sufferer how strongly he had discountenanced that measure.

"Or if you had only kept me from going to the house!" resumed Mr. Lane.

"But, my dear fellow, I wanted you to go. I had a wish, and it was father to a belief, that she and you would take to each other."

Mr. Lane groaned aloud, "Oh! if I had only told you all, you would have foreseen this calamity, and kept me away."

The unruly but honest tongue of the Doctor could hardly refrain from pointing out to Mr. Lane how his own reticence and want of candor in bearing his own name were at fault. Still he felt a secret conviction that Janet neither would nor could withdraw her love if she had once given it to his friend. Nor did he believe that Bedford Lyte had so acted as to forfeit the esteem of any woman, however noble, pure, or high-minded.

"But now you will tell me every thing, and trust me fully," he said. "Remember, you are in a difficulty, and two heads are better than one."

"Let us end the year like brothers," pleaded Mr. Lane. "To-morrow I will make a clean breast of it; but—"

"But if you broke the whole decalogue as Bedford Lyte, I am ready and willing to forgive you, knowing what I do of your life under this confounded *alias*, which has now become so much a part of you that you will seem to be masquerading in your own name. But why should you fear my judgment? Why should I be more censorious than Key? I know you have confided in him."

"But Key is a priest."

"So we are all priests," resumed Phelps,

with whom this was a pet heresy. "Whosoever sins we remit, they are remitted unto him or her. I don't believe Pio Nono nor St. Peter himself had any more power to remit sins than you or I have. But come and give me something to eat, for the love of Zeus. After all, the old pagan gods are fine fellows, and there's a good deal of vitality about them yet."

Mr. Lane declined the argument, but his mind was not at ease about his friend's judgment. In youth they two had made a compact with virtue. He had certainly broken that pact, and had allowed more than a lustre to pass away without giving his friend the opportunity of pronouncing whether that breach should sunder them or not.

The philosopher ate heartily, undisturbed by such misgivings, and quite prepared to follow in the parson's footsteps, and pronounce a plenary absolution upon Bedford Lyte. The latter gentleman only sipped some beef tea, which his good old Ada had cunningly concocted of meat and isinglass, so that the utmost nourishment was comprised in the smallest compass. Of this she would only give him a small tea-cupful, though he loudly called for more, and affectionately bantered her on having allowed him to fast so long, if, indeed, her story was true, which he professed to doubt.

"And indeed, Dr. Phelps," said the good creature, "if master hadn't a-promised, now that he's going away, to take me with him, I wouldn't ha' been answerable to ye for his life. The many and many a time I've a-been at his door with a cup of this nice beef tea, and he to order me off quite severe! Strong, they call him; so he be; and well he may be! Taking things to heart so!"

"Come along out into the fresh air again," said the subject of this oration, disposing his little bird gently on the back of his easy-chair, where it released its head from under its wing and opened one eye for a wink, as much as to say, "*Au revoir*! I will doze here till you go to bed, which you have not done for three nights, you know."

As we have already intimated, it was the eve of a new year, and the pious rector, without any particular direction in the canon or rubrics, kept it as a vigil, having even-song with a sermon at eight o'clock, and a midnight celebration of the eucharist. "I have used him ill," said Mr. Lane; "I didn't want to be dictated to. I wanted to go out of this dreadful life, and escape from a misery that was crushing me. Ah, Henry, old friend! why did not you save me from myself sooner, and from this last sin, and the misery in which I have involved the sweetest soul that God and nature ever clothed in beauty?"

"The complications may be unraveled yet," Phelps replied, hopefully.

"No," said the other, dolorously; "my

sentence is a life one; and I have been stealing into happy households and an innocent heart, like a ticket-of-leave man pretending to be a virtuous citizen."

"That is a case," said Phelps, astutely turning the subject, "where society retains a man's sin. Condemn the poor devil to a life sentence, and it matters not how virtuous he becomes. His one sin is retained, hung round his neck, and poisons every act and thought and feeling of his future life."

Then they turned into the church-yard and walked slowly in the shadow of the old yews which deepen its stony gloom. The weather had become clear and frosty. There was no moon, but the stars were bright and eloquent in the immeasurable azure vault above and around them. The bell for prayers had ceased, and the last of the scanty congregation had straggled in. Phelps had a shrewd suspicion, almost an assurance, of what had passed in his friend's mind, oppressed as he was by an ever-growing burden of secrecy, with the moral perception morbidly quickened (as he thought), with that vague longing which possesses some natures who have not the highest faith to trust some system wholly, to bow the neck of Reason to the yoke of consistent self-asserting Dogma, and to take such consolation as may be had in submission, in so-called Remission and Absolution. But for himself, Mr. Phelps thought lightly of such cities of refuge.

"Bedford," he said, puffing philosophically at his pipe in the sweet solemn starlight, and now looking upward through the gnarled boughs of a very ancient tree, under which his friend also was kindling a pipe—"Bedford, what a grand satire, this" (here he waved his pipe heavenward)—"this is upon dogma, and ritual, and all littleness!"

As Mr. Lane remained silent, the skeptic continued: "These stars, my friend, don't move majestically with that glorious rhythmic music through their orbs of space to light that unhappy little hierarch" (probably meaning the Reverend Cyprian) "and his dozen choristers and his score of devotees on their walk to church and back again. No occasion, my Bedford, to call stars and planets, whole systems, into being for such a purpose. A few tenpenny lanterns would do far better."

Luckless penitent! Tossed from Rome to Geneva, from Calvin to Key, and now assailed by a philosopher to whom Calvin and Key were both alike. Perhaps grief, his proper mistress at this juncture, stood him in good stead, outweighing the bomb-shells and hand-grenades of theology in her secret scales. He embraced her, as the unhappy will hug their misery, and she turned a deaf ear to doubt. Bitterly he smiled in his dark resting-place, standing with folded

arms, and leaning his broad back against the huge red trunk of the tree.

"And this grim tree," continued the ex-inspector of Anglican schools, "must have been vegetating here, transacting its own affairs with decorous gravity, but laughing at Celt and Roman, Saxon and Norman, Lollard and Anglican—laughing at 'em all in turn under its crumpled old bark this sixteen or eighteen centuries or more."

"You don't mean laughing at their religion?" urged Mr. Lane, now showing some interest in the subject of discourse, which perhaps may have been the object of his wily friend in treading upon such debatable ground.

"Indeed I do," he calmly rejoined.

"Do you know," said Mr. Lane, now speaking carefully and with evident conviction, "this very old tree has often struck me as being a good type of Christianity, with a new life springing continually out of its own decay?"

"And so far you have been right," Phelps assented. "There is a germ of truth still in a mass of struggling decomposition, and that keeps flashing out into new life, as you say; for truth can never die. But the whole system is out of date and well-nigh worn out."

"You don't mean that Christianity itself is nearly worn out?" Mr. Lane urged.

"Yes, I do. It can not be the crowning religion of the human race."

"I am sure I hope it is," said Mr. Lane, earnestly.

"I hope not," the other said, with no less fervor.

Then a great silence fell upon them, made audible, as it were, by the indistinct Gregorian strains within the church. For a while Mr. Lane, so lately contemplating a final act of rebellion against this creed, was smitten with awe lest it should not be the true solution of life's mysteries. Was faith merely a farce tricked out with sham solemnities? Were all puppets who walk through the church's history from Christ till now? Are the soul's experiences mere tricks of a heated imagination? Do the powers of nature indeed laugh at our phantom fights?

It seemed as though a dark veil was drawn across the heavens. The man bereft of his faith, weak as it was to impel or deter him, was surrounded by dark night. Mighty waves of fear tossed him on their inky summits and wrapt him in their changeful depths. Fierce blasts of doubt and distrust hurried him hither and thither. But now a sweet celestial light moved amidst the darkness and drew near to him. Out of the light there came a voice saying, "It is I: be not afraid." The words were few; but to him their import was very great. Recovering himself with an effort, he said, "Henry, my old friend, do not put Christianity from

you because I (or any other weak creature) fall short of my ideal. You would not reject our Parliamentary system because—"

"Wouldn't I?" interrupted the philosopher. "If the people were ripe for something better? And I, for one, think it high time they were."

Mr. Lane was bereft of his argument, but resolved to pursue the subject. "What do you call subjective truth?" he asked.

"A thing being true in relation to one's own mind," was the answer.

"Then," persisted the other, "I have subjective evidence of Christianity which is absolutely overwhelming. I have had a proof of it since we began this conversation. Is that faith?"

"What you call faith," said Phelps.

"But *could* you not have this sort of faith, if you would humble your intellect?" Mr. Lane asked.

"Faith, I had it once," Phelps answered, lightly, puffing out a long jet of smoke; "but it left me. Or rather *I* left it. It was a phase of experience through which I passed."

"Should you not want it again if you were dying?"

"No," replied Phelps, gayly, but seriously—"no, I think not. I don't think I should feel any better for it on this side the bourne; and if I found it wrong on t'other, I should be ashamed of myself, and horribly afraid to meet the shade of old Voltaire."

Doubtless Mr. Phelps knew there was faith of another and, as he thought, of a higher kind. And of this he trusted that he was not devoid; but limited his remarks just then to the special view of a special faith which was uppermost in his friend's mind.

In such a manner this eccentric sage endeavored to arouse his friend from the stupor into which remorse had plunged him. Before they retired to rest that night he craftily but intrepidly assailed more than one other of Mr. Lane's intellectual strongholds, at once helping to quicken that numbed spirit into a renewed vitality, and betraying on his own part, in politics as well as in theology, a heterodoxy which, if recorded in these winged pages, would go far to justify those pious ladies of Pedlington who feared that their new school-master, with all his talents and all his acquirements, might prove a dangerous guide to the ductile steps of youth.

CHAPTER XX.

A TRAGEDY.

DURING the whole of that New-Year's Day Mr. Lane was really engaged in preparing a mental brief out of which to conduct

his defense before the jury of his own convictions presided over by Judge Phelps. The latter judicial personage with a covert smile saw him inwardly toiling over it. "How simple is this pious penitent!" thought Phelps. And of Henry Phelps, D.C.L., M.A., etc., etc., Mr. Lane would often think in almost the very same terms, "How simple he is!" But now something dreadful existed in that simplicity which knew no sin—no sin at least of the deadly order; for we must bear in mind that Mr. Lane was now bound to regard iniquity from a theological point of view. On whichever side the truth may have reposed, Mr. Lane labored painfully, and Dr. Phelps smiled curiously. And during this strange day, unique in the annals of Henry Phelps, while he was waiting to receive the penitent's confession, he philosophized on sin and on responsibility and on what might constitute guilt in the heavenly courts. This man before him, this old and tried friend, had evidently sinned. He could not be a dreamer. He surely had committed some if not many of what their former school-fellow, Key, would consider "deadly sins." Yet Dr. Phelps, "for the life of him," as we say, but really to save his own self-respect, could not kindle in his breast one spark of indignation against the offender. From which, reasoned out fully and at great length and with great perspicuity—for the Doctor was no addle-brained logician—he concluded that, as far as man's judgment could approach the Divine judgment, a man was not guilty before God in relation to the breaches of the law committed by him; that is to say, not absolutely and unconditionally so. Yet this admission militated fiercely against his previous conclusions on this subject. Hitherto, if it had been possible to collect all the facts of whatever kind bearing on a crime, he would have undertaken to measure the criminal's guilt. And hitherto he had never doubted, and even now did not doubt, that his indignation would be in proportion to the malefactor's culpability.

With a half-morbid, half-honest perversity, Mr. Lane *would* believe that he was about to forfeit the esteem of the one man whose good opinion was to him in the place of a conscience. That he had been keeping the regard of Phelps for all these eight years by stealth, by a deliberate concealment of truth, he admitted to himself. The longer this fraud had lasted, the more base it had seemed to him. His own self-contempt on that account deepened in proportion to the sublimity of the trust which Phelps had reposed in him. Over this godlike man who had never sinned he had even assumed an air of superiority, had sometimes actually dared to speak and behave as if his own hidden baseness had placed him on a level of worldly wisdom above his friend.

In the ardor of youth, both loving alike what was noble, hating what was vile, yet feeling that in them, as in other souls which sought the light, there were possibilities of rambling into dark places, and of becoming at home in them, and finding the darkness to suit their dimmed eye-sight, these two lads had bound themselves together in a solemn compact. They would not fall from their heights. Obstacles might be reached which should impede their upward progress at this stage, or at the next, or the next. These might be overcome each in turn, or some one obstacle or another might prove insuperable. Certain moral summits might rear their heads inaccessible to the weary footsteps or the baffled spirits of these Titans; but fall from any level once attained to would they never. Hand in hand they stood strong in themselves, in each other, in that high and holy trust which all young men ought to have in celestial help which can never have failed them yet. On the threshold of life—there they threw down the gauntlet to the powers of evil. "We will do no base thing," they said.

But for one of themselves those powers which cherish crime and animate its agents had proved too strong. They met him as he walked alone, overbold, and took up his gauntlet. He trusted too much in himself, and fell—fell from his early heaven down, down into a very abyss, a Gehenna of passion. And out of this he had crawled, with an *alias*, with closed lips, and a sullen brow, contracting swiftly and sullenly when one attempted to win his confidence, when one who was noble made generous attempts to encourage him to begin again to be noble by confessing his baseness and deploring it. This false pride, sullen, cowardly, as it was, had bound his old iniquity up with his new righteousness, had made it part and parcel of his daily life for all these years, which otherwise had been fair enough since that one dark episode.

Mr. Lane's self-imposed isolation, though partly the result of a habit both of mind and temper, was mainly traceable to this conviction. And this deep, dreary self-abasement which he thought humility, but which was so closely allied to pride, had preyed upon him and eaten into his very possibility of self-respect—that condition without which a man of true nobility, however humble in attainments, can not be said to "live" at all.

How little those who prattle with glib tongues or who write shallow phrases about suicide can have read the human heart! If they could trace, or would trace, the inner experiences of a deeply tried man, how often they would see that the mere animal life has proved insupportable to one whose spirit was dead within him because he had lost some needful condition of its life! However

this may be, Mr. Lane's secret had pressed upon him with a crushing weight. The injury which he had unwillingly inflicted upon the girl whom he loved with a passion all the stronger for the restraint to which it was subjected seemed a natural consequence of the concealment which he had practiced. His proper misery had driven him to tell more of his baseness to a priest than he had dared to tell to his friend; and the priest had told him candidly that his confession must go further to become complete. This he acknowledged, and resolved to avoid a new deception. But how was the confidence to be given now? When Phelps came uninvited Mr. Lane was in very deep waters. This oldest and best friend came trusting, though injured by exclusion from confidence. He came holding out a hand, and saying: "You are sinking under that heavy secret. I have watched you swimming bravely, have seen you baffling and baffled by the waves of sorrow. I want to pull you ashore and to open that foul bag and cast its contents to the purifying winds of forgiveness, that we two may again walk hand in hand in the sunshine of friendship, still trustfully, as of old, but humbly because one of us fell, and his fall breaks our pride; for we are both men, brothers—nay, almost one man, so closely are our souls knit."

As this generous affection on the part of Phelps unfolded itself clearly to Mr. Lane, he had no longer a wish to reject it, or to endeavor to retain it on false terms, only a deep regret that by doing so hitherto he had injured this guileless friend, and put him now at length to the pain of withdrawing his regard from one to whom he had so long given it. For still Mr. Lane dreaded the result of his disclosures. Without incriminating others, he could not even avail himself of the whole truth in his own defense. The task was a very hard one. Let the innocent only sneer at it! The more this guilty but conscientious man studied it, the less prepared with it he was. The New-Year's Day wore itself out, and a great part of the night, yet nothing had been said upon that subject on which it was understood that at length there was to be confidence between them.

In the long dreary corridor outside the sitting-room door a forlorn old clock struck twelve. The strokes seemed interminably lengthened out, and the solemn sounds went echoing about the gloomy halls and passages. Then the silence was made audible by its sonorous ticking without, and within by the plaintive wail of a kettle on the hob, now parting with its last residue of water in a feeble wreath of vapor, anticipating a swift and fiery dissolution.

"Did you think I was in love with Eleanor as a boy?" asked Mr. Lane at length, speaking abruptly..

Mr. Phelps replied, "Certainly."

"But I was *not*," Mr. Lane rejoined. "I never saw that magic light on tree or bower, I never felt that glorious ecstasy called love, till quite lately. The object of my boyish passion was the place which you took from me at school."

"From you?"

"Well, which you got, and I didn't get."

"You did your best to get it," observed Phelps, who desired chiefly to draw out his friend's natural characteristics, and to make him feel and speak simply on a topic too long shrouded with mystery.

"Yes," Mr. Lane assented, "I did my best. I drove furiously, and I wish the race were to come again."

He glared defiance at the LL.D., and the latter glanced at him with kindling eyes and black, bristling mustache. But soon Mr. Lane's countenance fell, in contemplation of what was to come. Still, as a brave yet judicious general will avail himself of all natural and incidental advantages, so he fought from point to point in this dismal history. "I drove furiously," he repeated, "but my horses fell lame. I was undergoing a fire of excitement, anger, and indignation, toward the finish, which you knew nothing about."

"I have often thought so since," the Doctor candidly replied. "But come, fire away!"

"You remember my fight with Baily?" Mr. Lane continued, as if anxious to make the most of his past achievements.

Phelps nodded. His stiff black mustache projected, and his dark eyes twinkled with satisfaction.

"If I hadn't licked him," continued Mr. Lane, "I should never have had to confess any sins; for I should have gone away and hanged myself forthwith."

"Happy dispatch," suggested the Doctor. And Mr. Lane, grimly smiling, appeared to think that there might be a less satisfactory solution of certain difficulties than the whimsical custom to which his friend alluded.

"You know why I hated him?" the latter resumed.

Again Phelps nodded.

"Yes," said Mr. Lane, seeing that his friend understood the case. "Yes; the brute treated Eleanor badly. He has always behaved ill to every one but his father. *Arcades ambo*."

"Still," said the provokingly fair judge, "I would put that to his credit. A good son must have a redeeming point."

"Well," Mr. Lane rejoined, bitterly; "the old dog and the young hound together have run me down with fidelity and tenacity of purpose, and, as far as my hereditary advantages went, have ruined me. But God forgive them! And as to my inheritances, let them go. But oh! I little knew how they

were torturing *her* until just before the crisis. You know their house was the only home of my orphaned boyhood. As I grew older I gradually saw that George Baily had a secret power over her, to use in my absence, to conceal in my presence. I saw too that a restless devil within her goaded her always to fight him rather than let the strife languish. Indeed, when I was there she often had the best of it, for my presence stayed his hand. In that last Christmas holidays, before our final struggle in which you beat me so ignominiously, Eleanor and I were thrown much together; and to my surprise she clung to me as her natural protector, and spoke frequently of the Bails (her father and brother, as I had till then believed) as her natural enemies. I had no clew to the interpretation of all this."

"Nor have I," Mr. Phelps retorted.

But at this point of his narrative Mr. Lane regarded the expiring agonies of the tea-kettle with mute complacency.

"Come," urged the Doctor; "come, my boy. What was the clew to the secret of her domestic misery?"

"You once remarked an extraordinary resemblance between her eyes and forehead and mine," Mr. Lane replied. "Did it never occur to you to account for that likeness?"

"Never, I believe, till this moment," Phelps answered, after a pause; "but now it flashes across me like a half-remembered dream. Is it possible that she was not old Mr. Baily's daughter, not George Baily's sister, at all?"

"It is so."

"And was she really Captain Lyte's daughter, and your own cousin?"

"Yes."

Here a silence fell upon them both. Dr. Phelps was considering this strange discovery, and calculating how it might have influenced his friend's character and conduct. The latter was pausing because the farther he went the worse his story became.

"Go on, my boy," said Phelps at length.

"I can not."

"You must, now."

"Oh, the poor infatuated, ill-used, noble girl!" cried Mr. Lane, with a groan of unutterable anguish. "Phelps, my best, oldest, truest friend! how can I tell you these horrors against my own flesh and blood, against my craven self, against my hateful, mad, proud, contemptible self? The poor girl loved me—yes, loved me; and now, at last, I know what love is, and how all else is nothing when opposed to it. Then I knew nothing of love. But if you who saw us together thought I loved her, little wonder that she thought so too!"

"You know I had the Civil Fund pension of £100 a year till I came of age. Well,

when I found out the secret of Eleanor's parentage I wrote to my uncle and told him that I declined any further acquaintance with him, and that Eleanor herself had told me of his scheme for our marriage, to which I would never consent, even if abject poverty should stare me in the face.

"Then I went abroad, bidding Eleanor a very curt farewell, and thinking that she would now become her own father's heiress, and would soon abandon her foolish preference for me. I was overwrought and almost distraught with violent conflicts of emotion. My intention was to let my head rest and fatigue my body. I felt the want of a counselor much at that time, and missed you dreadfully; but was sure that if I came to you, you would advise me to make peace with my uncle and accept Eleanor's affection, and those things I was utterly resolved not to do. The old hunters, Captain Lyte and Mr. Baily, had got me in the toils, and I was resolved to break loose and be my own master.

"After a few months' absence I wrote from Basle to Baily, asking him to draw and forward to me my half year's pension, and to keep my address a secret, answering inquiries vaguely with a statement that I was traveling. That he hated me with a complimentary fervor I knew, but what more could he want (I thought) than what I had voluntarily sacrificed?

"The event proved. He sent the money safely enough; and the diligence which brought the mail brought Eleanor also to Basle. She had run away from a home where she was hated, and thrown herself upon a man who could not love her.

"We did not go on into Switzerland, as my intention had been. My pension would terminate with the expiration of my twenty-first year, and it behooved me to put my shoulder to the wheel. We returned to the German Baths, merely to be within reach of some quiet central towns, one of which I resolved to select for our residence."

Phelps was not slow to notice the change from "I" to "we" in the narrative, and beginning to be greatly agitated, he rose and commenced walking up and down the long dimly lighted room. But Mr. Lane, with eyes themselves fiery bright (could any one have seen them), sat still, reading the mysteries of the burning coals, and seeing in them phantom shapes, while in his ears rang cries from lips long silent. He remained thus silent for many minutes, and the Doctor's suspicions waxed stronger and stronger.

"Go on, Bedford," he said, bitterly—"go on. You wanted me to believe in the devil, and I am beginning to do so already."

"The devil? Yes," Mr. Lane replied, bitterly. "Who threw that poor ill-used girl

in my path during our glorious boyhood, when

'many an old philosophy
On Argive heights divinely sang,
And round us all the thicket rang
To many a flute of Arcady?'

Why had I not a home like you, and like almost all other boys? or, if my parents must die so early, out of the course of nature, why must I be sent to a hoary old knave in lieu of a parent, and left at the disposal of a brigand in the person of my nearest relative?"

"'Knave' and 'brigand' are strong terms," Mr. Phelps objected.

Then Mr. Lane told him the story of the double will: how Mr. Baily had induced General Lyte to execute a perfect will before his death, and afterward presented an imperfect previous draft of it to Captain Lyte as his father's only existing testament; how the captain had set this imperfect will aside (knowing it at least virtually to be his father's last will), and had left the fortune of which he was lawfully only life-tenant away from the true heir, dividing it between his godchildren Blanche and Janet Browne.

Yet the Doctor did not resume his gentle or sympathetic manner to this afflicted friend, but kept impatiently tramping to and fro, and urging Mr. Lane to "go on, go on," than which perhaps there are no two equally brief words as irritating and vexatious to a proud spirit.

"How am I to 'go on,' as you call it?" he asked, turning savagely upon his persecutor. "How am I to *go on* if you are down upon me already like this, when, so far, I had been more sinned against than sinning? Pray what had I done to forfeit your esteem up to this point?"

"Then what do you mean by 'We,' after that poor girl arrived at Basle?" asked the Doctor, not sorry of an opportunity for bringing Mr. Lane to the point on this subject.

"I am just going to—" began the latter. Then suddenly turning on his friend fiercely, and flinging humility to the dogs, he exclaimed, "Good God, man! You don't think I wronged my own kinswoman! How *dare* you?"

In no degree daunted the Doctor came closer, looked him calmly in the face, and said, "Oh, I thank the Giver of all good for this warmth of yours, my Bedford! Now I can bear whatever revelation is to come. But a terrible suspicion had taken hold of me. And I feared that my affection for you was going to be put to too severe a test. Forgive me."

So in the midst of Mr. Lane's confession he was called upon to change places and exercise the virtue of charity toward his friend, and this gave him courage to proceed.

He went on to tell Phelps as delicately as possible that his cousin's love for him, and

"FIVE MINUTES AFTERWARD I WAS STANDING OVER THE DEAD BODY OF A TALL, POWERFUL MAN."

her reckless self-abandonment in throwing herself upon him as she had done, caused him terrible embarrassment; that, after one or two vain attempts to induce her to return to London, he had proposed to marry her as the only way in his power to save her reputation; that she had resisted him in this design; and that, setting down her opposition merely to a heroic unselfishness, he had carried his point, and actually made her his wife before they left Basle.

Now, it appeared, when according to rule they ought to have commenced being "happy forever after," the terrible part of the narrative was to come, and we must let

the luckless husband indicate his own sorrows.

"From Schlangenbad, a pretty village embowered in beech and maple woods, we were one day being driven to Schwalbach, when Eleanor showed symptoms of great uneasiness and distress. I could only account for this by the rude stare of a gallant who had just passed us in another open carriage, and whose eyes certainly had dwelt upon Eleanor for the moment of passing with a look both of recognition and surprise. However, I soon forgot the man and his impertinence, and when Eleanor implored me to take her to Baden, had no sus-

picion that she would ever be annoyed by him again.

"We engaged apartments on the ground-floor of a secluded villa, which was unlike any other house in Baden. It had been built by an English lady, and had English grates and fenders in the lower rooms. There was also a front garden with railings in the English style. The public foot-path skirts these railings, and is divided from the high-road by the little river Oos. Rows of linden fringe both path and road.

"I had a notion that Karlsruhe or Stuttgart would suit us as a winter residence, and leaving Eleanor in charge of our good landlady (the person who rented the house), I went off with the intention of being absent three days. But being delighted with Karlsruhe, and wishing Eleanor to see it and help my decision, I returned on the second day.

"The sun had just set as I reached home. I was dusty and weary. I remember even now how dark and cool the little river looked as I turned from it and hastened across the grass-plot to our parlor window. A strange whim urged me to plunge into the stream and end my days by clinging to the roots of a tree under water. Not being either distinctly unhappy or apprehensive of evil, of course I shook off the whim. A startled scream answered my familiar three taps at the window, which, curiously enough, was shut, contrary to custom. Why did not Eleanor run to the window to greet me? Again at the parlor door I was kept waiting, for it was bolted within, and my poor wife evidently hesitated before opening it."

At this point of the narrative Mr. Lane sat staring into the fire without speaking, his teeth chattering as if with cold, and Phelps could see drops of anguish glistening among the shaggy locks on his pale forehead.

"Skip over that and tell me the sequel," said Mr. Phelps, laying his hand affectionately on his friend's shoulder.

"Let me see," Mr. Lane continued. "Five minutes afterward I was standing over the dead body of a tall, powerful man, who must have been comely enough. Eleanor, or her shadow, stood by me ringing piteous hands. She had lost the power of speech from fright."

"Was the man Balbry?" Phelps asked.

"Yes."

"Were they really guilty?"

"Yes."

"And is it his death which lies heaviest on your conscience?"

"No. I had broken her heart by my obstinate pride. She had flung herself away soon after I left England, and her coming after me to Basle was little more than a desperate rush to escape from him and see if I would not pity her."

"Still," urged the philosopher, "you have

been terribly punished by your own act in having married her. You had no censure to fear from me."

Mr. Lane heard these last words without clearly comprehending them. Then, as if Phelps had asked him again for his own indictment, he said:

"She revealed the secret of her own birth to me in honor. I cast it in her face, broke off the marriage contract between us, and then left the country, leaving her surrounded with enemies. Her heart was broken, and I half suspect her brain was deranged."

"Yet you married her after all. That should have healed her wounds and eased her mind."

"It was too late," Mr. Lane sadly answered.

"What and where is she now?"

"A Sister of the Black Veil in the convent of St. Agatha, at Ghent."

"Sane?"

"Usually. But sometimes memory overpowers reason, and she fails for a time."

So these two moralists seemed almost to overlook the fact that Mr. Lane had killed his rival. It had been done in the heat of anger, and was half accidental, as the baronet had fallen backward with his neck over the rim of an English fender, and Mr. Lane, having sprung at his throat, naturally fell forward upon him as he fell. The law of the duchy (Baden) took no cognizance of the accident, and it was vaguely reported that the baronet died from injury to the spine incurred by a heavy fall.

Yet it will appear in the sequel that Mr. Lane's expiation had to be wrought out with sighs and self-restraint and unremitting toil.

TWO SONNETS.

THE SUPERScription.

Read, not without thy life's most secret shrine,
Nor sitting by mid-day's half-stagnant stream,
Where half-souls turn God's counsel to a dream,
Mingling slow poison with life's choicest wine.
Read, not where guest's foot falls on the hallowed life,
Trampling its fruits and flowers into the dust.
Read, when by night thy spirit with the Just
Communes for healing of the day's dark strife.
Then read, when all day's robes are cast, and prayer
Invokes God's sleep to guard thy sacred head;
Then, as on sacramental wine and bread,
Feed on the life whose heart in song I bare,
What time I watch before the vouchsafed Sign,
The double Passion—of the Cross, and mine.

THE SIGNATURE.

Know me at last, thou Wonder, thou Delight,
Thou dawning Rapture of the later years,
Thou more than recompense for all the tears
And yearnings of my long and lonely night!
Know me at last! I am the mystic Flower,
Made vital by the thousand suns of space,
Whose hues are smiles of the Eternal Face,
Full grown for thy sweet hand in fated hour.
Know me at last! I am the mystic Fire
That burns all weeds from consecrated ground,
The crown of light that round thy brow is bound,
Thy unfathomed heart's predestinate Desire.
Bend all thy radiance on me, and approve.
Know me at last, at last: my name is—Love.

MONT ST. MICHEL.

MONT ST. MICHEL.

OF the many picturesque inlets of the French side of the English Channel one of the most attractive is the bay of Cancale, which washes a part of the coasts of both Normandy and Brittany. With Granville on the right and Cancale on the left of its mouth, it rolls its tides directly into the broader Breton sea or bay of St. Malo, in whose throat lie the Chausey and the Channel islands. Its shores, more like the banks of an inland lake than of the sea, are bordered with green slopes and wooded hills, and the grain fields lie so close to its waters that its foam is cast almost at the feet of the harvests.

At its foot, in the little bay of Avranches, an offshoot from its own, rises Mont St. Michel, an isolated pyramid of rock, whose summit overlooks a great part of the Norman and the Breton coasts, and in clear weather commands the cliffs of Jersey. On the west the eye takes in the Groin de Cancale, with its outlying fort of Rémaines; next Vivier, low and bordered with windmills; beyond it Mont Dol; then the towers and roofs of Beauvoir, Paa, Moidrey, and Huisnee; Avranches on its green ridge, the church of the Val St. Pair, the Roman tower of St. Leonard, the church of St. Geneta, the tower of Dragey, and last the hill of St. Jean-le-Thomas and the rock of Tombelaine.

From the main-land the most prominent object in the view is Mont St. Michel itself, a sombre cone of granite rising from a sandy plain to a height, including the buildings on its summit, of about four hundred feet. This plain, which is called the Grève, presents many singular phenomena. From the peculiar formation of the shores and the outlying islands and rocks, the tide rises here to a height more than double that at any other point on the coast. While the average rise at Cherbourg during spring-tides is twenty-one feet, at Granville, on the east side of the bay of Cancale, it reaches forty-five feet. The bottom of the bay of Avranches, of which about ten square leagues are uncovered at low water, has so slight an incline seaward as to be practically level, and when the tide comes in an enormous mass of water is poured over it at once, so that the plain is transformed in a few minutes into an angry sea. It is said that the irruption is so rapid during the equinoctial tides that the swiftest horse could not escape it. Fortunately its visits are periodically exact, and the Grève, which is left bare four or five hours each day between the tides, is roamed over with impunity by the neighboring villagers. At low tide the rock is left at least five miles from the sea.

The Grève, though safe to those who know

ARRIVAL OF PILGRIMS AT MONT ST. MICHEL.*

its ways, should not be visited by the stranger without a guide, for the sea is not the only enemy to be feared. No less dangerous are the moving sands, or *lises*, as the country people call them, which none but an experienced eye can distinguish from the solid ground, and in which the entrapped traveler, unless fortunate enough to be promptly extricated, would sink to fathomless depths. *Lises*, which are found ofteneest in the neighborhood of the little streams that traverse the Grève, may be produced artificially by beating the sand, which soon transforms the solid surface into a wet, spongy mass, indicating that the entire plain is permeated with water at no great depth.

Not even tradition tells when this rock first became the abode of man. Long before the Roman domination, when Armorica was the centre of Druidism, it was a sacred mountain, and some writers claim that it was the site of the college of the nine Druidesses to whom was given the power of healing maladies, of extorting the secrets of fate, and of controlling the elements. Hither came the mariner to purchase the arrows which possessed the virtue when shot into the sea of calming storms, and here were

celebrated the mysteries of the Gallic Venua, with rites not unlike those of the Samothracian Cabiri.

What it was called in those dark days is unknown, but when the Romans came they erected on it a shrine to Jupiter, and named it Mons Jovis. With the advent of Christianity some hermits built cabins and took up their abode there. In the sixth century St. Pair, Bishop of Avranches, formed these lone dwellers into a brotherhood; and in 708, when Childebert II. ruled France, Aubert, also Bishop of Avranches, built a church and surrounding cells, and dedicated the mount to St. Michael.

Under the protection of the Norman dukes the monastery prospered. In 963 Richard I. replaced the church and other buildings with finer structures, and bestowed the whole upon the Benedictines. It rapidly increased in wealth and in strength, and by the beginning of the eleventh century it had grown into an important fortress; and when William the Bastard was about to assert his claims to the English crown, Mont St. Michel contributed ships and men in aid of his cause.

The fortress remained an appanage of the English crown until the beginning of the thirteenth century, when it fell into the hands of the French king, Philippe Auguste, who expended large sums in strengthening and embellishing it. The English made strenuous efforts to recover it, notably in

* Every year, and especially on the 29th of September (*Époque de la fête patronale*), Mont St. Michel is visited by large numbers of pilgrims. In 1874 the *fête patronale* was celebrated with unusual ceremony. This illustration, and that which follows, have especial reference to the celebration last September.

the years 1417 and 1423, but always unsuccessfully. In 1469 Louis XI. founded there the knightly order of St. Michael, in gratitude to the archangel for having preserved the mount to France when all the rest of Normandy had fallen; and from that time onward were held there the chapters of the order, which bore the fitting motto, "*Immensi tremor oceani.*"

Mont St. Michel sustained several sieges during the wars of the League, after which its history is mainly peaceful. It was suppressed during the Revolution with the other religious establishments of France, and was made a prison for ecclesiastics who refused to take the civic oath. In 1811 it was converted into a central house of correction, a part of it being reserved for prisoners of state, and it was used as such until a few years ago. It is now in the possession of a few ecclesiastics, who occupy a part of the buildings as an orphan asylum.

FÊTE DU MONT ST. MICHEL—THE TORCH-LIGHT PROCESSION.

The rock of Mont St. Michel rises abruptly from the Grève on all sides excepting the east and the south-east, where it is defended by a high crenelated wall, strengthened by round towers. Between this wall and the wall of the abbey proper, where the rock has but a gradual rise, are crowded the houses of the little village of Mont St. Michel. Above the village is seen the rock, bearing a stunted growth of pines and evergreen oaks; higher still rise the walls of the abbatial buildings, strengthened with many buttresses; and above all, forming the apex of the pyramid, towers the church with its square tower and graceful Gothic spires. On its topmost

pinnacle once gleamed a colossal gilded figure of St. Michael, erected in the twelfth century, but it was destroyed by lightning in 1788.

From the exterior gateway a steep narrow street winds around the south side of the mountain to a second gate flanked by two towers. At each side of the entrance, which is closed with an iron-covered gate nearly twelve feet high, is placed one of the great bombards taken from the English in the siege of 1423. These guns, which are made of bars of iron bound together with iron rings, are twelve feet in length; one has a bore of nineteen and a half inches, the

other of fourteen and a half. A steep stair leads through the vaulted gateway to a third entrance, defended by a portcullis and by machicolations, which opens into the guard-room, whence concealed wickets and narrow stairways led into the different parts of the abbey.

The principal of the conventual buildings is that called the Merveille, from its immense size, its walls measuring two hundred and forty-six feet in length and one hundred and eight feet in height. It has three stories of halls, with a cloister above and vast vaulted crypts beneath. Of the halls, that called the Salle des Chevaliers, where the knights of St. Michael held their chapters, is the finest. It is ninety-eight feet long by sixty-eight wide, and is divided into four naves by three rows of columns. Like the greater part of the superstructure of the Merveille, it dates from the twelfth century. Above it is the cloister, a gem of Gothic architecture, and by far the most beautiful part of the building. Its windows, which look out on the bay, are three hundred and thirty feet above the sea.

The church occupies the summit of the rock, and is in the form of a Latin cross. Its nave and transepts are in the massive style of the twelfth century, but the choir is of the fifteenth century, and one of the best examples of the flamboyant style extant. Beneath the latter is a curious crypt, in the middle of which is a circle of short thick pillars set close together around a central one. They support the entire apsis and the base of the great tower, which do not bear perpendicularly on the main platform of the rock. Under the north transept is the great cistern, excavated in the solid

rock, from which the abbey was supplied with water.

Under the buildings upon the south and the west sides of the rock are the subterranean dungeons, of which there are several stories. Some of them are oubliettes, and many of them have fitting names, such as the Trap, the Devil's Dungeon, In Pace, etc. At the extremity of one of the larger caverns on the south side is shown the place where stood the cage in which prisoners of state were confined. It was here that Louis XV. shut up Dubourg, the Frankfort journalist, to be devoured by rats, because he had dared to lampoon Madame De Pompadour. The cage, which was built of heavy beams of wood placed three inches apart, was destroyed in 1777 by the sons of Philippe Egalité, Duke of Orleans, during a visit made by them to Mont St. Michel in company with their "governor," Madame De Genlis.

When Mont St. Michel became a house of correction, the church, the cloister, and other parts of the buildings were transformed into workshops, and the sound of hammer and file was heard where once echoed the clang of knightly arms and the voice of praise. But a few years ago the wooden platforms and partitions were destroyed by fire, and the place thus purified has not since been contaminated by the presence of criminals. Every lover of art will unite in the hope that this noble monument of a period which has left few other memorials comparable with it, this "grandest work of the Benedictines," as the Marquise de Créquy enthusiastically calls it in her *Souvenirs*, may receive henceforth the care commensurate with its historical and artistic value.

THE FIRST CENTURY OF THE REPUBLIC.

[Fifth Paper.]

MECHANICAL PROGRESS (Concluded).

PRINTING.

THE art of taking an impression from an inked stamp is of great antiquity, being found in the most ancient Egyptian and Assyrian remains. Of yore the rude king who smeared his hand with red ochre or the soot from a burning lamp, and then made the impression of his palm and digits beneath a grant of land, was a printer in his way in thus putting his hand to the document. Then came seals, engraved in relief or *intaglio*, and delivering an impression of the design upon bark, leaf, or skin, either white marks on a dark ground or dark on a light ground, according to the character of the engraving. Seals containing the pronouns of the Pharaohs, each in its cartouch, rewarded the early explorers in the

valley of the Nile, and more lately the stamps and tablets of the recorders of the cities of Mesopotamia have been disinterred by thousands. The impressions, having been made in plastic clay, and then baked, have endured without injury a sepulture of twenty-five centuries. They exhibit the kindred arts of engraving and plastic moulding. It may be safely assumed that they were also used for giving printed impressions, but such memorials are, in the nature of the case, less permanent. Some of the ancient stamps in the British Museum are of bronze, and have reversed raised letters, evidently intended to print on bark, papyrus, linen, or parchment.

To this stage of progress various nations of the world had advanced, and yet it can hardly be said that printing, as we understand the word, had been thought of. This

evidently originated in China, but it is not certain that Europe derived it from thence. The first notice that we find of printing is in the Chinese annals. Du Halde cites the following from the pen of the celebrated Emperor Van Vong, who flourished 1120 years before Christ. This was about the time of Samuel the prophet, and a little before Codrus, the last of the Athenian kings.

"As the stone 'Me' [ink, in Chinese], which is used to blacken the engraved characters, can never become white, so a heart blackened by vice will ever retain its blackness."

Other Catholic missionaries concur with Du Halde in supposing printing from blocks to have been invented at least as early as 930 to 950 B.C. The plan adopted was to take a block of pear-tree wood, squared to the dimensions of two pages of the work. On the smooth surface of the block the written pages are inverted, and the paper rubbed off, leaving the ink on the block, which is then delivered to the engraver, who cuts away all the parts not inked. No press is used, but the surface being inked by one brush, the paper is laid upon the block and dabbed down by a dry brush; the sheet is lifted, carrying the ink with it, and is folded with the blank sides in, one side only being printed; the folded edge being outward, the Chinese or Japanese book looks like one with uncut leaves. The first four books of Kung-fu-tze (Confucius) were thus printed between 890 and 925 A.D., and the description equally applies to the mode yet practiced.

The same system was used in Europe in the thirteenth century for printing playing cards and ornamenting fabrics; later, the works known as *block books*, each page being an engraved block like those of the Chinese. Such was the *Biblia Pauperum*, one of the earliest of European block books, compiled by Bonaventura, the chief of the Franciscans, in 1260. In manuscript form, as a book of forty or fifty pages of illustrated Bible scenes and passages, this Poor Man's Bible was a favorite for five centuries. It was printed as a block book about A.D. 1400. The *Speculum Humanae Salvationis* of Koster, of Haarlem, to whom the credit of the invention of printing has been hence ascribed, was also a block book. Volumes by the score have been written on the rival claims of the cities of Mentz and Haarlem to the invention of printing. From a careful examination of the subject it would appear that Mentz has the prior right, and that the general verdict in favor of Gutenberg is correct.

About the year 1041, a period when Edward the Confessor was King of England, another forward step was made in China. A blacksmith named Pi-Ching invented a mode of printing from plates formed from

movable types, each of which represented a word. The types were about the thickness of a half dollar, each had a word on its face, and they were arranged in order on a backing plate, to which they were attached by mastic.

The Chinese have never advanced beyond *ideographs*, or *word signs*, in which arbitrary symbols (*d*) are made to represent things, qualities, or actions. The language has no elasticity, and, like the Egyptian hieroglyphics (*a b*), is incapable of fulfilling modern requirements. In this respect it is like the ancient Scythic cuneiform (*e*); but the genius of the Mesopotamian nations could not be thus cramped, and the language gradually took on the syllabic form: the cuneiform of the second period (shown in *f*) is a transition form. The Persian cuneiform was substantially syllabic. Other languages of Asia early assumed the phonetic form, in which signs stood for sounds, though it was many ages before the vowels were written definitely. The Phœnician (*h*), which is the

PHOENICIAN AND EGYPTIAN WRITING.

h. Moabite Stone. i. Rosetta Stone.

basis of all the principal alphabets of Europe, had its twenty-two letters 700 B.C., when the black basalt stone was used to celebrate the successes of the King of Moab. *i* is a portion of the inscription in hieroglyphic and demotic from the Rosetta Stone.

That which the Chinese were incapable of doing, from the nature of the case, was done by John Gutenberg, who was born in 1400, at Mentz. In company with Faust and others he printed several works with wooden types and wooden blocks: the *Alexandri Galli Doctrinale* and *Petri Hispani Tractatus* in 1442; and subsequently the *Tabula Alphabetica*, *Catholicon Donati Grammatica*, and the *Confessionalia*. In 1450 the Bible of 637 leaves was printed by Gutenberg and Faust with cut metallic types. Faust retired from partnership with Gutenberg in 1455 and became allied with Schoeffer, and they published in 1457 the *Codex Psalmorum* with cut

metallic types; the *Durandi Rationale*, published by them in 1459, was the first work printed with cast metal types. Gutenberg took other partners, and published the *Catholicon Jo. de Janua* in 1460. He used none but wooden or cut metal types till the year 1462. Gutenberg died in high honor in the year 1468.

Peter Schoeffer, of Gernsheim, the partner of Faust and former workman of Gutenberg, was the inventor of *cast* types, the greatest invention of any of the series.

It may be mentioned that, in the early stages of the art, sheets were printed but on one side, and the backs of the pages pasted together. The pages were without running title, running folio, or direction word. The forms were usually folios, sometimes quartos. The character was a rude Gothic mixed with an engrossing character, and designed to imitate handwriting. Scarcely any division was made between words; the orthography was arbitrary and irregular; abbreviations, in imitation of cursive writing, were numerous; punctuation was confined to a double dot (:) or a single one (.), afterward a stroke (/), known as a *virgule*, was used for a slighter pause, and grew into a comma (,). Capitals were so sparingly employed that the beginning of sentences and proper names of men and places were not thus distinguished. This honor was reserved for paragraphs, and here the space was left vacant by the printer that the illuminated capitals might be put in by hand.

This was soon changed. The era of Leonardo da Vinci, Albert Dürer, Raphael, Michael Angelo, and Vandyck, of Benvenuto Cellini, Galileo, Kepler, Shakespeare, and Bacon, could not long endure mediocrity. The type-founders and printers were worthy of the occasion, and their work leaves little to be desired on the score of sharpness and color. The letters of their books have a vivid blackness that makes one who takes an occasional excursion into *black-letter* wonder where they obtained their ink. The *color* of our pages is gray and rusty in comparison.

In celebrating the achievements of the century we will not claim that we print better, but we do it more easily and much faster; while we handle with great appreciation and respect the works of our worthy, patient, and persevering predecessors, they would view with admiration mixed with awe the towering structure of Hoe, or the compact perfecting presses which print from a web of paper from one to three miles long.

and deliver in piles at the rate of 12,000 per hour. They might think, as the doctors of Paris did of Faust, when they considered, from the cheapness of his books and the exact correspondence of their pages, that he was in league with the Evil One.

The art of printing was scattered over Europe when the city of Mentz was taken and plundered by Archbishop Adolphus, of Nassau, in 1462. Within the next decade the Caxton press was set up at Westminster, and that of Theobaldus Manutius at Venice. *Æsop's Fables*, by Caxton, is supposed to have been the first book with its leaves numbered.

Italic, Greek, Roman, and Hebrew fonts were cast, letters were pruned of their irregularities and excrescences, and order was gradually introduced and concurred in.

The *Aldine* classics are celebrated in prose and verse; in the latter by Alexander Pope among others. The Aldine "Livy" was perhaps the first perfect book, as a modern printer might say. This press was in the hands of the descendants of Aldus for nearly a century.

Catch-words at the foot of the page were first used in Venice by Vindeline di Spori. They have but lately been abolished. *Sig-natures* to sheets were used by Zorat at Milan in 1470.

A new light dawned upon the nations of Europe. The avidity with which the pages of the printer were seized and read shows that an unsuspected yearning for knowledge possessed the minds of the people. From this time the current was uncontrollable, and the refuges of lies being undermined, commenced to totter and fall, and some others are yet toppling and falling from time to time.

Germany had taken the lead in the invention of printing, as it did seventy-seven years afterward, when the deputies of thirteen imperial towns protested against the decree of the Diet of Spire. The previous attempts at reform in England and Bohemia were before the invention of printing, and, though not fruitless, were apparently quelled. Italy during the Renaissance, at the beginning of the sixteenth century, was the home of arts and letters. Of the various editions of books published in the sixteenth century one-half were Italian, and one-half of these Venetian. One-seventeenth were English.

At Venice was printed the first newspaper, the *Gazette de Venise*, about 1563, during the war with the Turks; the *Gazette de France* appeared in April, 1631; the *London Gazette* in 1642; the *Dublin News-Letter*, 1685; the *Boston News-Letter*, 1704; the first German newspaper, 1715; the first in Philadelphia, 1719; in Holland, 1732. The growth, mission, and power of the press are to be considered elsewhere.

The first press in America was in Mexico. The *Manual for Adults* was printed on it about 1550, by Juan Cromberger, who was probably the first printer in America. The second press was at Lima, in 1586. The press at Cambridge, Massachusetts, was established in January, 1639, by Stephen Daye. The college was censor till 1662, when licensers were appointed. In 1755 the press was free. A psalter in the English and Indian languages was printed upon this, 1709. The press still prospers as the "University Press."

Printing-presses were established at New London, Connecticut, in 1709; Annapolis, Maryland, 1726; Williamsburg, Virginia, 1729; Charleston, South Carolina, 1730; Newport, Rhode Island, 1732; Halifax, Nova Scotia, 1751; Woodbridge, New Jersey, 1752; Newbern, North Carolina, 1755; Portsmouth, New Hampshire, 1756; Savannah, Georgia, 1763; Quebec, Canada, 1764. The first press west of the Alleghanies was at Cincinnati, 1793; west of the Mississippi, at St. Louis, 1808.

TYPE.

The fonts of the earlier printers, as we have said, had a quaint old Gothic character, with various curious tails and inflections, in imitation of the secretary hand of the period. Schoeffer took the best handwriting of his time for his model. The letters gradually became more formal and compact, with fewer exuberances of flourish and abbreviations. It was some time before Italian taste triumphed over German quaintness; but the change was made with more speed than one might suppose would have been the case, considering what a close corporation it was that owned the art of printing in the tight little city, with its tall houses, dark, narrow streets, and its strongly built bastioned walls frowning upon the River Rhine and the adjacent hill. When the archbishop with weapons of this world scattered the coterie of printers it was like the sending forth of the foxes and firebrands of Samson, which carried conflagration into the fields of the Philistines.

In 1465 Schweynheym and Pannartz, who printed first at Subiaco, and afterward at Rome, introduced a new type, very closely resembling Roman. It was professedly derived from the best handwriting of the age of Augustus; and in their *Commentary of De Lyra on the Bible*, 1471, are to be found the first Greek types worthy of the name. Subiaco was the first place in Italy where printing was practiced. In 1468 Gintner Zainer printed at Augsburg the first book in Germany with Roman type.

Roman letters were first used in England by Wynkyn de Worde, Caxton's foreman and successor. He employed them for distinguishing remarkable words or passages, as is now done with *Italic*.

Theobaldus Manutius (Aldus) introduced the *Italic* about 1476: this is believed to have been imitated from the handwriting of Petrarch. This type was first known as *Venetian*; by the Germans as *Cursive*. The first book printed in Italic was in 1501, with the title, *Virgilius; Venet; apud Aldum*.

In 1476 Aldus cast a Greek alphabet, and printed a Greek book. The Pentateuch was printed in Hebrew at Soncino, in the Duchy of Milan, 1482. Irish characters were introduced by Nicholas Walsh, chancellor of St. Patrick's, in 1571.

Aldus's Greek type and books were made by the assistance of Greek fugitives from Constantinople, which had been captured by Mohammed II. in 1453, since which the area of Turkish domination had been continually extending. Aldus finished the publication of his Latin classics in 1494. Some of his Greek works were interleaved with Latin translations.

In 1500 he printed the first part of his polyglot Bible, the Hebrew, Greek, and Latin being on the same page.

The first book printed in the English language was a translation of the *Recueil des Histoires de Troyes* of Le Fevre, by Margaret, sister of Edward IV. of England. When the princess married Charles the Bold, William Caxton was one of her household, and is understood to have assisted in the translation, as also in the setting up and printing, which were done at Cologne, 1471. Caxton moved a few years afterward to England, where, in 1474, he printed the *Game of Chesse*, the first book printed in England.

For some centuries each printer was a law unto himself as to forms and face sizes of letters, height of type, relation of face to body, and composition of type-metal. In course of time the most tasteful superseded those which had less excellence, and something like order was initiated. Without citing the successive changes and attempts at uniformity, it may be stated that the American and English practices approximate in the names of the various fonts and the sizes of body, from the small diamond, which has 205 ems to a foot, to canon, which has 18½ ems in that length. The agreement is not absolute, nor do even the American type-foundries have precisely the same standard. The French standard was established in 1730. The height to paper of the Bruce type is $\frac{22}{100}$ of an inch; other foundries make the height $\frac{1}{2}$ of an inch.

The number of punches in the Imperial Printing-office at Paris was 361,000 in 1860. It has fonts of fifty-six Eastern languages, and sixteen European languages which do not use the Roman character.

The "Spécimen Album" of Monsieur C. Derriey, of Paris (1862), affords the most beautiful and graceful examples of the art of the type cutter, founder, and printer. It

may fairly be said that the forms, disposition of parts, accuracy of apposition and register—the latter especially noticeable in the chromo printing—have never been excelled.

The scheme of a font is the proportion of the respective *sorts*; an approximate estimate may be given, but different kinds of work require different proportions; for instance, indexes, dictionaries, and directories are *hard on sorts*, as they require so unusually large a proportion of capitals and points.

In a font of 500 pounds:

Lower-case letters.....	264	pounds.
Points and references	20	"
Figures.....	14	"
Capitals.....	87	"
Small capitals	17	"
Braces, dashes, and fractions....	18	"
Spaces and quadrats	98	"
Italic	87	"

For French or Italian the above would be deficient in accented letters. Fonts for special work also contain numerous sorts not in the above, such as superior and inferior letters in capitals and lower-case, superior figures in Arabic or Roman, prime letters, arbitrary signs used in arithmetical, astronomical, botanical, chemical, classic, commercial, mathematical, musical, and other works.

Almost every science has symbols of its own. Algebra has one set, chemistry another. For a dictionary which attempts to represent the minute shades of pronunciation a great number are required. Thus in Webster or Worcester, what with letters with dots above and dots below, lines above, below, and across, there are probably 100 additional characters. Some foreign languages have very complicated alphabets. The Greek, with its "accents" and "breathings," requires about 200. Formerly there were so many logotypes and abbreviations as to require 750 sorts. The Oriental alphabets are complex. The Hebrew, with the Masoretic points, requires about 300 sorts, many differing only by a point, stroke, or angle. The Arabic has quite as many. In Robinson's Hebrew lexicon eight or ten Oriental languages appear, and required 3000 sorts, distributed through at least forty cases.

After all, this is simple compared with the Chinese, which has no letters, as we understand the word, no sign which represents a mere sound, but has an arbitrary symbol for each word in the language.

The Chinese dictionary shows 43,496 words; of these 13,000 are irrelevant, and consist of signs which are ill formed and obsolete. For ordinary use 4000 signs suffice. Kung-fu-tze can be read with a knowledge of 2500. There are 214 root-signs, so to speak, which indicate the pronunciation and form *keys* or *radicals*, called by the Chinese *tribunals*. Each character is a word, and the actual number is vastly increased

by tones which give quite a different value and meaning.

The number of letters in the following alphabets is thus given in Ballhorn's *Grammatology* (Trubner and Co., 1861):

Hebrew.....	22	Ethiopic.....	202
Chaldean.....	22	Chinese.....	214
Syriac.....	22	Japanese.....	72
Samaritan.....	22	Dutch.....	26
Phœnician.....	22	Spanish.....	27
Armenian.....	28	Irish.....	18
Arabic.....	28	Anglo-Saxon.....	25
Persian.....	28	Danish.....	26
Turkish.....	28	Gothic.....	25
Georgian.....	28	French.....	26
Coptic.....	28	German.....	26
Greek.....	24	Welsh.....	40
Latin.....	26	Russian.....	36
Sanskrit.....	296		

TYPE-FOUNDING.

Type-founding is the invention of Peter Schoeffer, and no important improvement on his mode seems to have occurred to the printers for several centuries. In early times all the operations, from the engraving of the punches, striking the matrices, and casting the type, down to the binding of the book, were carried on within the same establishment. Caxton seems to have regarded himself as well supplied, having five fonts. Type-founding was a separate business in England in 1637.

The "Caslon" type-foundry, established in London in 1716, is still known by that name.

The first type-founder in America was Christopher Saur, of Germantown, Pennsylvania, and the first font cast was of German type, about 1735. In 1768 a foundry was established in Boston, but did not succeed. Abel Buell, of Killingworth, Connecticut, succeeded so far as good work was concerned, but was prevented by a turbulent disposition and by the war of Independence, which supervened, and in which he took an active part, from pursuing the business to a successful issue. Just before the war of the Revolution he was one of the party who destroyed the leaden statue of George III. in the Bowling Green, New York, and was discovered at his house melting up the lead into type-metal, so as to put his Majesty to work disseminating information. A piece of the head of this statue, with some punches and matrices, was found many years afterward in the ammunition chest of an old field-piece to which Buell had been attached during the war.

The American provinces had a hard and generally unsuccessful struggle for independence in business before the idea of political independence seems to have occurred to them. No venture in type-founding was successful till about 1798, when Binney and Ronaldson established themselves by State aid in Philadelphia. The type-founding tools and materials imported by Dr. Benja-

min Franklin from France for his own use fell into the hands of Mr. Binney and partner.

The old hand-mould and spoon reigned supreme till 1838, when the first successful type-casting machine was invented by David Bruce, Jun., of New York. Machines for casting a number of types simultaneously, projecting from a common sprue like the teeth of a comb, had been invented in America and in Europe, but no success attended them.

David Bruce's machine is the model of all American and many European type-casting machines. The great difficulty experienced in the development of the machine was in the fact that the resulting type was porous and about fifteen per cent. lighter than the hand-made, each of which was formed by a peculiar spasmodic jerk given by the founder to the mould as he poured in the metal. The effect of this was to condense the metal and expel air. In the Bruce machine the

BRUCE'S TYPE-CASTING MACHINE.

metal is kept fluid by a gas jet beneath, and is projected into the mould by a pump, the spout of which is in front of the metal pot. Each revolution of the crank brings the mould up to the spout, where it receives a charge of metal; it flies back with it; the top of the mould opens, and the type falls out. The matrix containing the letter is held by a spring against the mould opposite to the opening at which the metal is injected, and the rate of making is about 100 per minute for average-sized type.

After casting, the jet or surplus metal at the foot of the type, and which formed the ingate of the mould, is broken off, the sides

of the type are rubbed on a grit-stone, they are set up regularly in sticks, corrected for inequalities, a groove planed in the middle of the base, forming what are known as *feet*. The proportion of each letter for a font of given weight is arranged in a galley six by four and a half inches, and forms what is known as a type-founder's page. This is papered and marked with the kind of letter contained.

Printing types were first electrotyped with copper in 1850, and have lately been nickel-plated.

TYPE SETTING AND DISTRIBUTING MACHINES.

It is now just about fifty years since the first type-setting apparatus was invented, and a thoroughly successful machine has not yet been introduced. Great hopes have been formed from time to time as one machine after another has been announced, and several of these have done very fair work. As mechanical contrivances they have been quite ingenious, and have worked with a degree of precision which made us think again and again that the goal had been reached at last. And yet to-day but few such machines are in use, and they only on a class of plain work where the number of sorts is limited. A machine must of course include capitals, lower-case, points, and figures; it can not be very efficient without small capitals and italics, but each addition to its capability for variety of work adds greatly to its complexity. After all, it is a race between fingers traveling from the stick to the boxes of the case and back again, and fingers beating upon the keys of the machine. The latter would of course carry the day, as the average travel of the hand after a letter is twelve inches from the stick, and the travel on the key-board of the machine is considerably less than one-half this, but there are so many little niceties to be observed in spacing the words and justifying the lines, work which is done by the skillful printer as he sets up the line, but which, with machine-set type, must be done afterward, when the line of type is broken into lengths for the measure of the work, and then justified by *spaces*. Type-setting machines have separate pockets or galleys for each *sort*, and the mechanical arrangement is such that on touching the key, arranged with others like the key-board of a piano or concertina, the end type of the row is displaced, and is conducted in a channel or by a tape to a composing-stick, where the types are arranged in regular order in a line of indefinite length, and from whence they are removed in successive portions to a justifying-stick, in which they are spaced out to the proper length of line required.

Three machines of this character were exhibited at the Paris Exposition in 1855.

Of the American machines that of Alden has perhaps excited most attention. The persistence of the inventor for seventeen years in the endeavor to perfect his invention, and his death, in 1859, when success appeared to be crowning his efforts, afford one more interesting item to the history of invention when it shall come to be written. His machine has types arranged around the circumference of a horizontal wheel, which rotates slowly, carrying with it fingers which pick up the proper types from their respective cells. The ordinary types are used, with the exception that each has its peculiar nick on one side, which will enable the fellow-machine to discriminate when *distributing* the type.

In the distributing process the *dead matter* is placed on a bed to the right of the key cylinder, and is taken up line by line as each is exhausted. The types are taken up by distributing transits in the revolving wheel, selected by means of the nicks, and then transferred by way of the channels to the respective type pockets. Extra spaces, etc., are tipped out at the end of the channel. Unnicked type are thrown into a separate box, italics into another.

Another instance may be given: the Kas-tenbein composing machine, in which common types are used, each sort being arranged vertically in a series of tubes, like the pipes of an organ. As a letter key of the keyboard is struck, the lever connecting with the particular letter tube opens the lower end of the tube, and allows the lowest type in the rank to fall into a groove which conducts it to the slide where the letters are assembled in a long line, and whence they are taken by the compositor's rule and justified.

The distributing machine reverses this method. The *dead matter* is placed on a bed, each line is cut off and the types raised *seriatim* so that they can be read by the observer. The corresponding key on the key-board being depressed, the type is pushed into its appropriate tube, ready for supplying the composing machine.

Printers have been wont to boast that a practical type composing and *justifying* machine presented a problem which even Yankee ingenuity and persistence could not solve; but in view of the progress made in this direction during the last decade, it can hardly be doubted that complete success will be achieved in the near future.

Still later machines for composing and distributing, the invention of Mr. Paige, are now exhibiting in New York, and work well. It remains, however, to be determined whether or not the capital invested in them and the casualties incident to complicated and delicate machinery will discourage their use in place of compositors, who own themselves, are always ready, and for whom sub-

stitutes can be found if one or another prove sailing or erratic.

STEREOTYPING.

The art of casting solid metallic plates from type was invented by William Ged, a goldsmith of Edinburgh, in 1731. The plates ordered by the University of Oxford for an edition of the Bible were mutilated by jealous printers and thrown aside—the old tale of narrow-minded prejudice and ignorance. Ged's plan was the *plaster process*, but after its abandonment several other means were tried before the plaster was resumed.

Carez (France, 1793) had a plan of dashing down the inverted form upon a surface of hot lead just in the act of solidifying. The cast thus obtained was used in the same way to obtain a cameo impression for a printing surface. Didot's plan consisted in casting types of a hard alloy, and pressing them into a surface of pure lead. This was brought down upon a paper tray of molten type-metal just in the act of solidifying. The *English Monthly Magazine* of January, 1799, comments on this plan. Herham set up the form in copper matrices, and took a cast therefrom in type-metal. These three plans were French.

Stereotyping was introduced into the United States by David Bruce, of New York, in 1813. The first work cast in America was the New Testament, in bourgeois, in 1814.

In the *plaster process* of stereotyping the type is set up with spaces, quadrats, and leads which come up to the shoulders of the type. Guard-lines and bearers are placed at the top of the page and at intervals of the type lines to support the plate during finishing. The type is then oiled, and inclosed by a flask to hold within bounds the fluid plaster, which is poured upon the face of the form, and worked in between the letters by a roller covered with flannel and leather. The plaster soon sets, and the mould is carefully raised by screws which lift it vertically from the form. The stereotype plate is then cast from the plaster mould, which is done by inclosing the mould in a box and plunging it into the bath of molten metal. The casting pan is

CASTING PAN.

of iron, consisting of a tray and a lid, the latter having at its corners gaps for the metal to flow in. Each pan has an iron plate or floater three-eighths of an inch

thick, which fits within it. Upon this plate the mould is laid face downward. The cover is chalked and secured by a yoke and screw. The pan is swung over the pot, and lowered on to the metal so as to become heated, then depressed so that the metal flows in at the corners and forces itself between the *floater* and *mould*. When the pan is filled it is submerged, and left till the bubbling has ceased. It is now swung over

STEREOTYPE CASTING APPARATUS—PLASTER PROCESS.

the water-trough and cooled. The cast is knocked out of the pan, the surrounding metal broken off, and the stereotype freed from the plaster.

The plate is then finished by trimming the edges, laying it on its face, and shaving off the back to bring it to an even thickness. The bearers are cut away with a chisel and mallet, the heads trimmed, and the sides beveled with a plane upon the shooting-board. The plate is then carefully examined and faults repaired.

In the *clay process* a plastic composition of fine clay and plaster of Paris, with a small quantity of gum-arabic water, is spread with a trowel to the thickness of a quarter of an inch upon a plate which is secured to a frame shown in the drawing as hinged like a tympan to the press bed. The form is laid face upward on the bed, the face of the type is brushed over with benzine, covered with a cloth and paper, the tympan is turned down upon the form, the bed run under the platen, and an impression

taken sufficiently deep to cause the clay to flow into the blank spaces and give the general outlines of the type. The press is then opened, the cloth and paper removed, and also any superfluous material which has been thrown up by the first pressure, and would be likely to bind. The press is again closed, and a complete impression taken, imbedding the type in the plastic material to the desired extent. This process is usually repeated one or more times in order to give a sufficient depth to the cups of the letters. The metallic plate carrying this mould is removed from the press, and the mould hardened by drying. When dry it is set afloat face upward in a vat of melted type-metal in order to bring it to the same temperature as the metal. A wire somewhat thicker than a finished stereotype plate, and bent so as to surround three sides of the mould, is placed on the plate, and a second plate is clamped over the wire, as in a moulder's flask. The whole is then put in a trough, the open edge of the mould upward, and the metal poured in. The casting is cooled by pouring water on the plate containing the mould. When the flask is opened the metal adheres to the mould, which is removed by wetting and brushing. The plate is then planed, trimmed, and dressed up for use.

Curved plates for cylinders are made from a flat form by using a sheet of spring steel of the desired curvature for a mould plate, which is spread flat on the tympan, and the plastic material is applied upon what is to be the concave side. After the impression is taken the sheet is released, and resumes its normal curvature, bending the plastic mould with it. The face of the plate is, of course, somewhat distorted, the stereotype appearing as if taken from type a little more condensed one way than that actually employed in the form.

The *papier-maché* process is very expeditious, and is generally used on daily papers of large circulation. A paper matrix is formed by spreading paste over a sheet of moderately thick unsized paper and covering it with successive sheets of tissue-

paper, each carefully patted down smooth; the pack is then dampened. The face of the type is oiled, the smooth surface of the paper treated with powdered French chalk, and laid upon the type. A linen rag is wetted, wrung out, and laid over the paper, and dabbed on the

back with a beating brush so as to drive the soft paper into all the interstices between the letters of the form. Remove the cloth, lay a reinforce sheet of damp matrix paper upon the back of the matrix, and heat again to perfect the impression and unite the surfaces of the two. For large establishments a matrix rolling machine is used. A double thickness of blanket is placed upon the matrix, the form and matrix laid in a press, and screwed down tight. The lighted gas heats the press and the form, and dries the paper matrix. The press is unscrewed, the matrix removed, and it is warmed on the moulding press. The

STEREOTYPE MOULD-DETVING PRESS—PAPER PROCESS.

matrix is then placed in the previously heated iron casting mould, and a casting gauge to determine the thickness of the stereotype plate is placed upon it. This extends around three sides of the matrix, the other being left open to serve as a gate at which the molten metal is poured in. The cover is screwed tight, the mould tipped to bring the mouth up, and the metal poured. When the metal is set the mould is opened and the matrix removed. The plate is then trimmed and otherwise prepared in the usual manner.

ELECTROTYPING.

Electrotyping is an application of the art of electroplating, which originated with Volta, Cruikshank, and Wollaston about 1800-1. In 1838 Spencer, of London, made casts of coins and impressions in intaglio from the matrices thus formed. In the same year Jacobi, of Dorpat, in Russia, made casts by electro-deposition, which caused him to be put in charge of the work of gilding the dome of St. Isaac's at St. Petersburg. Electrotyping originated with Mr. Joseph A. Adams, a wood-engraver of New York, who made casts in 1839-41 from wood-cuts, some engravings being printed from electrotype plates in the latter year. Many improvements in detail have been added since to the process as well as the appliances. Mur-

ray introduced graphite as a coating for the forms and moulds.

The process of electrotyping is as follows: The form is locked up very tight, and is then coated with a surface of graphite, commonly known as *black-lead*; but this is a misnomer. This is usually put on with a brush, and may be done very evenly and speedily by a machine in which the brush is reciprocated

BLACK-LEADING MACHINE.

over the type by a band wheel, crank, and pitman. A soft brush and very finely powdered graphite are used, the superfluous powder being removed, and the face of the type then cleaned by the palm of the hand. Knight's wet process of black-leading, as practiced at Harper and Brothers' establishment, is, however, much to be preferred, and will be described presently.

A shallow pan, known as a moulding pan, is then filled with melted yellow wax, making a smooth, even surface, which is black-leaded. The pan is then secured to the bed of the press, and the form placed on the bed, which is raised to deliver an impression of the type upon the wax.

ELECTROTYPING PRESS.

The pan is removed from the head of the press, placed on a table, and built up, as it is termed. This consists in running wax upon the portions where large spaces occur between type, in order that the corresponding portions in the electrotype may not be touched by the inking-roller, or by the paper sagging down in printing.

The wax mould being built, is ready for black-leading, to give it a conducting surface upon which the metal may be deposited in the bath. The wax mould is laid face upward on the floor of an inclosed box, and a torrent of finely pulverized graphite suspended in water is poured upon it by means of a rotary pump, a hose, and a distributing nozzle, which dashes the liquid equally over the whole surface of the mould. Superfluous graphite is then removed by copious washing, an extremely fine film of graphite adhering to the wax. This is Silas P. Knight's process, and answers a triple purpose. It coats the mould with graphite, wets it ready for the bath, and expels air bubbles from the letters. This process prevents entirely the circulation of black-lead in the air, which has heretofore been so objectionable in the process of electrotyping. Black-lead being nearly pure carbon, is a poor conductor, and in the usual process a part of the metal of the pan is scraped clean to form a place for the commencement of the deposit, and the back of the moulding pan is waxed to prevent deposit of copper thereon. When the dry black-leading is used the face of the matrix is wetted to drive away all films or bubbles of air which may otherwise be attached to the black-leaded surface of the type.

The mould is then placed in the bath con-

ELECTROTYPING BATH AND BATTERY.

taining a solution of sulphate of copper, and is made part of an electric circuit, in which is also included the zinc element in the sulphuric acid solution in the other bath. A film of copper is deposited on the black-lead surface of the mould, and when this shell is sufficiently thick, it is taken from the bath, the wax removed, the shell trimmed, the back tinned, straightened, backed with an alloy of type-metal, then shaved to a proper thickness, and mounted on a block to make it type-high.

Knight's expeditious process consists in dusting fine iron filings upon the wet graphite surface of the wax mould, and then pouring upon it a solution of sulphate of copper. Stirring with a brush expedites the contact, and a decomposition takes place; the acid leaves the copper, and forms with the iron a sulphate solution, which floats off, while the copper is freed and deposited in a pure metallic form upon the graphite. The black surface takes on a ruddy tinge with marvel-

ous rapidity. The film is afterward increased in the usual manner in the electro bath, but the deposit takes place immediately and regularly over the whole surface. The saving in time, acid, copper, and zinc is very great.

THE PRINTING-PRESS.

The *printing-press* in its earlier forms was but an adaptation of the ordinary screw-press. The form was locked up in a tray and placed on a platform, upon which the platen was brought down by a screw traveling in a cross-bar above. The screw was moved by a lever, which was shifted into holes in the boss of the screw.

The Blaew was the first patent press, 1620. The carriage was rounced in beneath the platen; the pressure was given by a handle attached to a screw hanging from the beam, and having a spring which caused the screw to fly back as soon as the impression was given. Blaew was a very ingenious and versatile man, and was for some time, in the earlier portion of his career, associated with Tycho Brahe, at the observatory of the latter in Denmark, in contriving instruments and reducing observations. Subsequently he was in Amsterdam, where he made globes and maps, and invented his improvements in printing-presses. He died there in 1638.

BENJAMIN FRANKLIN'S PRESS.

The Franklin press, one hundred years afterward in London, was a Blaew press with some minor improvements.

To this succeeded the Stanhope press, about the end of the eighteenth century. The oscillating handle operates a toggle to force down the platen upon the paper on the form. The bed travels on ways, and

LOED STANHOPE'S PRESS.

the tympan and frisket are hinged to lay back in elevated position.

The "Columbian" press, by George Clymer, of Philadelphia, was invented about

"COLUMBIAN" PRESS.

1817, and was perhaps the first important American contribution to the art of press-making. The power is applied to the platen by a compound lever consisting of three simple levers of the second order. Peter Smith's hand-press soon succeeded the "Columbian," and in 1829 the "Washington"

"WASHINGTON" PRESS.

was patented by Samuel Rust. The pressure in this is obtained by a compound lever applied to a toggle-joint, and the platen is lifted by springs on each side. The frame is made in sections, and the bed is run in and out by turning a crank which has a belt attached to its pulley or *rouveau*. The tympan and frisket are held up by the nature of their hinges, which allow only a certain amount of swing.

Power-presses or printing-machines, as they are indifferently called, belong exclusively to our century. Nicholson obtained a patent for a cylinder printing-machine (1) in 1790. It is not known that it was ever brought into use, but several of its features have survived in later and successful machines. The ink was applied by a roller; the types were made narrower toward the foot, so as to fit against each other snugly when attached to the exterior surface of a cylinder. The type cylinder revolved in gear with a leather-covered impression cylinder, and at another part of its rotation with an inking cylinder, to which inking apparatus was applied. The arrangement was modified (2) for a flat bed.

König, a German, constructed a printing-machine (3) for Mr. Walter, of the *London Times*, in 1814. The issue of the 28th of November of that year was the first newspaper printed by machinery driven by steam-power. It gave 1100 impressions per hour, and subsequently was worked up to 1800. The paper was held to its cylinder by tapes; the form was reciprocated beneath the inking apparatus and the paper cylinder alternately. To double the rate, a paper cylinder was to be placed on each side of the inking apparatus. The ink was placed in a trough, and ejected upon the upper of a series of rollers, passing downward in the series; and here first occurred the distributing roller with end motion.

König's press (4), which consisted of two single machines acting in concert and consecutively upon the two sides of the sheet, was perhaps the first attempt at a perfecting press. It was erected in 1818, but did not prove successful.

Donkin and Bacon's machine (5), 1813, was built for the University of Cambridge, England. Several forms were attached on the sides of a prism, and were presented consecutively to the inking cylinder and paper cylinder. In this machine were first used the composition inking-rollers, of glue and molaesca.

In 1815 Cowper obtained a patent for curved stereotype plates, to be affixed to a cylinder (6). By duplication of parts the machine (7) was designed to become a perfecting press. The greater portion of the cylinder forms a distributing surface for the ink, the remainder is occupied by the stereotype plate.

PRINCIPLES OF ACTION OF POWER-PRESSES.

Applegath and Cowper's single machine (8) went back again to the flat reciprocating bed, the double machine (9) being a perfecting press. This machine was the first to have diagonal distributing rollers to spread the ink smoothly by sliding on the reciprocating inking-table.

Applegath and Cowper's four-cylinder machine (10), 1827, superseded König's in the *Times* office, and printed at the rate of 5000 per hour on one side. It had four printing cylinders, one form of type on a flat bed, and the paper cylinders were alternately raised and depressed, so that two

were printed during the passage one way, and the other two on the return passage. A pair of inking-rollers between the paper cylinders obtained their ink from the table.

Applegath's machine, 1848, was long used upon the *Times*. It introduced one novelty—placing the whole series of cylinders on end. On the vertical type cylinder the type were arranged in upright columns, forming flat polygonal sides to the drum. Arranged around it were eight sets of inking apparatus alternating with eight impression cylinders, and the paper, fed from eight *banks*, was delivered upon as many tables. The paper fed from each feed-board was carried by tapes and rollers, and passed on edge to the type and impression cylinders, was carried off, thrown over flatwise, caught by a boy, and placed upon the table. The number of sheets per hour worked upon this machine rose from 8000 in 1848 to as high as 12,000, printed on one side.

The Hoe type-revolving printing-machine (11) is made with two to ten printing cylinders arranged in planetary form around the periphery of the larger type-carrying cylinder. The type is secured in *turtles*, or the stereotype is bent to the curve of the cylinder. The circumference of the central cylinder has a series of binary systems, the elements of which are an inking apparatus and an impression apparatus, the paper being fed to the latter and carried away therefrom by tapes to a flyer, which delivers it on to a table. It has as many banks as feeder or impression cylinders.

There are numerous modifications of the flat-bed and type-revolving machines for more or less rapid work, perfecting or for one side only; for fine wood-cut work, book-work, or job-work; with continuously revolving cylinders or stop-cylinders, which pause while the bed returns; with inking-

rollers varying in number with the kind of work required; and with many variations in size for posters, handbills, and cards.

The first flat-surface printing-machine was made by Daniel Treadwell, of Boston, in 1822. His machines, first used in Boston, were afterward used by Daniel Fanshaw in New York in printing the Bibles and tracts for the "American Bible Society" and the "American Tract Society." The machines for the former society were driven by a steam-engine, and those for the latter by two mules in the upper story of the Tract-house building, using an endless-track power. In this press the platen comes down on the type. These were the first printing-machines in America driven by other than hand-power, and were long used by Gales and Seaton in Washington in printing the Congressional reports, etc.

Next was the Adams press, which was introduced in 1830, has been since much improved, and still has a high reputation. Its movement is based on that of the hand-press, and gives a perfectly flat impression by lifting the bed of the press and its form against a stationary platen. Sheets are fed to the press by hand, and taken away by tapes and a fly. One thousand sheets an hour is a full speed for a large Adams press on book forms. It is shown in the figure by a longitudinal vertical section: *a* is the bed, which is raised by straightening the toggles, *b b*; *c* is the platen, *d* the ink fountain and ink-distributing apparatus. The inking-rollers, *e e*, pass twice over the form, and are attached to the frame of the tympan, *f*. The segment *g* serves to straighten the toggles, and cause the impression; *h* is the feed-board, *i* the drive-pulley, and *k* a gear wheel, with a pitman rod to *g*; *l* is the fly.

Single-cylinder presses, such as Hoe's, Potter's, Campbell's, etc., have a flat bed, which

ADAMS PRESS.

CAMPBELL'S SINGLE-CYLINDER PRESS.

is geared to reciprocate at an even speed with a revolving cylinder. Sheets of paper are fed to the cylinder, which carries a prepared tympan. The inked form runs along with the sheet until it is printed, when the form is retracted and inked again. In some machines the cylinder stops after the impression is delivered.

The Campbell press is remarkable for several fine points of adjustment. The operation is controlled by the sheet, which, when badly fed, is thrown out. The registering is operated by a small valve through the agency of points, making an electric circuit through point-holes in the sheet. When the press fails to print, the exhaust apparatus is brought into action, operating a bolt attached to a diaphragm, which locks up the impression. It has other peculiar features well worth mentioning if space permitted.

America produces a remarkable variety of handy job presses, known by the name of the makers, as the "Gordon," or by names which constitute trade-marks, as the "Globe," "Liberty," "Universal," etc.—a favorite device both with books in the early days of the art and with presses for a hundred years past; witness the "Columbian" and "Washington" hand-presses. One instance may be given.

The form in the "Gordon" press is secured in a chase, which is clamped to the bed, *b*, of the press. This bed rocks on a pivot at *c*, and comes into parallelism with the platen, *p*, when the impression is about to be given. The platen rocks on the main shaft, *d*, which is propelled by pitman and intermediate gearing from the treadle, *i*. The arm, *m a*, is the roller-carrier, which swings on a pivot, *r*, and carries the rollers, *w w*, alternately over

the form and the revolving disk, *t*, which distributes the ink: *g* is a counter-weight to balance the swinging bed and attachments, and operate the movable fingers by a spring bar, *e*: *v* is the feed-board.

The web press is a later thought, and bids fair to supersede all others for large editions and long numbers, where great nicety is not required. It is not yet expected that for fine work and cuts it will supersede the flat-surface and reciprocating-bed presses.

The "Walter" press prints the *London Times* and the *New York Times*. A roll of paper, *a*, three miles long, reels off over the pulley, *b*, which serves to keep it taut. It then passes by the wetting rollers, *c c*, and over the cylinder *d* to the first type cylin-

WALTER'S PERFECTING PRESS.

der, *e*, between which and the blanket cylinder, *f*, it receives its first impression. Following the direction of the type cylinder, it passes between two blotting cylinders, and is then delivered to the second printing cylinder, *g*, receiving the impression at *h*. It is then cut by a knife on the cylinder *i*. The sheets are finally piled by two persons on the paper-boards, *k k*. The speed of the Walter press is 11,000 printed sheets per hour.

The "Bullock" press, so named from the inventor, the late William Bullock, of Philadelphia, carries the forms upon two cylinders, requires no attendants to feed it, and delivers the sheets printed on both sides. The paper, in the form of an endless roll, is moistened by passing through a shower of spray. A single roll will contain enough

for several thousand sheets, and the printing operation, including the cutting of the paper into proper lengths, proceeds uninterrupted until the roll is exhausted. The roll of paper having been mounted in its place, the machinery is started, unwinds the paper, cuts off the required size, prints it on both sides at one operation, counts the number of sheets, and deposits them on the delivery board at the rate of 6000 to 8000 per hour. The roll of paper, *a*, is cut into sheets by a knife on roller *b* acting against the cylinder *c*. The sheets are seized by grippers, carried between the impression cylinder, *g*, and the form, *e*, receiving the first impression. The printed sheet then follows the large cylinder, *g*, to the second form, receiving its second impression from this form acting against the large drum, *g*. From the

"VICTORY" PERFECTING PRESS AND FOLDING MACHINE.

large cylinder the sheets are automatically delivered to the receiving board: \dagger is a counting device or arithmometer. The inking-rollers are shown above the inking cylinders, beneath which are the ink-troughs. The starting lever is shown on the right.

The "Victory," like those just described, receives its paper from a roll. The names on the parts will obviate the necessity of specific description. The paper is led over two wetting boxes, and then over two hot copper cylinders, and entered between the first type and impression cylinders. Here one side is printed, and it thence goes to the second type and impression cylinder, where it is backed. It then travels on tapes to the cutting and folding cylinders. Here it receives a transverse fold, and the doubled paper is passed to a serrated knife, which cuts the first printed sheet from the web. A second blunt knife again folds the double sheet, which is carried by grippers to a vi-

bratory frame, entering each alternate sheet to the respective pairs of cross-folding rollers, which deliver the sheets to tapes, which carry them to a swinging delivery frame, by which they are deposited in a pile on the table.

This machine will damp, print, cut, fold, and deliver 6000 to 8000 per hour of an eight-page newspaper of fifty inches square; or it will damp, print, cut, fold, and paste at the back a twenty-four page paper at the speed of 7000 per hour.

The "Hoe" web perfecting press is one of the lately established and successful candidates for public favor. The paper is printed from a roll containing a length of over four miles and a half, equal to 10,000 papers. The machine has three pairs of cylinders geared together. A roll, having been previously damped, is lifted into place by a small crane, and the paper from it passes between the first pair of cylinders, the cir-

cumferences of each of which are just equal to the required length of the sheet. One of these cylinders has its periphery covered with stereotype plates of the matter to be printed, and is supplied in the usual manner with an ink fountain and distributing rollers, which, as the cylinder revolves, apply the ink to the stereotype forms. The other cylinder is covered with a blanket, and as they revolve together, with the paper between them, they print its first side. The paper then passes on between the second pair of cylinders, and presents its blank side to the stereotype plates of the second type cylinder. It next passes to the cutting cylinder, the periphery of one of which has a vibrating and projecting knife that at each revolution enters a groove in the opposite cylinder and severs a sheet from the roll. The sheets are successively conveyed by two series of endless tapes to a revolving cylinder, which retains them until six (or any desired number) are collected upon it, when they are delivered in a body to the sheet flyer. A circular cutter cuts the double sheets into single copies.

A counter is attached which shows the number of sheets printed. The machine occupies a space of about twenty feet long, six feet wide, and seven feet high, and delivers 12,000 to 15,000 perfected sheets per hour.

These machines have a reputation on both sides of the Atlantic, being used by the London *Lloyds' News, Standard, and Telegraph*, while five of them are now building for offices in the United States and two for Australia.

FOLDING MACHINES.

As an improvement occurs in one of the machines of a series, every other one has to

mend its pace to keep up. So we found it with the ginning, carding, spinning, and weaving of fibre; so it was with the smelting, puddling, rolling, forging, turning, and planing of iron: one improvement begets another, and a halting member of a series which retards the speed becomes the object of so much solicitude that it shall go hard but he ere long outstrip his brethren in the race.

Machines for folding newspapers and sheets for books follow naturally in the wake of the presses. They are made of various kinds for octavo, 16mo, and 32mo; also for folding 12mo, cutting off, pasting, and inserting the inset; in some cases placing it in a cover, and doubling it up into compact shape for the mail wrapper.

The book-folding machine illustrated is for octavo work, sixteen pages on a sheet, eight pages on a side.

The sheet is placed on the table so that two register points pass through two holes in the sheet previously made on the printing-press. The folder comes down upon the folding edge, the pins give way, and the sheet passes, doubled edge first, between a pair of rollers, which compress it; tapes deliver it to a second table beneath, where a second and a third folder act upon it in turn, and it is delivered into a trough at the rate of 1500 per hour.

With 12mo work imposed in two parts of sixteen and eight pages respectively, the machine cuts them apart, and folds the larger part like an octavo; the smaller folds but once, and is then "inset" into the octavo portion, which forms the "inset."

The two-sheet folder and paster, for large twenty-four-page periodicals, folds one sheet of sixteen pages, 30 $\frac{1}{2}$ by 45 $\frac{1}{2}$ inches, inseting the eight pages within the sixteen, and pasting and trimming all, delivering a complete copy of twenty-four pages ready to read at the rate of 1200 per hour. It will fold eight pages alone, sixteen pages alone, with or without pasting or trimming, or will fold, paste, and trim the eight pages, inseting without pasting them in.

Machines of this general character are also made for folding, pasting, and trimming, or for folding, pasting, trimming all around, and putting on a cover of different-colored paper. The *Christian Union* is folded, inset, and covered in this manner, four of these machines being attached to a four-cylinder "Hoe" press.

ADDRESSING MACHINES.

Addressing machines are of two general kinds; one cuts the addresses from printed and gummed strips and attaches them to the paper. The Dick machine works in this way.

The other mode is to set up the addresses in a galley, and bring them successively to a spot at which the enveloped papers are consecutively presented.

The machine illustrated is one of many of the latter class. It prints with ink on the papers or wrappers at the rate of 3000 per hour. The names are set up in long narrow

ADDRESSING MACHINE.

galley holding fifty or seventy-five each, and after inking with a hand-roller, these are placed successively in the channel of the table, and are pushed along by the apparatus till each name in turn has come under the impression lever, which is worked by the treadle. The motion of the galley is automatic, and the machine indicates a change of post-office by the stroke of a bell, so that the papers may be thrown into separate piles to be bundled for mailing.

The "Fornalith" addressing machine also operates in a very satisfactory manner.

PRINTING FOR THE BLIND.

The art of printing in raised letters which may be distinguished by the touch originated and has been developed within the century. The first successful efforts in this direction were made at Paris in 1784 by the Abbé Valentin Haüy, who in the same year founded "L'Institution Royale des Jeunes Aveugles," the first institution ever established for the instruction of the blind.

Various systems of forming the embossed characters have since been introduced, which may be divided into two classes—the arbitrary, arranged exclusively with reference to the supposed greater facility with which their forms may be distinguished by the touch, no attempt being made to imitate ordinary printing; and the alphabetical, in which the letters resemble those ordinarily employed.

Prominent among the first are those of Lucas, Frère, Moon, Braille, and Carton. Lucas's system is composed of a series of dots, curves, and straight lines, each of which represents a letter, distinguishable by its form or the position in which it is set. Many contractions and abbreviations are employed, and though it is claimed to be easily read by the touch, its bulk and the frequent ambiguities arising from the peculiar system of abbreviations are objectionable. Thirty-six volumes are required to contain the Scriptures, which in the American lower-case alphabet are comprised in eight.

Frère's system is phonetic, thirty-six characters being employed, each representing a simple sound.

Moon, himself a blind man, represents the letters of the ordinary alphabet by characters, each composed of but one or two lines. The printing is read alternately from left to right and from right to left.

Braille's system is that generally employed in France: the letters are formed by combinations of dots varying in number from one to six.

Carton's system also employs dots, but arranged to more nearly resemble the letters of the Roman alphabet.

Among those known as alphabetical are—

The French, a combination of lower-case and capitals.

Alston's, English, has modified Roman capitals.

Friedlander's, American, Roman capitals of the kind known as block letters.

That of Dr. S. G. Howe, principal of the Institution for the Blind at Boston, Massachusetts, employs an angular form of lower-case for all the letters except G and J, which are capitals. This character is used at most of the institutions in the United States, and many valuable works have been printed in it.

Mr. N. B. Kneass, of Philadelphia, himself a blind man and a publisher of works for the blind, employs lower-case like that of Dr. Howe and block capitals, under the title of "Kneass's improved combined letter."

ENGRAVING.

The early history of engraving concerns the inscriptions on stones; the "iron pen," and inlaid "lead letters" in the rock, referred to by Job, if that be a fair understanding of the passage. Contemporary with this are the carved and lettered obelisks of Egypt, the tablets of Assyria and Etruria, the engraved gems in the breast-plate of Aaron, perhaps the leaden plates inscribed with Hesiod's "works and days," which were so long preserved at the fountain of Helicon, in Boeotia, as recorded by Pausanias.

From inscriptions the Greeks proceeded to engraving maps on metallic plates; and

the brass plates containing the Roman laws were complete enough for printing, but it does not seem to have been thought of. The history of engraving is the history of printing; but we must not repeat it here.

The art of engraving is naturally divisible into three orders—metal, wood, stone; the latter better known as lithography, and considered separately.

Engraving on metallic plates originated with chasers and inlayers. It can not but be that such artists took proof in dirty oil on rag or leather, but no impression of intrinsic value was had until the time of Finiguerra, a Florentine artist, in 1440. Euclid was printed with diagrams on copper in 1482. The copper-plate press was invented in 1545. Etching on copper by means of aquafortis was invented by F. Mazzuoli, or Palmegiani, in 1532; mezzotint engraving by Von Siegen in 1643; improved by Prince Rupert, 1646, and by Sir Christopher Wren in 1662.

Stipple engraving—also called "chalk engraving," from the resemblance of the work to crayon drawing—was invented by Jacob Baylaert in London in 1769; engraving on steel as a substitute for copper, by Jacob Perkins, of Philadelphia, in 1819.

The present century has not devised much that is new except the ruling machine by Wilson Lowry.

Plate engraving flourished in England from 1800 to 1850, but photography and lithography have gradually pushed it aside, since which the skill has decayed and the demand fallen off. Until this decadence persons of average taste would claim that though our predecessors excelled in rude vigor, our execution was as good as that of the earlier masters, and our effects better, the connoisseurs in the antique to the contrary notwithstanding. Nor will it avail for such to quote Gifford's sarcasm,

"We want their strength: agreed; but we alone
For that and more by sweetness all our own."

Wood-engraving originated in China, as we have had occasion to observe before; its first uses in Europe were in ornamenting paper and fabrics, afterward for making playing-cards.

The earliest known wood-cut with a date—the St. Christopher of 1423—is in the Althorpe Library, England, which, it may be stated in passing, contains the most valuable single volume in the world, an edition of Boccaccio printed at Venice by Valdarfer in 1474, of which no other perfect copy is known. It sold at the Duke of Roxburgh's sale in 1812 for £1260. The art of wood-engraving was much improved by Dürer, 1471–1528; by Bewick, 1789. It has gone on improving ever since, by fits and starts, but always onward. The great use made of it by the *Illustrated London News* is

an era; its advance over the *Penny Encyclopedia* affords a good means of judging the rate of progress. The American *Aldine* and *Picturesque America* are triumphs of the art.

LITHOGRAPHY.

The art of engraving or drawing on stone, so that printed copies may be obtained therefrom in the press, originated with Alois Senefelder, of Munich, 1796–1800. The invention was not a mere accident, as recounted in the common myth of an absent-minded man, a piece of limestone, and a waiting washer-woman, but was the result of earnest, persistent, and intelligent work directed to an object kept steadily in view.

The stone used for lithographic work is a compact sedimentary limestone of a yellowish or bluish-gray color, which comes from the Solenhofen quarries in Bavaria. It is ground by moving one stone upon another

LITHOGRAPHIC HAND-PRESS.

with sand between them, and then polished with pumice-stone.

Upon the stone thus prepared the design may be produced in four ways:

1. It may be done with a fluid, watery ink.
2. With a solid crayon.
3. By a transfer from an inky design on paper.
4. By engraving with an etching point.

1. The ink is essentially a soluble soap colored with lamp-black, applied with a pen or hair-pencil. The stone is then etched with a weak acidulous solution, decomposing the soap, combining with its alkali, and setting free the fatty acid in contact with the particles of carbonate of lime of which the stone consists, forming an insoluble lime soap which no washing or rubbing can remove and no fatty matter can penetrate. The stone is then flooded with gum-arabic water to incapacitate the clear parts from receiving ink when wetted. The stone is now placed in the press and made ready.

HOE'S LITHOGRAPHIC PRINTING-MACHINE.

With a sponge and abundance of water excess of gum is washed off, and, while still wet, the drawing is washed out with turpentine applied with a rag. This appears to obliterate every thing, but a close inspection shows the work as a pale white design on the face of the stone. The stone is now rolled up by passing a roller charged with printing-ink over its face, which is still damp; the greasy ink adheres to the white design, while the clear gummed damp face takes no ink. A sheet of paper is laid upon it, the tympan closed, and the stone pulled through. The operations of damping, inking, and printing are then repeated in succession.

2. The work by *lithographic crayon* is upon a *grained stone*, the surface of which is evenly roughened by grinding with very sharp and even sand of a grade according to the fineness of grain required. The crayon is of soap, wax, and tallow, and it is used on the stone as a drawing chalk is upon rough Whatman paper. The subsequent processes in preparing the stone are the same as those before described. The process gives opportunity for much artistic taste and display, the broken surface of the stone preventing the continuity of the lines, whose depth of color will depend upon the pressure of the crayon upon the rasping surface.

3. The *transfer method* consists in placing the design on paper and then transferring it to the stone. The writing, for instance, is done on ordinary sized paper, but preferably on paper prepared with a coating of gelatine, which may be colored with gamboge. The written sheet is damped, laid face down on the stone, and pulled through. The ink adheres to the stone, which is treated as before.

4. The *engraving method* differs from the preceding. The surface of the stone is treated with gum-arabic water, which, when dry,

is colored to allow the succeeding work to show. The design is then scratched in^d with needles or diamond points, and the face of the stone flooded with oil, which is absorbed by the stone where the etching points have laid it bare. The coloring matter and excess of gum are washed off, and the lines are filled with ink, the gum protecting the clean surface. The paper is laid on, and the stone pulled through the press, the sheet lifting the ink out of the lines. It is not usual to print from the engraved stone, but to transfer an impression therefrom to another one and print in the usual way.

There are many modifications of the art: a tint is rubbed on dry, and distributed or rubbed off according to the lights and shades of the design; by another mode the surface is covered with a solution of asphalt and crayon, and scraped off for the lights. The list might be much extended.

Until a comparatively recent period all lithographic printing has been upon hand-presses, but lately a successful lithographic printing-machine has been made. Hoe's machine is a stop-cylinder press, that is, one in which the cylinder comes to a stop pending the adjustment of the sheet. The paper is fed to grippers on the cylinder from the inclined table above. The traveling bed on which the stone rests is drawn under the cylinder by a crank and connecting rod from the end of the frame below, and the cylinder, after being thrown into gear, is rotated at the same time (carrying the sheet with it) by a rack attached to the side of the bed. At the end of the stroke the cylinder goes out of gear, and remains stationary and locked during the return of the bed and stone, the latter passing under a cut-away part of the cylinder, so as not to come in contact with it. In place of a tympan the cylinder is covered with a thin

rubber blanket. The inking of the stone is effected by parallel rollers (from three to six) in front of the cylinder, upon which are heavy riding rollers of iron, the latter being made to vibrate laterally to aid the distribution of the ink. These inking-rollers are covered with leather, like the ordinary hand-rollers for lithographic printing; they receive their ink from a table which travels with the bed, and are driven by a rack or friction pieces on the sides of the bed. The ink is fed to the table from a fountain at the end of the press, and distributed by a number of oblique-lying rollers, also covered with leather. The automatic damping arrangement is at the back of the cylinder. It consists of a shallow trough containing water, partially immersed in which a cylinder of wood is made slowly to revolve. An absorbent roller is held in contact with the surface of this roller for a longer or shorter time, according to the amount of water required upon the stone, after which it carries its increase of moisture over to a heavy riding roller, which again gives it up to two damping rollers covered with linen, which traverse the stone as it passes beneath them, just before it meets the inking-rollers near the cylinder; the feed of water admits of adjustment as to quantity while the press is in motion.

The pressure in this press is adjusted by means of butting screws, which lift or lower the bed in the traveling carriage; these screws are turned by a key from above. When the sheet is printed it is conveyed by an intermediate cylinder provided with grippers to the fly at the end of the press, and there deposited, face up, on the pile of printed work.

This press, though by no means identical with European machines of the same class, may be regarded as furnishing an illustration of the essential features of them all.

The introduction of the lithographic power-press has totally remodeled the lithographic trade throughout the world within the short period of six years (1868-74), increasing the possible production about tenfold. It has lowered the cost of, and in fact rendered possible, large editions from stone which in former times found their way to the type press, with very inferior results. By this change the general public have profited largely.

Chromo-lithography, the highest development of the lithographic art, differs only from the ordinary processes in the imposition of a number of impressions in different colors from as many different stones upon a sheet of paper, the combination of colors making a finished picture. An outline drawing is transferred to each stone required to complete the picture, so as to secure exactness in the co-relation of all parts on each stone. Upon these stones the artist draws

the different tints and colors, the number varying with the character of the picture. Mr. Prang's famous chromo, "Family Scene in Pompeii," occupied forty-three stones. An artist must have a high degree of skill in drawing, a fine feeling for and thorough knowledge of color, and must be able to tell what number of stones will be required, what the order of the tints and colors, what effect one tint will have upon the succeeding ones. Careful *register* is required, so that each color may fall in its proper place in the picture.

Senefelder died in 1834. Every phase of the lithographic art described in the foregoing was indicated, originated, or practiced by him. The development and perfection of the present day, in every branch of his great invention, would gratify and astonish him infinitely. He would gaze in amazement at the lithographic power-press printing thousands of sheets daily, and would be lost in admiration at the sight of a chromo which he would confound with the original painting, and which his art has placed within the reach of every one. All this he would readily comprehend; *photolithography* alone would be to him a mystery and a revelation.

PHOTOGRAPHY.

The art of photography is entirely embraced within the century. The solitary fact bearing upon the subject, and known to the world previous to 1776, was that *horn-silver* (fused chlorid of silver) is blackened by exposure to the sun's rays. It is now known that many bodies are photo-chemically sensitive in a greater or less degree, but some of the salts of silver and chromic acid in conjunction with organic matter are pre-eminently so, and are used practically to the exclusion of all others.

Scheele in 1777 drew attention to the activity of the *violet* and *blue* rays as compared with the rest of the spectrum; and Ritter in 1801 proved the existence of *dark rays* beyond the violet end of the visible spectrum by the power they possessed of blackening chloride of silver. Wollaston experimented upon gum-guaiacum. Wedgwood, previous to 1802, was the first to produce a photograph, in the technical sense of the word; this was a negative of an engraving which was laid over a sheet of paper moistened with a solution of nitrate of silver. Such a picture had to be carefully preserved from daylight, or the whole surface would blacken. Neither Wedgwood, nor Davy, who accompanied with observations the memorandum submitted by Wedgwood to the Royal Society, devised any mode of fixing the image.

From 1814 to 1827 Joseph Nicéphore Niepce, of Chalons on the Saône, experimented on the subject. In the latter year he communicated his process. He coated a

plate of metal or glass with a varnish of asphaltum dissolved in oil of lavender, and exposed it under an engraving or in a camera; the sunlight so affected the bitumen that the parts corresponding to the white portions of the picture or image remained upon the plate when those not exposed to light were subsequently dissolved by oil of bitumen and washed away. This was a permanent negative picture. In 1829 Niepce associated himself with Daguerre.

In 1834 Fox Talbot commenced his investigations, and in January, 1839, announced his *calotype* process. He prepared a sheet of paper with *iodide of silver*, dried it, and just before use covered the surface with a solution of *nitrate of silver* and *gallic acid*, and dried it again. Exposure in the camera produced no visible effect, but the latent image was developed by a re-application of the gallo-nitrate, and finally fixed by *bromide of potassium*, washed and dried. A negative so obtained was laid over a sensitized paper, and thus a *positive print* was obtained. This was a wonderful advance.

In the same month, January, 1839, Daguerre's invention was announced, but was not described till July of that year. In the *daguerreotype*, which has made the name of the inventor a household word, and furnished a test of skill in all the spelling schools of the United States, polished silver-surfaced plates are coated with iodide of silver by exposure to the fumes of dry iodine, then exposed in the camera, and the latent image developed by *mercurial fumes*, which attach themselves to the iodide of silver in quantities proportional to the actinic action. The picture is fixed by *hyposulphite of soda*, which prevents farther change by light.

Goddard in 1839 introduced the use of *bromine* vapor conjointly with that of iodine in sensitizing the silver surface.

The addition of chlorine was by Claudet in 1840. M. Fizeau applied the solution of gold, which combined with the finely divided mercury, and in part replaced it.

In 1848 M. Niepce de St. Victor coated glass with *albumen*, and treated it with nitrate of silver to sensitize and coagulate it. The film hardened in drying, and furnished a negative from which pictures might be printed by light.

The *collodion process*, by Scott Archer, of London, was one of the most remarkable inventions of the series, and has made photography the most important art industry of the world. A plate of glass is cleaned, floated with collodion, sensitized with iodides and bromides, usually of potassium. It is then plunged in a solution of nitrate of silver. Metallic silver takes the place of the potassium, and forms insoluble iodide and bromide of silver in the film,

BELLOWS CAMERA.

which assumes a milky appearance. The plate is exposed in the camera, and the latent image developed by an aqueous solution of protosulphate of iron, the picture gradually emerging by a dark deposit forming upon those places where the light has acted, the density of this deposit being directly proportional to the energy of the chemical rays. When sufficiently developed, the plate is washed with water, and fixed by washing away the free silver salt by a solvent, such as the cyanide of potassium or hyposulphite of soda. This removes the milky character of the film, and leaves the picture apparently resting on bare glass.

To produce *positive photographic prints* from such a negative a sensitized sheet of paper is placed beneath the negative, and exposed to the sun's rays. The light passes through the negative in quantity depending upon the transparency of its several parts, and produces a proportionate darkening of the silver salts in the albuminous surface of the paper. The paper is now washed to remove the unaltered nitrate, *toned* by a salt of gold, fixed by hyposulphite of soda, washed, dried, mounted, and glazed.

The *solar camera* is used for making enlarged prints from a negative. It is an adjustable portion, having a central aperture

at which the negative is exposed to the rays entering at the window, *b*; *c* is the lens; *d* the board for the paper enlargement.

Space can not be spared for even the recitation of the names of the various processes which have from time to time been prominently before the public. Some of these were invented in the infancy of the art, and have been long superseded by more perfect methods; others yet survive for certain purposes.

The *ambrotype* is a thin collodion negative on glass made by a short exposure, and developed so as to produce as white a deposit as possible on the lights. Such a picture is not looked at by transmitted light, nor is it valuable as a negative; it is to be backed up with a black surface, generally a black varnish, and regarded by reflected light only. Under these circumstances it appears as a positive, the deposit reflecting and the black backing absorbing the light. Pictures of this kind are rapidly made, and finished direct from the camera, as is the case with the *daguerreotype*, while the cost is very much less. They are, however, very inferior to good positives on paper, and had to make way for the latter as the negative process improved.

At the present day *ambrotypes* are rarely to be met with, but *ferrotypes*, or *tinatypes*, as they are sometimes called, are produced by a perfectly analogous process, the substantial difference being that the collodion picture is made directly upon a thin iron plate covered with a black enamel or lacquer, which protects both its surfaces from the action of the negative bath, and acts the part of the black backing used in the *ambrotype*.

Ferrotypes are still in vogue, the quickness with which they can be produced and their exceedingly small cost making them popular with the public. Cameras provided with a large number of lenses are employed in their production.

The trouble and difficulty in the efficient working of collodion negatives out-of-doors created a desire for a means of preserving a collodion plate in a sensitive condition, so as to render it unnecessary to coat, sensitize, and develop the plate where the landscape is taken. Accordingly a number of preservative and dry-plate processes have been invented. No dry process, however, gives results fully equal in quality to the work from wet plates, but they offer other advantages which can not be ignored.

The stereoscopic camera used for field work has an arrangement for instantaneous exposure of the two lenses, which admit pencils of beams to the plates in the binary chamber. Shutters are placed in front of each tube, so arranged that by touching a spring they are simultaneously rotated, bringing for an instant of time a hole in

STEREOSCOPIC CAMERA.

each shutter in correspondence with the tube, admitting rays of light from the object to the sensitized surfaces in the interior.

The first *daguerreotype* portrait from life was taken by Professor John W. Draper, of New York, in 1839. An announcement of it was made in the *London and Edinburgh Philosophical Magazine* in March, 1840. A full account of the operation was subsequently published in the same journal. He also took the first *daguerreotype* view in America, a view of the Church of the Messiah, from a window of the New York University. In his laboratory Professor Morse learned the art.

Daguerre made an unsuccessful attempt to photograph the moon. Dr. J. W. Draper succeeded in 1840 in obtaining a photograph of the moon on a silver plate with a telescope of five inches aperture. He presented specimens to the New York Lyceum of Natural History in 1840. Professor G. P. Bond, of Cambridge, Massachusetts, made photographs of the moon in 1850 with the Cambridge refractor of fifteen inches aperture. Many others followed. Mr. Rutherford's photographs of the moon are most excellent. Mr. Delarue, in England, must also be mentioned.

PHOTOLITHOGRAPHY.

Photolithography is a mode of producing by photographic means designs on stone from which impressions may be obtained in the ordinary lithographic press.

The first attempts in this line were by Dixon, of Jersey City, and Lewis, of Dublin, in 1841; they were followed by several inventors in Paris, Vienna, and Rome.

Their experiments were with resins directly upon stone. Joseph Dixon, 1854, was the first to use organic matter and bichromate of potash upon stone to produce a photolithograph. Poitevin was the first to recognize the fact that bichromated organic matter altered by light took the greasy ink from the roller. No great measure of suc-

OSBORNE'S COPYING CAMERA AND TABLE.*

cess was attained by operations with resins and directly upon stone. The various gelatine processes have been more successful.

J. W. Osborne patented in Australia September 1, 1859, and in the United States June 25, 1861, a transfer process, in which he prepares a sheet of paper by coating one side with a mixture of albumen, gelatine, and bichromate of potash, and dries it in the dark. This is exposed under a negative, whereby a visible change is produced, the brilliant yellow of the sheet, due to the salt of chromium, being changed to a chestnut-brown. In addition to this visible change, the organic matter becomes insoluble. A coating of transfer-ink is now applied to the whole exposed surface by passing the sheet through the press, face down, upon an inked stone. When the sheet is removed the photographic picture is almost invisible. The sheet is then floated, ink side upward, upon hot water, the action of which is to coagulate the albumen, rendering it insoluble, and to swell and soften the gelatine, causing the part affected by light to appear depressed by contrast. The sheet of paper so floated is next placed upon a slab, and the superfluous ink rubbed off by a wet sponge. This operation develops the picture. The sheet is then washed, dried, and transferred to the stone in the usual way. The coagulated albumen forms over the whole surface of the paper a continuous film, which adheres

strongly to the stone during the transfer process, preventing any shifting and consequent doubling of the lines. This is, for all practical purposes, the first successful photolithographic process, and has been used in the Crown Lands Survey Office of Victoria since September, 1859, in the publication of maps. Substantially the same process is used in the Ordnance Survey Office of England. The duplication and copying of drawings for the United States Patent-office has been for some years performed by this process, which, in accuracy and speed, leaves nothing to be desired.

The copying camera employed in making negatives from drawings is shown in the figure. The camera (containing the negative plate) and the plan-board, on which is tacked the drawing to be copied, are adjustable on a table, which is tilted on its truck to give the drawing a good presentation to the light. The focusing is done by a thin metallic belt, giving a rapid and positive movement on either side of the problematical focus. The table is always brought into a horizontal position in focusing, the end of the camera box being covered by a hood, under which the operator stands. So placed, he controls the positions both of the plan-board and the lens, and has the ground glass always at a convenient distance from him. In copying at or near full scale the position of the lens affects the size of the picture, making little change in the sharpness of the focus, which latter operation is then done with the plan-board. When a large reduction is required, the position of the plan-

* The majority of the illustrations for this article are borrowed from *Knight's Mechanical Dictionary*, published by J. B. Ford and Co., New York.

board affects the size, and the focusing is done with the lens.

MISCELLANEOUS PHOTO PROCESSES.

Besides the processes which have been described under the titles *Photography* and *Photolithography*, there are a number of others which should not be entirely overlooked. The processes yet remaining to be stated depend upon the use of gelatine.

Mungo Ponton in 1839 first discovered the sensitiveness to light of a sheet of paper treated with bichromate of potash. Becquerel in 1840 determined that the sizing of the paper played an important part in the change. Fox Talbot in 1853 discovered and utilized the insolubility of gelatine exposed to light in the presence of a bichromate. Dissolve gelatine in hot water, add to the solution some bichromate of potash and dry it; the compound is sensitive to light in a way different from ordinary photographic paper. If a photographic negative on glass be laid over a sheet of this prepared gelatine, the portions shielded from light by the dark parts of the picture will dissolve as readily as before, while the parts acted on by light will form a tough tawny substance unaffected by hot water.

From this point the gelatine processes naturally divide into two groups.

1. The first group includes *carbon printing*. Poitevin, in 1855, was the first to use carbon combined with gelatine as a vehicle, availing himself of its insoluble character after exposure. This process is as follows: Paper is coated with a compound of bichromate of potash, gelatine, and lamp-black dissolved in cold water. This paper is dried in a dark room, exposed beneath a negative, and the parts not affected by the actinic action of the light dissolved off by hot water. The resulting picture is a positive print in black and white, of which the shades are produced by the carbon of the lamp-black, blackest where the light acted most freely, and with all the various shades according to the relative translucency of the different portions of the negative. Poitevin subsequently introduced a process for carbon printing under a positive. The process was materially improved by Swann about 1861. He transferred the film, after exposure, to another surface with the face downward, so that the dissolving was effected from its back, after which it was retransferred to the paper, on which it remained.

2. The picture is produced by the action of light on bichromated gelatine, and is made (a) to produce a print capable of being transferred; or (b) to serve as a printing matrix, from which impressions may be taken by the ordinary lithographic means; or (c) to obtain an impression in relief which may be printed from in the ordinary printing-press.

(a) The first success in this line resulted in the process of photolithography, which has been considered.

(b) Paul Pretsch in 1854 discovered and utilized the quality which a sheet of bichromated gelatine possessed of not swelling in water after exposure to light. Poitevin, 1855, was the first to recognize the fact that bichromated organic matter altered by light took greasy ink from the roller. Tessié du Motay and Maréchal, in 1864, were the first to print from a photographic image on bichromated gelatine as from a lithographic stone.

The *Albert-type*, named from Albert, of Munich, the *autotype*, the *heliochrome*, by Edwards, now worked by J. R. Osgood, of Boston, and many others might be cited, differing in minor respects. Edwards, in the *heliochrome*, produced a movable film; by the addition of chrome-alum to the gelatine a tough, tawny, insoluble sheet is formed, capable of standing rough usage, and yet retaining its property of being acted on by light in the presence of a bichromate, and of receiving and refusing greasy ink. The sheet is exposed under a negative, mounted on a metallic plate, the superfluous chemicals washed out, and then printed from with lithographic ink on an ordinary platen printing-press, being damped between each impression, as in ordinary lithographic printing.

(c) *Relief-work* is produced in several different ways, but can not here be described. Niepce de St. Victor in 1827 led the way by an asphaltum and etching process.

The *photoglyphic* process of Fox Talbot, 1852, was another etching process. The *photogalvanograph* of Pretsch, 1854, depended upon the swelling of the gelatine after exposure; a matrix was taken in gutta-percha, and from this a cameo plate was obtained by electro-deposit. The *phototype* belongs to this sub-class. Poitevin in 1855 had a process somewhat resembling this, in which he obtained a cast by the use of plaster hardened with protosulphate of iron. Osborne in 1860 transferred the inked gelatine sheet to zinc, and etched to make a relief.

In the *Woodbury process*, from which such excellent results have been obtained for illustrating the *Medical and Surgical History of the War*, the gelatine picture in relief, obtained by light, is placed in contact with a sheet of soft metal, and subjected to heavy hydraulic pressure. This gives a picture in reversed relief and depression. Such a mould is deeper in the places answering to the shades in the original picture, and conversely, shallower in the lights. It is filled with a solution of colored gelatine in hot water; a piece of paper is placed on top and pressed down with a level lid, so as to squeeze out the superfluous gelatine. The paper is then lifted, bringing with it the colored gelatine, which forms the picture.

PHOTO-MICROGRAPHY.

The co-application of the microscope and photographic process has led to wonderful results, which we may briefly illustrate by an example. Merely referring to the early attempts of Donné, and the experiments of Gerlach, Albert, and Maddox in Europe; and of Rood and Rutherford in America, we may describe the plan adopted by Colonel J. J. Woodward, M. D., of the United States Army

exposure. For powers between 500 and 1500 a $\frac{1}{8}$ -inch objective is employed, dispensing in general with an eye-piece or amplifier, and placing the sensitized plate at a distance not exceeding three to four feet from the microscope. In the case of objects having very minute details, however, it is frequently advantageous to employ an eye-piece or amplifier rather than enlarge a negative taken with a smaller power.

Though natural sunlight is to be preferred, it may be sometimes necessary, when this is wanting, to employ artificial illumination. For this purpose the electric, the magnesium, and the oxy-calcium lights have been used with success. Of these the electric light is the best, and for its production Dr. Woodward employs a Duboscq lamp, operated by a battery of fifty small Grove elements, ten in a cell.

The accompanying figure is a fac-simile of a photograph obtained by the instrument just described. It is an enlargement on a scale of 817 diameters from a writing on glass by Webb, of London, for the United States Army Medical Museum. The writing was executed with a diamond point by an instrument of Mr. Webb's invention, and known as a micro-pantograph.

The glass slip also contains the following inscription in a larger writing: "Webb's Test. The Lord's Prayer. 227 letters in the $\frac{1}{8} \times \frac{1}{8}$ of an inch, or the $\frac{1}{1000}$ of a square inch, and at the rate of 29,431,458 letters to an inch, which is more than 8 Bibles, the Bible containing 3,566,480 letters."

The area within which the prayer was written was micrometrically verified by Dr. Woodward, who found that it and the

WOODWARD'S MICRO-PHOTOGRAPHIC APPARATUS
(WITH SOLAR LIGHT).

Medical Museum in Washington. He dispenses with a camera and ground glass. The operating-room has two windows, through one of which sufficient yellow light is admitted to enable the operator to work; the lower part of the other window is provided with a shutter fourteen inches high, the upper part being blackened. In the shutter is a hole in which is inserted a tube, *a*, through which the solar light reflected from a plane mirror, *b*, or, preferably, a heliostat, is thrown upon the achromatic condenser of the microscope, *c*, which is placed on a shelf at the window of the dark room. The light reflected through the tube, which is provided with an achromatic lens of about ten inches focal length, is thrown upon the achromatic condenser. *d* is the focusing device; *g f*, the negative holder and its stand.

For powers from 200 to 500, a $\frac{1}{4}$ -inch objective without an eye-piece is used, the power being varied by increasing or diminishing the distance of the sensitized plate from the instrument. A cell filled with ammonio-sulphate of copper, which absorbs the non-actinic rays, is interposed between the large lens and the condenser, and a hood is drawn around the instrument to prevent any loss of light.

For objects magnified less than 500 diameters the time of exposure, being less than a second, is regulated by a sliding shutter placed before a slit in front of the microscope, the width of the slit being adjusted to correspond with the required length of

*Our Father which art in
heaven hallowed be Thy
name Thy kingdom come
Thy will be done in earth
as it is in heaven Give us
this day our daily bread and
forgive us our trespasses as we
forgive them that trespass
against us and lead us not
into temptation, but deliver
us from evil. Amen*

THE LORD'S PRAYER.

above inscription were contained within a space $\frac{1}{8}$ of an inch square.

According to a statement made in 1882 by Mr. Farranta, president of the Microscopical Society of London, Mr. Peters has succeeded in writing the Lord's Prayer so as to be distinctly legible, with sufficient magnifying power, within the space of $\frac{1}{1000}$ of a square inch.

WASHINGTON, D. C. EDWARD H. KNIGHT.

THE LAST JOURNALS OF DAVID LIVINGSTONE.*

DAVID LIVINGSTONE.

THE world owes a debt of gratitude it can never pay to the faithful servants who, through dangers and against obstacles which the imagination can but faintly picture, bore the dead body of their friend and master, with all the precious records of his wanderings and discoveries, from the little village where he breathed his last to the sea-coast at Zanzibar. But for their affectionate devotion these records would have been lost; and with the exception of what was contained in the diary intrusted to the

care of Mr. Stanley, all knowledge of the important discoveries made by the great traveler during the last seven years of his life would have perished. Thanks to the fidelity of these poor ignorant men, in the narrative now given to the world, covering seven years of continuous travel and discovery, not a break occurs. "We have not," says the editor of this deeply interesting work, "to deplore the loss, by accident or carelessness, of a single entry from the time of Livingstone's departure from Zanzibar, in the beginning of 1866, to the day when his note-book dropped from his hand in the village of Ilala, at the end of April, 1872." The preservation of these documents appears almost miraculous when we consider the nature of the perils through which they were borne to a place of safety. The little

* *The Last Journals of David Livingstone, in Central Africa, from 1865 to his Death. Continued by a Narrative of his Last Moments and Sufferings, obtained from his faithful Servants Chuma and Susi.* By HORACE WALLACE, F.R.G.S., Rector of Twywell, Northampton. With Portrait, Maps, and Illustrations. New York: Harper and Brothers.

band of faithful servants had to make their way with their precious burden hundreds of miles through a wild and terrible country, through lands where the debased and superstitious tribes would have torn them in pieces had it become known that they were carrying a dead man, over rivers swollen into raging torrents, across mountains, and through dense forests, where dangers lurked in every thicket. Yet although at every step beset with perils, suffering oftentimes from hunger and thirst, and sometimes almost dead with fever, the dreaded scourge of equatorial Africa, they remained faithful to their sacred trust, and gave an example of fidelity and heroism that should never be forgotten.

Before proceeding to sketch, in a necessarily brief manner, the last years of Dr. Livingstone's life, a word should be said in regard to the nature of the notes and journals thus wonderfully preserved. Our readers will remember that when Mr. Stanley left him in 1872 Dr. Livingstone intrusted to his care a very large diary, sealed up and consigned to the safe-keeping of his daughter, Miss Agnes Livingstone. When the rumor of his death was confirmed this book was examined, and found to contain a considerable part of the notes he had made during his travels previous to his meeting with

Mr. Stanley. It was his custom always to have in use metallic note-books, in which the day's jottings were recorded. When time and opportunity served, these were carefully entered in the larger volume. It seems, however, that during the last three or four years of his life this rule had to give way to the toils of travel and the exhaustion of distressing sickness. While in the Manynema country he ran out of note-books, ink, and pencils, and had to resort to shifts which at first made it very doubtful whether the most diligent attempt at compilation would succeed in bringing order out of what appeared to be inextricable confusion. Such pocket-books as remained at this period of his travels were utilized to the last inch of paper. In some of them were found lunar observations, the names of rivers, the height of mountains, advancing toward the middle from one end, while from the other the itinerary grows day by day interspersed with map routes of the march, botanical notes, and carefully made drawings. But in the mean time the middle portion of the book was filling up with calculations, private memoranda, words intended for vocabularies, and extracts from books, while here and there the stain of a pressed flower causes indistinctness. Yet the thread of the narrative runs throughout, and nothing

line, as well as all his maps, which now for the first time come to light.

It would be impossible to overstate the importance of Dr. Livingstone's researches and discoveries. By his own exertions, beset with perils and obstacles which would have driven back a man less courageous and determined, he has filled up a great space in the map of Africa; he was the first European whose eyes beheld vast inland seas whose existence had been vaguely conjectured from native reports; he laid down the course of hundreds of new rivers, and noted their volume and the velocity of their flow. Most important among the facts recorded in his journals is the discovery that Lake Nyassa belongs to a totally distinct system of waters from that which holds Lake Tanganyika and the rivers running north and west. With regard to the latter lake he leaves an

ORUMA AND SUGI

but his invariable habit of repeating the month and year in each date prevents hopeless confusion. At last pocket-books gave out, and old newspapers, yellow with African damp, were sewn together, and a substitute for ink was improvised. Loving patience at length accomplished the laborious task of deciphering this portion of the journals. On comparing this great mass of material with the journal intrusted to Mr. Stanley, it was found that a great deal of most interesting matter could be added. In the hurry of writing and copying dispatches previous to his companion's departure, Dr. Livingstone had rapidly entered up from his note-books as much as time permitted. Fortunately he carried the original note-books up to the time of his death, so that they were forth-coming with his other effects. His faithful men had saved every

interesting problem to be solved by future explorers. It may be taken for granted that he would hardly venture the surmise that Tanganyika may have a subterranean outlet without having duly weighed the probabilities in the scale with his elaborate observations. But whether this lake really pours its waters through the caverns of Western Kabogo into the vast rivers flowing northward is a problem which must soon be determined by actual exploration.

Besides geographical information of importance, these journals contain innumerable notes on the habits of animals, birds, and fishes; on phenomena of every kind that came under the keen, searching eye of the great traveler as he moved through some of the grandest and most beautiful scenes in the world; descriptions of native life and habits; and sketches of personal adventure,

KILLING BONES

told with the natural modesty of a great man, whose thoughts were more on his work than on himself.

In preparing these journals for publication, the editor, a life-long friend of Dr. Livingstone, and for some time his companion in Africa, received valuable assistance from the doctor's faithful men, Chuma and Susi, to whom the world is indebted for the pres-

ervation of his manuscripts. They were with the editor for four months. Among other good services, they aided the artist by reproducing in exact fac-simile the hut in which Dr. Livingstone died, besides making models of the "kitanda" or traveling cot on which he was carried during his last journey, and of the village in which his body lay for fourteen days.

Dr. Livingstone's point of departure on his last journey was the island of Zanzibar, where he arrived from Bombay on the 26th of January, 1866. A letter from Sir Bartle Frere, Governor of Bombay, addressed to his Highness Sejuel Majid, Sultan of Zanzibar, to whose consideration and friendly aid the great traveler was warmly commended, procured for him many tokens of kindness from that petty sovereign, but, owing to the delays that seem to be inseparable from dealings with the people of Eastern countries, his preparations for starting were not completed until the 18th of March. He sent forward to Ujiji, on Lake Tanganyika, a portion of his supplies, consisting of beads, cloth, flour, tea, coffee, and sugar, consigned to the care of an Arab trader at that post named Thani bin Suelim. This man turned out to be a great rascal. On the 19th of March he left Zanzibar in the *Penguin* for Rovuma Bay, at the mouth of the river of that name. His live stock, consisting of six camels, three buffaloes, two mules, four donkeys, and a calf, was sent off in a dhow, the name given to the coasting vessels of East Africa and the Indian Ocean. His party was made up of thirteen Sepoys, ten Johanna men, nine Nassick boys, two Shupanga men, and two Waiyans, Wakatani and Chuma. Several of these men had previously been employed by Dr. Livingstone on the Zambesi and Shiré; thus Musa, the Johanna man, was a sailor on the *Lady Nyassa*, while Susi and Amoda were engaged at Shupanga to cut wood for the *Pioneer*. The two Waiyan lads, Wakatani and Chuma, were liberated from the slavers by the Doctor and Bishop Mackenzie in 1861, and lived for three years with the mission party at Chibisa's before they were engaged by Livingstone. The Nassick lads were entire strangers, and were trained in India.

Rovuma Bay was reached on the 22d of March, and until the 6th of April the time was busily occupied with preparations for the march into the interior. The doctor was in high spirits and full of courage.

Leaving Rovuma Bay on the 6th of April, he started southward with his little caravan. On the evening of the next day the buffaloes and camels were severely bitten by the tsetse fly, a pest of an insect, whose bite will usually lay the foundation of a disease that destroys animals in a few weeks. This was the beginning of misfortunes. Sickness assailed the men, who were obliged often to cut a way through dense jungles of thorn climbers, one species of which gave them a great deal of trouble. It bears some resemblance to the scabbard of a dragoon's sword, but along the middle of the flat side runs a ridge from which springs up, every few inches, a bunch of inch-long straight sharp thorns. It hangs straight for a couple of yards, but as if it could not give its

thorns a fair chance of mischief, it suddenly bends on itself, and all its cruel points are now at right angles to what they were before. It really seems to be eager for mischief, stretching out its prickly fingers in all directions to inflict injury upon every one who comes within reach—a clear case of natural depravity.

The route pursued by Livingstone followed the general course of the Rovuma. As the little caravan ascends the river, sometimes marching along the bank, and sometimes over or around the flanking hills, thriving villages are passed, surrounded by cultivated fields, where rice and tobacco are grown. The Sepoys proved very troublesome. They beat the animals so brutally when the Doctor was not in sight that several fell sick and had to be left behind. On the 1st of May the party reached a country comparatively free of wood, and were able to move on without the perpetual cutting and clearing that hitherto had delayed their progress. The brutality of the Sepoys grew worse and worse, and their habitual laziness gave the Doctor no end of trouble. They would sit down and smoke, leaving the animals standing loaded in the hot sun. They refused to carry their belts and bags, and their powers of eating and vomiting were astounding. They would eat a hearty breakfast, and an hour afterward they would sit down to gorge again, unless Dr. Livingstone was on hand to keep them moving. It is not surprising that the supplies of food soon gave out, and as it was difficult to buy new stores, the party soon began to suffer from hunger.

As Livingstone pressed further into the interior the horrors of the slave-trade became more and more apparent. One day he passed the dead body of a woman tied by the neck to a tree. The people of the country explained that she had been unable to keep up with the other slaves in a gang, and her master had determined that she should not recover to be the property of any one else. Others tied in a similar manner were seen further on. There is a double purpose in these murders. The terror inspired in the minds of the survivors spurs them on to endure the hardships of the march. One day one of Dr. Livingstone's men wandered from the party and came upon a number of slaves yoked together with slave-sticks, like those shown in a preceding illustration. They had sickened for want of food, and had been abandoned and left to die. When found they were too weak to speak. Some of them were mere children.

On the 15th of July Livingstone reached Mataka, near the southern end of Lake Nyassa. The town, which numbers at least a thousand houses, and is surrounded by small villages, is situated in an elevated val-

YOUNG & SWOLLEN EYELIDS.

ley overlooked by lofty mountains. The chief, Mataka, kept the party waiting for some time in the veranda of his large square house, but at length appeared with a broad smile on his good-natured face. He was about sixty years old, dressed as an Arab, and as his remarks were frequently greeted with laughter, he was judged to be a wit. He gave the party a very hospitable reception. They had marched for eight days on a meagre diet of porridge and rice, and the change from hard and scanty fare made several of them sick. The natives of this region, the Waiyana, are described as being far

THE LAST MILE OF LIVINGSTONE'S TRAVELS.

from handsome. Their heads are of a round shape, with compact but not particularly receding foreheads. The lips are full, and with the women a small lip-ring just turns them up to give additional thickness. Their style of beauty is exactly that which was in fashion when the stone deities were made in the caves of Elephanta and Kenora, near Bombay.

Livingstone remained at Mataka until the 29th of July, when he started for Lake Nyassa. The march for a part of the way was through a depopulated country. The natives differ as to the cause. Some say slave wars, and assert that the Makoa from the vicinity of Mozambique played an important part in them; others say famine; others that the people have moved to and beyond Nyassa. Certain it is, from the potsherds strewn over the country, and the still remaining ridges on which beans, sorghum, maize, and cassava were planted, that the departed population was prodigious. The Waiyans, who are now in the country, came from the other side of the Rovuma, and they probably supplanted the Manganja, an operation which we see going on at the present day. The lake was reached, at the confluence of the Misinjé, on the 8th of August. "It was," says Livingstone, "as if I had

come back to an old home I had never expected again to see; and pleasant to bathe in the delicious waters again, hear the roll of the sea, and dash in the breakers." The head man there, Mokaloé, was very friendly, and presented millet, porridge, cassava, and boiled hippopotamus meat. He had his little domestic afflictions, and confided them to Livingstone. One of his wives had recently run away. Livingstone asked how many he had left, and on being told twenty in all, the Doctor remarked that was nineteen too many. He gave the usual answer, "But who would cook for strangers if I had but one?" He was a great toper of beer, and his manner of drinking was curious. As he emptied the contents of a huge jug down his capacious throat, a slave girl put both hands round his waist below the short ribs, and gradually drew them round in front, as if to make the liquor go equally over the stomach.

Livingstone now crossed the Shiré, which flows into Nyassa at the southern end of the lake, and continued his journey on toward the Mazitu country. The way was rendered doubly laborious by the immense "earth sponges" frequently encountered. They consist of black porous earth covered with a hard wiry grass and a few other damp-lov-

ing plants. When one treads on the black earth, though little or no water appears on the surface, it is frequently squirted up the limbs, and gives the idea of a sponge. In the paths that cross them the earth readily becomes soft mud, but sinks rapidly to the bottom again, as if of great specific gravity: the water in them is always circulating and oozing. The places where the sponges are met with are slightly depressed valleys, without trees or bushes, in a forest country where the grass, being only a foot or fifteen inches high, and thickly planted, often looks like a beautiful glade in a park. They are from a quarter of a mile to a mile broad, and from two to ten or more miles long. The water of the heavy rains soaks into the level forest lands: one never sees runnels leading it off, unless occasionally a foot-path is turned to that use. The water, descending about eight feet, comes to a stratum of yellow sand, beneath which there is another stratum of fine white sand, which at its bottom cakes so as to hold the water from sinking farther. Livingstone had previously found the same thing in the Kalahari Desert when digging for water for his cattle. The water is guided by the fine sand stratum into the nearest valley, and here it oozes forth on all sides through the thick mantle of black porous earth which forms

the sponge. In the desert it appears to damp the surface sands in certain valleys, and the Bushmen by a peculiar process suck out a supply. When he had dug down to the caked sand there years before, the people begged him not to dig farther, as the water would all run away, and he desisted, because he saw that the fluid poured in from the fine sand all round the well, but none came from the bottom or cake. Two stupid Englishmen afterward broke through the cake in spite of the entreaties of the natives, and the well and the whole valley dried up.

On the 24th of September Livingstone reached the large village of Marenga, situated at the extremity of the "beel" of the lake. The people collected in great numbers to gaze at the stranger. The chief was ill, but his brother was present, and asked a few questions. Livingstone took the occasion to be a good one for telling him something about the Bible and the future state. The men said that their fathers had never told them aught about the soul, but they thought that the whole man rotted and came to nothing. What Livingstone said was very nicely put by a volunteer spokesman, who seemed to have a gift that way, for all listened most attentively, and especially when told that our Father in heaven

VILLAGE WHERE THE BODY WAS PREPARED.

loved all, and heard prayers addressed to Him. Here Livingstone was deserted by all the Johanna men, who went back to the coast and spread a report of the great traveler's death, which filled the whole civilized world with sorrow, until Mr. Edward Young made a journey to Nyassa, and ascertained the story to be merely an invention.

Still pushing northward, Livingstone reached Kimsusa's on the 28th of September. Kimsusa, an old friend, gave him a most hearty welcome, and fairly loaded him down with provisions. When Livingstone was ready to start on, Kimsusa accompanied him a part of the way, his numerous wives acting as porters. The lack of means of transportation was the cause of much delay. Obligated to avoid places stripped of provisions, the party pursued a zigzag course, like a ship baffled with foul winds. The people, too, were unable to give information about others at a distance from their own abodes. An intelligent smith, who acted as guide for a portion of the way, did not know a range of mountains about twenty miles off. "It was too far away for him to know the name." Another source of annoyance was the hostile attitude of the Mazitu people, who were sending out marauding parties and plundering in every direction. Great caution was necessary to avoid falling into the hands of any of these parties, while their spoliations

had made it very difficult to obtain supplies of food. On nearing one village the travelers were mistaken for Mazitu raiders, and the villagers issued out in force to attack them. The true character of the party was discovered in season to prevent bloodshed. To add to their discomforts, four goats were lost or stolen. Livingstone felt this loss very keenly, for whatever kind of food he had, a little goat's milk made it all right, while without it the coarse fare was very hard of digestion.

Among the numerous notes of natural history scattered through this part of his journal we find mention of the honey-guide, an extraordinary bird that flies from tree to tree in front of the hunter, chirruping loudly, and will not be content till it arrives at the spot where the bees have made their nest. It then waits quietly till the honey is taken, and feeds on the broken crumbs of comb that fall to its share. While resting one day two honey-hunters came up with the party. They stopped to talk and smoke, and the honey-guide they were following waited quietly on a neighboring tree until they were ready to go on, when it again took the lead.

Toward the end of January, 1867, Livingstone met with a very serious loss, that of his medicine chest. Two Waiyau servants deserted. They had been very faithful, and

knowing the language of the country well, were extremely useful. Their uniform good conduct had inspired confidence, and they were more trusted than any of the other servants. But they deserted in a dense forest, taking with them the medicine chest and several valuable packages. The forest was so dense that there was no chance to get sight of the fugitives, and a heavy rain coming on, their foot-prints were entirely obliterated. Livingstone felt as if he had received the sentence of death.

On the 1st of April, 1867, Livingstone reached the southeastern end of the body of water called Lake Liemba, which subsequently proved to be the southern extremity of Lake Tanganyika. The first view was obtained from an elevation of about 2000 feet. The lake appeared to be eighteen or twenty miles broad, and they could see about thirty miles up toward the north. Livingstone was enchanted with the place, and remained there some time. The lake lies in a deep basin whose sides are nearly perpendicular, but covered well with trees; the rocks which appear are bright red argillaceous schist; the trees were then all green: down some of these rocks come beautiful cascades, and buffaloes, elephants, and antelopes wander and graze on the more level spots, while lions roar by night. The level place below is not two miles from the perpendicular. The village (Pambété) at which they first touched the lake is surrounded by palm-oil trees—not the stunted ones of Lake Nyassa, but the real West Coast palm-oil tree, requiring two men to carry a bunch of the ripe fruit. In the morning and evening huge crocodiles were observed quietly making their way to their feeding-grounds; hippopotamuses snorted by night and at early morning.

A few days after arriving at this beautiful spot Livingstone had an alarming fit of insensibility. He found himself floundering outside of his hut and unable to get in. He tried to raise himself by laying hold of two posts at the entrance, but lost his grasp when nearly upright, and fell back, striking his head heavily against a box. Some hours elapsed before he could recognize where he was. Not many days afterward he experienced another attack of the same kind. The loss of the medicine chest was sorely felt.

Livingstone remained about six weeks on the shore of the lake trying to pick up some flesh and strength. The natives showed him many acts of kindness, and gave him valuable information about the movements of the Arabs who had come into that country in search of ivory, and were fighting their way. This induced him to go south around the district infested by these marauders. When he had traveled about sixty miles he heard that the head-quarters of the Arabs were twenty-two miles further on.

They had found ivory very plentiful and cheap, and had pushed on toward the west till attacked by a chief named Nsama, whom they beat in his own stockade. They were now at a loss which way to turn. On reaching Chitimba's village Livingstone came upon them. They were about six hundred in number. On presenting a letter he had from the Sultan of Zanzibar he was immediately supplied with provisions, beads, and cloth. They approved of his plan of passing to the south of Nsama's country, but advised waiting till the effects of punishment, which the Bäulungu had resolved to inflict on Nsama for breach of public law, were known. It was anticipated that Nsama might flee: if to the north, he would leave Livingstone a free passage through his country; if to the south, he might be saved from walking into his hands. But it turned out that Nsama was anxious for peace. He had sent two men with elephants' tusks to begin a negotiation; but treachery was suspected, and they were shot down. Another effort was made with ten goats, and repulsed. This was much to the regret of the head Arabs. It was fortunate that the Arab goods were not all sold, for Lake Moero, which Livingstone was anxious to visit, lay in Nsama's country, and without peace no ivory could be bought, nor could he reach the lake. The peace-making between the people and Arabs was, however, a tedious process, occupying three and a half months—drinking each other's blood.

Passing to the north of Nsama, and moving westward, Livingstone reached the north end of Moero on the 2th of November, 1867. There the lake is a goodly piece of water twelve or more miles broad, and flanked on the east and west by ranges of lofty tree-covered mountains. The range on the west is the highest, and is part of the country called Rua-Moero; it gives off a river at its northwest end, called Lualaba, and receives the river Kalongosi (pronounced by the Arabs Karungwesi) on the east near its middle, and the rivers Luapula and Rovukwe at its southern extremity. The point of most interest in Lake Moero is that it forms one of a chain of lakes, connected by a river some five hundred miles in length. First of all, the Chambezé rises in the country of Mambwé, northeast of Molemba. It then flows southwest and west till it reaches latitude 11° S., and longitude 29° E., where it forms Lake Bemba, or Bangweolo; emerging thence, it assumes the new name Luapula, and comes down here to fall into Moero. On going out of this lake it is known by the name Lualaba, as it flows northwest in Rua to form another lake, with many islands, called Urengé or Ulengé. When Livingstone crossed the Chambezé the similarity of names led him to imagine that this was a branch of the Zambesi. The natives

said, "No; this goes southwest, and forms a very large water there." Subsequent explorations proved the correctness of this information.

Adjacent to the upper end of Lake Moero lies Casembe's town, which Livingstone visited near the end of November. The town covers a mile square of cassava plantations, the huts being dotted over that space. Some have square inclosures of reeds, but no attempt has been made at arrangement: it might be called a rural village rather than a town. No estimate could be formed by counting the huts, they were so irregularly planted, and hidden by cassava; but Livingstone's impression from other collections of huts was that the population was under a thousand souls. The court or palace is a square inclosure of three hundred yards by two hundred yards, surrounded by a hedge of high reeds. Inside, where Casembe honored the traveler with a grand reception, stands a gigantic hut for Casembe, and a score of small huts for domestics.

On this occasion Casembe sat before his hut on a square seat placed on lion and leopard skins. He was clothed in a coarse blue and white Manchester print edged with red baize, and arranged in large folds so as to look like a crinoline put on wrong side foremost. His arms, legs, and head were covered with sleeves, leggings, and cap made of various-colored beads in neat patterns; a crown of yellow feathers surmounted his cap. Each of his head-men came forward, shaded by a huge ill-made umbrella, and followed by his dependents, made obeisance to Casembe, and sat down on his right and left; various bands of musicians did the same. When called upon Livingstone rose and bowed, and an old councilor, with his ears cropped, gave the chief as full an account as he had been able to gather of the English in general and the great traveler's antecedents in particular. The fact that Livingstone had passed through Lunda to the west of Casembe, and visited chiefs of whom he scarcely knew any thing, excited most attention. He then assured Livingstone that he was welcome to his country, to go where he liked, and do what he chose. A display of the presents intended for the chief closed the interview. The Casembe (the word signifies general) visited by Livingstone was a usurper, and on coming into power, about five years before, had ruled with such barbarity—cropping ears, lopping off hands, and selling children—that many of his subjects had taken refuge in neighboring countries. His favorite mode of punishing his ministers was cropping their ears. The public executioner, who generally attended him, carried a pair of sharp shears for this purpose.

While in this region Livingstone heard

stories of wonderful under-ground dwellings in the Rua Mountains. These caverns or excavations extend for a distance of twenty miles, and are capable of housing a population of ten thousand souls. Provisions are stored in them for use in case of war, and a perennial rivulet flows inside. In some cases the doorways are on a level with the plain, in others they are reached by means of ladders. On one occasion, when the main entrance was besieged by an enemy, some one who knew all the intricacies of the excavations led a party out by a secret passage, surprised the besiegers, and drove them off with heavy loss. Livingstone thinks that these under-ground dwellings may have been dug out by the original burrowing race, as the present natives know nothing of their origin, and have no traditions concerning it.

After many tedious delays, Livingstone started from Casembe's on the 11th of June, 1868, on his way south to discover Lake Bemba, or more properly Lake Bangweolo, Bemba being the name of the country in which it lies. On his way he crossed a wide grassy plain, through which flows the Luongo, a deep river embowered in a dense forest. The trees were covered with lichens, some flat, others long and thready, "like old men's beards," and waving in the wind as they do on the mangrove swamp trees on the coast. A company of slaves passed, singing as if they did not feel the weight and degradation of the slave-sticks about their necks; but on asking the cause of their mirth, Livingstone was told that they were rejoicing at the idea of coming back after death and haunting and killing those who had sold them into slavery. Their song ran, "Oh, you sent me off to Manga" (sea-coast), "but the yoke is off when I die, and back I shall come to haunt and to kill you." Then all joined in the chorus, in which the name of each trader was repeated. It told not of mirth, but of the bitterness and tears of the oppressed.

On the 18th of July Livingstone reached the shore of the lake, one of the largest in Central Africa. He records the fact with characteristic modesty: "Reached the chief village of Mapuni, near the north bank of Bangweolo. On the 18th I walked a little way out, and saw the shores of the lake for the first time, thankful that I had come safely hither." He was unable, from obstacles thrown in his way by the natives, to make a thorough exploration of the lake; but from information gleaned from canoe-men, he judged its dimensions to be not less than one hundred and fifty miles in length by eighty in width. It contains four large islands, the largest of which sustains a thriving population and flocks of sheep and goats.

Livingstone started back on the 30th of

July, and on the 7th of August reached Kombokombo's stockade, in the Imbozhwa country, where, on account of the disturbed condition of the country, he was obliged to remain a long time. His Arab associates of the last few months had taken up Casembe's cause against the devastating hordes of Mazitu, who had swept down on these parts, and had repulsed them. But now a fresh complication arose. Casembe and Chikumbi, chief of the district, became alarmed lest the Arabs, feeling their own power, should turn upon them and take possession of the whole country; so they joined forces and made an attack on Kombokombo, one of the leading Arabs. The assault was repulsed, but the Arabs felt that they could no longer remain in security, and accordingly united their forces in order to effect a safe retreat. This was accomplished on the 23d of September, Livingstone and his little party going with them. Kombokombo soon parted from his associate, Syde bin Omar, with whom Livingstone kept until the cataracts of the Kalongosi were reached.

Livingstone's object was now to reach Ujiji, on Lake Tanganyika, where he hoped to find letters, a good supply of medicines, and stores for trading. Weeks and months of tedious waiting and slow, toilsome travel were before him. The new year, 1869, opened badly. He fell dangerously ill. For some time the entries in his journal failed altogether, and when resumed they were very brief; nor was he able at any time during this seizure to continue the minute maps of the country in his pocket-books, which now for the first time fail. Before reaching the western shore of Tanganyika he became so weak that he was carried, for the first time in his life, in a kitanda, or frame, like a cot. Even this was painful to the sick man. The way was rough; head down and feet up alternated with feet down and head up, while changing shoulders by the bearers, involved a distressing toss from one side to the other of the kitanda. On the 14th of February he reached the western shore of the lake, at the confluence of the river Lofuko. After some delay canoes were procured for the voyage to Ujiji. There, on the 14th of March, the sorely tried and almost dying traveler was landed, to meet with a grievous disappointment. His supplies, which had been left to be transported from Zanzibar by caravan, had been made away with in all directions. Medicines and wines had been left at a place thirteen days' journey east of Ujiji, and of the goods that had reached the latter settlement a large amount had been stolen.

While waiting to recover strength and get fresh supplies Livingstone employed his time in writing letters to his family and friends in England. These letters never reached Zanzibar.

By the 12th of July, 1869, Livingstone felt sufficiently strong to set out for the exploration of the Manyema country, an unknown region lying west of Tanganyika. He found that the country and the people differed in almost every respect from the regions lying nearer the east coast. The Arabs had an inkling of the vast quantities of ivory which might be procured there, and Livingstone went into the new field with the foremost of those hordes of Ujijian traders, who, in all probability, will eventually destroy tribe after tribe by slave-trading and pillage, as they have done in so many other regions. The country is described as surpassingly beautiful. Palms crown the highest heights of the mountains, and their gracefully bended fronds wave beautifully in the wind, and the forests, usually about five miles broad, between groups of villages, are indescribable. Climbers of cable size in great numbers are hung among the gigantic trees, many unknown wild fruits abound, some the size of a child's head, and strange birds and monkeys are every where. The soil is excessively rich, and the people, although isolated by old feuds that are never settled, have attained considerable skill in cultivation.

In this region Livingstone spent nearly a year, making many discoveries of great importance, which must be passed without mention here. He met, as usual, with many difficulties and obstructions, and endured many serious hardships. Finally, toward the end of June, 1870, all his men deserted except Susi, Chuma, and one other; and with these faithful attendants only, he pressed forward toward the Lualaba River, which he was most anxious to explore. The obstacles in his way proved to be too great, and he was at length obliged to retrace his steps. He halted at a place called Bambarré. Here he witnessed a hunt for sokos, an entirely new species of chimpanzee, of which he gives a very interesting description. An extensive grass-burning had forced the creatures out of their usual haunts, and, coming on the plain, they were speared. The soko often goes erect, with a hand to its head as if to steady the body. It is an ungainly beast. Its light yellow face shows off its ugly whiskers and faint apology for a beard; the forehead, villainously low, with high ears, is well in the background of the great dog mouth; the teeth are slightly human, but the canines show the beast by their large development. The hands, or rather the fingers, are like those of the natives. The flesh of the feet is yellow, and the eagerness with which the Manyemas devour it leaves the impression that eating sokos was the first stage by which they arrived at being cannibals: they say the flesh is delicious. The soko is represented by some to be extremely knowing, successfully stalking

men and women while at their work, kidnapping children and running up trees with them. It seems to be amused by the sight of the young native in its arms, but comes down when tempted by a bunch of bananas, and, as it lifts that, drops the child: the young soko in such a case would cling closely to the armpit of the elder. One man was cutting out honey from a tree, and naked, when a soko suddenly appeared and caught him, then let him go. Another man was hunting, and missed in his attempt to stab a soko. It seized the spear and broke it, then grappled with the man, who called to his companions, "Soko has caught me!" The soko bit off the ends of his fingers, and escaped unharmed. These animals do not attack unarmed men, and never molest women. If wounded, they will seize the hunter by the wrist and bite off the fingers. They will draw out a spear, but never use it, and stuff leaves into the wound to stanch the blood. Some of the Manyemas think that their buried dead rise as sokos.

At Bambarré Livingstone was rendered helpless for nearly three months by distressing ulcers on the feet. His mind was clear and active, and he occupied himself with his notes, maps, and journals. We find among his notes a vehement protest against "theoretical" discoverers and map-makers, with special mention of one who, in laying down the probable course of the Chambezé, made it run between three and four thousand feet up hill, and called it the "New Zambesi," probably, says Livingstone, because the old Zambesi runs down hill.

At length, on the 16th of February, 1871, he started northward, having received some supplies and a reinforcement of servants. After traversing a wide extent of country, passing through many villages, and crossing many small rivers, he reached the Lualaba River, at the town of Nyafigwé, a short distance below the confluence of the Kunda. Most anxious to explore the great river, which at this point is very deep and not less than three thousand yards across, and to visit a lake formed by the confluence of two rivers west of the Lualaba, to which he had given the name of Lincoln, in honor of the martyr President, Livingstone was baffled by inability to procure canoes, want of supplies, and the disturbed condition of the country. He was witness to a terrible massacre of unoffending people and to the burning of many villages, but was helpless to prevent these atrocities. After weeks of weary waiting he started back for Ujiji on the 20th of July, and after a dangerous and eventful journey, during which on several occasions he narrowly escaped death, he once more found himself at the great Arab trading station on the eastern shore of Tanganyika. He was reduced to a skeleton; but the market being held daily, he

hoped that food and rest would soon restore him. He discovered, however, that during his absence all his goods had been sold by the rascal who had charge of them, leaving him almost a beggar among strangers. It is not surprising that he fell into a despondent state of mind. "I felt," he writes, "as if I were the man who went down from Jerusalem to Jericho and fell among thieves;" but when his spirits were at their lowest ebb, the good Samaritan was close at hand. One morning Susi came running to him at the top of his speed, and gasped out, "An Englishman! I see him coming!" and off he darted to meet him. Livingstone followed. The American flag at the head of a caravan betrayed the stranger's nationality. Bales of goods, baths of tin, huge kettles, cooking pots, tents, etc., made the wayworn and half-starved explorer think, "This must be a luxurious traveler, and not one at his wits' end like me."

The stranger proved to be Mr. Henry Moreland Stanley, the energetic and untiring correspondent sent out by the proprietor of the New York *Herald* with orders to obtain accurate information about Livingstone if living, and if dead to bring home his bones. Stanley's arrival was most opportune. The fresh supplies of food, the exciting news of the world from which he had been cut off for nearly two years, raised Livingstone at once from his despondency. In a week he began to feel strong again. "I am not," he writes, "of a demonstrative turn—as cold, indeed, as we islanders are usually reputed to be—but this disinterested kindness of Mr. Bennett, so nobly carried into effect by Mr. Stanley, was simply overwhelming. I really do feel extremely grateful, and at the same time I am a little ashamed at not being more worthy of the generosity."

Stanley reached Ujiji in the latter part of October, 1871, and remained with Livingstone until the middle of the following March. Meanwhile they made a canoe voyage to the northern end of Tanganyika, and discovered that the river Lusizé, previously supposed to be an outlet, pours its sluggish waters into the lake. "The outlet must therefore be sought elsewhere. Livingstone conjectured that its waters might flow off through subterranean channels, or possibly through the Mokungo into the Lobumba River. On returning from this survey the travelers explored the Unyanyembe region, and then Stanley took his departure for the coast. He urged Livingstone to return with him and recruit his shattered health before continuing his arduous task. But the brave old man was firm in his determination not to leave Africa until he had made one more effort to solve the grand problem of the Nile sources. At Unyanyembe the travelers parted, on the 14th of

March, 1872, Stanley pushing toward the coast with the news for which the whole world was looking with anxious solicitude, and Livingstone waiting at Kwi-hara until the arrival of supplies and men, to be sent back by Stanley from the coast, should enable him to set out once more.

Livingstone was "all but certain" of the existence of "four full-grown gushing fountains" on the water-shed eight days south of Katsinga, each of which at no great distance off becomes a large river; that two of the rivers thus formed flow north to Egypt, the other two south to Inner Ethiopia. Even were these not the fountains of the Nile mentioned to Herodotus by the secretary of Minerva, at Sais, in Egypt, Livingstone deemed them worthy of discovery, as lying in the last hundred of the seven hundred miles of water-shed in which nearly all the Nile springs unquestionably rise. It was his purpose to go from Unyanyembe round the south end of Tanganyika, across the Chambezé and to the south of Bangweolo, then due west to the ancient fountains. By pursuing this route he hoped that no sources of the Nile flowing from the south would escape him. "No one," he writes in his journal, "will cut me out after this exploration is accomplished; and may the good Lord of all help me to show myself one of His stout-hearted servants, an honor to my children, and perhaps to my country and race!"

While waiting thus Livingstone was not without material to afford him occupation. Distances were calculated from native reports, preparations for the coming journey were pushed on, many of his astronomical observations were copied out, and minute records taken of the rain-fall. Still it was a period of trying suspense. It was not until the 14th of August that the stout-hearted old man was gladdened by the arrival of a troop of fifty-seven men and boys. Of his original followers only five remained. These were Susi, Chuma, and Amoda, who joined him in 1864 on the Zambesi—that is, eight years previously—and Mabruki and Gardner, Nassick boys hired in 1866. The new-comers by degrees became accustomed to the hardships of travel, and shared with the old servants all the danger of the last heroic march home. It must not be forgotten that it was to the intelligence and superior education of Jacob Wainwright, one of the new-comers, that the world was indebted for the earliest account of the eventful eighteen months during which he was attached to the party.

Preparations for the journey were now pushed forward with great energy, and on the 25th of August, 1872, Livingstone started south from Unyanyembe. The records in his diary are very brief, and we frequently come across the entry, "Ill." His old enemy was upon him, and he had little strength

for resistance. The men speak of few periods of even comparative health from the date of September 18. Still he pressed on as rapidly as his growing weakness would permit, always looking for the bright side where all seemed dark, and with his mind intent on the grand object of his life. As the party approached Lake Bangweolo the difficulties of the march increased. The surface of the country was traversed by immense "sponges." The men speak of the rest of the march as one continual plunge in and out of morass, and through rivers which were only distinguishable from the surrounding waters by their deep currents and the necessity for using canoes. To a man reduced in strength, and chronically affected with dysenteric symptoms ever likely to be aggravated by exposure, the effect may be well conceived. It is probable that had Livingstone been at the head of a hundred picked Europeans, every man would have broken down. His company of followers must have been well led, and under the most thorough control, to endure these marches, for nothing crows the African so much as rain. Livingstone soon became unable to endure the wading, and was carried across the sponges and streams on the shoulders of his faithful servants.

Added to the natural difficulties of the way, there were delays from the treachery of guides and scouts, from the necessity of sending out parties in search of food, and from the rapacity of native chiefs through whose territory the line of march lay. Under the pressure of these harassing obstacles, Livingstone's disorder increased, and his hair all turned gray. Up to April 21 he wrote every day in his journal, though the entries are very brief; from the 22d to the 27th of that month he had not strength to write any thing but the several dates. Under date of April 27 is this entry:

"Knocked up quite, and remain—recover—sent to buy milch goats. We are on the banks of the Mollamo."

These are the last words that David Livingstone wrote. The party was now south of Lake Bangweolo. Since the 21st Livingstone had been unable to ride the donkey he had brought from Unyanyembe, and his servants, in order to carry him with as little pain to him as possible, made a kitanda of wood, consisting of two side pieces of seven feet in length, crossed with rails three feet long and about four inches apart, the whole lashed strongly together. This frame-work was covered with grass, and a blanket laid on it. Slung from a pole, and borne between two strong men, it made a tolerable palanquin for the exhausted traveler. To render the kitanda more comfortable, another blanket was suspended across the pole, so as to hang down on either side and allow the air to pass under while the

sun's rays were fended off from the sick man. By this means Livingstone was carried to the river Molilamo, or Lulimala as it stands on the map. Here it was necessary to remain until canoes could be procured for crossing. This was accomplished, and on the 29th Livingstone, with great difficulty and at the expense of excruciating pain, was got over the river and taken to Chitambo's village, a short distance further on. For the first mile or two they had to carry him through dreary swamps, and were glad enough to reach something like dry ground. The village was almost empty, the inhabitants being absent guarding their growing crops, and the men found room and shelter ready to their hand. The rapidly sinking traveler was taken into a vacant house and laid gently on a bed. A fire was lighted outside, nearly opposite the door, and a boy slept just within to attend to his master's wants in the night.

The next day he was still weaker. At night-fall some of the men silently took to their huts, while others, whose duty it was to keep watch, sat round the fires, all feeling that the end could not be far off. About 11 P.M. Susi, whose hut was close by, was told to go to his master. At the time there were loud shouts in the distance, and, on entering, Livingstone said, "Are our men making that noise?" "No," replied Susi; "I can hear, from the cries, that the people are scaring away a buffalo from their dura fields." About an hour later Susi was again called by Majwara, the boy. On reaching the bed he was directed to boil some water, and for this purpose he went to the fire outside, and soon returned with the copper kettle full. Calling him close, he asked him to bring his medicine chest, and to hold the candle near him, for the man noticed he could hardly see. With great difficulty Livingstone selected the calomel, which he told him to place by his side; then, directing him to pour a little water into a cup, and to put another empty one by it, he said, in a low, feeble voice, "All right; you can go out now." These were the last words he was ever heard to speak.

It must have been about 4 A.M. when Susi heard Majwara's step once more. "Come to Bwana; I am afraid; I don't know if he is alive." The lad's evident alarm made Susi run to arouse Chuma, Chowperé, Matthew, and Muannaséré, and the six men went immediately to the hut.

Passing inside, they looked toward the bed. Livingstone was not lying on it, but appeared to be engaged in prayer, and they instinctively drew backward for the instant. Pointing to him, Majwara said, "When I lay down he was just as he is now, and it is because I find that he does not move that I fear he is dead." They asked the lad how long he had slept. Majwara

said he could not tell, but he was sure that it was some considerable time. The men drew nearer.

A candle, stuck by its own wax to the top of the box, shed a light sufficient for them to see his form. Livingstone was kneeling by the side of his bed, his body stretched forward, his head buried in his hands upon the pillow. For a minute they watched him: he did not stir; there was no sign of breathing; then one of the men advanced softly and placed his hands on his cheeks. They were quite cold. Livingstone was dead. It was the morning of May 1, 1873.

The faithful men at once held a consultation as to the best means of preserving the body and the effects of their beloved master. They were in a trying position. Africans have a horror of the dead, and great caution was necessary in preparing the body and conveying it to the coast. We have already alluded to the heroic fidelity with which this was done, and must refer our readers to the book for the deeply interesting narrative of the adventures of these loyal men on their long and perilous journey to the sea-board. Great indeed must have been the love that dared and overcame so much! So long as the name of David Livingstone is known and honored among men, these brave and faithful servants will be remembered with gratitude.

A WOMAN'S CHOICE.

BLANCHE was all in a cloud of tulle and lace. Lorrimer likened her somehow to his pet mountain peak just tipped with sunshine and draped in rarest mist. The sunshine, of course, was her face: was ever brighter, fairer, more dainty, delicate, and fine? The color glowed in her cheek like a flame, then paled rapidly away. Of what combination was composed that subtle bloom, and whence came that wonderful blue in her eyes?—so blue that no color was ever on his palette like it.

She was even more than fashionably fair, for with all this filigree and fuss about her, there was that in the grace and rhythm of her every movement that appealed to the artistic soul of Lorrimer.

"You will not, you *must* not go," she murmured, and her tones were full of coaxing entreaty; but her glance wandered away to the whirling pairs in the corridors, and her foot beat time to the music.

"How you envy these dancing dervishes!" said Lorrimer.

"No, no," she whispered in return. "You know I would rather talk with you. But was there ever any thing so ravishing as that galop?"

"It is the one dance I hate above all others," said Lorrimer—"a dashing, desperate hand-to-hand conflict, that when you are

engaged in, I must be out of sight and hearing!"

Blanche sighed. It was doubtful if she even heard this last remark. Every faculty of her being was absorbed just then in that throbbing of the tumultuous-strained galop, now in the very height and fervor of its maddest temptations.

And now Mr. Lennox appeared at the further end of the corridor. He put up his glass and looked upon one side and the other. Oh, could he be looking for her, and already the galop on the wane! Blanche's color rose, her eyes sought eagerly the trained steps of yonder Terpsichorean, and Lorrimer knew that whatever soul was in this beautiful body had gone out to meet the master of the dance. All too soon there is nothing left him but the glimpse of a white arm and hand on a black dress-coat, and away she whirls out of his sight in the arms of this Lennox, the emptiest-headed coxcomb that Lorrimer knew.

What could he do but go back to her prototype, the mountain peak, that even now rested fair and still in that star-lit valley of New Hampshire? Going from the train the next evening, the mile and a half to the farm-house was one long revelation of beauty.

Lorrimer knew that the sturdy, powerful step that strode past him and was fast becoming lost in the distance was that of the son of his landlady at the farm, and was dimly conscious of a lack of courtesy in not hailing him as a companion; but Nature was in one of those delicious moods that he wanted to be alone with her, and, besides this, John Bradshaw was a morose, surly, cross-grained boor at the best—a fellow born to a heritage of beauty which he was sacrilegious enough to despise.

Lorrimer had heard this young man declare that if the whole mountain were his own, he would gladly swap it—ravines, glens, wind-blown summits, and all—for a bit of good rolling prairie land, and from that time Lorrimer had held him as one who would sell his birthright for a mess of pottage.

At the breakfast-table the next morning Lorrimer did not fail to contrast the viands at the farm with those resting at that moment on the sumptuous board he had just left, and remarked to himself that perhaps the very stint of luxury to which they were condemned added to the bounty of those palaces of pleasure wherein the lovely Blanche found her home during the summer months.

Not that he cared a pin for himself. Thanks to the life he led, he was blessed with the digestion of an ostrich, and could live upon any sort of food for the time being; but at the further end of the long barren table his eyes rested upon the slim, some-

what bent form of the village school-teacher; her thin little hand dallies with the spoon in the wretched concoction called coffee in her cup, on her fire-blistered plate swims again the bit of stringy ham in the sea of turgid gravy, and in the steam that exhales from the pyramid of yellow biscuits before her Lorrimer fancies he can see the familiar afrite of saleratus threatening the poor child's weary day.

He would have taken any trouble just then to have transported this poor little blighted woman to the side of the beautiful Blanche, and would have tasted a rare felicity in seeing her enjoy what he estimated as "a square meal." And now she rises from the table and goes forth to be the victim of this small Inquisition in the shape of a school.

Lorrimer caught up his sketching apparatus and joined her at a turn of the road. The red dust had already fallen thickly on her black dress; the little figure drooped wearily. One of her hands had instinctively sought her forehead and pushed back the hat that seemed to compress her brain.

"Such a headache this bright morning!" she said, smiling faintly up at Lorrimer. "What a blot I must seem on this lovely landscape—nothing but tremors of nerves and throbbing aches and pains! Isn't it strange in this mountain air?"

"Not at all," said Lorrimer, looking first at her and then at his knapsack, half inclined to drop the one and carry the other. "The mountain air is sadly diluted when it reaches our bed-chambers, Miss Wharton; it comes to us fresh from the kitchen drain, and is strongly tinctured by the flavor of our breakfast-table, only it has the disadvantage of being live pork in this case. Our mountain air is a deadly malaria!"

"Do you, then, thrive upon poisons?" said Miss Wharton; and her fleeting glance was a subtle tribute to Lorrimer's blonde and classical allurements.

"Oh, as for me," he replied, "I am just now like Venus, straight from the sea."

"The sea!" she exclaimed, clasping her hands together with an involuntary air of yearning. "I'd give the world, Mr. Lorrimer, just for a glimpse of it—just to hear the lap of the waves on some sandy beach, and drink in for one little moment delight enough to last me a lifetime!"

"You've never seen the sea?" said Lorrimer.

"Never," she repeated, with a sad accent that reached the heart of her companion; "nor ever shall, I suppose."

Here a square whitewashed building loomed up in front of them, a troop of noisy children swarming about its portal. She took a key from her little reticule, unlocked the door, let the unruly crowd flock

in, then went after them herself, with a little nod of adieu to Lorrimer. He stood there a moment with an air of distraction and dismay, as one who stands without a prison gate and finds that the misfortune of the creature within, deprived of God's sunshine and the bountiful air, has tainted his own freedom and rendered it for the time abortive. Then he walked slowly back to the spot where best he could catch the light and shade on his mountain peak; but despite himself his thoughts drifted to the little school-teacher and her love for the sea.

It was so readily seen, after all; quite an ordinary matter to get down to the ocean; even possible to do the trip and back again in a day if one looked sharp about the trains: amusing to hear the little woman's excitement about so simple a matter as the swash of the waves on the beach. Blanche never looked at things in that light; but then Blanche—good Heavens!—Blanche De Vigne and Melicent Wharton were two vastly different beings: one was sunshine, the other shadow; that was it; and to a painter—confound it!—both these elements were necessary. A fellow grew tired of a blaze of light forever; he wanted rest in the shade—natural, quite natural!

Many a time that day his brush dropped from his hand and his gaze wandered down the rough red road. When at last the shadows lengthened into afternoon, and the point of light down that dusty perspective became a little black figure of a woman, Lorrimer dashed his sketch into his box, wiped off the color from his palette, and started out to meet her.

His long swinging stride soon swallowed up the distance between them, so that he joined her not far from where they separated in the morning.

"I have a project in hand," began Lorrimer, with the air of one who takes a thing for granted, "that will delight you, Miss Wharton. I find I must run down to the sea-shore again, and propose to take one of your holidays for the trip. Suppose we say next Saturday. Could you be ready, do you think, for the early morning train? We'd have to be at the station by five-twenty-eight."

Miss Wharton looked at him in bewilderment. He thought he had never seen a face so appealingly weary; heavy black rings circled her honest gray eyes, and the long black lashes seemed too tired to lift themselves to his face. Her step was sad and slow, as if even the light dust became an obstruction.

Lorrimer went on, eagerly, "We could get there in capital season for me to study a trick of green in that foreground wave that I've never yet dared to handle successfully."

He talked on volubly, as if it were a proposition to go blackberrying in the neighbor-

ing field, and by the time they had reached John Bradshaw's five-acre plot of timothy and clover that adjoined the farm-house, Miss Wharton had been able to about half understand that there was a faint probability on the following Saturday of her not only seeing the sea, but that she might even reach that rapturous delight in the companionship of Mr. Lorrimer.

The gleaming of a ferocious scythe through the fragrant grass made Melicent shudder. She felt that if John Bradshaw could but know the hopes and yearnings of that little hour they would have as little mercy at his hands as yonder innocent blooms of clover.

The intervening days were passed in a sort of trance, the country school-mistress finding the rude blackboard once in a while taking gigantic dimensions, and the shock heads of her pupils swimming before her delirious fancy. Even when they were actually in the cars together on that wonderful Saturday she was afraid it was a dream, and could only hope it would not be too rudely dispelled.

As for Lorrimer, now that the affair was really under way, he enjoyed it immensely, pointing out the various landmarks as they went along, and remarking to himself the rare talent Miss Wharton had for saying nothing when she had nothing to say. Blanche would have driven him wild the first five miles with a torrent of silly platitudes, would have sent him hither and thither at every station in search of impossibilities, would have weighed him down with ridiculous burdens, and would have complained bitterly of the heat and dust, which really were aggravating. But this little woman by his side uttered no word that could not be construed into ecstasy.

At last they stood upon the beach together and looked far out upon the shining sea. Lorrimer felt no peculiar exaltation till he was conscious that the hand resting upon his arm trembled, and looking down, he found her face paling and glowing by turns, her lips trembling, actual tears falling out of her eyes.

Straightway the soul of Lorrimer took fire. He saw with a painter's eye the inimitable scene before him, and every wave seemed to surge in his heart and overwhelm it with beautiful fancies. Some of these he poured into the ears nearest him, depicting with rare felicity the emotion that her own agitation had excited, and both of them stood there in that supreme exaltation of feeling that rarely overtakes mortality, however happily situated.

Even when the intensity of these emotions rendered them the less durable, and the tidal wave of enthusiasm was going out with every hour that slipped by, there still remained the reflection of a joy rarely tasted,

and Lorrimer declared to his companion that thus far it had been a perfect day.

She did not reply, but he had become able to interpret felicitously this silence of hers.

Excitement had brought a glow to her cheek and a brightness in her eyes; but Lorrimer had the mortification to find that the "square meal" he had determined upon in her behalf remained almost untasted.

The sombre monotony of her black dress was relieved by the red ochre of their journey; the sea wind had tossed the primness out of her brown braids and blown back her close-brimmed bonnet; a child-like air of wonder and delight completed the metamorphosis of the demure little school-teacher, and Lorrimer looked at her with undisguised admiration.

He sighed as he put her in the hands of one of the maids at the hotel: his critical eye saw the necessity that this new-born loveliness should be toned down a little before they started homeward.

"Make yourself as ugly as possible," he said, "before we again enter the grim presence of our friends the Bradshaws; but don't be long about it, for we haven't a minute to spare."

When Miss Wharton reached the foot of the staircase again her companion was gone; and looking about for him nervously, for she began to feel that the moments were important, she saw a gay party trooping in at the doorway, and in their midst, in close converse with Lorrimer, was a young votary of fashion whose toilet never seemed to need toning, that no journey seemed to disarrange, no dust to sully, or wind to ruffle.

Melicent stared open-mouthed at this masterpiece of nature enhanced by art, and could remember nothing more enchanting in the whole length and breadth of this wonderful journey to the sea. She did not wonder, with that miraculously gloved hand resting on his shoulder, and that bewitchingly bonneted head so near his own, that he should forget the existence of a plain little woman he had in charge for the day.

She started when a hand fell upon her arm. There was something in its touch familiar and yet repelling. It was muscular, strong, hard as iron: she shuddered as she looked up in the frowning face of John Bradshaw.

"You followed me, then," she said, bitterly.

"It is well that I did," he replied, calmly. "There is just time to reach the train, and I don't suppose you care to stay in this place until Monday."

"No, no," cried poor Melicent; and clutching the iron hand, she was soon lifted into the stage, and out of sight of the sea and its surroundings.

Not until she was hemmed closely into a seat in the car did her straining eyes catch sight of a horseman in the distance, gallop-

ing, shouting, gesticulating wildly, but in vain.

"Oh, John!" she said, "stop the car! quick! there is—" But something in his grim smile froze the words on her lips.

"It's always the way," said a passenger near her; "some one's sure to be too late."

The train went on, of course. Lorrimer watched it till it was out of sight, as people will in the first moment of bitter frustration. Then he took off the hat that seemed like a band of iron; his brain throbbed, his temples burned. This was the end, then, of his project for ameliorating the bitterness of this poor little woman's life. He had wantoned away the moments that decided her whole future destiny. To lose that train was to be compelled to stay at the watering-place until the following Monday, without a friend or acquaintance save himself. He had thus exposed her to an infamy which only her good sense and wonderful aptitude had averted. All he could remember was a wild white face at the window, and a little hand outstretched to him. How she got there was a mystery.

And now what was to become of her, as, alone and unbefriended, she steamed back to that persecution in her sterile home? What would the bony and conventional Mrs. Bradshaw say to this escapade? and how would it be looked upon by the stern and black-browed John?

Perhaps she would get lost upon the way, or miss the connecting trains, or it might be that she had no money with her for the necessary expenses of her journey. Even if all went well on the trains, his heart sank within him when he thought of the lonely walk awaiting her at the dead of night in that wild defile of the mountains. There was something unspeakably ignominious in the thought that he had brought all this unhappiness upon any woman, and yet Lorrimer spent almost an hour in creating imaginative torture for her whom in his remorse just then he would have given his life to save a single pang.

Suddenly a queer little engine steamed up to the track, right under his very nostrils. The smoke-stack didn't seem to Lorrimer much higher than his hat, and he leaned down from his horse to speak to the smoke-begrimed artisan within. Soon his horse was given to a boy near by, and Lorrimer crept into the little box beside him, and never did moments lag so heavily as those before this queer little machine went again on its way; and never did the miles disappear behind that little engine as on that day that Lorrimer became its one passenger. He always declared the exigencies of the road were created at that time for his benefit, and the engine was an instrument of Providence in behalf of a despairing soul.

Great drops stood out on his brow as

they devoured the long stretch of road; and those drops becoming mingled with the grimy smoke and cinders that filled the air about him, his face soon became strikingly similar to that of his working companion, and by the time he bade the man good-by not a soul that knew him would recognize in this sooty, begrimed, dirt-stained, and travel-sore pilgrim the dainty and delectable son of fashion who had so lately joined in that *tête-à-tête* with Blanche De Vigne.

It was even now impossible for Lorrimer to intercept Miss Wharton at any point in her journey except where she finally left the train, and had before her that mile and a half walk homeward. To do this he was compelled to take an express further on, and walk back again to the home station. He calculated that as she would have to wait at one place an hour for the connecting train, he might be able to get there in time.

When he left the express he felt refreshed and eased, he could not tell how, by the evening air blowing in his face. The night was soft, warm, and hazy; mellow, but not overbright. Speeding on fleetly over the rough, stony by-road and across the bewildering tiles, it had never seemed possible to Lorrimer that his legs could have been coaxed into such brilliant action. Something like a prayer escaped from his lips as, nearing the station, he saw the great gleaming eye of the up train already in the distance. As it belched out its shrill shriek and clattered along to his feet, he felt them trembling beneath him.

Useless to describe the agony of suspense in that moment. Would she, *could* she, after all, be there? Or was she, the victim of some mistake, left over by the roadside?

There were few passengers to get off at this insignificant little stopping-place. Lorrimer's heart stood still as among them he saw John Bradshaw and the slim, shrinking form of the school-mistress. For a moment he stood paralyzed. What did it mean? Then he sprang forward. A hundred different emotions rendered him speechless, but he held out to her his hands.

She shrank back, and John Bradshaw's arm encircled her in a protecting grasp.

"Get out of the path, Sir," he said, roughly.

Lorrimer, seemingly unconscious of his presence, drew still nearer to Melicent.

"For God's sake, Miss Wharton," he said, "don't drive me away from you after all I've gone through to get here!"

She stopped at the first sound of his voice, and all the strength of John Bradshaw couldn't force her on.

"Why—why," she faltered, "it's Mr. Lorrimer!"

Her hand half escaped from John Bradshaw's arm; she took one little step forward.

"Yes, yes," said Lorrimer, eagerly. "I beg of you, oh, I pray of you, Miss Wharton,

give me the chance to tell you all I've suffered since I last saw you!"

"Nonsense, Sir," said the stern voice of Bradshaw. "It'll be well on for midnight now when we reach home. I should think you'd find it natural that this lady should prefer my company to yours."

"Then let her say so," said Lorrimer, standing directly in the path of the irate young farmer. "I will only take this verdict at her hands, and may Heaven incline her heart to mercy!"

She looked from one to the other. The sturdy form of Bradshaw loomed a full foot above that of Lorrimer. The rugged outlines of his face caught a rude grandeur in the dim light. Lorrimer's aspect was pitiable indeed. His eyes were haggard with excitement and blood-shot with cinders; his face, streaked with soot and the greasy smoke of the engine, was almost unrecognizable; his traveling suit of that peculiar French gray so dear to the heart of an artist wore many a discolored patch. But he held out his hands to her imploringly, and there was that in his eyes that was almost magnetic in appeal.

"Come," he said; "oh, be generous!"

Bradshaw felt the hand upon his arm tremble.

"Choose, then," he said, pushing it from him—"choose between this man's company and mine."

It was a sin and a shame. I wish she had chosen Bradshaw. He was a fine, manly fellow in the main; he had been, in his own hard way, a hero in her behalf; there was at that time even in personal attributes no comparison between the strong, sensible mountaineer and the vacillating, womanly artist.

But Miss Wharton faltered out something to the effect that she thought she ought in courtesy to listen to the apology of Mr. Lorrimer; and with one little half-drawn sigh, she fell forward half fainting in the perfidious custody that had only that day proved so dangerous.

"You dear, dear little woman!" said Lorrimer, as the tall figure of Bradshaw strode away in the distance, "you never shall repent this generosity. There is not under the loving infinite canopy of heaven a nobler, greater soul than your own, or a more penitent, grateful heart than mine!"

And as if she had not had enough of the sea, before she reached the farm-house that night she even consented to cross the ocean itself on her wedding journey with Lorrimer.

"He'll leave her on the other side," said John Bradshaw to me when he heard of it, "and come back with the first pretty face that seizes his fancy." But I hope this was only John's way of disposing of their future. For my part, I have every hope for its joy and prosperity.

DE WITT CLINTON AS A POLITICIAN.—(*Concluded.*)

By JOHN BIGELOW.

WITH the quick instinct of an insatiable ambition, Clinton early discerned in Van Buren his most formidable competitor for political leadership in the State of New York, and therefore upon no one is he so virulent and unrelenting in denunciation. Between the years 1817 and 1824 nearly every letter to Post contains some vituperative allusion to Van Buren, as for example :

"Whom shall we appoint to defeat the arch-scoundrel Van Buren?"

"It is very important to destroy this Prince of Villains."

"We can place no reliance upon the goodwill of Van Buren. In his politics he is a confirmed knave."

"Honey in his mouth, words of milk,
Gall in his heart, and fraud in his acts."

"With respect to Van Buren, there is no developing the man. He is a scoundrel of the first magnitude, beset by enemies at home and abroad, having the shadow of influence, and able to do much for a good cause, but without any fixture of principle or reality of virtue."

"Your plan of uniting the State is a good idea, but you can never effect it through treachery and duplicity, through Van Buren and Skinner."

"Van Buren must be conquered through his fears. He has no heart, no sincerity."

"Van Buren is now excessively hated out of the State as well as in it. As he falls we will of course rise. There is no doubt of a corrupt sale of the vote of the State, altho' it can not be proved in a court of justice. The very idea is destruction, and it is indelibly fixed in the public mind.....He had been courted all round, and finally closed with the highest offer."

But, unhappily, not content with exhausting the rogues' calendar in search of epithets to apply to a gentleman whom the State of New York delighted to honor—Van Buren, be it observed, was all this time a Senator of the United States—Clinton did not scruple to employ the poisoned weapons of calumny and scandal against his more successful rival. Not to dwell upon Van Buren's alleged sale of the State to President Madison just cited, and which is repeatedly charged in this correspondence, though, as he admits, not susceptible of proof in a court of justice, we will select two cases, neither of a political nature, and both lacking the quality and degree of authenticity that justify the use that he made of them.

At the close of a letter dated October 24, 1824, he writes :

"You see what they say about Mrs. M. It is said that V. B. paid her rent when under distress in this place."

In another letter he speaks of this Mrs. M., whoever she was, as having borne a bad

character, in justification of an insinuation he had thrown out to Post that John Q. Adams had been too intimate with her.

The following letter, written shortly after Van Buren's election to the United States Senate, opens with a piece of scandal yet more unworthy of the circulation he gave it:

"ALBANY, 30 August, 1822.

"MY DEAR SIR,—Since writing my last a rumor which has been insinuated to the disadvantage of Van Buren has been embodied in a tangible shape. On his way to the West the back seat (to which he had a claim) was occupied by Genl. Breckinridge, of Virginia, the uncle of Mr. Porter, formerly a member of Congress—a man of character and decided courage—with two ladies. V. B., considering him a plain countryman, as his looks would indicate, patted him with his cane and demanded his seat. This was indignantly refused, and on Duer's announcing him as a Senator, the Genl. stated that he was sorry the State of N. Y. was disgraced in being represented by a blackguard. The next stage produced a challenge, which V. B. declined, and he must either crouch or be whipped. So goes the report, probably exaggerated, but in substance correct; and this humiliation may account for his evident embarrassment and distress of physiognomy when I have seen him. Of his cowardice there can be no doubt. He is lowering daily in public opinion, and is emphatically a corrupt scoundrel."

As to the "rumor" here cited, and the sweeping epithets applied to Van Buren throughout this correspondence, there is every reason to believe that Van Buren would have been spared them all if he had not had the ill fortune to be, or seem to be, an obstruction in the path of Clinton's ambition.

It is but just to Mr. Van Buren to say that he was never provoked or betrayed by Mr. Clinton's example to neglect any of the proprieties of official life in his demeanor toward that statesman. We hazard little in saying that not a syllable of what is technically known as "unparliamentary language" about Clinton can be traced either to his lips or pen. We may even go farther, and say that he never permitted Clinton's undisguised and aggressive hostility to him to blind him in the least to Clinton's merits as a servant of the public. In this respect, if no other, his revenge upon Clinton was condign.

When the act authorizing the Erie Canal, upon which Clinton had staked his entire fortunes as a statesman, was before the Legislature, Van Buren, then a member of the State Senate, rose, and, to Clinton's surprise, made what Colonel Stone, who was present, characterized as his great speech of the session, in favor of the bill. In a letter to Dr. Hosack describing the scene that followed, Colonel Stone says :

"When Mr. Van Buren resumed his seat, Mr. Clinton, who had been an attentive listener in the Senate-chamber, breaking through that reserve which political collisions had created, approached him and expressed his thanks for his exertions in the most flattering terms."

When Clinton was inditing the bitter paragraphs to Post, of which we have cited specimens, he little suspected that the finest tribute that would ever be paid to his memory was destined to fall from Van Buren's lips. We might almost say the noblest tribute ever paid to any statesman, for we do not know where can be found a much finer bit of mortuary eloquence than closes the paragraph we are about to cite from the speech with which he prefaced some resolutions which he offered at a meeting of the Congressional delegation at Washington on the occasion of Clinton's death:

"We can not, indeed, but remember that in our public career collisions of opinion and action, at once extensive, earnest, and enduring, have arisen between the deceased and many of us. For myself, Sir, it gives me a deep-felt though melancholy satisfaction to know, and more so to be conscious that the deceased also felt and acknowledged, that our political differences have been wholly free from the most venomous and corroding of all poisons, personal hatred. But in other respects it is now immaterial what was the character of these collisions. They have been turned to nothing, and less than nothing, by the event we deplore, and I doubt not that we will with one voice and one heart yield to his memory the well-deserved tribute of our respect for his name, and our warmest gratitude for his great and signal services. *For myself, Sir, so strong, so sincere, and so engrossing is that feeling that I, who while living never—no, never—envied him any thing, now that he has fallen, am greatly tempted to envy him his grave with its honors.*"

It is not easy to determine whether to have merited such a tribute or to have paid it, under all the circumstances, should confer the greater distinction.

The following letter has reference to a duel in which De Witt Clinton had been concerned with John Swartwout as long ago as 1802. Swartwout was a devoted friend and admirer of Aaron Burr, then Vice-President. The friends of Clinton, among whom Cheetham was most conspicuous and most scurrilous, accused Burr of coquetting with the Federal party—the gravest offense which in those days could be laid at the door of a Republican. It reached Clinton's ears that Swartwout had accused him of opposing Burr upon personal and selfish grounds. Clinton responded, in his gentle and unimpassioned way, by proclaiming Swartwout "a liar, a scoundrel, and a villain!" This was reported to Swartwout, and of course a challenge immediately followed. Colonel Smith, Swartwout's second, has left us the following account of what occurred on the ground at

Weehawken, where the combatants respectively sought satisfaction. Clinton was accompanied by Richard Riker, the hero afterward of Halleck's *Recorder*:

"The gentlemen took their stations, were each presented with a pistol, and, by order, faced to the right, and fired, ineffectually. At the request of Mr. Riker I asked Mr. Swartwout, 'Are you satisfied, Sir?' He answered, 'I am not.' The pistols then being exchanged, and their positions resumed, they by order faced to the right, and fired a second shot, without effect. At the request of Mr. Riker I again addressed Mr. Swartwout, 'Are you satisfied, Sir?' He answered strongly in the negative. We proceeded, and a third shot was exchanged, without injury. At the request of Mr. Riker I again asked Mr. Swartwout, 'Are you satisfied, Sir?' He answered, 'I am not, neither shall I be until that apology is made which I have demanded. Until then we must proceed.' I then presented a paper to Mr. Riker, containing the apology demanded, for Clinton's signature, observing that we could not spend our time in conversation; that this paper must be signed, or proceed. Mr. Clinton declared he would not sign any paper on the subject; that he had no animosity against Mr. Swartwout; would willingly shake hands and agree to meet on the score of former friendship.

"Mr. Swartwout insisting on his signature to the apology, and Mr. Clinton declining, they stood at their posts and fired a fourth shot. Mr. Clinton's ball struck Mr. Swartwout's left leg, about five inches below the knee. He stood ready and collected. At the request of Mr. Riker I again addressed Mr. Swartwout, 'Are you satisfied, Sir?' He answered that it was useless to repeat the question: 'My determination is fixed, and I beg we may proceed.' Mr. Clinton repeated that he had no animosity against Mr. Swartwout, was sorry for what had passed, proposed to advance, shake hands, and bury the circumstance in oblivion. During this conversation Mr. Swartwout's surgeon, kneeling by his side, extracted the ball from the opposite side of his leg. Mr. Swartwout standing erect on his post, and positively declining any thing short of an ample apology, they fired the fifth shot, and Mr. Swartwout received the shot in the left leg, about five inches above the ankle, still, however, standing steadily at his post, perfectly composed. At the request of Mr. Riker I again addressed Mr. Swartwout, 'Are you satisfied, Sir?' He forcibly answered, 'I am not, Sir; proceed.' Mr. Clinton then quit his station, declined the combat, and declared he would fire no more. Mr. Swartwout declared himself surprised that Mr. Clinton would neither apologize nor give him the satisfaction required, and, addressing me, said, 'What shall I do, my friend?' I answered, 'Mr. Clinton declines making the apology required, refuses taking his position, and positively declares he will fight no more; and his second appearing to acquiesce in the disposition of his principal, there is nothing further left for you now but to have your wounds dressed.' The surgeons attended, dressed Mr. Swartwout's wounds, and the gentlemen in their respective barges returned to the city."

It was currently rumored at the time that during the duel Clinton was heard to say,

"I wish I had the *principal* here." The letter which will now be cited states that Clinton actually challenged Burr on the field, and regretted that he had not challenged him in the first instance, with whom was his quarrel, instead of Swartwout, for whom he had no unkind feelings whatever.

How Clinton should have challenged Burr on the field without its resulting in a meeting is not quite intelligible to us now. Though not much given to the redress of personal grievances in that way, Burr was the last man to leave a hostile message from an adversary like Clinton, then a Senator of the United States, unanswered.

Had they met, it is curious to reflect how the history of this State and country might have been modified. Hamilton might have still been living, perhaps an ex-President; the Erie Canal might have been anticipated by the railway; Clinton might have gone to his grave execrated as an assassin, and Burr have become, instead of Hamilton, the martyred hero of a barbarous code.

"ALBANY, 21st September, 1832.

"MY DEAR SIR,—I return S.'s letter. It is satisfactory. The affair of the duel ought not to be brought up. It was a silly affair. Clinton ought to have declined the challenge of the bully, and have challenged the principle, who was Burr. There were five shot, the antagonist wounded twice, and fell. C. behaved with cool courage, and after the affair was over challenged Burr on the field. It will not do to re-agitate this question. Jackson and Clay have both been in duels.

"The loss of the *Aurora** is not irretrievable. The *C. O.* must be supported.

"Y. is despised and talked against openly; his holding on when he had an opportunity to resign properly is considered the result of avarice. Savage and Skinner talk plainly against him, and he is the subject of commonplace ridicule."†

The contest in which this duel had its rise produced a crop of similar appeals to the code of honor.

The year after, Clinton was challenged by Senator Dayton, of New Jersey, a warm partisan of Burr. This affair, however, was arranged without a meeting, but the year following Robert Swartwout fought with Richard Riker, who had been Clinton's second, and severely wounded him. The same year Coleman, the editor of the *Evening Post*, was provoked by Cheetham, the *Thersites* of the press in those days, to challenge him. Friends, however, interfered, and the affair was settled upon the understanding that

Cheetham would behave more discreetly in future. Out of this challenge, however, grew another quarrel which was attended with altogether deplorable results. A harbor-master of New York by the name of Thompson—he was called Captain Thompson—gave it out that it was Coleman, not Cheetham, who had shown the white feather on the occasion just referred to. Coleman heard of it and challenged him. They met in what is now Twenty-first Street, then called "Love Lane," at the edge of a winter's evening. The ground was covered with snow, and it was cold and nearly dark. A shot or two was exchanged without effect. The principals were then brought closer to each other, that they might see one another more distinctly. At the next shot Thompson cried out that he was hit, and fell headlong into the snow, mortally wounded. Coleman and his second hurried away, while the surgeon raised the bleeding man and examined his wound, at the same time suggesting to him the propriety of never mentioning the names of any of the parties to the meeting. Thompson promised he would not, and kept his word. "He was brought," says Mr. Bryant,* "mortally wounded, to his sister's house in town; he was laid at the door; the bell was rung; the family came out and found him bleeding and near his death. He refused to name his antagonist, or give any account of the affair, declaring that every thing which had been done was honorably done, and desired that no attempt should be made too seek out or molest his adversary."

At the caucus of the members of Congress by which Madison was nominated as the successor of Jefferson for President but one member from New York was present. The caucus which renominated Madison contained only twelve persons from States east of New Jersey. Those Republicans who objected to the caucus system of nomination fixed their eyes upon Clinton as the candidate most available for breaking down the caucus system of nominations and the Virginia dynasty at the same time. Clinton was accordingly nominated by the Republicans of the State of New York, and received 89 electoral votes to 128 given to Madison. He triumphed in the overthrow of King Caucus, but, like Samson, he was obliged to fall himself under the ruins of the temple which he pulled down upon the heads of his enemies. It placed him under the ban of the Republican administration at Washington, threw him into suspicious relations with its enemies, which subjected him to the charge of Federalism—a crime fatal to politicians in those days as that of "Abolitionist" became in later times—and resulted in his removal from the office of

* Duane did not succeed in interesting the friends of Clinton sufficiently in his paper to sustain it through the year. He got some business agency in South America, where he remained during the struggles of the South American republics for their independence. On his return he was appointed prothonotary of the Supreme Court of Pennsylvania for the Eastern District, which office he held until his death.

† And yet Yates was elected Governor almost unanimously only a few months after this letter was written.

* "Reminiscences of the *Evening Post*."

mayor in 1815; it arrayed the New York city delegation in the Legislature solidly against his canal policy, merely because it was his; it gave him a hostile Legislature in 1819; it placed his friends in the minority in the Council of Appointment, and also in the Constitutional Convention of 1821; it transferred from him to Yates the office of Governor in 1823; and finally, what he felt more than all else, it provoked the Legislature on the last day of the session, the 15th of April, 1824, to remove him from the office of Canal Commissioner.

At the date of this most unworthy act of partisan vindictiveness Clinton had devoted fourteen of the best years of his life to promoting the internal commerce of the State by the development of a wise and comprehensive system of canal navigation; and whether in or out of office, though a comparatively poor man, he never received any compensation, directly or indirectly, for his services.

Like all wrong and injustice, in due time this also returned to plague its inventors. The news of his removal had no sooner reached the principal towns of the State than public meetings were held to denounce the proceeding. In the city of New York, the home of Clinton's most active opponents, not less than ten thousand persons—a very large meeting in those days—assembled to testify their discontent, and the proportion in other places was still greater. Clinton was immediately put in nomination again for Governor in place of Yates, whose term was about to expire, and he was elected over Samuel Young, the administration candidate, by a majority of over 16,000.

Crawford too, whose election to the Presidency it was a part of this intrigue to secure by the defeat of Adams, who was popular in the State, was defeated, and Adams was elected, thus righteously accomplishing the very results which by foul means they had sought to prevent. Three days after his removal from the Canal Commission, Clinton writes thus briefly to Post:

"There is to be a meeting here to-morrow night about the removal of Canal Commissioner. Never was there a meaner act or more unpopular one. It has roused the most apathetical. There was a complete understanding between Suydam* and Wheaton,† and the latter went about among the members to get the resolution passed."

This comparatively accidental association of the friends of Clinton and Adams in resistance to the Crawford conspiracy in the

Legislature furnished Adams, when he became President, with an opportunity, of which, no doubt, he was glad to avail himself—after his election, but before his inauguration—of offering the English mission to Clinton. Clinton, unwisely, we think, and unfortunately, declined the invitation. "Having recently," he says in his letter to the President, "accepted from the people of this State the highest office in their power, I can not, consistently with my sense of duty, retire from it until I have had an ample opportunity of evincing my gratitude and my devotion to their interests."

In a letter written to Post on the 5th of September previous, and before the Presidential election, he speaks of some proposition made to him through Post, by which, he says, "It is proposed to bind him [Clinton] hand and foot, and put him completely in the power of his enemies, and intrust his fate to the negotiations of a devoted tool of theirs."

"The proposition," he goes on, "is also involved in intrinsic difficulties, and is repugnant to my sense of propriety in reference to all persons connected with it directly or indirectly, and it therefore has my unqualified negative. It would be very questionable whether, all things proper, I should consider it expedient to accept of any place at W. [Washington]. I do not attach much importance to it, nor do I think that it can be a stepping-stone. On the contrary, it can be a stumbling-block for an honest man, and can only promote the views of corruption and knavery."

Evidently the proposition was one by which Clinton was in some way to ally his political fortunes to those of one of the more prominent candidates for the Presidency.

On the 7th of March of the same year, 1825, Clinton, in a letter to Post, alludes to the English mission, and intimates that he did not give the President all his reasons for declining it:

"I have declined the London mission, as I told you I would any office from any source. Any other course would have been incompatible with my fealty to the people of this State after the signal honors conferred on me. Various other considerations entered into this determination, but the leading one above mentioned was the only one mentioned in my answer to Adams."

It will be remembered that the English mission was then offered to Rufus King, whose term of office as United States Senator had just expired, and was by him accepted. Of this selection Clinton thus writes to Post on the 18th of April, not many days after it transpired:

"R. King's appointment is very unpopular. Better, however, than any of the other candidates. All his negotiations will fail. It is ut-

* A prominent lawyer of Kingston, a member of the Senate, and a stanch Federalist. It is said that many years previous to this, hostile messages passed between him and Van Buren, which, however, through the interposition of friends, did not result in spilling any of the blood of either.

† Henry Wheaton, the historian of international law.

terly untrue, as his friends say, that he had an offer before Clinton.*

Why Clinton took such a discouraging view of King's mission does not appear. It may be attributed to the well-known condition of Mr. King's health, which did, in fact, render his mission fruitless, and sent him home after a few months' sojourn in London, or to the fact that King was a leading Federalist, and therefore had great difficulty to contend with in trying to do any thing that should appear right in the eyes of a Republican.

Clinton was the last person to abandon the hope that he would be the successor of Monroe to the Presidency. Doubtless the pathology of the Presidential rabies is much the same in all cases, but few persons ever have an opportunity of a clinical inspection of its ravages. These letters of Clinton constitute perhaps the fullest and most instructive record of the complaint that is known to exist.

Clinton was not an exception among American politicians in desiring the people to enjoy to the fullest extent the right to select their own servants, with the understanding always that they would be sure to select such as suited him. *Ex. gr.:*

At the opening of the Legislature in January, 1822, he writes:

"10 Jan., 1822.

"MY DEAR SIR,—.....You may rely on these things:

"1. First, that none of the high-minded men will be appointed.

"2. That the present judges may be nominated, but will be rejected.

"3. That Yates and Van Buren are both prostrate, and the latter particularly so.

"4. That Young's party is friendly to Clinton, and growing.

"5. That Root is going down hill.

"6. That all that we want is organization and exertion. If Clinton can get this State, the Eastern and Western States will unite in his favor, and in that of no other."

On the 21st October, 1822, he writes:

"The odium attached to the name of Federalist has been a millstone round the neck of true policy. It is now almost universally dropt in this District, in the District of which Oneida County is part, and in the Herkimer County Meeting. I hail this as an auspicious event. Names in politics as well as science are matters of substance, and a bad name in public is as injurious to success as a bad name in private life. In the adventures of Tristram Shandy the Hero got a deprecated name fixed on him, which, like a bird of evil omen, pursued him thro' life..... Have you seen the attack on Crawford in the New Haven *Herald*? What an *exposé*! chiefly from Clark's pamphlet. In what a ruffian light he appears! The rancorous and stiletto spirit

betrayed by — appears to have been a germination from the Crawford School. Without the epicurean elegance, the fascinating manner, and the acute intellect of Burr, he appears to be as hardened a ruffian, and exhibits the clown instead of the Gentleman aspiring to the highest seats in the community.

"One observation. In all the litigant papers of the belligerent little men you see latent fears and jealousies of Clinton.

"Our friends are up and doing in Ulster. The inferences I draw from the Signs of the Times are—

"1. The ascendancy of our party from the collisions of parties. In proportion as they quarrel with each other they will draw closer to us. The last hate being the most violent (on account of its recency and its being a family quarrel), will supersede the former antipathy.

"2. The old names as well as the old lines of party will be abolished.

"3. Nominations by Caucuses will be exploded.

"4. Yates, Van Buren, etc., will go down like the stick of a rocket.

"5. The prostration of Crawford. Jackson and Clay will not get up. Calhoun and Adams are now *hors de combat*."

It will be observed by this letter that Jackson, whose candidacy for the Presidency Clinton espoused so warmly at a more advanced stage of the canvass, was regarded at this time in the light of a rival.

On the 25th November, 1822, Clinton writes to Post:

"Col. Dwight, a member of Congress from Mass., was here last night, very bitter against Crawford and V. B. Write to C. [*Columbian*] *Observer* that the latter [Van Buren] has sold the vote of the State for the Vice-Presidency or a foreign mission."

On the 24th December, 1822, Clinton writes:

"Where can *Publicola* be procured? It is J. Q. Adams's answer to Paine's *Rights of Man*. It ought to be republished.

"I think that Crawford is completely done over, beyond the possibility of resuscitation. It appears that he has no hold of the public mind. He has never distinguished himself by speeches, by writings, or by actions. The display in his favor altogether arose from the venality of some printers, from the bustling activity of a few imprudent friends, and from the obtrusive impudence of his pretensions. He has expired like the rattlesnake, with a very slight blow; he has received the *coup de grace*, altho' he may continue to move his tail until the setting of the sun.

"The piece of Clay is not calculated to reflect honor on him; it is evasive and insidious, and Adams's prompt reply has a manly aspect. I think that Clay must descend into the Arena, or be disgraced. If he does, he will not stand upon *terra firma*. He does not possess that quality which a Poet calls 'Nature's chief Masterpiece'—the art of writing well.

"Can you procure a collection of the patriotic addresses and answers during John Adams's Reign of Terror? In his defenses of American Constitutions, or Essays on Davila (I forget

* This, like all the letters of Clinton in which he speaks of himself in the third person, though in his handwriting, is not signed.

which), he says 'that a limited monarchy is the best species of republican Government.' This is a key to the political opinions of his son."

On the 8th January, 1823, Clinton writes:

"However strange you may think it, *Van Buren himself* has an eye to the Presidency. When I say this I speak understandingly. It arises from his past success, from his inordinate vanity, and from his enthusiastic references to himself. The strength of Van Buren consists in his having possession of the State Press."

On the 18th January, 1823, he writes:

".....A coalition between Adams and Crawford—between an acid and an alkali! What a Munchausen tale!—a tale told by a wise man, signifying nothing. Is it possible that your credulity could be enlisted by such a fable?"

"I give a different version to the report. Calhoun's friends as well as Clay's want Clinton to decline; attempts have been made in various ways to produce this result; and this is a bugaboo they got up to accomplish it. It proceeds from that quarter at Washington—Vandeventer, Dix, etc."

Early in the winter of 1822-23 Mr. Cantine, one of the editors of the *Albany Argus*, died, and on the 31st of March, 1823, the Legislature appointed Edwin Croswell and Isaac Q. Leake State printers. Yates had just succeeded Clinton as Governor. On the 18th of March of that year Clinton writes:

"A bill has passed the Assembly making Croswell and Leake State printers, when Riggs would have taken the office at an annual saving of 1000 dollars to the State."

In the course of the year 1823 Clinton openly avowed his preferences for Jackson, and his letters for that year abound with allusions to Jackson's prospects, though by the following paragraph in a letter written March 4, 1824, it would appear that Clinton had still some Presidential illusions. A Democratic convention had just nominated Jackson at Harrisburg, and, shortly before, Dallas had withdrawn Calhoun's name as a candidate, and represented that his friends, who were numerous in the State, would support Jackson.

"I am surprised to see that you think that Dallas gave up Calhoun by concert, or that you suppose that he has withdrawn. Depend on it that neither is the case."

"The Crawfordites are out of spirits. The Virginia ticket of Electors is a very feeble one. You see that Jefferson and Madison, notwithstanding ————boastings, are not on."

"What course we ought to pursue is uncertain. But we ought not to recede without strong reasons, nor ought we to hold on against hope."

"I think that Crawford is *hors de combat*. Calhoun never had force, and Clay is equally out of the question. Pennsylvania has made Jackson strong. As for Adams, he can only succeed by the imbecility of his opponents, not by his own strength."

"In this crisis may not some other person bear away the palm?"

As late as December of the same year Clinton betrays his conviction that something favorable to his aspirations would yet "turn up."

"Do you recollect," he writes, "the story of Themistocles the Athenian? After the naval victory of Salamis a council of Generals was held to determine on the most worthy. Each man was to write down two names, the first and the next best. Each General wrote his own name for the first and that of Themistocles for the second. May not this contest have a similar result? I am persuaded that with common prudence we will stand better than ever."

On the 17th February, 1824, Clinton writes:

"The impression here is that V. B. [Van Buren] and his junto are politically dead. The impression will produce the event."

He had written on the 6th of August previous in the same strain:

"Van Buren is now excessively hated, out of the State as well as in it. There is no doubt of a corrupt sale of the vote of the State, altho' it can not be proved in a court of justice. The very idea is destruction, and it is indelibly fixed in the public mind. V. B. was closeted with Crawford the day before he left Washington, and wrote a note to Calhoun, hoping political differences would not affect private friendships. Old R. [Rufus] King wrote to the President recommending V. B. in the highest terms for the vacant judgeship."

The friends of Crawford, of whom Van Buren, General Root, and Samuel Beardsley were prominent in the State of New York, desired that a nomination should be made by a Congressional caucus, it being certain that of the members who would take part in such an assembly a majority would favor Crawford. To this end a caucus of the Republican members of the Legislature was held at Albany on the 22d of April, Walter Bowne in the chair, wherein it was resolved that a Congressional caucus for the nomination of a President ought to be held, and its candidate supported. It was while this caucus was impending, and on the 17th of April, that Clinton wrote as follows to Post:

"The *National Intelligencer* speaks of Crawford's success in this State as certain. This is the result of a corrupt coalition to support them. Halsey, Rogers, Suydam, Meyer, Goodell, the Speaker, and Wheeler were the men that brought about the nomination. Porter is also for Crawford. Cramer plays another fiddle, with a view of gathering from the other flocks."

"You may rely on it that there never were greater scoundrels combined in deluding the people."

"Clay ought to resign forthwith. His chance is worse than nothing. Jackson would then prevail with all the Western States if we can get New Jersey."

On the 21st April, 1824, Clinton writes:

"As for New Jersey, we can get her. I see

no terrors in Adams's papers; his influence has gone with his morals. The next point is Ohio. If we succeed there—and I think we will—Adams is out of the question.

"Unless the next election effects a complete revolution, this State goes for Crawford. The signs of the times are very auspicious. Pierson, Wheaton, and Drake are, I take it, down in New York. Tallmadge can scarcely get a vote in his own county. He is the prince of rascals—if Wheaton does not exceed him.

"I have no doubt of Jackson's success in all the Southern States except Georgia and Virginia. The West—the West—and all is right. Clay can do no good to himself by holding out, and if he plays the dog in the manger he will receive general execration."

On the 23d July, 1824, Clinton writes:

"Calhoun is acting a treacherous part to Jackson, and is doing all he can for Adams. The policy of this step is obvious. I have no doubt but that it entered into the choice of your Convention Delegates in N. Y. How easily a signal victory might have been obtained! But this step will have no decided result.

"The appointment of Wheaton as a Delegate is a barefaced insult, and must be met as such.

"The policy of Calhoun is base and dishonorable. A preference of Adams is one thing, but a deceptive course on this subject is another."

On the 27th July, 1824, Clinton writes:

"I am glad that you have communicated to Mr. E. your views of the duplicity and treachery of C. and Co.* Perhaps there is not a man in the U. S. more hollow-hearted and base. I have long observed his manoeuvres, and after a short observation my opinion was formed on this subject, and every day's notice confirms it. The object of this little junto is to associate us in their disgrace by prevailing on us to come out in favor of Adams. This will shield their treason, and at the same time give them the benefit of all our influence. Mr. L. and S——d are the mere automata of C., and J. B. M. is the unconscious creature of their duplicity, and as such ought to be guarded against."

On the 28th July, 1824, Clinton writes:

"You will return these letters immediately. They show the treachery exercised against Jackson. C——n is at the bottom of the whole—a thorough-paced political blackleg."

On the 21st August he writes:

"I do not think that any thing can be made out of the Clay affair. Oil and vinegar can not unite.....The great danger is that there will be a quarrel between the friends of Jackson and Adams, and that in the war between the lion and the unicorn the cur may slip in and carry off the prize.

"In Jackson we must look for a sincere and honest friend. Whatever demonstrations are made from other quarters are dictated by policy and public sentiment."

On the 23d October, 1824, Clinton writes:

"I have received a confidential communica-

tion from Washington which states that on the 12th instant, when Lafayette was received by the President, Crawford was present, and his whole appearance and behavior indicated mental fatuity, and a moral and physical wreck. On passing the President, who was conversing with Adams and Calhoun, he made his way directly between them, forcing them all to fall back in order to get out of his way. After sitting for some minutes with his hat on, he took it off."

The failure of an election of President by the people in 1824, the choice afterward of Mr. Adams by the House of Representatives through the influence of Mr. Clay, and Mr. Clay's subsequent acceptance of the office of Secretary of State from Mr. Adams, are among the most widely known events of our political history. After the ineffectual vote by the people, but before the House of Representatives had made its selection from the three most popular candidates, Clinton wrote as follows to Post:

"5 Jan., 1825.

"MY DEAR SIR,—.....Your letter assumes a tone in respect to the Presidential Election which I own surprises me. I have no faith in the discernment of your Washington Correspondents, and very little in their candor. J. B. M. is the creature of the P.M.G., and Genl. B. has lost his mind with his health. I can not trust driveling intriguants or shallow-pated tools, who derive all their importance abroad from their supposed influence at home.

"I have received letters from J. B. M., and they are of a piece with those he wrote from Washington on another occasion. I detect deception in every line. My accounts are very different. I can readily believe that Clay will take the course pointed out, but it will be ineffectual, and end in his ruin. Crawford's friends it is impossible can coalesce; but if such an event takes place, and the coalition is as you represent, it will prostrate the conspirators as an unprincipled and profligate league, and I shall have nothing to do with it. A dying administration is without power, and I do not believe that Monroe can enlist a single vote.

"My choice is a very plain one. My preference for the hero is known and avowed, and $\frac{2}{3}$ of the people of this State are of the same opinion. The question is now before Congress, and by them will it be decided. There is a concert at Washington to make a mob and attempt to drown the public sentiment of this State. It is a pitiful manoeuvre, and worthy only of contempt. With this view Tracy and two or three more members have been duped to write letters boasting the certainty of Adams's success. The very great earnestness displays conscious imbecility, and gives the lie to their statements."

On the 7th March, 1825, and after Clay had accepted office under Mr. Adams, Clinton wrote to Post:

"I truly regret the appointment of Clay. It augurs badly for the purity of our Republican institutions. I did not think it in the compass of possibility."

On the 3d of the month following Clinton writes again:

* Calhoun and Co.

"Clay has sent me his vindication. He does not touch the main points, and his intimation that his office has a claim upon the Presidency is very unwise."

As soon as it was understood that Mr. Clay had consented to enter the cabinet of Mr. Adams a general shout of "bargain and corruption" was put up by the friends of the defeated Presidential candidates throughout the country.

Mr. Kremer, a member of Congress from Pennsylvania, publicly charged Mr. Clay with having sold his influence in Congress to Mr. Adams. James Buchanan, of the same State, was designated by General Jackson as one who could testify to the fact. John Randolph provoked a challenge and the privilege of firing two pistol-charges at Clay, and having Clay fire the same number at him, by stigmatizing the Clay-Adams alliance as "a coalition of Puritan and black-leg."

Buchanan was finally compelled to repel the responsibility with which General Jackson had clothed him as a witness of the corrupt understanding alleged to have existed between Clay and Adams, asserting that the general had probably inferred their corruption from the fact that Buchanan himself had tried unsuccessfully and through precisely the same temptation to seduce Clay to the support of Jackson.

The essential indecorum of Mr. Clay's conduct in taking the first cabinet office from Mr. Adams, whom his vote had just elevated to the Presidency, furnished all the proof of corruption that the public required, and neither the denials nor duels of Mr. Clay nor the protestations of Mr. Buchanan could restore to Mr. Clay the confidence of the nation. As a specimen of the popular reasoning upon the subject we will cite the following paragraphs from a letter of Clinton's to Post, bearing date August 15. The year is not given, but we presume it was 1827.

Clinton looks upon the allegation purely as a piece of partisan artillery, which he thinks had been badly manœuvred, of which Buchanan's card was evidence, and he then goes on to show the aspect in which the case should have been presented to the people. The Jackson party of that day, and Clinton among the rest, went upon the principle that if the allegation was not true, it was as good as true.

"After my letter of yesterday I have seen Mr. Buchanan's publication. It appears to me that this affair has been badly managed. It was never to be expected that positive, direct testimony could be adduced to establish a charge of corruption of that nature. It must emanate from circumstantial evidence, and on this footing it alone ought to be put as sufficiently conclusive.

"1. The known habits of the parties.

"2. An arrangement for their mutual benefit; and,

"3. This in opposition to C.'s constituents, his interests, and Western popularity.

"4. In opposition to the opinions of Adams's best friends.

"5. The silence of Clay for a long time.

"6. His imputed advances to General Jackson.

"7. The known irregularities of his conduct and the selfishness of Adams.

"8. The profligate men associated in the corrupted East and West.

"It appears to me that no other evidence is wanted but the circumstances of the case.

"Jackson, Eaton, and D. W. have shown great imbecility in this concern. You can see that B.* is boiling with rage, and that he is only restrained by political considerations.

"In cases of this kind it is difficult to procure the evidence of an accomplice, and if you can, it is rarely worthy of credit."

The administration of Mr. Adams did not prove popular; the friends of Crawford and Jackson united at once against him in favor of Jackson for their candidate in 1828; and from the following paragraph in a letter from Clinton to Post, on the 5th December, 1827, it appears that Clinton, if he could not have the first place on the ticket, would not have refused the second:

"From some late indications, if C. [Clinton] was associated with J. [Jackson] as Vice-P., the great body of the Adams men would ground their arms."

On the following day, the 6th December, Clinton writes:

"There is no doubt of Jackson's success. Conversions as miraculous as St. Paul's daily take place. The people are sick at heart of Adams. He is personally hated and politically abhorred."

In less than three months from the day these last two notes were penned, De Witt Clinton was in his grave. He died very suddenly on the 11th of February, 1828, at the comparatively early age of fifty-nine. He had enjoyed all his life most excellent health, and in all this body of correspondence there is but one allusion to his health. We will quote it, if for nothing but its singularity. It was written on the 30th of December, 1827, scarcely six weeks before his death:

"With the compliments of the season, you will accept my best prayers for your health and happiness. Without the former the latter can not be expected. The kind anxiety you express for mine is really gratifying. I can not account for the numerous rumors propagated on that subject. The fears of friends and the anticipations of foes are proofs of some importance, and would make me vain, were it not that the latter exhibit human nature in too mortifying an aspect. I believe that your prescriptions, founded on personal experience, are generally good. My complaint is of the same character vulgarly

* Buchanan.

called dyspepsia, or a derangement of the chest. It is cured by diet, by exercise, and change of air; and nurtured by excess, by a sedentary life, and by violent irritations. Of the first and the last I am guiltless, but the want of exercise is my besetting sin."

The first impression produced by a perusal of the correspondence, of which we have sought to give our readers a faithful and intelligent impression, is one of astonishment that a man capable of such great things as Clinton proved himself to be could ever have taken such a lively interest, as he seemed to, in the mere scullionery of politics. To be at the head of a successful party seemed to absorb him utterly. There was no detail of party management with which he did not occupy himself personally and persistently. He did not foresee that the only work of his which survived him, and which has transmitted his name to later generations, owed its successful initiative to the involuntary leisure to which he was condemned by his removal from the office of mayor in 1815, and the prostration of all his political prospects apparently forever.

Had Lord Bacon been allowed to remain upon the woolsack, it is not likely that his name would ever have descended to posterity imperishably associated with the inductive philosophy; and had Clinton's political career been as uninterruptedly successful as Van Buren's, it may well be doubted whether his fame would have been more durable.

It must be said, however, in extenuation of Clinton's folly in giving to party so much of what was meant for mankind, that none of his political contemporaries in this State seem to have less overrated the rewards of political success than he did, or to have been more fastidious about the means of securing them, while none of them sought more earnestly than he to achieve their own through the public good. Clinton no doubt put too much faith in the arm of flesh and in political arts of man's device, but his ends were always noble and patriotic. If he failed as a statesman, like Phaeton driving the chariot of the sun, he failed in attempting great things. His hands were always clean. He was never poorer in worldly wealth than when he died; and he scorned all the baser motives of the selfish throng that ever infest

"party's pond, wherein
Lizard, toad, and terrapin,
Your ale-house patriots, are seen
In Faction's feverish sunshine basking."

These letters betray a willingness to criticise and censure, a proneness to ascribe unworthy motives, a blindness to the faults of his partisans and to the merits of his adversaries, which impair the symmetry of his greatness, as in life they impaired his popularity and influence. Had his days been lengthened, and had he been permitted to

emerge from the somewhat provincial arena in which he spent his entire public life, he would have learned no doubt by experience what the Russians have cast into a proverb, that "the wise man when alone thinks of his own faults, and when in company forgets the faults of his friends," and that in politics more especially we should never forget that the adversary of to-day may to-morrow be an indispensable ally.

MAGASS, THE OUTLAW OF THE CARPATHIANS.

FROM THE GERMAN.

THROUGH the floating mist which spread like a dreary sea around the massive round tower of the manor-house of the lord of Jauma, the britzska of the proprietor, drawn by three work-horses, had sailed, as it were, into the court-yard. The old Cossack, Petreuko, stood by the step, with drowsy eyes and hair half filled with straw, helping out first the gracious Herr Adam Kanwizki, and then the young priest whom his lord had brought from Lemberg to be the tutor of his children.

"Hey, Lucas," drawled out the old servant, "rub your eyes open! Here's the young father's trunk!"

Meanwhile the lady of the house had come out, a little, slender, Polish woman, sallow but piquant, her brown hair *en papillotes*, her hands in the pockets of her prettily fitting outside sacque, and a big cigar in her small red mouth. She received the tutor with expressive Polish courtesousness, apologizing for the poor hospitalities her house could furnish.

"Nothing new?" asked the lord.

Frau Celina shrugged her shoulders.

"There was a great red fire to be seen in the night," said the old Cossack.

"Is all the work done?" asked the proprietor.

"All but drawing in the wood," replied the Cossack. "We have had no horses."

"The peasant might drive out there now," remarked Frau Celina.

This peasant, Kvitka, born on the estate, and rendering socage service, was about thirty years old, and with his black hair hanging down over his forehead, his long mustache and unshaven beard, presented rather a forbidding appearance.

"Do you hear, Kvitka?" said the Cossack.

"You are to drive to the wood."

"Not I."

"Are you crazy?" screamed the Cossack.

"What does he say?" inquired the proprietor.

"That he won't drive."

"I have driven the master to Lemberg and back again," said Kvitka, humbly; "I've done my tenure service for the week."

"But if I order you?" cried the mistress, in a rage.

"It's against the Emperor's patent."

"He is right," interposed Herr Kanwizki; "let him go away." With this he went up the steps, followed by the priest.

The peasant was going off quietly, when Frau Celina cried, "Hold him there!"

The Cossack seized him by the sleeve and held him back, while Kvitka said, calmly, "What would you have? I have done my service."

"You are going to resist, are you?" shrieked the Cossack. "You are an outlaw too."

"You will go for the wood?" said the mistress, pale with anger, as she threw away the cigar.

"No."

"Give me the short whip." She held the peasant firmly with one of her delicate, trembling hands, and with the other gave him several smart strokes of the whip.

"Well, what have you got now?" asked the Cossack, while the mistress, drawing a long breath, went slowly toward the house.

"My horses in good plight," said the peasant, smiling, and patting his small lean horses on the neck.

"Take away the horses," cried Frau Celina, turning round, "and whip him out of the yard."

The peasant swung himself on the led-horse and rode off with the team.

"After him," commanded Frau Kanwizka, "and bring the horses back." Perceiving the priest, who remained standing on the steps, she said, smiling, "A pretty reception this for a guest. Come in!" And taking his arm, she led him into the dining-room.

There sat Herr Adam Kanwizki at breakfast, in his comfortable dressing-gown, and smoking his long chibouk.

They sat down to breakfast, and Frau Celina played the hostess in most amiable style. The priest, her guest, was scarcely twenty years old, slender, good-looking, with fine light hair, and somewhat boyish red-cheeked face, sharp gray eyes, and a thin yellow down on his prominent upper lip. He was elegantly dressed, and had an aristocratic air. He chatted away about Lemberg, literature, the last popular play, and described each actress with her toilet from chignon to slipper. The lordly proprietor began to look upon him with respect.

Just then the door opened, and the Cossack brought in Kvitka.

"Well, what's the matter with you?" inquired the master.

"Matter enough; they've taken away my horses."

Herr Adam looked toward his wife, but he said nothing.

"Will you go for the wood?" asked Frau Celina.

"How can I? My horses are out of wind, and they'll drop under me."

"You won't go, then? What if your horses are taken away?"

"I shall complain to the court."

"Good! You shall be whipped. Petreuko, give him at the block—"

"But, gracious lady," whimpered Kvitka, "that can't be so!"

"Do you mean to make a complaint to the court?"

"No."

"Will you go with the horses?"

"I can't."

"Hey! Then the devil take you," cried the proprietor. "Take his horses, for all I care, and drive him off."

Kvitka had no sooner gone than a fresh disturbance arose in the yard.

"May I be permitted to see what is the matter?" inquired the priest, who was named Father Antoni Motolski.

Frau Celina opened a window herself, and looked out into the yard. A servant was holding a gray-haired peasant by the collar. His teeth were clenched and his face worn and pale as he struggled to free himself.

"What's the matter here?" cried the mistress to those below.

"A thief!" exclaimed the servant, who held the man fast.

"Who is he?"

"Hrekora, from Labje. He's stolen ten sheaves of wheat."

"Lie in your teeth, you Turk!" screamed the man.

"What have you to say for yourself?" asked Frau Celina.

"Yesterday I was doing my service at harvesting," said the old man. "They loaded my wagon down till the beam broke, and when I was gone after some rope they stole the sheaves."

"You stole them yourself, you robber!" cried the master. "Take away those Hungarian oxen of his."

"God punish me if I've stolen! The master dare not take my oxen."

"Not dare!" laughed the nobleman. "I have known you for a long time; you are nothing but a rebel. Appeal to the court, if you want to; I've left a good character for you there. You will find it out one of these days." Saying this he made a threatening motion with his long pipe.

"You can do it if you please," said the peasant, becoming perfectly quiet. "I tell you Magass will look after you. You have half killed Iwan Bossak with your whips, and he has gone to complain to Magass."

"The gallows are all set up ready for him!" cried the proprietor, purple in the face.

"Hunt him out of the yard with the dogs," ordered the mistress.

The old man ran off at full speed, and the dogs after him.

"A perverse set you have here," observed Father Antoni, gallantly closing the window.

"You must not be misled by what you have witnessed," said Frau Kanwizka, eagerly; "the law justifies us in what we have done."

"It's all owing to the mountains," said the nobleman.

"Do you think they have any direct influence?" asked the priest.

Herr Kanwizki opened his eyes in astonishment. "Just as you please to take it," he replied. "Yes and no. What I meant was this—that the people in the mountains are a different set from those on the plain. The Huzul is proud of his name, and the fellows are insolent because they have never been serfs or rendered service."

"Incredible!" cried the priest, slapping the table with the palm of his hand.

"Fact!" continued Herr Adam, as he complacently smoked his long pipe. "A Huzul would rather starve to death in his mountains than work for us for money. They are wretchedly poor, but they dress better than our peasants. They till their miserable bits of ground, pasture their sheep, traffic among themselves for what they need, and will stand bravely one against ten. Beautiful people! And the women!" Herr Adam shut his eyes and blew the smoke through his nostrils.

"Tell me about them."

"The people here are like the native savages in the American prairies, such as you find in the romances," remarked Frau Celina.

"And they have sorceresses too," added the husband, very seriously.

"Don't talk so, I beseech you!" cried his wife.

"Well, I could relate many incidents," said Herr Adam, hiding himself in a cloud of smoke.

The Cossack entered and began to clear the table, while Frau Celina, looking over her shoulder at her husband with a contemptuous glance, said to Father Antoni,

"There are some among them who have a secret knowledge of natural powers which has been transmitted from parent to child."

Herr Antoni gave eager attention, and at last said, "Then these mountaineers, these Huzuls, are a free and brave people, something like the Scots in Walter Scott, or the Indians."

"Yes; they are not to be trifled with," replied Herr Adam. "If you send our peasants to the whipping-post, they kiss your hand. But a Huzul!—ha!—joke with him, and he'll split open your skull on the spot with his long-handled hatchet. And every one has his gun, and a handful of powder gives him more delight than a bagful of ducats. A barbarous people, but fondly attached to their mountains. A savage race!

Why, a youth often grows up to be a man without ever having seen the inside of a church."

"Ho! ho!" exclaimed the Cossack. "And robbers too!"

"It spoils our peasants," continued the proprietor, "to have such an example every day before their eyes."

"And many robbers too!" cried the old Cossack.

"Silence!" said the mistress.

"Robbers!" began Herr Antoni, in an excited tone. "This is extremely interesting. I have never seen any except on the stage. Are there really many robbers here?"

"Ho! ho! Millions!" asserted the Cossack.

"What nonsense to disquiet a guest in this way!" cried the lady.

"This is a real cordial to me, I assure you," gallantly observed the priest. "I am so happy to be here with you and Herr Adam, and these robbers. Go on and tell me about the robbers." He seemed to take special delight in the word. "Where do they come from?"

"Whence comes the grass?" asked Herr Adam, very sagely. "Whence comes the water? Whence the metals? They grow, do they not? So the robbers have always grown in the mountains. As the Polish peasants waged war in the mountains against the noblemen, so the Hajdamaks here in the Carpathians. And the stories of war and hatred to the Latin Church and to the nobility live in their songs and traditions. And the contest will last till the peasant is free."

"Then these robbers are a sort of rebels or outlaws? And why does not the government put them down?"

"A robber or outlaw has never touched any official of the emperor, but they take off our very skins."

"Strange! Who would have thought it?" cried Antoni, repeatedly. "Who is this Magass the old man spoke of? I should think such a common vagabond—"

"What should you think?" asked Herr Adam, energetically, as he threw himself back in his chair and opened wide his eyes. "Magass is a paladin of romance, plundering the rich and protecting the poor. He's here and nowhere and every where, but always a hero."

"And he can't be wounded," said the Cossack; "no ball can hit him. He has a band of several thousands—"

"What are you saying there?" asked the mistress, abruptly.

"Well, if there are a few hundreds less than that, what does it matter, since he lords it over the whole region, holds his tribunal over the nobility, and sends his letters into all court-yards?"

"Can a robber write?" asked the priest, in astonishment.

"Yes," Herr Adam asserted; "and he has with him a sort of a priest, expelled from the Greek Church, who does his writing for him."

"This amuses me mightily," said Herr Antoni.

The dogs now set up a barking, voices were heard in the yard, and a heavy tread on the steps.

"Who may this be now?" sighed Herr Kanwizki.

"It's Michal," said the Cossack, looking out.

"What does he want?"

Michal, a thickset, red-faced tenant, with silver rings in his ears, now entered the room in a state of great perturbation as he moved his head, which he had grasped with both hands.

"A great misfortune, gracious Herr!" he exclaimed. "The outlying farm was burned down last night."

"Ah! impossible!" Even the resolute little lady becoming pale, and Herr Adam sitting motionless.

"O God!" lamented the tenant, "I'm a lost man; and it's all out of revenge on your account, gracious Herr. Magass has done it."

"Magass!" screamed the nobleman. "We must go there."

"I shall accompany you," added Frau Kanwizka; "and you must go too, Herr Antoni."

"Oh, I—of course."

"Saddle the horses, Petreuko, at once."

The lady made a hasty toilet, and looked quite pretty in her loose brown curls and closely fitting riding-dress.

It was a melancholy sight. Smoke and sparks were still rising from the heap of ashes and charred timbers, and the tenant's wife, with her youngest child at her breast, was sitting under an apple-tree, while the other children were trying to collect the cows.

The noble proprietor gazed speechless at the desolation, while the tenant pointed in silence to a post on which was nailed a sheet of coarse paper. They went up to it and read these words, written in large letters: "Magass, the outlaw, has held here a tribunal according to the ancient law."

In the afternoon the nobleman and his wife, with the new tutor, sat in the ivy arbor behind the house. The monthly roses were wilted, and the low sun gave a dull reddish light.

"Idyllic! perfectly idyllic!" cried Father Antoni.

"A beautiful idyl!" grumbled Frau Celina. "I am reminded of a Spanish proverb, which says, 'Just behind the cross stands the devil;' so behind this Polish idyl there stands the rebellious peasant with his straight scythe, and the robber with his loaded gun."

Herr Adam sat considerably out of tune.

"It does no good to grieve for what can not be remedied. We must be reconciled to the inevitable," said the young priest.

"Invent some way, if you can, to root out this God-forsaken nest of robbers," sighed the nobleman.

"Nothing more easy," said the father; "their captain must be got hold of, in the first place."

"That has been tried before this," rejoined Herr Adam.

"How, if I may be allowed to ask?"

"With a large military force," replied the proprietor.

"Why not try cannon and ships?" inquired the priest.

Herr Adam stared and looked puzzled.

"With your leave," continued Herr Antoni, "it must be *à la Fra Diavolo*."

"How is that, may I ask?"

"With wiles, Herr Adam—with wiles. All great robber chiefs have been betrayed by the girl they love. Wasn't it so with the Old Testament Samson?"

Herr Adam contracted his eyebrows in philosophic meditation, and after a while muttered, "A good thought—a very good thought."

The noble couple shortly after retired, in order to consider this suggestion, the gracious Frau going into the house, and her husband to the barn. Father Antoni betook himself to the court-yard, where the old Cossack was cleaning up the rickety calash.

"Do you smoke, uncle?" asked the priest, taking his tobacco-box out of his pocket. The Cossack ruffled his hair, sighed, and stared.

"Well, where's your pipe?"

The old man drew it forth with a perplexed smile, and the priest filled it with his own hand, and then gave him a match to light it. A match was a great rarity here in the mountains.

"Where does the maiden live that Magass loves?" asked the priest.

The wheel the old Cossack was cleaning creaked and groaned piteously.

"What do you want, reverend Sir?" said the old man at last. "Don't meddle in such dangerous matters."

"But I wish to know where this girl's home is."

"Not here," slowly replied the old man, as if he were trying to think; "yonder, away off in the mountains, with an old witch who makes thunder-storms, and rides off sometimes on a black cat."

"But how can she go on a cat?"

"It's a cat as big as a new-born calf. You may convince yourself of that."

"That's what I mean to do. Will you drive me there?"

The Cossack knit his brow, and then said

to himself, "It's nothing to me if he gets—I'll go."

On the same day, guided by the Cossack, the priest took the road leading to one of the dark, narrow passes of the mountains. Passing beyond the scattered herdmen's huts, he came to a real owl's nest, that could hardly be distinguished from the rock itself. He looked about in vain for some kind of entrance, and at last knocked rather faintly on the closed wooden shutter. The shutter was opened, and two big gray eyes confronted the priest.

"What do you want of me?" cried a deep hoarse voice.

"Some good advice."

"Good advice costs something."

"I will pay you well; let me in."

"Go round the rock; I'll meet you."

The old woman came out and helped him up the rock with her bony hand. He entered a large, square, low room with three windows opening to the south, and another door besides the one through which he had passed. Some steps led to a trap-door in the ceiling. Opposite the door was a stove, and in one corner a bed, near which there was an antique chest painted with large flowers of various colors, and a cupboard decorated in the same Byzantine style. On the walls were pasted pictures of saints of the Greek Church. In another corner was the seat of the old woman, a high carved stool with faded red cushions, looking something like the throne of the Byzantine emperors. A wooden block, which cut a sorry figure, served as a footstool, and at the head the bleached skull of a horse stood up in all its ghastly ugliness.

The old woman took up her spindle, seated herself on her throne, and motioned to the priest to sit down. Her eyes were full of intelligence and courage, and the white hair flowing from beneath her brown head-dress gave her an almost venerable aspect.

"What do you wish to consult me about, reverend Sir?" inquired the old woman.

"I have been sent as an invalid to ask your advice."

"You are not sick," replied she, in a quick and sharp tone. "This is not what you came for."

"No; I desire to have a conversation with the maiden who lives here with you."

Her look now became distrustful and hostile. "What has the girl to do with you?" she asked. "No," murmured she; "this won't do—in God's name, it won't."

"Call her;" and the priest threw two pieces of silver coin into her lap.

Without touching the money, the old woman replied: "How am I to call her? She will come without being called, and I can't hinder you from staying here." Then she took to spinning industriously, humming to herself. The setting sun blazed in through

the open door. The priest was silent, and the old woman became silent too. Suddenly the side door was opened, and on the threshold there stood a beautiful young girl, about whose form the red sunlight glowed like a saintly halo. Father Antoni involuntarily, almost reverentially, stood up. An imposing figure, almost six feet in height, but with a perfect harmony of proportion in every limb and feature, a genuine daughter of the Carpathians, confronted him in a half-terrified, half-threatening attitude. Her oval face and commanding features expressed strong character, and her complexion seemed to have borrowed from the sunny atmosphere, like the peasant women of Murillo, its tint of fresh ruddy brown. Dark, heavy eyebrows met over the glowing eyes, and the deep red of her full lips contrasted with the bright scarlet of the ribbons which restrained the luxuriance of her flowing hair. Little shells from the mountain stream Tyssa—the native ornament of the Carpathian women—were scattered through her hair, and looked as if floating in the dark gleaming waves of their native stream. A skirt of blue cloth fell down in folds from her waist over the bright red morocco boots, and a bodice of the same color, open at the bosom, showed a fine linen kerchief beneath; while the embroidered flowers on the sleeves, the broad red girdle, and the short sleeveless cloak of white cloth, worked with yellow worsted and bordered with fine black lamb-skin, gave her a picturesque and Oriental appearance. Gold coins answered the purpose of ear-rings, and hung in heavy chains around her arms, while a string of large rich pearls round her neck came down to her breast. She held in her hand a mountain staff tipped with lead, and on her shoulder was perched a large raven, which slowly moved its outspread, glistening wings.

"Why have you come to my house?" inquired she, in that wonderful violoncello tone of a deep alto voice. And as she uttered these words she raised her staff with a threatening air. The raven flew up with a screech, and made several circles in its flight around the head of the priest. "Well, answer," said the Huzulin, as she fastened her eye searchingly upon him, an eye before which the youthful and courageous priest quailed, and cast down his own to the floor.

"Well, here I am. What is it you want?"

"I should like to have a conversation with you alone."

The noble-looking giantess smiled, as if with pity, and made a sign to the old woman, who slowly withdrew.

"Be seated," said the Huzulin, with the air of a princess.

Father Antoni approached her, extending his hand. She did not stir.

"Give me your hand."

She extended her hand in a cold and lofty manner, and the priest held it firmly as he said, in a low and thrilling tone,

"You are a beautiful woman—by Heaven, a beautiful woman!"

"I know that; for the best man in all the mountains loves me."

"And he would be a stupid blockhead, unworthy to have this beautiful sun to shine upon him, if he did not love you. But you might have for lovers lords, great lords, princes, if you wanted to. What is your name?"

"Wera Gregorewitsch. But why do you make such a proposition to me? I have no wish to listen to any such talk. Spare your pains, and be off before Magass comes."

"Is he coming?" The priest had seated himself close to the giantess. "You can dig up a treasure, a costly treasure, without using any magic art," he said.

"Why do you speak of magic arts?" asked she, in a tone of displeasure.

"Are you not all more or less witches in the mountains here?" said the priest; "and you—you most of all—have you not bewitched this wild robber?"

"No magic arts were needed for that," rejoined Wera, curling her lips with the consciousness of her own charms. "And what sort of a treasure can one dig up?"

"A real treasure of gold and silver and jewels, if you will sell Magass to us."

"What good would Magass do you? what would you do with him?" she naïvely inquired.

"Hang him, my darling!"

The Huzulin sprang up with all the passionate wildness of a child of nature, her eyes sparkling with rage.

"Leave me! You are no holy man; you are a seducer—a devil!" She made the sign of the cross on her forehead and her breast. "I will have none of your treasure. Thank God if I do not hand you over to Magass."

A shudder ran all over the priest.

"What do you intend? You would—"

"I believe you are afraid of me," said the Huzulin, with a complacent smile.

"Why should I be afraid of you, my dear one—my angel?" whispered Father Antoni.

"Why? Because I, though only a woman, am stronger than you; and if I pleased, I could by myself bind you fast, as if you were a child." And the beautiful giantess immediately seized his wrists, and held him fast with his arms crossed as if he was handcuffed.

"Verily, you could overpower and bind me."

"But it would not be worth the while," said she, quietly, as she let go of him. "Now be off from here."

"Will you not inform us, then, when Magass is coming?" began the priest once more.

"Is that all you want?" cried Wera, in astonishment. "Well, he is coming this evening. I tell you so that you may get out of his way, for you are all afraid of him, you Poles, as sinners are afraid of their God. Yes, he is coming this evening, and will go away in the morning. But I will not betray him. I am only a poor girl, without parents, without relatives, without friends, but I will sell no one. And then," she added, scornfully, as she let the gold coins slide through her fingers, "what could you give me that I can not have from him whenever I will? He is in the mountains what the Emperor is on the Danube, what the Czar is in Moscow."

She opened the chest, whose cover was pasted inside with pictures of saints which surrounded a broken mirror, knelt down and looked at herself in the glass, and then sat down on the threshold with arms over her knees. She leaned against the oaken doorpost, and as she gazed out into the glimmering landscape, sang the melancholy popular song,

"My heart is sad and dreary."

The priest returned to the manor-house, and late in the evening set off again, accompanied by Herr Adam and the Cossack on horseback, with a posse of farm servants and peasants on foot, to take the outlaw chief, Magass, whom Father Antoni had reported as to be found that night at Wera's hut. Frau Celina waved her handkerchief until they were lost in the darkness, and then sat down to read the latest French novel. Hour after hour passed, and the lady at last threw down the book with a yawn, and with arms crossed on her breast, walked impatiently up and down the sitting-room. Then she seated herself at the piano, ran her fingers hastily over the keys, got up again in her restlessness, oppressed by the anxiety of waiting and by the hushed stillness of the midnight. Suddenly the great watch-dog in the yard gave one deep, hollow bark, and then a second, after which all was still. Shortly afterward a soft tread was heard in the entry without. The lady opened the door, but immediately bounded back in terror.

Before her stood a man six feet tall, and with a swarthy countenance, who smiled and bowed. "Make no alarm," said he, as the noble lady shrieked in affright, "or something unfortunate may occur."

"But who are you, then?"

"I am Magass. You have sent them after me, and here I am."

"Jesus Maria!" groaned Frau Kanwizka, taking refuge behind the piano.

Magass had now stepped into the room and shut the door. The lady gazed at him in blank and speechless terror.

Magass possessed a splendid form, of heroic proportions. He was tall, erect, and powerfully built. A coarse dirty shirt, throw-

sers of blue cloth, and shoes tied with strings of rawhide, could not conceal the shape and motion of his handsome olive-colored limbs. His brown jacket was thrown carelessly over his shoulders, upon which his long black hair fell down, and his dark broad-brimmed felt hat was ornamented with shimmering peacock feathers, red ribbons, and various kinds of coins. A knife was sticking in his broad girdle, studded with brass knobs, and an embroidered pouch of colored checked cotton was suspended diagonally from the right to the left side; while over one shoulder he carried his gun—a prize from the Turkish war—whose barrel was damask-eneed and ornamented with a sentence from the Koran, and in the other hand he carried his long-handled axe.

"Well, what do you want, then? Take my jewels; they are all at your service," said the lady.

Magass shook his head. "Don't regard me as inhuman, gracious lady," said he, in humble tone. "You have sent all the men from this farm off into the mountains. You are alone and exposed to danger, and so I have come to protect you in the absence of the men."

The nervous little woman came very near fainting. The outlaw perceived it, and withdrew, to stand guard like a sentinel at the outside door.

During this time Herr Adam was proceeding with his force through the village of Jauma and up the mountain pass. When they came to the wooden cross whence only a narrow foot-path led to the owl's nest of the old Widma, they held a council of war.

"We had better dismount," advised the priest.

"But who will hold the horses?" inquired Herr Adam.

"I will," cried the Cossack, with great alacrity.

"No, no; one of the peasants can do that."

"One of the peasants, then," sighed Petreuko.

"Forward, then," ordered Herr Adam. "Petreuko, you are to take the lead."

The old man grumbled a little, crossed himself, and then went forward with seeming indifference, and at a tolerably quick step. After him came the priest, then Herr Adam with the farm servants, the peasants bringing up the rear. They crossed gullies and clambered over rocks that lay in the path as it wound up the mountain, with a wall of rock on one side and a foaming torrent roaring at a great depth beneath on the other. A thick mist began to rise and veil the stars, and no object could be seen even a few paces in advance.

"Here's the spot where the five merchants were murdered," said the Cossack, pointing to a cross. "Here's where they were pitched down the precipice," pointing to the fear-

ful chasm. Suddenly he ducked his head, just as a raw soldier does when first under fire, and all the rest did the same. "What was that?" asked the priest in a whisper.

"A bat," growled the Cossack.

They came to the tree which bridged the roaring torrent, and at the moment Petreuko placed his foot upon it a shrill whistle was heard high up among the mountains, and then a wild mountain bugle sent forth its thrilling notes.

"It's the robbers," whispered Herr Adam. "Give me some liquor." Receiving no reply, he whispered more urgently, while his knees trembled, "Some liquor, brother," and reached back his hand, which grasped only the empty air. He turned round, and not one of his people was to be seen. There stood the three heroes alone in the mountain pass. Suddenly there came a fearful crash, and an awful plunge into the yawning chasm of some stones which had become loosened high above, and as they rolled down had carried with them large masses of earth and stone.

The three heroes remained on the spot not another moment. They uttered no sound, but ran in breathless haste until they reached the plain, hearing behind them and around them the contemptuous hooting of owls. It was nearly morning when they reached the inn at Jauma, exhausted and reeking with perspiration. There they found the rank and file of their demoralized force. Herr Adam surveyed them with a stern look as he said, "You are answerable for the failure of our expedition; but I will let you off, and say nothing more about it."

At daylight Herr Adam, accompanied by his entire troop, reached the gate of his manor-house, and found there a sort of placard stuck upon the post.

"Read it," he said to the Cossack, for the notice was written in the Russian ecclesiastical language, which the Pole found it difficult to decipher.

"Order to Herr Adam Kanwizki, lord of the soil at Jauma, to give back to Kvitka his horses, and to Hrekora his Hungarian oxen, forthwith, else a tribunal will be held over him according to the ancient law."
"MAGASS, Wataschko."

"Does it say that?" murmured Herr Adam, as in terror he began to spell out the words, letter by letter, with the help of the priest.

"It is really that," said Father Antoni.

"Well," said Herr Adam, "let the horses go."

"And the oxen too?" inquired the Cossack.

"What do you ask that for?" asked the vexed Herr Adam, in a sharp tone. "The oxen too."

Frau Celina has hung up her whip, and Father Antoni confines his visits to the members of his own parish. Not even a shed has since then been burned, and no robber has stood guard at Frau Kanwizka's door.

MISS ANGEL.

BY ANNE THACKERAY.

CHAPTER VIII.

THOSE WHO GO AND THOSE WHO ARE LEFT.

KAUFFMAN felt that his grief at parting from his daughter was to be expressed by no vulgar leave-taking, but by a solemn farewell on the piazza, with all the company looking on. He was anxious to be able to bless Angelica, and to burst into tears under the very eyes of the Ambassador, and amidst all the bustle and audience which belonged to the state of the great English nobleman—gondolas arriving at the starting-point, couriers, porters staggering with heavy luggage, in which my lady's beautiful clothes were packed; my lord himself swearing, if the truth must be confessed, and stamping about in a pair of huge boots; Lady Diana standing a little apart, with a book in her hand, while her maid and her man-servant scolded and superintended the packing of her carriage. The children were come, and stood in a shy cluster by their governess, with traveling hoods tied under their chubby faces.

Every one and every thing was ready for the start except old Kauffman, who had not yet taken leave, and her ladyship, who was late. She had sent word that the first carriageful should start without her, but this my lord would not hear of.

Angelica's heart was heavy enough now that the moment of parting was come. She made the best of it, however, knowing her father's susceptibility. "We shall see Verona, father, and Genoa, and the south of France; and we shall stop at Paris," she said, wistfully looking at the loved haggard face. "We will go there together coming back; and tell Antonio he is to come too. Where is Antonio?"

"Here he is," said Zucchi, stepping forward from behind.

"Ah, my child, at your age you may well have hope," said John Joseph, shaking his head; "but at mine, who shall say what a day may bring forth?"

Angelica turned very pale. "Oh, father, why should you talk so sadly? Heaven has been so good to us always," she faltered. "Together or apart, dearest dear, it is the same Providence that will keep us that has given to me my kind father, and to you your little Angelica, who loves you so!" She clung to his arm as she spoke. At that moment the Embassadress at last arrived in her gondola, stately and collected, chiefly concerned for the comfort of a small dog she carried under her arm. Every body uncovered and made way for the great lady.

"Here is my faithful Muse," she gayly greeted Angelica, with a very unconcerned nod to old Kauffman, who immediately stepped up to her, with tearful eyes and clasped hands, and would have gladly made a long and moving speech if he had had opportunity. Lady W. seemed much too absorbed to listen: there was no time to lose. The Ambassador laid his hand on the old man's shoulder and said, very kindly, "My lady will have good care of your daughter, M. Kauffman. Don't be disturbed about her." And then, as the old fellow broke into hysterical grief, he added, somewhat perplexed, "You know, if you repent, it is not too late for you to keep her even now." But terrible as parting was, not to part would have been a still greater misfortune, and old Kauffman, much alarmed, was silent immediately, and tried to gulp his tears. Antonio felt very angry with him, but forgave him for Angelica's sake.

"Good-by, Angel," he said, cheerfully. "I like your Ambassador; he has a good heart. And don't fear for the old father."

"Will you give him some Marsala wine for his dinner?" said Angel, with quivering lips.

Then somebody signed to her to get into a carriage. It was Lady Diana's two more maids, and the younger little girl had already scrambled in. The outriders spurred their horses, the footmen sprang on to the steps, and the whole procession started off along the road to Verona. Angelica eagerly stretched from the window, and followed her father with her eyes, as Antonio led him away; then she fell back into her corner.

Lady Diana leaned out to get one last view of the wonderful city. As she did so she caught sight of a man's pale face looking after them, half concealed by an archway. It was Count de Horn. Lady Diana shot a suspicious glance at Angel, who was quietly rubbing away her tears with her handkerchief. For nearly a mile they neither of them spoke. Little Charlotte whispered to her nurse; the wheels rolled on; the tassels and handles jingled and jogged. They were driving along a flat plain bounded by delicate hills, but nobody looked at them, and for a long way Angelica went on crying; but as there are rainbows in the air, so there are rainbows often shining after tears, and Angelica looked up in a little while, and tried to talk to her companion.

Lady Diana was, however, absorbed in a book which had just come out, called *The Vicar of Wakefield*.

People may live together for years and years in all peace and misunderstanding, as far apart as if in a different country, and utterly separated by a thousand gradations of interest and realization. It is the border lands of feeling that usually encroach upon one another, come to open warfare; and unlike as they were in appearance and character, Lady Diana and Angelica had enough of sympathy to dislike one another cordially before their journey together was over. Lady Diana was not happy with her cousin's wife, and the mere fact of that lady's sudden infatuation for the young painter had set the elder woman against Angelica. Lady W. not unfrequently took these passing fancies. She had had one once for Diana herself, but that was when she first married, ten years before, when Diana was seventeen. Neither of them could bestow what the other wanted. Judith wanted admiration, not love; poor Diana wanted love—there was nothing in her to be admired, she sometimes thought, with a sigh, but there *was* something to be loved. So she felt in her own heart, although little by little even that something seemed drying up and turning to strange bitterness and pain. She had loved her cousin, Lord W., dearly; they had been brought up together, and were more brother and sister than cousins. She had given her heart to his children; she trusted in his friendship and protection; and now Judith in a hundred little ways seemed to be trying to alienate him and them from her. She might have lived on happily if Lady W. would have allowed her to do so; she was not an unreasonable woman, and very little would have made her happy. Perhaps her life had been missed. Her brusquerie frightened people; her standard was a high one; and you always felt somehow that she was carrying the scales.

Miss Angel looked at her as she sat engrossed in her marble-covered book. She saw a stout, pale-faced person, very much overdressed (Lady Diana left her clothes to her maid, who was fond of bright colors). She was plain, uninteresting, dull, looking older than she really was, and speaking less kindly than she really felt. One thing only seemed to draw Angelica to her—a curious, indescribable sense of truthfulness of nature and reliability that were like Antonio. Angelica felt thankful to remember that he was with her father.

Antonio was always as good as his word. he kept with old Kauffman all that day, and only left him, cheered and sitting in the starlight at his favorite wine-stall, with old Pintucci as a companion. Then Antonio went away; he had work to do, and some heaviness of heart to shake off, and he longed to get away and be alone.

The next day a little scrap of penciled paper came back by one of the returning

couriers. It was hastily scrawled over with more good-by's and messages for Antonio. He read them with a half-sarcastic smile. "She wants me to take care of her father; that is what she means," he thought; and yet, though he doubted, the little messages were a comfort to him—she was kinder absent, on paper, than present and in words.

But Antonio was merbid where Miss Angel was concerned. He used to contrast her fate and his. He was only some seven years older in years, but how many in feeling, in experience! A long illness and shattered nerves had stood him ten years' experience. His hair at thirty-two was as gray as old Kauffman's; his hand trembled at times like an old man's; and his temper was crabbed and uncontrolled; he had no part in life but that of a convenient friend, taken up, put down, made use of. It made him furious at times to think of it. Poor Antonio would have gladly been young, handsome, rich, splendid; but that was not possible.

It was, however, possible to love her. Possible! it was impossible not to do so, with all her faults, her childish inconsiderateness, and her absurd vanity, her curious hallucination about herself (which, after all, was not to be wondered at). Antonio felt he could not but love her. He was much the prouder of the two, much the more suspicious, and much the more self-conscious, if the truth was known. It does not follow because a person is not handsome, or particularly prosperous, or successful in his affairs, that he is to experience every self-denying virtue. Antonio's intellect was in many respects far in advance of his powers, and of Angelica, and of the people she lived among: he was constantly chafed by a position which certainly was not equivalent to his abilities. He did not care for money for himself, but he liked to be able to help others, and his want of means was a bitter thorn in the side of a generous and yet orderly man. Although in his heart he felt that no one else in all the world could love her as he would have done, yet there were times when he gladly would have forgotten her if he could. Why was he to waste his good affections upon this careless and light-hearted girl? What had she done to deserve a good man's heart—or an indifferent man's heart, for the matter of that? You need not be specially good to suffer. "People were what they happened to be," thought Antonio. He had no intention of succumbing to fate; he had plenty of courage, and meant to make the very best he could of his powers, such as they were; and if he rated himself highly, it was because he was a sensible man, and knew what was in him, and not because he was a vain one, whose head was turned by other people's flattery.

CHAPTER IX.

ARCADIA.

MEANWHILE the lady of Antonio's dreams has ascended into realms undreamed of by struggling mortals trying to earn their daily bread. It was a curious experience for the painter-maiden to find herself suddenly one of an important company, traveling with relays of horses, with servants in attendance, putting up in the best rooms of the inns along the road, talking and hearing talk of lords and palaces and mansions as if they were things of course. There were splendid wax-lights burning on her dressing-table, servants at her call, and orders to give almost for the first time in her simple life. She had lived with great people before. When she had been painting the Cardinal at Como, he had asked her to breakfast. The Bishop had invited her to see his pictures, but there had been no real intimacy as now. She might have felt shy but for the Embassadress's charm of manner, and Angel was too simple and credulous not to trust her companions, whoever they might be, and to believe in all they told her.

The Ambassador was invariably kind; the little girls were delightful. If only her father had been there, Angelica would have had nothing to wish for. They crossed a sun-gilt and bountiful country, where the lovely garlands were hanging from branch to branch. Pan sits in a field piping on his two reeds to the peasants; white oxen come up to listen. The vines are heavy with brown fruit; the shadowed chestnut-trees burst from the valley, those mild valleys, castle-crowned and billowing to golden forelands. Some indescribable balm and strength and ease of heart seem to belong to all these lovely modulations of form and color. The bridge spanning the stream leads to the town below, to red roofs and vine bowers, from whence the people are looking up. A far-away cottage door opens wide, a woman comes out and flings a handful of fruit to some children.

The great carriages roll on, shaking and jolting, with the faces at the windows. The distant shadows and hills inclose the golden plains, delicately piled wreath upon wreath, now flying, now inclosing once again. Something seems to sing a *Laus Dei*: "Accept! accept! open your hearts; open wide your hearts!" is the hymn echoing along the way.

Lady Diana, who had let her book fall, looked round. No one had spoken; it was only her own heart that had cried out.

It was quite dark when they reached Verona, and came to a great busy court-yard, full of hospitality and confusion. Angel stepped away unnoticed, and went for a little way along a black and narrow street.

The apertures of the houses were lighted, curtains swung before the doors; the citi-

zens were gossiping within after their day's work. The sky was black and starless; you could scarce distinguish it from the sloping roofs. Angel did not go far; she heard clocks striking in the darkness overhead, the river rushing by the bridge. She felt that life had begun in earnest, and that this strange black veil of darkness hid a future of which she could form no conception as yet. But she would work to please her father, and to fulfill the mission that she felt was hers, and to earn money for them both. She might laugh as others did, and talk and seem to forget, but in her heart she did not forget that it was her aim to strive for beautiful and noble things, to teach others to look up at a high ideal. Antonio should see this was no idle fancy.

A sudden tipsy shout from one of the little drinking-houses frightened the young prophetic, and she turned and ran back as quickly as she could.

"How flushed you look, child!" said Lady W., as Angelica came flying along the gallery where she was standing with her children.

Window after window was lighted in honor of the Ambassador and his suit. Most of them opened on to the gallery, and Lady W. was waiting while her attendants unpacked and made ready.

"You must remember that you belong to us now. You must not run off alone," said she, gravely.

"Not go alone!" said Angelica. "I have been used to go alone all my life."

"You are a person of consequence now, child," said Lady W., smiling. "You must pay your penalty."

Next morning poor Angelica ventured no farther than the busy court-yard of the inn, although she longed to start off and see the place of which she had heard so much. She watched the people coming and going along the galleries, the oleander-trees in flaming rows. The great cathedral bell was going. A storm was brewing, the white and gray clouds heaving from beyond the roofs. As she stood there she heard a tramping along the wooden gallery; the Ambassador came up with his boots, leading little Judith by the hand. Perhaps he read Angelica's wishes in her eyes, for he asked her if she would accompany them in their morning's walk, and the girl gladly accepted. They went a little way through the streets, between the quaint crowded houses, across a wide piazza, toward a great arched gateway leading from the busy world outside into a silent cathedral. My lord passed in, first taking off his cocked hat, and little Judith tripped beside him. Miss Angel had seen many cathedrals; this one seemed to her to be an afterthought—an echo of those where she had so often knelt by her father's side.

Looking about, they passed on across the

marble pavement into a little cloistered court that lay behind the nave. It led to the baptistery. In this little court were some tombs and slabs engraved with coats of arms and inscriptions. A priest was standing thoughtfully absorbed in deciphering one of the flat grave-stones. He looked at Angelica as she passed. It was a kind and troubled face, that attracted her strangely, and she looked down from his face to the inscription he had been gazing at.

"IN PATIENCE POSSESS YE YOUR SOULS," was rudely carved on the marble slab.

"Patience!" cried Angelica, answering her own thought; "there are so many things better than patience!"

The priest looked up, surprised. "Yes, but when other things have failed," he said, in a despairing sort of way, "then patience is still left to us."

"No, no!" cried little Miss Angel, impetuously; "hope for something must remain while there is life. Patience is only death, only despair."

Long after, she remembered the little scene—the sad-faced priest, the solemn text, at a time when her own soul seemed failing for fear. But even then Angel was true to her creed. She might despair and die, or live and strive to hope for better things; but simple blind submission was a thought unbearable to her, and false to her own heart.

When Angel came back she was surprised to find that Lady W. again did not seem to approve of her sight-seeing, although this time she had not gone alone. "If you had come to me I should have taken you myself," said her patroness.

The journey proceeded in beauty and tranquillity. The weather frowned upon them as they neared the Mediterranean, with its long rolling breakers, its bordering groves and hills. The olives climb the steep acclivities, and from their smoky pyre rise white villages, like flames bursting from the summits. They stopped to change horses at a little place called Bordighiera, on the coast of the Mediterranean.

The sun had come out and the clouds had disappeared; a sort of dimmed brightness was every where, on the sea, on the village. In a little smiling grove beyond a wall, where a small gate swung upon its hinges, Miss Angel went up an avenue of lemons and olives, and breathed the sweet morning pastoral silence. Close at hand was an old ivy well. The pretty pensive figure itself was not unsuggestive, looking thoughtfully down into the water. Her heart beat with hope, with a sort of romantic delight and sweet absurdity. Some peasants passed; a woman carrying a load of leaves and tendrils of vines, and driving a beautiful white cow with long arched horns.

Then came the shepherd, followed by

some goats trotting with tinkling bells, and lastly, two little children with goat-skin coats; one had her hands full of un-ripe olives.

The youngest was carrying something held carefully against its little breast. The child looked up with two wild eyes at the pretty lady leaning against the old iron crank of the well. Something in her look invited his confidence, and he held up a little dead bird as he passed.

"What are you going to do with it?" Angel said, kindly.

"We are going to dig a grave," said the child. "It is dead!" and the little thing walked on with careful steps.

When Mrs. Angelica Kauffman sent her picture to Maiden Lane, it was somewhat pompously entitled "Shepherd and Shepherdess in Arcadia, moralizing at the Side of a Sepulchre, while others are dancing in the Distance;" but it was some vague remembrance of that morning dream which first suggested it to her.

She is not the only dreamer to whom Arcadia has been revealed: mightier dreams than hers have reached that mystic country.

"Auch ich in Arkadien," writes Goethe as a motto to his Italian journey. "*Et in Arcadia ego*," Sir Joshua has painted on a tomb in the background of a smiling picture.

"What can this mean?" says Dr. Johnson, looking at it. "It seem very nonsensical. 'I am in Arcadia.'"

"The king could have told you," says the painter; "he saw it yesterday, and said at once, 'Ay, ay! Death is even in Arcadia!'"

After all, Arcadia would be a sorry, stagnant sort of place without its tombstone. There is so much in life which is death! The fullness of life itself is a sort of death, of change, of absorption. There is death to evil as well as to good, death to pain, to dullness, and to death itself, when, with a sudden uplifting of heart in the fullness of time, Faith and Hope seem at last to overflow the barriers that have imprisoned them.

CHAPTER X.

"THE GENTLEMAN'S MAGAZINE" FOR 1766.

To read of the times when Miss Angel came to take up her abode among us is like reading the description of a sort of stately ballet or court dance. Good manners had to be *performed* in those days with deliberate dignity. There is a great deal of saluting and snuff-taking, complimenting and exclaiming; people advanced and retreated, bowing to the ground and balancing themselves on their high heels.

With all the dignity, there is also a great deal of noise, shouting, and chattering.

There are runners with torches, splendid footmen in green and golden liveries surrounding my lady's chair.

The King of Denmark is entertained in splendid fashion. The Princess of Brunswick is the heroine of the court journal. Cornelly lights up Soho Square with wax-candles, while highwaymen hang in chains upon the gallows in distant dark country roads. Our young King George is a bridegroom, lately crowned, with this powdered and lively kingdom to rule, and Charlotte Regina to help him.

There are great big coaches encumbering the street. Mr. Reynolds himself drives with painted panels, but Cecilia can still send for a chair when she wishes to be carried to Baker Street. Vauxhall is in its glory, and lights up its bowers. Dr. Burney gives musical parties, at which Piozzi performs. The cards fly in circling packs; the powder puffs rise in clouds; bubbles burst. The vast company journeys on its way. Golden idols are raised; some fall down and worship, others burst out laughing. Some lie resting in their tents, others are weeping in the desert. Pre-eminent among the throngs one mighty shade passes on its way. Is it a pillar of cloud sent to guide the straggling feet of the weary? From the gloom flash rays of light, of human sympathy not unspoken. How many of us, still wandering impatient, might follow that noble hypochondriac, nor be ashamed of our leader! He walks along, uncertain in his gait, striking alternate lamp-posts, an uncouth figure in soiled clothes, splendid-hearted, with generous help for more than one wounded traveler lying helpless by the road. Do we not read how noble Johnson stoops and raises the prostrate form upon his shoulders, and staggers home to his own house? He has not even an ass to help him to bear the burden.

The first time that Angelica saw him she was in her dream of preoccupation and happiness and excitement: were the thieves about her even then? The second time she was alone and in sorrow, breaking her sad heart and despairing. Then came to her the shabby feet bringing good tidings, the deep and truthful voice speaking strange comfort, the kind hands raising her and giving the balm of hope renewed to her bruised soul. Sir Joshua might assist a friend in sorrow, but he could not give comfort, for he did not realize as Johnson did the depths to which a human heart may sink.

Meanwhile Angelica laughs and holds her own. Her thieves (if thieves they are) are well-mannered ones. They pay her compliments, bring her tickets and flowers, invite her to dance and to sing, and to all sorts of pleasant things, and ask to have their portraits taken along with their betters. How was she to know them from her real friends? How was she to believe those who warned

her? Her very power over others blinded her to their faults. She could make people charming and kind by her own gayety of heart and outgoing grace.

She had not seen very much of the worldly world as yet. Every thing was new and full of interest. She watched all the figures go by, but she had no clew by which to form some judgment, and with one accord Angelica's complimentary contemporaries united to dazzle and to blind her. If you had heard the babble of the stream as it passed by Angel's not unwilling ears, the compliments, the half truths, the exaggerations, you would have forgiven her for believing not all but too much of what she heard. Compliments were as much part of the manner of the time as the snuff and the powder puffs.

Miss Burney's diary gives one a specimen of the good-natured exaggeration.

"The sweetest book!" cries Mrs. Thrale; "the most interesting! the most engaging! oh, it beats every other book!" "The most elegant novel I ever read in my life! such a style!" says Lady Saye and Sele. Then Mr. Soame Jenyns breaks forth in a higher strain: "All creation is open to the authoress; no human being who ever began that book had power to put it down." Even Miss Burney, in her usual modest confusion, feels that this is almost beyond her deserts, and takes refuge with the old housekeeper, who is coming up to the door, and exclaims to her mistress, "Ah, madam, how happy are you to have Minerva in the house!"

Angel was not Minerva only, but all the heathen divinities combined with all the Christian graces—a sort of combination of Muses and Virtues, according to her admirers; of brilliant talent, of frivolity, and heartless flirtation, according to her enemies. And Angelica herself? She never thought about herself, but gratefully accepted kindness, hoped, loved, believed, was happy, was miserable, without much method, innocent and unresenting. Rossi describes Angelica at this time as not very tall in stature, but of slight, well-proportioned figure; she had a dark clear complexion, a gracious mouth, white and equal teeth, well-marked features. Above all, he says, her azure eyes, so placid and so bright, charmed you with an expression it is impossible to write; unless you had known her you could not understand how eloquent were her looks.

"Il Ranolds" painted her, continues old Rossi, and Bartolozzi engraved the picture, and she painted herself many times. Sometimes she painted herself happy and brilliant, sometimes old and sad. There is one picture in the dress of her country, when the dimness of life and its troubles had passed over her path: it is all marked upon her face in sad and noble lines that detract from her beauty.

The house in Charles Street stood in a little park or garden, which had been deserted for many months, while the house was closed, and the inhabitants were basking in brighter horizons than that of Berkeley Square. Lady W. had given Angelica two little rooms on the ground-floor. The larger and darker was to serve as a bedroom; the second, with its glass doors and delicate inlaid chimney, was to be her working place for the present. As soon as she had made her way in the London world, and had earned a little money to start with, she was to be established in a studio of her own; but here for the present Angelica was well content to put up her canvases, and to begin work the very first morning after her arrival. She was not particular, and she could contentedly settle down in one corner or another. If this one had been a little larger, it would have suited her perfectly. The garden itself was green and neatly kept. Lord W. had a turn for such arrangements. There was a sort of terrace walk that ran round the house, and led to the bench beneath the trees. They were shady enough, and flourishing, notwithstanding London smoke. Light mists and drifts from the square passed across the garden. Sometimes bright skies lit up overhead, with a different quiver, indeed, to that thrill of azure life Angel was used to; but they shone as English skies should shine, veiled only by rain-giving clouds and gentle practical mists.

"You must make yourself at home, child," said Lady W., kindly, as she took her into the room. "Call for what you want; Mrs. Betty will attend upon you. You can receive your sitters in this outer room. Your good fairy, you see, has planned it all. Do you think you shall be happy here?" she said, looking at her steadily.

"Yes, indeed!" said Angelica, taking her hand and kissing it gratefully.

"I think you *are* a good creature," said Lady W., with a sort of suppressed sigh. "I know not why I should think so. I have been disappointed over and over again."

So she went away, leaving her poor little *protégée* somewhat perplexed as to what mysterious fidelity was expected of her. I don't believe, to tell the truth, that Lady W. knew very well herself; but, as other people before her, she wished every body to be and to do what she desired for them, and when they, naturally enough, went their own way, she considered herself deceived and disappointed and ill treated by fate. She was not happy with all her possessions. Perhaps for great and small ladies too there is no lesson more difficult to learn than that of being contented and happy with the happiness and interests that happen to fall to each lot. We are willing to accept this event which does not belong to our history,

that friend who does not need our regard, the interest or occupation which is the share of somebody else; but our own talents, it must be confessed, we often gladly put away in their napkins. Lady W. was a mysterious woman. She was good-natured, self-absorbed, wanting she knew not what. She took to people with great fervor for a time; then perhaps her expectations grew unreasonable, and her best and kindest nature being wounded, her selfish and colder feelings came to add to the confusion. It is certainly trying to live with this race of self-made demi-gods and goddesses.

Angelica found that Lady W. meant to leave her very free to lead her own life. Her breakfast was brought to her in her room. Until dinner, which was at three, she had her time absolutely to herself, and the sacrificial rites to vanity were only expected of an evening.

It is certain that a studio has a charm of its own which it is scarcely possible to account for, no matter how shabby, how bare, it may be: there is the easel, the pure light shining upon it; there is the painter reproducing your dream or his.

Angelica's little oval studio was a fit setting for her inspirations. Nymphs seemed to her waiting upon the terraces; heroes were crossing the paved hall or mounting the arched staircase outside that led to Lady W.'s receiving-rooms; and besides these visionary interests, Angelica was not insensible to the pleasures of actual manipulation, to the friendly mesmerism of her brush traveling across the canvas, her colors lying on the palette—to the actual charm of her work, its tools, and practice. Perhaps authors may have the same feeling when they sit down to a convenient table and find the faithful pen that has so patiently attended their flights and falls lying ready for use.

The first morning, however, she could hardly paint for excitement. She tried to turn her mind to her "Arcadia," and began to sketch it upon the canvas, but it was in vain: she could not apply; all London seemed to come between her and her tranquillity. To her great relief and satisfaction, the door opened at last, and Lady W. came into the painting-room: "Now, my sweet Kauffman, leave your work," she cried. "Come, child, come! I have ordered the coach. I am dying to take you to call at Mr. Reynolds's." "Sweet Kauffman," without an instant's hesitation, laid down her palette and tripped into the next room to get ready. She found that Mrs. Betty was waiting there by her mistress's orders with a pretty and mysterious garment for Angelica to wear upon this great occasion. The waiting-woman tried it on. The young girl looked at herself in the dim mirror, pushing back her lace. The glass reflected the pretty figure, the black silk shoes.

CHAPTER XI.

PAINT.

LADY W. was pleased with Angelica's artless pleasure in her new French hood. But she hurried her impatiently. "He goes out early. Come! do not let us delay. Now it is *my* turn to take you to see pictures." They had not far to go. The great coach turned the corner, crossed Piccadilly, turned up by Leicester Fields, of which the north side was open in those days, and stopped at the door of a very large and stately house. A servant opened to them, then a secretary came up. Lady W. seemed to know him, and called him M. Marchi.

"Mr. Reynolds was not at home; Miss Reynolds was engaged," the servant said. And M. Marchi, in reply to a question, told them that Lord Henry Belmore was not painting there that day.

Lady W., much disappointed, cast a glance at Angelica. "Might we not go in?" said Angelica; and Lady W. immediately agreed, and swept into the hall, desiring the servant to lead them to the studio. The dining-room door was open on one side of the hall, on the other a long broad gallery, carpeted and hung with pictures, led to the studio. There were sofas, and comfortable fires burning: the gallery was evidently used as a sort of sitting-room. There was a spinet in a recess, and a child's doll sitting bolt-upright upon the keys. With shy, curious eyes Angelica looked about, noting every thing with suppressed interest. What dignified personages are these hanging to the walls? A picture was leaning against the back of a chair just outside the studio door, and it attracted Angelica. It was the portrait of a young man in a crimson military coat, with gold embroidery, powdered hair, and a very gentle and charming face.

One or two very noble pictures were suspended on the walls.

"That is Sally Lennox, and that is her cousin," said Lady W., pointing to a figure in a noble composition, in which Juno and the Graces had taken mortal shape, (surely the most graceful and beautiful of that day). Libations were flowing, and tranquil altars to beauty had been raised in shady groves by the courteous painter. As a contrast to this dream, a reality was hanging opposite—the portrait of a man with a squint and a long lean figure, and a saturnine-looking face.

"There is an ugly fellow," cried Angelica, gayly, standing on tiptoe to look. "He is much too ugly to be so well painted. I wonder he does not frighten those beautiful ladies away."

"That, madam, is Mr. Wilkes, the patriot," said the secretary, who had followed them, the man who was an Italian, half secretary, half assistant, to Mr. Reynolds. "This is

the well-known Colonel Barré," he continued, and he pointed out another long lean form, with a military coat and a sloping head.

On the opposite side of the gallery smiled two charming persons, who will hold their graceful place while Sir Joshua's *cera* and *lacca* and *olios*, as he notes them in his diary, still exist. When these particles are dispersed into space, the names of the beautiful actresses will still remain to us associated with the traditions of his art, as charming Mrs. Cline (Clarinda, she writes herself in his list), and Mrs. Abingdon, smiling and gracious, and soothed for the moment from the irritation caused by Garrick's wrongs. "That portrait is a young Mr. André," the attendant went on, pointing to the picture which Angelica had examined; "he has just gone into the army, and it was the coat he was anxious about, more than the face."

The gallery contained most of the pictures. The open door at the end led to the studio. It was a good-sized room, with a window high up in the wall, a high-raised chair for sitters. Angelica entered in some excitement, started eagerly forward. "This light is excellent," she exclaimed. "I never saw it so arranged before. And that is where he paints!" and she went and looked with reverence at the palettes with their wooden handles, at the great pencils with their long stocks, at the high chair where the age came to sit to its painter. Presently she herself jumped up, laughing, into the chair, and she was still perched there when the master of the house himself walked in, and, after one surprised glance, made his obeisance to Lady W.

Lady W. had thrown herself into a graceful attitude, and stood leaning against the side of the step. She bent her head, graciously composed, while Angelica, in some confusion, came down from her high place.

"I have brought you— Guess who this is that I have brought you," Lady W. said, continuing to look so charming herself that the painter could only make her a bow and say,

"You have brought me a vision of Paradise, madam. My poor place seems beautified by such gracious apparitions. I am sorry," he continued, "to have been out when you arrived. I had been sent for to a friend in difficulties, who adds to mine by taking up time that might have been better spent. Was not my sister here to attend on you?"

"Miss Reynolds was not dressed," said the outspoken Marchi. "She begged me to make her excuses. She was in no fit state to appear."

Mr. Reynolds turned away and began to point out the pictures. Angelica looked, listened, and thrilled with heartiest admiration and reverence. Once turning round, the painter caught the expressive flash of her ea-

ger eyes. How different was that language from languid fine-lady criticisms, to which he was now hardened! Something told him (he was quick to read faces) that this was no ordinary visitor. One instant's glance said more than half a dozen commonplaces interchanged. He stopped short as he was walking by Lady W. "You have not yet introduced me to your friend," he said. "Can this be, indeed—" He looked at Angelica curiously and kindly.

"This is my Kauffman, Mr. Reynolds. You have found her out at last. Did I say one word too much?" asked the great lady, smiling. He did not answer directly. Angelica shrugged her shoulders in some slight confusion. She was pleased by the respect with which he addressed her.

"Will you honor me by permitting a visit to your studio to-morrow morning, madam?" said the great painter to the quivering, smiling, charming little painter in her pretty quaint dress. The satin trimmings glistened in the sloping light of the high window. The light just caught her white throat and the pearls Mrs. Betty had looped in her hair. The painter's kind looks seemed also to shine, Angelica thought, and she blushed up with innocent pleasure. Mr. Reynolds accompanied them ceremoniously to the door of his house, and Angel, as she followed, detected a little figure wrapped in a sort of cloak appearing in a doorway. It was a little middle-aged lady, who advanced toward them with a tripping step; then, perhaps seeing Mr. Reynolds was with them, she suddenly vanished again with extraordinary celerity.

"Do not fail us, false man," said Lady W., holding up her mitten. Then she asked casually whether Lord Henry had shown Mr. Reynolds his last attempt. "Shocking daubs, are they not?" she said, with a sort of forced laugh; but the painter answered gravely that there was merit in them not to be passed over.

"There! is he not charming?" cried Lady W., as they drove off in the great coach. "I told you so! it is decreed in the book of Fate. You need not look so innocent, child." All the way back Lady W. was her brightest and most charming self.

All that afternoon and evening she loaded her protégée with kindness, with pretty speeches. Lady Di, who was a good woman at heart, but not more perfect than her neighbors, began to feel even more provoked and indignant than usual. Angelica, who had tried in vain to conciliate her, accepted all this homage in good part, and at every fresh compliment looked with childish glee to see how Diana frowned. Then came Lord Henry, joining in with Lady W. and echoing her words. He called himself a passionate admirer of art, and it was from him that Lady W. had learned to take so great an in-

terest in pictures, although it must be confessed that under his distinguished guidance her taste lay more in the direction of pastels and miniature-work and copies from great masters than in the works of great men themselves.

Mr. Reynolds walked across Berkeley Square, and found the two ladies of the house standing looking out by the gate of the park. "Miss Kauffman is at home in her painting-room; come this way," said Lady W. "Let us take her by surprise. You can enter by the glass door." The surprise was very short, for Angelica was listening to every footstep. Once she thought Mr. Reynolds had come, but it was only Lord Henry Belmore, who, rather to her annoyance, asked leave to wait in her studio for Lady W., with whom he was going out. She let him sit down where he would, and went on with her painting. Then came more steps on the terrace and voices, and Angelica looked up, blushed, and sprang to open the window.

This time she saw the person she was waiting for so impatiently. Mr. Reynolds came forward, dressed in his velvet coat, and with a bag wig. He was of middle size, and looked young for his age. He was a little deaf, but in those days in *tête-à-tête* he needed no trumpet. His clear eyes shone with placid benevolence under their falling lids. He had scarred lips, mobile and sensitive. His voice was singularly pleasant.

"Here is a friend," said Lady W., as they all came in. Then her voice changed. "Henry, you here? We were waiting for you outside."

"Surely you told me to come to the studio," said Lord Henry. Then he stepped up, and seemed trying to conciliate, and the two walked off into the garden.

"How long had he been here?" Lady Di asked.

"A long time," said Angelica. "Ten minutes—more, for I repainted the heel of my Cupid's little foot."

"And you evidently suffered from his vicinity," said Mr. Reynolds, smiling, "for your picture is charming, but you will have again to repaint your Cupid's foot."

Lady Diana gave a scornful sort of laugh. Miss Angel blushed up indignantly.

"Do you really mean it? I assure you I was not thinking of any thing but my work. I hoped that the little foot was rightly turned."

"I wonder," said Mr. Reynolds, "if you will pardon me for speaking sincerely? I should think—I am convinced that you will not recommend any painter of real talent ever to attempt to work without a model. Some of the French school maintain that it is better to trust to one's own inspiration, but there I can not agree."

Angelica, who had expected compliments, was slightly disappointed at the turn conversation had taken, but for the sake of argument she attempted to contradict Mr. Reynolds, then suddenly she burst out laughing at her own childishness, and apologized with deprecating blue eyes, knowing that people always forgave her when she looked them in the face.

"I can only speak from my own experience," said Mr. Reynolds, smiling kindly. "Mr. Stothard, I believe, uses no models. I may be wrong;" and he began examining the other sketches in the room with expressions of warm admiration.

Lady Diana stood by all this time. It was now her turn to be vexed. She said to herself that Angelica was a vulgar flirt, and that Mr. Reynolds was a vain dupe; and then this odd woman, reproaching herself for secret feelings that she dared not express, said, suddenly, in her loudest and most disagreeable voice, "Because Miss Kauffman has well-shaped eyes it does not follow that you should deny what you know to be true, Mr. Reynolds; her pictures are out of drawing; it is all very pretty and sentimental, but quite false to nature."

Mr. Reynolds disliked anything approaching to a scene, and turned quietly away and began to examine her sketch of Arcadia. "I have been at work for double the time that your friend has lived," he said, "and I have not yet been able to attain the truth of line that we all aspire to. My admiration and respect for Miss Kauffman's work are too sincere for me to hesitate to declare what seems to me to be its excellence, or what in it might still further be improved." Then he stopped and went back to the first picture again. "Correctness of eye is only to be acquired by long habit. When any thing is properly made our own it becomes part of ourselves, and operates unperceived. We may thus exercise a kind of instinctive rectitude of mind which will supersede all rules." He spoke quietly, continuing on purpose to give Angelica time to recover from Lady Di's unprovoked attack. He was as much annoyed with her as was possible to a man of his gentle and controlled nature. The tears of vexation shining in Angel's eyes did not mend matters or soften him toward her adversary; but with some sudden brightness and effort Angelica brushed them away unaffectedly, and said,

"Thank you, Mr. Reynolds; you have now given me heart again; and in truth Lady Diana is not the first person who has warned me of my defects. But the others warned me from kindness—and so did you," said the girl, turning suddenly to Lady Di. She could not bear to say an unkind word.

"It was from no kindness," said Lady Di, turning pale. "You are quite right. People should forbear to speak unless they are

in sympathy with those they would criticize, not even though the picture is out of drawing;" and she walked out of the room.

Before Mr. Reynolds left he fixed a day for their next meeting, and asked leave to paint Miss Angel's portrait.

CHAPTER XII.

PENNELLO VOLANTE.

ANGELICA wrote long happy letters to her father in her uncle Michael's farm. When was he coming? was Antonio with him? was he not rejoiced at his child's good fortune?

Happy as she was, she missed him sadly at times, and longed for his paternal sympathy and advice and help.

She had visited many painters, she told him, M. Cipriani among the rest; but chief of all was Mr. Reynolds, the first painter in the town. "He has his own peculiar manner," writes Angelica; "his portraits are almost historical. He has a flying brush" (*un pennello volante*), "and a great knowledge of *chiar-oscuro*."

Then she told her father of all the kind things people said. Mr. Reynolds himself had asked her to paint his portrait. Those she had executed had already given satisfaction. Lady W. had promised her letters to the Duchess of Argyle. The great and talented Mrs. Damer had promised to sit. She had heard that the queen herself had asked with interest concerning her. "Mr. Reynolds was the kindest, the most untiring friend. I might, indeed, think too much of his kindness," wrote Angelica, "but that I have vowed to think only of my art, and have closed my heart to all other passions." There is a little paper still in existence which the girl wrote one night in a thoughtful mood: "Not easily shall I bind myself. Rome is ever in my thoughts: the Holy Spirit will direct me." It was a habit of hers to write upon little slips of paper little sentiments straight from her heart. Then she wrote again, detailing more and more success. The Princess of Brunswick was in London at this time, and had ordered a portrait of Angelica herself, and this picture had procured her the honor of a visit from the Princess of Wales, the mother of the king. Such an honor had never before been done to any painter, writes Angelica; and now she may think of a home for her dear to come to; now she may begin to see her way clearly established. Her letters at this time, says Rossi, are those of a person at the summit of tranquillity and joy. She tells her father of a proposition of marriage and of her refusal (it was soon after this that M. Fuseli left London and went abroad). But notwithstanding

these letters, John Joseph still delayed. Poor Antonio was in despair. In vain he urged and entreated him to start for England. He could not afford to wait any longer for the obstinate old man.

Angelica, who had felt somewhat forlorn at times, always brightened up after a talk with Mr. Reynolds. He spoke with all Antonio's directness and sympathy, and with authority as well. They had many long talks together. She enjoyed her sittings very much, and told him openly of all her concerns, in which he took unfailing interest.

She had been longing for some word of protective admonition; she had an instinctive desire for protection; it was as necessary to her as liberty. Mr. Reynolds seemed to give her more sense of ease by his few kind words than did all the compliments and adulations to which she was now so used. Sometimes unduly excited about her work, sometimes utterly depressed and hopeless, the bracing sense of the truth as it struck another person's mind came to her with an unspeakable relief, not the partial truth of adverse criticism, which is always hard to bear, but the considerate judgment of one so high in authority, of a person qualified to speak.

And for him was it not a new world of happiness to have such a sitter, bringing new life, light, and color into his hard-working life? "Miss Angel—Fiori." Is not this written in that book of fate, his diary for the year? The flowers were for her birthday. Lady W. had promised to sup in Leicester Fields that evening after the play. "Mr. Reynolds and the rest all join us here," said Lady W. "Make yourself beautiful, my Angel, and do not be late."

She was glad that he was expected, and she went to dress with a light heart, feeling that friends were true, life was worth living, and even dress worth dressing. Miss Angel spared no pains in her attire that evening, and had shown her art in a sacque and petticoat of white silk, resembling network—not unlike that one worn by Mrs. Nollekens at her wedding. It was shot with gray and embroidered with rose-buds. The deep and pointed stomacher was pinked and gimped. The sleeves of this dress closely fitted the arm to a little below the elbow, from which hung three point lace ruffles. Her neckerchief was of point, and confined by a bunch of rose-buds, and the three rows of pearls were tied with a narrow white satin ribbon behind. They were Roman pearls, but not the less becoming to her slender throat.

Her hair was piled over a cushion (cushions were rising in favor steadily year by year).

She wore a small cap of point lace to correspond with her ruffles. Her shoes were

of the same material as her dress, with Bristol spangles and heels three inches high. She came in smiling and laughing, in her wildest spirits, prepared to enjoy, and to admire, and to be admired, if the truth must be confessed.

As she entered the room she saw a figure standing against the light. "Is that you, Mr. Reynolds?" she said, for she was still thinking of him. "Have you been waiting long?" Mr. Reynolds was fond of speaking Italian, and often used that language, but this deep, angry voice was very unlike his gentle tones:

"I have been waiting for many weeks, and you are not yet ready for me, I see." Surely that was not Mr. Reynolds; and some one slipped out of the shadow, and Angelica uttered a little exclamation, for Antonio's dark eyes were flashing at her, angry, happy, suspicious, melting at the sight of her again, frowning at her greeting. For one minute she was herself enchanted to see her old companion; she clapped her hands and darted up to him with a glad exclamation: "Antonio! Antonio! who thought of seeing you! My father, where is he?"

Zucchi was silent for one instant, looking at her admiringly. He had never dreamed of her in such beauty and brilliance: but was it indeed Angelica? "I have broken my promise, Angelica; I have come without your father," he said at last. "But it was in vain I urged him. I should have lost my year's work had I waited longer. I left him ten days ago at Morbegno; he is well, and well cared for. He will come, he says, when you are in your own house."

"So much for your promises!" cried Angel, bitterly disappointed, and unjust to poor Antonio. "You have left him, poor dear! Who is one to trust if I can not trust you, who are always warning one against others; you, who—"

The door opened as she was speaking, still eager and excited, and a servant announced Mr. Reynolds, and, almost immediately after, Lord Henry Belmore and M. Fuseli. Lady W. affected an artistic society. She had met the young painter with the lion head not long before, and taken to him, perhaps, among other reasons, because she had been somewhat piqued by his indifference.

Mr. Reynolds was in full dress. He wore his red velvet court suit and his sword. He came up, carrying the flowers he had ordered in the morning, and presented them with a little compliment full of *bonhomie* and grace. The expression of his face was very kind as he bent before the young deity at whose shrine they all seemed to lay down their arms. As Mr. Reynolds stepped forward, Angelica's passing anger was distracted. She had forgotten it all; but Antonio's heart sank with gloomy apprehension. Her

anger had pained him less than her pleasure now did. Was ever any one so absurd, so proud, so sensitive, as this shabby little painter?

Not Mr. Reynolds in all his glory, not Angelica, radiant and supreme, could guess the depths of that curious nature. Angelica might have understood him if she had had time or wish to do so; but she was pre-occupied, impatient; her beautiful silk dress rustled at every step; her many lovers and friends were all arriving, saluting, talking, and calling her away. The door kept opening and admitting first one person and then another. Lady W. made her state entry, followed by my lord in his blue ribbon. Zucchi saw some of the people present glance at him with surprise; and when the lady of the house entered, her look of inquiry and amazement might have disconcerted a far more experienced man of the world than Zucchi.

"This is my old friend Antonio Zucchi," said Angelica, coming forward, with her quick, familiar voice; "he came to bring me news of my father, dearest lady." Then she turned to him more constrainedly, for Lady W.'s somewhat haughty stare was still upon Antonio. "You must come to-morrow morning when I am alone, Antonio, and then we will talk over our business;" and she held out her hand.

"Our business!" said Antonio, coldly. "I have no business. I came as a friend to see you. It is time I should retire and leave you to your acquaintance;" and he bowed to Lady W., not without dignity, and then to Angel.

"Will not your friend honor me to-night with his company at supper?" said Mr. Reynolds, always courteous and considerate of others, and he came forward as he spoke.

Antonio stiffly declined, made him a haughty bow, and was gone. Once outside, he could control himself no longer. As he ran down stairs he impatiently struck his hand upon his head, muttering something like "False! false!" to himself. He did not even see Lady Diana, who passed him on her way to join the company, and heard his words. As she opened the door she was shocked and revolted by Angelica's gay burst of laughter. Her first feeling had certainly been that of present relief. Every body looked more at ease as Antonio left the room, and the voices rose. But although Antonio was gone, he still seemed present to Angelica in some mysterious way. Diana did not know that her good spirits were partly caused by his coming. A little later on and Angelica became a little *distracted*, and it was the Kauffman, and not Mr. Reynolds, who begged for a repetition of M. Fuseli's question. What were they all talking about? The new erection in the king's gardens at Kew, the Chinese

tower, designed by Chambers, and costing ever so many thousands.

"I can not say I admire it," said Mr. Reynolds. "We are dwellers in London, and not at Pekin."

"But we drink Bohea out of China cups; we wear brocades and crapes from China," said Angelica; and she held up one of the long loose sleeves.

"And we, madam, are certain to be charmed by any thing you choose to wear or to do," said Mr. Reynolds, bowing again; "but you did not erect the Chinese tower."

CHAPTER XIII.

HAMLET.

MR. GARRICK was acting Hamlet that evening in powder and court dress, facing the infinite in a periwig, and treading the great globe of life in paste shoe-buckles. There was something magnetic in the night, misty as it was with vapors inclosing the theatre, and creeping in from outer doorways, and veiling the brilliant charms of the ladies present, the rouge on their cheeks, the pretty crimsoned lips. Then the great play itself seemed to spread and spread and drive out all other impressions. It was not only on the stage that it was being acted.

Garrick was not generally liked in the part of Hamlet; but to-night the place seemed to grow and grow, to become the life of those human beings all assembled there. They were come together to see a play, to laugh at one another and make signs, and to admire and criticise, but they remained to listen to the secret of their lives unfolded.

Garrick's faithful adorer, Miss Hannah More, sat palpitating in a box by Mrs. Garrick's side.

Zucchi was in the pit. He knew none of the people there. He was looking for one face which had not yet appeared.

In a stage-box sat the shabby and noble figure of a man with a scarred and benevolent countenance, and by his side an intelligent little ferrety person, peeping forward to get a better view of the audience. "They come, Sir," he said; "the whole party; they have secured two excellent boxes. There is Mr. Reynolds and Fuseli, and there is the fair observed of all observers, Miss Angelica. Mr. Reynolds has not invited me to sup with him to-night. I hear he is giving a great festivity. You, of course, are privileged."

"There is no privilege, Sir, in being admitted to a house where friendship has established a right of way," said the big shabby man. "But to-night I shall refrain. Mr. Reynolds is not unbiassed by the transient influences of those inferior to him in intellect. Miss is far more reliable. *She* would make my tea undisturbed by any circumstances."

Mr. Boswell was craning to get a good view of the "transient influences" now surrounding Mr. Reynolds. Lovely, smiling, splendid, Lady W. had never looked more stately and beautiful than she did that night. Her charm seemed diffused somehow; and she and Angelica sat opposite, like two mirrors reflecting one another. A summer and spring blooming in brightness. Their fans waved; the flowers seemed to fill the box. Even Lady Di looked her best.

Mr. Boswell then discovered Dr. Burney and his daughters in another part of the theatre. "Mrs. Thrale should not have been absent on such a night as this," he remarked. Dr. Johnson again rebuked him, and Mr. Boswell, as usual, listened with the greatest attention and deference, sometimes giving a start as if to add emphasis to his respect.

The play began, and even Dr. Johnson was silent.

In great acting there is some subtle measure impossible to describe, some time passing in certain harmony; and that night, when Hamlet stood upon the stage, a mysterious intelligence not to be explained seemed certainly and at once to flash between him and his audience. The plain commonplace-looking man became instantly and without effort the master of all those splendid people who were watching him. It was as if he were the pulse that flowed through their veins. This hour was his own, as this mood was his to which he gave the note, the time, the life almost. How nobly he stands listening while the poor ghost moans its awful plaint! Hamlet's beautiful voice seemed to strike home to every heart when he answered in clear, tranquil tones. Then rise passion and remorse, and woes thicken as the play goes on; the notes come full and dull with passion, and the words seem to break bounds and jar and clang.

Is the noble prince maddened as he turns in heart-scorn, rending, and railing at all those he has loved and trusted? Through this storm of shaken life comes poor Ophelia, wandering forlorn and helpless. Mrs. Addington was not acting that night, but a young actress whose utter simplicity and sweetness touched them all.

"I did love you once," said Hamlet.

"Indeed, my lord, you made me believe so!" says Ophelia.

"Get thee to a nunnery!" he cries, remorseless, carried far, far beyond the mood of love, but tender still even in this moment when a swerving finite nature is suddenly brought to face the infinite truth. It lies between them, awful, inevitable. The scene was so tender, so inexpressibly sad and despairing, it raised all the audience out of their petty chatter and racket of snuff-boxes. Miss Hannah More burst into tears.

Was some great power alive among them all, and speaking by the mouth of this little man? It was a relief to every one when every-day came in once more. The players distract the jarred soul, and bring it back for an hour into common words and daily life again.

"Mr. Garrick outdoes himself to-night," said Mr. Boswell.

"Sir," said his tutor, "you mean that Garrick outdoes your preconceived opinion of his powers. He has played his part with memory. He is a good repeater of other men's words." But when Mr. Reynolds came into the box presently and made some slight objection to some part of Hamlet's performance, the old man rose up in wrath.

"Let me tell you, Sir, that David is a genius; his fame is prodigious; his excellence as an actor is universally acknowledged; he is more likely to be correct than you are. He leaves nothing to chance; every gesture, every word, is studied in his closet."

Mr. Reynolds did not stay to argue the matter, although he has left a record of some such dialogue with his old friend. To-night he was in haste to return to his companions.

Angelica had scarcely recovered from her emotion when Mr. Reynolds returned to his place by her side. It was not only Miss Hannah More whose tears had flowed that evening. For little Angelica, the doom of inevitable seemed to strike her for almost the first time. The knell sounded in her ears. Poor Ophelia's story seemed so unutterably sad! "How could he leave her?" she said; "oh, how could he?" And she turned to Mr. Reynolds, and then laughed, and tried to wipe away her tears. "I am ashamed," she sobbed, all confused. "Might I retire to the back of the box?" She moved her chair as she spoke.

Both Mr. Reynolds and M. Fuseli came forward, and each on either side held out a hand to assist her.

Angelica half laughed, and looked from one to the other gayly through her passing tears. She put out her two little hands, and raised herself with the help of both the gentlemen.

Some one in the pit who had been looking on turned very pale and made an indignant movement.

"How angry that man looks!" said a casual spectator to his companion. "Is he not a countryman of yours, M. Cipriani?"

"My countrymen are apt to look angry when they are vexed," said M. Cipriani, who was a dark-eyed man, with a long nose, and brown face full of refinement and intelligence. "Your countrymen take life more calmly, Mr. Nollekens," he added, laughing.

"That man was frowning at the Kauffman up among her fine birds. My heart!

how she is carrying on with Mr. Reynolds!" said Mr. Nollekens.

"She is of a gay and innocent temper, and thinks not of evil tongues," said M. Cipriani, kindly. "She has real talent. She brought me some drawings yesterday."

CHAPTER XIV.

IN THE FLITTING OF A MOMENT.

ALL the house in Leicester Fields was lighted up ready to receive them, and for once Mr. Reynolds had given them special orders that every thing was to be prepared for his guests' comfort. I think it was on this occasion that the new dinner-service was ordered in, and the cut glass which is mentioned in history.

He thought more of the eyes than the palate, and Miss Reynolds was of too timid and anxious a disposition to order the occasional chaos of the house upon her own responsibility.

Mr. Reynolds stood by the fire behind Angelica's chair while the supper was going on. Mr. and Mrs. Garrick were to have come, but Garrick was tired after his performance. He had spoken in epilogue, had taken them all by surprise. Not one of them had recognized him in the clownish countryman who came in with a spade under his arm.

Mrs. Garrick herself had been wondering who it could be, when her little dog suddenly began to wag his tail as he lay concealed on her lap, and then she knew that though they were deceived, Flash had discovered his master. It was M. Fuseli who told the little story, with which Lady Di was enchanted. Lord Henry seemed to think it would be a subject for Mr. Reynolds's pencil.

"Does your lordship mean the little dog's tail?" said Angel, laughing.

Lady W. frowned; she did not like Lord Henry's suggestion to be lightly taken.

Angelica was in a curious excited condition that night; she was unlike her usual self—placidly cheerful, easily pleased with the history of life as it reached her. Hamlet had stirred the very depths of her heart. Then came the reaction of outer things, the compliments, the admiration; the scent of the flowers seemed to rise into her brain, the lights dazzled, the talk carried her away.

M. Fuseli made no secret of his devotion. If Mr. Reynolds was more reserved in his manifestations of interest, it was not that he felt less. She felt that he was with her all along. He threw in a word from time to time, attended quietly to her wants. Lord Henry, who was also somewhat excited, filled up Lady W.'s glass, and said,

"Shall we drink a toast to the beauty and living Muses among us?"

"Let us rather drink to our rivals," said Mr. Reynolds, smiling and bowing to Angelica.

M. Fuseli cried out that he would not drink such a toast. "I shall drink my toast in silence," he said; and he also looked at Angelica.

"Drink what toasts you will," cried Miss Angelica, starting up from table with a gay laugh; "I shall go and enjoy a different feast."

She walked across the room and across the long passage into the studio, of which the great doors were open. Her heart was still beating. She was treading upon air. She was standing looking at a lovely picture on Mr. Reynolds's easel, when she heard a step on the polished floor, and looking round hastily, saw that her host had also left the supper-table and come in search of her. He had come yielding to the impulse of the moment, and for once in his tranquil life carried away by the influence of something that seemed stronger than himself and that habit of self-control by which he justly set such store.

Angelica had become a painter again, as people do who have two lives to lead. She was looking at the picture, and for a moment she had forgotten the painter in wondering at the breadth and depth and grace of that lovely combination of color, of feeling, of flowing ease.

It was no depth of "divine despair" that overmastered her now, as when she had gazed at the great triumphant Titian in the gallery at Venice. It was with some sort of hope that she could look and admire and try to realize the simple mystery of this new master's art.

The picture happened to be the full-length portrait of the beautiful Lady Elizabeth Kepple, represented as a bride-maid sacrificing to Hymen. The sad fate of this lady excited much feeling at the time.

She married Lord Tavistock, who was killed by a fall from his horse not long afterward. His young wife died of a broken heart, and was mourned in all the odes and elegies of the day.

Is there any sign of this sad coming shadow in the lovely, radiant picture before which Angelica stands in the old attitude, bird-like, pensive?

It is the old attitude, but I am not sure that Antonio was not right, and that the shabby green gown was not more becoming than the delicate silk and rose-bud embroideries. But dress was certainly one of her special gifts, and what she wore became a part of herself. It is just as characteristic of some other women to be beautiful notwithstanding their clothes.

"I am trying to find out what charms you use, Mr. Reynolds, in this beautiful, wonderful picture. I think you breathe upon the

canvas, and will the life into your creations. I can not account for the result you attain to in any other way."

He did not answer immediately. Then he smiled. "The only incantations I have used here are a little color and oil mixed with magilp," he said, "and a coat of varnish, dear lady. Perhaps, while you are in the room," he repeated, "my poor works may seem to breathe for a few minutes; but that is your doing, not mine. You must know," he added, with some change of voice, "what a difference *your* coming makes to this house and to its master, who also comes to life in your presence, I think. Can you not understand me?" he said. "Can you not guess what, if I dared, if I were so presumptuous as to form a hope, that hope would be?"

Angelica was beginning to understand this earnest gaze, this grave, emphatic manner. Lady W. had prophesied and prophesied, and Mr. Reynolds had given hints before now, and her own heart had sometimes spoken; his beautiful pictures had spoken a hundred times; and suddenly Miss Angel turned round in not unrelenting consternation and excitement. With a sort of flashing thought she pictured all future possibilities to herself. Was this quiet, tranquil gentleman her future husband? Was this great lighted house her home?

Then she thought of her father. She seemed to see him comfortably installed in this sumptuous and comfortable haven.

She had wandered off into this day-dream, and almost forgotten Mr. Reynolds, who was standing patiently watching the bright expression of that smiling face. Alas! as she smiled his heart failed. He could read faces: that was his trade. Good-will he read upon those smiling lips, enthusiasm in those blue eyes, but not one melting gleam of personal tenderness and feeling, not one relenting emotion of heart-felt response, not one answer to his own strange, unexpected throb of heart. "I am presumptuous," he said; "and yet I must persist in my presumption. Dear lady, tell me do you understand me? Can similarity of taste and feeling, and my deep and heart-felt homage, which will never be less sincere than now, whatever your answer may be, stand you in the place of those many gifts in which I know I am deficient?"

Angelica blushed up crimson, and suddenly began to tremble. Mr. Reynolds felt his own agitation growing almost beyond his control. He turned away to recover and to regain his calm. As he turned away Angelica looked after him with grateful eyes. Antonio would say she had sold herself for money. No, no; if she accepted him, it would not be for any sordid reason. He must not think such reasons influenced her.

"But, Mr. Reynolds, you have your art.

Is she not your mistress?" said Angelica, coquettishly.

"You know my infirmity: I did not catch your meaning," said Mr. Reynolds, immediately coming back; and when Angelica repeated her sentence, which certainly was scarcely worth the trouble of repeating, he replied, in answer:

"Art may be a mistress that we painters must be content to worship with a hopeless passion. She can not be a wife, an equal, a living friend and helper, answering to the need of our human hearts."

His tone was so simple that it touched Angel very much.

"But why did you, then, think of me, Mr. Reynolds?" said she, with a slight quiver.

If Angelica answered flippantly, it was not because she did not feel his words, but because some instinctive honesty prevented her from letting him imagine that she had any deeper feeling than that which she really experienced. Compared to *his*, her own feeling seemed so slight, so worthless, that she was ashamed. She stood looking at him gratefully, with one of her azure looks.

"If I marry, as I suppose I must," she said, "I fear my husband will have to be content with a second place—with a third," she went on, looking down and clasping the little velvet at her wrist; "for I have my father's happiness to think of as well as my own. Believe me, Mr. Reynolds," she said, smiling gayly, "it will be vastly more sensible to leave things as they are."

Miss Angel had been honest, but I think, woman-like, she intended him not to be content with such an indefinite answer.

He did not quiver or show much change of manner when Angelica gave him her bright, saucy denial, and yet to him it seemed far more definite than she had any idea of. Reynolds went on quietly talking—so quietly that Angelica asked herself in amazement whether she had dreamed that he had proposed. He showed her one or two pictures, explained what pigments he had used for them, and when Lady W. came in from the supper-room with expressive looks and eyes directed curiously upon the two, he waited till she joined them, asked her opinion of his picture, quietly included her in the conversation, and then walked away with her.

Angelica stood by the picture, looking after them in a strange and undecided state of mind. She watched Lady W.'s silk dress shining, and Mr. Reynolds's sword swinging as he walked; then they joined some of the company, and a burst of laughter reached Angel, standing alone by the great easel. All the pictures seemed looking at her reproachfully. "What have you done? why have you vexed our good master?" they said. "How kind he was! how considerate! how

manly were his words! what a true gentleman he is in all his ways! What have you done? why did you do it?"

Little Miss Reynolds came flitting through the rooms, looking for a handkerchief she had dropped. She found Angel still alone in the studio, and exclaimed, in surprise, "Alone! Bless me, my dear! how is this? What has happened? Has Joshua made the offer? With all his faults, child, he will make a good and faithful husband."

"Did he tell you?" said Angel, bewildered, and longing for sympathy.

"Tell me! Not he, child. He is as mum as the church steeple to me. Sisters play a small part in men's lives. So he has done it, hey? You need not fear telling me. I understand it all. Don't cry, my dear; don't cry. I have no doubt you spoke very prettily, and I'm sure I don't know where he could find a sweeter wife," said the little old maid, looking at her with kind eyes.

A DREAM.

THE early moonlight, faint and meek,
Fell in white lines across her bed,
And turned to gems on lash and cheek
The tears that had but now been shed.
Sleep, coming with the shadows, brought
A slow relief from grievous thought.

It dulled the present sharp distress,
The sense of loss too hard to bear,
The haunting thought of loneliness,
The imminence of untried care.
She lost remembrance of the pain
That dawn would surely bring again.

She lost the world; so, tardily,
Another consciousness was born.
And then she dreamed that she was free,
Wandering beyond her life, forlorn;
And soul and body still were wed,
Although it seemed that she was dead.

Some mighty power, unseen and strong,
Had cast her in an angry sea.
She strove to breast its billows long;
And, as she struggled wearily,
She saw a low black line of shore,
With lights upon it, just before.

And, striving still more urgently,
She almost reached the wished-for land;
Then a great wave rose in the sea,
And bore her over rocks and strand;
Rolled back, and left her there, alone
And helpless in a land unknown.

But while she lay there, torn and bruised,
And dripping with the chilly brine,
She seemed to see, with sense confused,
The darkness round about her shine,
To feel a touch that charmed all pain
From broken frame and weary brain.

And One bent near with pitying face,
So grave, so gentle, and so sweet,
So full of promise and of grace,
She smiled while lying at His feet—
As homesick children, home once more,
Forget the grief that came before.

He led her to the inner land—
The night was hard beset by day—
She was content to hold His hand.

(It seemed there were no words to say,
Because she understood so well
Whatever there could be to tell.)

She saw the place was glad and bright,
With welcome strangeness heaven-fraught;
She had not known it by the sight,
And yet it was not new to thought:
All happy living things were there,
Refined, to suit a finer air.

A little bird flew from above
And softly lit upon her head;
She knew it for a petted dove
She loved in childhood—long since dead;
The Christ smiled, as she spoke its name,
And said, "We kept it till you came."

And there were flowers and trees and sky—
All wraiths of olden memory:
Each tiny detail, far and nigh,
With some past beauty did agree.
The Christ said, "See! they are the same;
We kept them for you till you came."

Then suddenly she heard a voice
Like some dear well-remembered song;
It made her very heart rejoice
At comfort it had wanted long.
She knew, ere sight could satisfy,
He she had mourned for stood close by.

Again her radiant Leader smiled—
The smile told more than words could say;
"You needed not to mourn, my child,
For God keeps all He takes away."
Again He said, "They are the same;
He kept them for you till you came."

Then lived a joy that naught can tell;
Delight that filled infinity;
Love, with no former parallel,
And utter peace that heaven made free.
But, breaking through this glimpse of grace,
A murmur seemed to fill the place.

The vision faded, passed away,
And left the darkness blank and old;
She saw the light of dawning day
Far in the east. The air was cold;
The cock's shrill warning of the sun
Told of another day begun.

Editor's Easy Chair.

THE recent reception of a liberal English statesman at a fine club-house in New York was the occasion of a note, in a neat Italian hand, which the Easy Chair received, asking if it could clearly explain why the English gentleman and brother finds it so difficult in this country to conform to the conventions of dress. Of all people, says the writer of the note, the English are the most formally conventional in regard to dress, and yet when they are here they constantly shock us with their negligence, or ignorance, or contemptuousness. "On the occasion to which I refer, the guest of the evening explained that he had totally misunderstood the character of the assembly. He had supposed it to be a meeting of gentlemen at a political club, and he had come as he would have gone to a London club." In this case, then, it was a mere misunderstanding, and a natural one; and how easy such misunderstandings of social forms and conventions are upon all sides, and even in this happy land, may be seen in the fact that on one occasion when a club in New York proposed to honor a member of Parliament by a reception, its cards invited the guests to meet the Honorable John Smith, which would have been the usual form in speaking of a member of Congress, but was wholly an error when applied to a member of Parliament. The Easy Chair therefore submits to its enlightened correspondent that if it was strange in the one case that the British statesman should mistake the proper costume, it was equally strange in the other that a club of American gentlemen should mistake the proper title of their guest.

But while the erudite Herr Teufelsdröckh has mystically expounded the philosophy of dress, a little careful observation or inquiry will save every man and woman who is interested in the matter all chagrin. It is true, as the correspondent says, that the British convention in dress, as in so many other things of greater moment, is absolute and inflexible. Herr Teufelsdröckh cites from Bulwer's *Pelham*, a sacred book, as he says, of the dandiacal sect, the solemn truth that it is permitted to mankind, under certain restrictions, to wear white waistcoats. But he could now truly say of the same sect, including in the term all British "good society," that it is incumbent upon mankind to wear white cravats at dinner. This necessity, indeed, sometimes occasions ludicrous incidents, for British good society requires that its butlers and waiters wear white cravats also. At a large and solemn "party" an inexperienced American, who was looking for a waiter, in despair at all the grave and respectable persons in black clothes and white cravats that surrounded him, turned suddenly upon his neighbor and asked, "I beg your pardon, Sir, but are you the waiter?" And the grave neighbor gravely responded, "No, Sir, I am not; are you?"

The same fate that imposes the dress suit and the white cravat at dinner and in the evening, requires that the sober man of business shall go down town in the morning in a black frock-coat. The eccentricities of shooting-jackets and cut-aways and all the fancy coats are for the country exclusively. Upon his paternal acres or under his ancestral oaks, in the Highlands or upon his travels,

the Englishman of the dandiacal sect may wear colored coats and knickerbockers, if he will, and every excess in cravats is permissible. This is a rule in that sect so exact that if a member is seen in the street in London in a fancy coat, it is at once assumed that he is on his way to or from the train, just going to the country or arriving from it. These habits are to "good society," or the sect in question, like the laws of nature. The members conform without thought, as they do to the law of gravity. Consequently, when the conditions are changed, as in a foreign country—let us say, for instance, that land known to Englishmen as "the States"—they are bewildered, and, without intention and without knowledge, they seem to be the most eccentric of mortals, and they are fortunate if they are not considered to be affronting the genius of our institutions, as Mrs. Trollope mentions that the spectator in the dress circle at the theatre who sat between the acts upon the front of the box with his back to the pit was roundly hissed as insulting the majesty of the people.

It is not many years since a young Englishman of the bluest blood, who had come out to hunt the buffalo, seemed to expect to find them in every dining-room into which he was asked. He appeared at dinners of ceremony in checked trousers and extraordinary cravats and indescribable coats and heavy shoes, while the native beaux and belles, irreproachably attired, looked at the guest of honor in amazement, uncertain whether to laugh or to swell with indignation. Had he been asked to a similar dinner in London, he would have gone in full dandiacal costume, and without a thought. It was foolish to suppose he meant to insult his host and the company here, and the favorite explanation of his conduct was that he was a young British pachyderm, and did probably confound people with buffalo. So also when Lady Clara Vere de Vere came over to see us, her disregard of the *convenances* of dress was extremely distressing to the American cousin. Staying at a hospitable and refined house, she asked if they were to dress for dinner, and being told that full dress was not indispensable, she appeared in a kind of morning wrapper. Herr Teufelsdröckh would say that the British lion is not naturally a dressing animal, or tactful, or flexible of mind, and that when once he lost the ruts of routine he was utterly lost and floundered hopelessly.

Yet, again, how much excuse there is for him when once abroad in the American wilds! In a country where dinner is always an evening ceremony, as with the sect that we are considering, we may paraphrase the touching line of the poem which assures us that "her heart and morning broke together," and say that "the sun and frock-coat set together." When the sun sets, no Englishman of the sect feels safe until he is in a white cravat and all that belongs to it. "There is safety," says Teufelsdröckh, "in a swallow-tailed coat." But what shall he do when the laws of nature are disregarded or reversed? The best of men may land from the ship and go to dine with an American family in a country where dinner is a shifting feast. They will, of course, array themselves in the garments which

nature seems to prescribe: such is the force of custom. But if, as is very possible, they do not find the host so arrayed, and if after dinner other friends drop in, who have dined, indeed, but whose coats and cravats offer no evidence of the fact, what are the best of men to do? If they are invited to take tea in another house, they will properly reason that "dress" is not expected. But if, upon presenting themselves in brogans and Tweed coats, they encounter a select circle of swallow-tails and white cravats, they can have no recourse but to invoke the shade of the lamented Mrs. Beeton, and pray for light in a dark world.

A noted Englishman relates with what agonizing doubt and trepidation he went to dine with an American friend in the country in the afternoon. It was only just out of town, and he was to return after dinner. It was sacrilege to put on a dress-coat and white cravat by daylight and to make a short trip in the cars, and intolerable to think that, after the awful ordeal, it might all be unnecessary and unexpected. To take a valise was equal torture, for it might be construed as an expectation of elaborate dressing which was not designed. The victim, therefore, at his wits' ends, compromised upon a frock-coat and black trousers—a combination inexpressibly odious to an Englishman of the strait sect; and he arrived to find his host in a white duck coat and blue cravat.

"But why," said a friend, "did you not ask?"

"It did not occur to me," replied the Briton.

This solution of the difficulty by interrogation naturally occurs to the Yankee, but it does not occur to his British cousin. Yet it is plain that there is no reason for surprise that the Englishman is unable to discover a custom which does not exist. When he finds that there is apparently no fixed celestial law of dress for certain social ceremonies and occasions, but that every man seems to follow his own sweet will, he too naturally does what seems right in his own eyes. It is perhaps our fault that, knowing the situation, we do not help our foreign friends. The younger saints of the dandiacal sect know into what perplexity even they may fall upon these points of convention and of dress. The wise Teufelsdröckh, as we saw, says that it is permitted to mankind, under certain conditions, to wear white waistcoats. But what are those conditions? There are men now living who remember when a white waistcoat was *de rigueur* at a state dinner, and also when a white waistcoat was *mauvais ton* upon the same great occasion.

Nay, there are points of similar importance which are even yet unsettled, and which exercise immortal minds. Whether, for instance, the host, mistrusting that some incautious or unknowing guest may arrive unclothed in white as to his neck, or with square skirts instead of a swallow-tail, shall himself wear a black cincture about his throat, and suffer his coat to present the scow rather than the swallow, is a problem which still vexes the dandiacal mind. Is it trivial and unworthy the thought of man? But consider what sanction consecrates the importance and significance of clothes. What is a king but clothes? Your majesty's self is but a ceremony. Strip from the head of the *grand monarque*, as Thackeray liked to do, the flowing peruke, and from his body the velvet and lace and gold-flow-

ered robes, and what a manikin is left! Or who that heard it has forgotten that racy and biting analysis of George the Fourth which Thackeray gave us from Dr. Chapin's former pulpit, with his fingers in his waistcoat pocket, and his kind eyes twinkling over his spectacles: "But this George, what was he? I look through his life, and recognize but a bow and a grin. I try and take him to pieces, and find silk stockings, padding, stays, a coat with frogs and a fur collar, a star and blue ribbon, a pocket handkerchief prodigiously scented, one of Truefitt's best nutty-brown wigs reeking with oil, a set of teeth, and a huge black stock, under-waistcoats, more under-waistcoats, and then nothing."

How many a pious pilgrim hastening to Rome to hear the exquisite *Miserere* of Allegri, and pushing in the suffocating throng to the door of the Sistine Chapel, has been turned back by the imperturbable Swiss Guard, who are nothing but fantastic clothes-horses, because of the want of the dress-coat of the dandiacal sect of civilized society! If it is comical that immortal beings should insist upon swallow-tails at dinner, what is it that those tails should be required as the condition of hearing the lamentations of the prophets and the expiring sighs of Calvary? Yet nowhere is the "clothes question" so vital as in the church. It is called symbolism there, and a violet robe and a gray robe and a red cape and a white stole are significant of feelings, of hopes, of every range of human emotion. It is but another form of the swallow-tail and white cravat, and you may as wisely sneer at the College of Cardinals lamenting in violet as at Pelham dining in a dress suit, or Lady Bareacres in arms to match.

Civilization and progress and modern ideas have an effect upon the clothes question which the æsthetic circles deeply regret. Steam and the doctrine of the equality of man are destroying the distinctive costumes of classes of society which has been thought to be so chief an element of the picturesque in foreign travel. The peasant of Berne or of any Swiss canton, the Roman woman "beyond the Tiber," the pifferaro from the Abruzzi, and the shepherd of the Campagna have all their costume, which marks their position, and which saves them, says the romantic conservative, from the temptation of expense or the discontent of social ambition. But now there is no remote settlement upon the frontiers of civilization, no miners' village at the copper mines of Lake Superior, where your *Bazar* does not penetrate, carrying the fashions of Paris and the Fifth Avenue, and sowing in innocent hearts and minds the seeds of sartorial unrest. You have no assurance, he says, that if you take the wings of the morning and fly to Alaska or the shores of Hudson Bay, you will not find the woman cutting out a *fichu* and the man contemplating a swallow-tail. And if that be so, we have but another proof of the significance of clothes. They serve as the signs and the measure of advancing civilization. The progress of the doctrine of the brotherhood of man may be tested by the increase of the number of white cravats at dinner. Much of the picturesqueness of travel, the romantic conservative may not have observed, springs from the unhappiness of the world. "He pities the plumage," says Thomas Paine, in the exquisite metaphor which in itself

disposes of the magnificent wail of Burke's Reflections upon the French Revolution—"he pities the plumage, but he forgets the dying bird."

To recur to the question of our correspondent, and to answer it: it is for the very reason that our British brother has certain immutable laws of dress in the dandiacal circle, and because we have not, that he is so confused and lost when he falls upon our lawlessness. The British statesman in question thought that he was going to a political club, which was true, and as in all such clubs that he knew full dress is unknown, it did not occur to him that full dress could be expected. And as if to confound the confusion that exists among us upon this momentous subject, how many men, full of generous hospitality, at whose table you are as sure of the feast of reason as of the flow of Yquem and the presence of that *fromage de Brie* upon which the Congress of Vienna, which agreed upon nothing else, was agreed as the best cheese in Europe—how many such men, when they ask you to dinner, and you say, "Dress-coat?" answer, and whirl you into space, "As you choose!" In such a country how can the English cousin know either when it is permitted or when it is a duty to wear the swallow-tail?

MR. TIBBINS wishes that his experience in making New-Year's calls may be made useful as an illustration of the deceitfulness of appearances. He is one of the gentlemen who do not keep dogs, although he lives in the country, and who declines social visits to persons who do. Mr. Tibbins is, however, just and impartial. "My friends," he says, "shall not complain of any obscurity in my conduct. I simply offer them the alternative, me or your dog: not both. If your tastes and preferences are such that you will have large or small animals lying within your gates, yelping and growling at every person who enters, smelling at ankles, and producing lively apprehensions which are not in the least allayed by calling the beast a 'poor fellow' and remarking that he was never known to bite—if," says Mr. Tibbins to his friends, "these are your preferences, we will not quarrel. I respect your idiosyncrasies, and I beg you to respect mine, while I embrace this occasion to mention that among the most prominent of mine is an indisposition to have my ankles smelled at by dogs of any breed or of any size, whether they are poor fellows or not, and an insuperable disgust with the barking of beasts when I go to make a social call. That it is very selfish in you or in any person to subject his friends to such ordeals I do not say. That I leave entirely to your own judgment, only remarking that although black snakes and green snakes are not venomous reptiles, and are probably 'poor fellows,' I do not think that those who delight in having them coiling and gliding about their parlors ought to be vexed with their neighbors for not calling. The line must be drawn somewhere," says Mr. Tibbins. "You may not draw it until you come to snakes; I draw it at dogs."

When, therefore, you stroll about the delightful country in his neighborhood, and mark the abodes of the rich and the great, and say to him, "That is a charming place," Mr. Tibbins answers, "Yes: he has dogs: I never go there." Mr. Tibbins was naturally very much exhilarated by

the hydrophobia excitement last summer, and hoped at one time that the public feeling might be carefully kindled to a general crusade against dogs. "I lately read in Mr. Warner's letters from the Nile," he said, "of an African king who had never seen a horse until Colonel Long came riding into his capital. Think, O my friend, of some happy island-valley of Avilion, where never dog barked loudly nor was ever seen!" Of course so severe a taste as Tibbins's in a world so largely canine produces inconvenience, as a dislike of butter in a society which holds to a natural and necessary relation between bread and butter will often expose the dissenter to difficulty. Such a man, in a crowded and elegant assembly, who at supper has incautiously bitten a heavily buttered sandwich, in the midst of a bout of badinage with youth and beauty, understands the emotion of those who, with Mr. Tibbins, dislike to have their ankles smelled at by dogs, yet who suddenly, within a neighbor's grounds and far from help, perceive that a dog is actually engaged in that office.

But Mr. Tibbins went out merrily upon New-Year's morning, resolved at least to pay one visit, long neglected, to a neighbor who had become his neighbor the summer before, who had given no signs of dogs, and who, as Tibbins assured himself, was much too sensible a man to suffer them about his house or grounds. Our friend began the day prosperously, finding every body cordial and gay, and doing, as he thought, his full share toward the enlivenment of each call. At last he came to the new neighbor's, and went humming gayly up the neat plank walk from the gate, then turning briskly around the house, putting it, as it were, between himself and retreat, he was advancing rapidly toward the front-door, when he suddenly stopped, with a sickening sense of betrayal, as it were, in the house of a friend; for directly before him, within easy spring, so to speak, lay a large dog upon the door-mat and directly under the bell. He was asleep, and upon perceiving him Mr. Tibbins, as if upon tiptoe for silence, reconnoitred the situation. To advance and ring the bell was simple madness, for the dog would of course awake the moment a foot struck the step, and in the confusion of sudden awakening and of close quarters with an intruder he would probably be very reckless and sanguinary, and not in the least amenable to the "poor fellow" blandishment. Mr. Tibbins, therefore, without moving, looked at the windows, hoping to see somebody looking out whom he might with beaming pantomime summon to the door, and so save himself the contact which seemed to be inevitable. But there was no one looking out, and the closed windows seemed to him to stare with blank indifference, so that he says he had had before no idea how cruel windows can be. It then occurred to him that if he could open communications with the kitchen, and entice some maid or man to the door without ringing, the difficulty would disappear, because the maid or man would pacify the dog. But to reach the kitchen required a lateral movement which would leave the enemy directly across his line of retreat. Moreover, any movement whatever exposed Mr. Tibbins to the risk of making a noise, which would arouse the foe and precipitate the engagement. He therefore maintained his position, looking hopefully toward the kitch-

en, but, seeing no one, he reluctantly held a further council with himself.

The obvious heroic course was to step upon the piazza and ring the bell. But he saw, again, that it was impossible to touch the bell without bringing himself close to the dog, who would then, of course, awake and snap immediately at the nearest object, which would be Tibbins his leg. And what was the possible use of heroism under such circumstances? He might as well advance and kick the dog. But was the dog asleep? was he not dead? was he not—why shouldn't he be—a stuffed dog, an old family favorite, perhaps, now placed upon his familiar resting spot as his own monument? This thought cleared the prospect for a moment, but instant gloom shut in again, as Mr. Tibbins saw a slight breathing motion, and perceived that the beast still lived. One of the advantages or misfortunes of a New-Year's Day in the country, according to the point of view, is the infrequency of visitors. To our friend this infrequency seemed to be, upon this occasion, a misfortune. Had there only been a merry group turning the corner at the moment, he would have joyously joined it, and so long as he could see other legs between himself and the enemy his soul would have been at rest.

But his position was peculiarly solitary; nor did any other visitor appear, and Mr. Tibbins remained for some time motionless, regarding the situation. There was no sign of relief. As no visitor came to go in, so none came out. No friendly face shone at the windows—no helping hand opened the door. At any moment the dog might open his eyes, and, in that case, he would certainly not be content with a survey of the situation. Mr. Tibbins, who is no mean classic, remembered Xenophon and various other great and renowned commanders who retired in good order and not in the least demoralized, and reflecting that the sage truly defined prudence as the crown of wisdom, he gently turned, and careful by no rude noise to disturb the peaceful slumbers of an innocent animal which, some poets have suggested, might properly share our heaven, he tiptoed quietly around the house, and rapidly descending the plank walk, firmly closed the gate behind him, and felt his heart swelling with gratitude for a great mercy.

A few days afterward he met his neighbor, and said to him that he had designed to call upon him on New-Year's Day, but that he had discovered a dog in the path, and as he never called where dogs were kept, he had been compelled to lose the pleasure of a visit. He then told the story of his attempt, in the midst of which the neighbor broke into the most prolonged and immoderate laughter, and when Mr. Tibbins had ended, said to him, "My dear Sir, that dog is immemorably old and superannuated, and he is blind and deaf and toothless."

"Indeed!" replied Mr. Tibbins. "But he might not have been."

—"And yet I will confess," he said to the Easy Chair, later, "that the incident is a very pretty sermon upon the deceitfulness of appearances, which I respectfully offer to your acceptance."

It was natural that an intercollegiate contest of brawn should suggest one of brains. The glories of the regatta have shone so far, and

kindled so much interest and emulation, and the Isthmian and Olympian games are so familiar to the studies and imagination of scholarly youth, that when once there was a precedent of any kind of friendly combat, other kinds were sure to follow. Recently, too, the spirit of the age and of America has renewed the life of the college in this country, and superseded many of the old practices and reverend traditions.

Mediævalism has held its own nowhere more successfully than in the college precincts, until a very late day. The student barracks, usually bare, forbidding, and inconvenient, reproduced the conventual buildings in which the monks led their secluded and theoretically studious lives. But those conventual buildings and that monkish life furnished the examples and precedents of every form of modern student life in the barracks. Nor is there any luxury or roistering, any wassail or gayety, in college halls to-day which can not trace itself back to the old monasteries and their denizens.

Men of threescore and more in this country recall their college as an academy for the teaching of Latin, Greek, and algebra, with a worthy clergyman at the head, and others of the cloth as professors: an academy at which the boy of thirteen and fourteen was entered, and from which he graduated two or three years before he was of legal age, and while he was still a boy. But as communication with Europe became more constant and convenient, and the standard of scholarship and of university life there more familiar—as the favored young American who had graduated at home went over the sea and returned after having heard the lectures of the College of France, and having known the thought and mental activity of Germany and England—a change gradually stole over the character of the American college and its curriculum; the idea of a more thorough and generous scholarship, of an adaptation of the college system to the life and spirit of to-day, entered the academic mind, and slowly modified the college. A great change has now been wrought. It is observable chiefly in the system of elective studies; in the change of the president from an old clergyman whose function is teaching, to the young man of accomplishment and energy, who supervises all the interests of the university; in the wider range of study, embracing all branches of science as not inferior in dignity and value to the classical course; and in the higher range of scholarship. The consequence of these changes is that young men rather than school-boys enter college, and the college itself is becoming a university.

Of course so long as the college depends much upon the fees of students for its support it can never expand into a proper university, nor can its standard of scholarship ever be lofty. This was one of the points which was clearly seen by the shrewd mind of Ezra Cornell, and when the Wells Seminary for Girls was opened in the pretty building upon the bowery shores of the Lake of Cayuga, he gave a practical point to his speech of sympathy and welcome by saying that he would be one of ten to subscribe a thousand dollars as the nucleus of a fund. Many of the older colleges, Harvard, Yale, Princeton, and some of the new, such as the Cornell, have now almost all the university conditions so far as they can be arbitrarily supplied, although none has

quite reached the ground upon which Agassiz insisted that such an institution ought to be planted, and that is, control by the teaching body. They know, he said, better than any one else the real wants of the institution; and if they are fit for their places, they can manage it infinitely better than a board of comparative strangers whose relation to it is external and perfunctory.

As the college has thus ceased to be a school or an academy, the interests and ambitions of the under-graduates have extended, and the intercollegiate contact of emulation naturally began in the form of manly sport. Modern thought requires that the student shall not be a mere book-worm or pedant, but that he shall have a body not unworthy the mind, and that a puny valetudinarian shall no longer be the type of the college boy. Athletic sports have therefore disputed attention with intellectual studies. Excess was easy, and the tendency has been often foolishly cultivated. To pull the best oar and to make the best demonstration or translation were not often practicable to the same person, and a choice was therefore made, so that students were divided into studying men and sporting men, and at the age of twenty the prestige of muscle seems manlier than that of mind. As the annual regatta grew in importance and renown, and came, as in the last two years, to have a universal national interest, it almost seemed as if the hand might carry it against the head—and "the stroke" of the university crew distance in the young imagination the "senior wrangler" of the college. Certainly no achievement in the legitimate collegiate course, no attainment in the intellectual training for which young men go to college, ever excited such vast and echoing recognition as the triumph of last summer, for instance, at the Saratoga regatta, and it is hardly doubtful that the great majority of the students would have preferred the glory of that day to the proper honor of Commencement.

The contest of essay writing and oratory, which will doubtless enlarge itself to include scholastic examinations, is significant, therefore, as a most healthful reaction and assertion of the dignity of intellectual pursuits. To win a boat-race in the contest of many colleges is good; but to win a race in the same contest in a philosophical or literary exposition, in accuracy of knowledge of the ancient and modern tongues, in scientific research, or force, grace, and clearness of oratorical appeal, is not less good, and gives a dignity to the whole which must otherwise be lacking. The beginning made this year was creditable and auspicious. It was twofold, consisting of essays and orations, and the public performance and awards were made in the Academy of Music, in New York. The great throng which filled the building on one of the stormiest evenings of the winter showed at least the interest of a large circle. There was probably no question in any mind that the orations were better than the average Commencement speech, and that some of the speakers showed the true oratorical instinct. Mr. Bryant, amidst great applause, announced the judgment of the Committee upon Oratory, after Colonel Higginson had read that of the judges of the essays. What this committee said is indicative of the promise and possible value of these contests hereafter:

"We would say in closing that the average quality of these essays is, in our judgment, decidedly above

that of the usual college compositions; that they are generally marked by simplicity, directness, and modesty, combined with a fair amount of originality, and with great freedom from verbiage and bad taste. The successful essays on Utilitarianism are free from all mere conventionalism or sectarian bias, and the successful Shakespearian essays show no undue dependence on the French or German school of critics. We are, on the whole, heartily pleased with the success of this first Intercollegiate Literary Competition in essay writing."

THE Governor of New York says that the State of which he is Chief Magistrate has about four millions and a half of inhabitants. He is therefore the chief of a truly Empire State. Yet if he should set out upon his travels through the country, he would hardly be received by shouting crowds, nor would he be regarded with singular curiosity. We have just been considering the importance of clothes. See, now, the value of names. For the governor of a mild-eyed race of diminishing people, numbering scarcely sixty thousand persons, has been traveling through the country, and has been regarded with great interest, followed by crowds, and studied by curiosity, because he was called a king. The Easy Chair chanced to encounter his Majesty at New Haven, whence he was about to proceed in his royal progress to New Bedford. He sat in a drawing-room car placidly smoking, while the eager citizens of the State of Sherman and of Trumbull thronged the platform and stared through the window and cheered his Majesty lustily as the train rolled away. It was a bitterly cold winter afternoon, but at every lonely little station in the open country along the Sound, and between the Connecticut and the Thames, there was gathered a crowd, although it was hard to see whence it could have come, and men and women pressed and pushed and stared, and still his Majesty smoked calmly on and was cheered upon his way. At one station he came out upon the platform and waved a salute to some very pretty girls, and the welkin rang with the delighted shouts of the spectators. Then the royal traveler resumed his cigar and his journey; and when he reached Providence, red and blue lights were burning in his honor, and committees were waiting, and an immense crowd stood hurrahing and rushing and saluting the majesty of Hawaii.

The name of King is very soothing to the republican soul, for there was certainly nothing but the name that commended this guest so strongly to public curiosity: not that he is not a worthy man, for that is not questioned, but simply that he really has nothing but the title, certainly none of the power and circumstance of a monarch. There is a constitution for the government of the Sandwich Islands which prescribes that the King may appoint his successor, but the successor must be approved by the nobles, and as the King may name as many nobles as he chooses, he virtually appoints his own successor. The revenue of the government is about half a million of dollars. The King is paid \$22,500, the debt is about three hundred thousand dollars, and the expenses of the government for two years do not reach a million. Mr. Nordhoff, from whose interesting book upon the country—praised by the King as accurate and candid—we gather these facts, says that the government is "mild, just, and liked by the people." Per-

haps it was for that reason that we gazed with such curiosity at this royal guest.

And yet as the regal party passed along, and committees and high officers of state and the great good-natured multitude showed the King every mark of honor and respectful interest, as the ceremonious dinner at the White House and the reception by both Houses of Congress were described, and as the Easy Chair even read of

the courteous attentions of the New York municipality, and reflected upon the wisdom that we had heard about the inferiority and proper place of certain people in this world, and of the "instinctive" feeling of true Americans in certain directions, it inwardly echoed the remark of one of the most philosophical observers of the homage, who said, in amazement, "Great Heavens! have they seen the color of his face?"

Editor's Literary Record.

WE notice with unalloyed satisfaction that among the novels that lie on our table as we write there is not one of the type so common for the last few years, depending for its interest on ill-assorted marriage, matrimonial infelicities and infidelity, seduction, separation, and perhaps a tragic death. They are, with probably one exception, pure and wholesome in character, and introduce us to scenes and personages harmless if not absolutely inspiring. The one exception, if it be one, is THOMAS HARDY'S *Far from the Madding Crowd* (Henry Holt and Co.), the title of which is interpreted, we suppose, by Gray's line, "Far from the madding crowd's ignoble strife." It is a story of English rural life, the pictures of which are drawn with considerable artistic power. But the artist is rather a skillful copyist than an original student of nature. He has studied the works of George Eliot to good purpose, but the indefinable something in the master is wanting in the disciple. There is a minute attention to detail, too, which is possibly commendable, but which accompanies a singular ignorance of or indifference to the relative importance of the objects in the scenes, which are painted, so to speak, without perspective.—*Lorna Doone*, by R. D. BLACKMORE (Harper and Brothers), possesses a double interest—that which belongs to a series of carefully painted pictures of life absolutely new to most American readers, and that of a story whose plot is well constructed, and which is not wanting in fresh and vivacious incident. The scene is laid in the borders of Devon and Somerset, England, in the wilds of Exmoor and Bagworthy forests; the time is the latter part of the seventeenth century. To the accuracy of the author's scene and character painting we can not testify; but his work bears internal evidence of careful and conscientious study, and the result is certainly graphic and apparently truthful. The conflicts with the Doones, and the recovery of the stolen maiden by the hero of the novel, afford an opportunity for romantic incident. The story is autobiographical in form, and Mr. Blackmore has succeeded in the very difficult task of effectually concealing his own personality, and preserving throughout his narrative that of the story-teller, John Ridd.—*Old Myddelton's Money* (Harper and Brothers) would make a capital comedietta, and we shall not be surprised to see it successfully dramatized. The plot is, indeed, artificial. In life no Lady Laurence ever plays such a trick as that which is in the novel so successfully played upon the deluded expectants of the fortune at her disposal. But the trick is none the less entertaining, and is so well contrived that

most readers will be as surprised at the *dénouement* as were the actors themselves in the scene. Apart from the ingenuity of the plot, the story exhibits marked power in characterization. Royden Keith is one of the strongest and best characters we have lately met in fiction, and his devotion to the rescue of Gabriel from his undeserved opprobrium and real hazard is a fine illustration of modern chivalry.—*The Sign of the Silver Flagon* (Harper and Brothers) is another of B. L. FARJEON'S stories, who is either the most prolific of novelists, or else he is obeying the Scriptural injunction, and is bringing out of his treasures things both new and old. It is two love stories twisted into one, with several suggestions of others in the minor characters. There is, indeed, enough of raw material wasted in the book to make three or four ordinary novels. Mr. Farjeon is prodigal of his wealth, and spends it as though he had confident faith that it was, as the wealth of genius always is, illimitable. Only a man of quaint genius could have conceived the strange fancy of the ghostly dinner at the Silver Flagon, and only a man of true genius could have executed the fancy without passing the invisible line which separates the sublime from the ridiculous. Nothing that Mr. Farjeon has written affords a severer test of his power than this hazardous but successful fancy.—In *A Foregone Conclusion* (J. R. Osgood and Co.) Mr. W. D. HOWELLS writes, delightfully of course, of Venetian life; writes as one who knows with perfect familiarity the life which he portrays; writes as one who has seen and studied the very minutiae of that life. Of course, too, his work has the literary finish which belongs characteristically to him; the polish, not of much and long artificial culture, but of natural, easy grace. But grace is not power; and even when we read the love scene between the poor priest and Florida, the little touch of the expiring fountain is somehow more central than what should be central—the expiring heart of the unloved priest. Grace and strength are surely not inconsistent, yet the strongest passion requires in the telling a certain ruggedness of expression, and the bitter conflict of the priest's soul is something which requires for its fullest utterance an indifference to beauty, and a concentration of every thought and sentiment in the passion alone. *A Foregone Conclusion* is more notable for its descriptions of the external life of Venice than for its expression of the internal life of a priest in conflict between human love and a mistaken sense of religious duty.—*The Love that Lived* (Harper and Brothers) is an old story in a new form; a story of woman's patient, heroic, unselfish, suffering

love; the story that is as old in its essential elements as womanhood, and as various in its forms as the experiences of human life. If love were not truly deathless, the bitter experiences which make up the tragic story of Robert Rivington's first wife would have tortured her love to death. Indirectly the story teaches a lesson well worth the learning—that heroic silence is a sacred duty when suffering in silence is the only way in which irremediable evils can be prevented from extending their baleful influence into other and innocent lives. The novel is, however, in no sense a didactic one. It is emphatically dramatic. There is great artistic power in some of the scenes; the husband's recognition of the first wife, for example, and her touching devotion to him in his last hours in her own little cottage.—*Aileen Ferrers* (Harper and Brothers) is an original novel in that the authoress takes boldly, but with shrewd veiling of her purpose, the unpopular side on the social question, nowhere so much discussed as in and through fiction, of the intermarriage of different classes in society. Aileen Ferrers finds, after five years of education in cultured and refined society, that Ralph, the bailiff's son, has not the life that is congenial with her own, and that, not because of conventional barriers, but because of real and ineradicable variations, the engagement must be broken—for his sake no less than for her own. That social distinctions are real, not wholly imaginary and factitious, is the moral of this simple, quiet story. It is one of pleasant scenes and characters, not marked by any notable degree of power, but by much more of strong common-sense in dealings with the problems of love and life than is to be found in most fiction, or even in most of life.—*After Dark, and Other Stories* (Harper and Brothers) completes the Illustrated Library Edition of WILKIE COLLINS's novels. The entire set, fourteen volumes, is dedicated in the author's autograph to "The American People." Mr. Collins's rare constructive ability appears perhaps as characteristically in his short as in his longer stories, but not to so good a purpose. His peculiar genius requires for the evolution of a plot, always ingenious, and generally perfect in the adaptation of its various parts, a larger space than twenty or thirty pages. The short stories which make up *After Dark* would be quite as acceptable without the artificial thread which connects them. Few readers will stop to peruse the prologues. This volume completes the only American edition of the works of the novelist who ranks with the first of living story-tellers, and in the construction of plot, if not also in the portraiture of character, is without a superior in either English or French literature.

Four volumes of essays discuss from different points of view certain phases of the various problems which concern women's health, usefulness, and happiness. However little the wisdom of some of these discussions may commend them to our judgment, the discussion itself is commendable. It is characteristic of a civilization which in nothing more shows itself to be Christian than in its interest in and consideration for the weak, and its manifold endeavors, on the one hand, to elevate woman above the position of a mere upper servant of the household, and, on the other, to protect her womanhood from the assaults of would-be friends but real foes, and the perpetui-

ty of the home which is her castle, albeit sometimes converted into her prison.—*Dress Reform* (Roberts Brothers) indicates its character by its title. It consists of five lectures, by five lady lecturers. It is the weakness of reformers always to exaggerate, both in their own thoughts and in their writings and addresses, the abuses which they propose to reform. The wise man will not go to the abolitionist for an impartial picture of slavery, nor to the temperance orator for an impartial representation of the average effect of wine and wine-drinking. He will not be surprised to see the evils of modern dress exaggerated by those who propose to remedy them. The use of flannel under-clothing is general among women, despite the assertion (page 11) that "the lower extremities are covered more frequently than otherwise with but one thickness, and that of cotton." Cloth gaiter boots are so entirely out of fashion that the case reported on page 13 must be regarded as quite exceptional. The proposed reforms also will not all of them commend themselves to the common-sense, still less to the taste, of women; but the three essential principles advocated—no weight on the hips, no extra weight of false hair on the head, and thorough protection of the extremities from cold—are certain to come, in time, into universal adoption, whether or no the particular methods of execution here recommended secure general approbation.—*The Ugly Girl Papers* (Harper and Brothers) are addressed to ugly girls. Their object is to give them some instruction for the improvement of personal appearance. Of course those who propose to abolish the mirror, and who regard all endeavors after personal beauty as a product of a reprehensible vanity, will taboo this little volume. Those who, with us, think it right not only to esteem but to cultivate beauty, will heartily welcome it. The book discusses, of course, complexion, and suggests cosmetics; but a large proportion of its pages is devoted to a discussion of more serious defects, such as stooping and ungainly postures, and to counseling remedies which improve beauty by improving either the health or the heart, as bathing for skin disorders, and a cheerful disposition for a wrinkled and a fretted face.—In *For Better or Worse* (Lee and Shepard) "Jennie June" argues for the permanence of the marriage relation, and sets forth those principles which, adopted, will make it both permanent and happy. There is not much new to be said on this subject. But new pupils are coming into life to learn old lessons; and the old lessons of truth, love, duty, purity, fidelity, Jennie June presents freshly and earnestly. Her book is a timely protest against certain disorganizing forces of modern thought.—Finally, the *Bazar Book of the Household* (Harper and Brothers) discusses household life mainly in its physical aspects. Some features of its opening chapters, on the "pairing of men and women," in which laws of marriage are deduced from those which govern the sexual relations of the lower animals, belong rather to the scientist or the social philosopher than to the young girls into whose hands the book is likely to fall. Yet here the counsel is that of common-sense, though we wish the purely physical aspect had been made less prominent. The rest of the volume discusses the household and its life. It is concise and practical, covers too much ground to af-

ford much detail, and contents itself chiefly with inculcating certain general principles, sanitary and moral, which it leaves the readers to apply for themselves. While these volumes discuss cognate themes, and sometimes the same theme, we may say in general terms that the first discusses dress with respect to its effect on health; the second, both dress and habit, with reference to their effect on beauty; the third, home life in its moral aspects, not without regard to its physical; and the fourth, home life in its physical aspects, not without regard to its moral aspects.

A simultaneous and seemingly successful attempt is being made in this country and in England to rescue the name of Edgar A. Poe from the odium in which it has been involved, in part at least, by reason of his unfortunate choice of a literary executor. His compiled *Works*, published in Edinburgh, and edited by JOHN B. INGRAM, and his *Poems*, published in this country by W. J. Widdleton, and edited by R. H. STODDARD, are each preceded by a biographical sketch. Mr. Ingram has done his work much more thoroughly and elaborately, and he charges Mr. Griswold not only with carelessness and inaccuracy, but with positive falsification. These charges are so far authenticated that if they are not responded to, the odium which has hitherto been attached to the unfortunate poet will be transferred to his biographer. Mr. Stoddard writes more cautiously, but he apparently makes equally good his assertion that Mr. Griswold's biography is untrustworthy. "He knew Poe, but disliked him bitterly. Poe made him his executor, but he had no conception of the duties which that delicate task imposed upon him. He misused Poe's papers by using them to his disadvantage solely. He neglected to inform himself thoroughly in regard to Poe's life. He misstated the year and place of his birth; and, writing on them after his death, made no effort to fill up the melancholy outline of his last days." Certainly it would not be easy to find one less naturally competent to write a true portraiture of the life and character of Poe than such an author as Rufus W. Griswold. The successful, the assiduous, but unimaginative and unimpassioned compiler was utterly incapable of appreciating a character so moody, so sensitive, so curiously imaginative, so unhappily passionate, and so misused by his unfortunate education as Poe. Mr. Stoddard is by no means blind to the poet's defects, and is neither a eulogist nor apologist, but in telling us the story of his birth and early life he discloses the secrets of the poet's later misfortunes. We are sure he could not have been loved so faithfully and so well if he had not been lovable; and we lay down the pathetic story, with its tragic ending, impressed that when the last account shall be made up, Edgar A. Poe will be ranked among those more sinned against than sinning.

Two useful works afford, on a somewhat different plan, a basis for the study of general history. Miss THALHEIMER follows her *Manual of Ancient History* with a *Manual of Mediæval and Modern History* (Wilson, Hinkle, and Co.). The latter work was more difficult than the former, and possesses equally admirable characteristics—more difficult because it leads the writer into eras about which there not only have been, but still are, acrimonious disputes. The history of

the Reformation, of the American Revolution, of the French Revolution, of our own civil war, all come within the period of which she treats. Of course it is impossible to give in a compact form the history of these epochs without in effect taking part in the controversies to which they have given rise. Her work, however, has been done with notable impartiality, and gives evidence of a singularly calm and unbiased judgment. The maps of both manuals, which are admirable specimens of drawing and engraving, are also separately published in a handy volume, entitled *The Eclectic Historical Atlas*. They are nineteen in number. The two volumes make a concise and complete general history of the world from the earliest period to the present day. We know of nothing of its kind equal to it. It prepares the scholar for the study of history in detail by presenting first a bird's-eye view of its entire course. He who masters it will master, as most students do not, the relations of different epochs and eras to each other.—*Epochs of History*, edited by EDWARD A. MORRIS, M.A. (Scribner, Armstrong, and Co.), prepares for a general study of history by the opposite method. It assumes that the student should proceed from particulars to generals, that he can not understand a general history of the world until he has mastered the life of some single individual or some single era, and that when he has done this in respect to a number, he is prepared to take the bird's-eye view, in which these special subjects of his study will take their approximate place. The four volumes before us, prepared by different authors, treat respectively of the 'Thirty Years' War, the Houses of Lancaster and York, the Crusades, and the Era of the Protestant Revolution. They appear to be well executed, and their arrangement makes them convenient for reference. We particularly commend the latter of the four volumes for the breadth of its conception and portraiture of a movement which it appropriately terms the "Protestant Revolution," and particularly for its exposition of the revival of learning which accompanied the religious reformation, and of the influence of the Oxford reformers. Whichever theory of study be adopted, these volumes will prove useful, on the one theory the *Manual*, on the other *Epochs of History*, serving as an introduction to its fellow.

A Dictionary of Religious Knowledge for Popular and Professional Use; comprising full Information on Biblical, Theological, and Ecclesiastical Subjects. Edited by the Rev. LYMAN ABBOTT, assisted by the Rev. T. J. CONANT, D.D. (Harper and Brothers). This valuable work answers well to its title, and admirably fulfills the design of its editors, which was "to furnish information on all Biblical and religious topics in a clear, compact, and popular form." We have kept it experimentally on our table for some weeks, during which we have made it a point to consult it on every subject within its range on which we needed definite and particular knowledge. The result has been that we have been furnished by it, in a few paragraphs, with facts and opinions for which we should otherwise have had to refer to many different volumes. Thus having occasion to consult the article "Colossians," we found here the gist of all that Alford has given in his prolegomena to the epistle addressed to the Colossians, together with the sali-

ent points of the articles in Smith and Kitto on the same subject, and all within the compass of a page and a half. The editors have winnowed well the labors of their predecessors in the different fields of their inquiry, and the gain to the reader in these days, when so much has to be done in so little time, is immense. The book combines the characteristics of Smith's, Fairbairn's, and Kitto's dictionaries, and adds of its own an ecclesiastical department, which renders it virtually a dictionary of religious denominations, as well as a hand-book to the Bible. Where so much has been accomplished, the accuracy of the editors is remarkable, though we have detected here and there, as, for example, in the summary of the history of Scotch Presbyterianism, a slight error both in date and in substance. The first secession was in 1732, not in 1712, and was the result not of a voluntary withdrawal, but rather of the suspension, if not expulsion, of the seceders. These, however, are small matters, and do not appreciably affect the value of the work as a whole. For those who wish to get in a brief compass the results of modern scholarship and criticism on all Biblical and theological questions we do not know a better book. It will be invaluable to Sabbath-school teachers and students generally.

A very entertaining volume of travels is a *Ramble Round the World*, by Monsieur le Baron de Hübner, translated by Lady HERBERT (Macmillan and Co.). He left Queenstown on the 14th May, 1871, to cross the American continent and study the reforms progressing in Japan and resisted in China, and reached Marseilles on the 10th January, 1872. We doubt whether the most enterprising Yankee could succeed in "doing" an equal amount of the world in a shorter space of time. "On my road," he says, "I mean to amuse myself, that is, to see all that is curious and, to me, new, and every evening I shall note down in my journal what has been told me during the day." The reader will not expect from such a purpose any thing but a superficial book of travels. Superficial it certainly is, but lively, entertaining, in a manner instructive.

BRIEFER NOTICES.

Not the least valuable feature in *Parnassus*, edited by RALPH WALDO EMERSON (J. R. Osgood and Co.), is the preface. In this Mr. Emerson gives in a wonderfully compact form a remarkably suggestive critique on poetry and the great poets. Chaucer, Shakspeare, Ben Jonson, Herrick, Milton, Wordsworth, Byron, Tennyson, are characterized, each in a paragraph which presents the features of the poet all the more strongly because in words so few. The volume itself is no ordinary compilation. It is a growth of years. It took its origin, the author tells us, from an "old habit of copying any poem or lines that interested me into a blank-book." Thus this compilation has not only the advantage of long scrutiny and careful sifting—that sifting which time only can give—but also that of being a selection by a critic of such rare discernment as Mr. Emerson. The arrangement of matter is topical, not alphabetical, which is a serious disadvantage. There is, however, a complete table of contents, an index of authors, and an index of first lines.—Here are three volumes of poems for the children—*Little Songs*, by Mrs. E. L.

FOLLEN (Lee and Shepard); *Rhymes and Jingles*, by MARY MAPES DODGE (Scribner, Armstrong, and Co.); and *Childhood Songs*, by LUCY LARCOM (J. R. Osgood and Co.). Mrs. Follen's *Little Songs* are childhood classics. "Kitty in the Basket" and "The Three Little Kittens" are almost as well known among the children as any of the more ancient melodies of Mother Goose herself. These may be taken as a type of the volume, which is one of simple rhymes, charming to the little ones from their very simplicity. The illustrations add to the attractiveness of the volume. *Rhymes and Jingles*, a larger volume, covers a larger range. Still it is almost wholly a book for young children. It is full of queer, quaint fancies, abounding with humor, but without much sentiment or pathos. *Childhood Songs*, with but few exceptions, address themselves to older readers. The mothers will read them with quite as much interest as will their children. They are true poems, embodying less of fancy but more of sentiment than *Rhymes and Jingles*, and containing much that is tender and truly beautiful. The first two books will amuse, the third will develop; the first two will be the more attractive in the reading, the third will be sweeter in the memory.—We do not wonder after reading *The Circasian Boy* (J. R. Osgood and Co.) that the author, MICHAÏL LERMENTOFF, should have been unpopular with the Russian court. A more fervent and impassioned outcry for liberty it would not be easy to find in literature. Mr. CONANT, to whose translation the American public is indebted for this version of one of the most famous works of one of Russia's most famous poets, tells us, in the introduction, that Lermontoff has been compared with Byron. The comparison, if this simple story be any test of the Russian's genius, is by no means fair to him; for impassioned though it be, there is nothing morbid in it, nothing that will not find its answer in the heart of every reader who truly loves liberty for himself or others, and who is able to appreciate the bitterness of soul with which the caged bird beats against the gilded wires of its comfortable cage. Of course we can not answer for the accuracy of the translation, which is from a German version of the original, but in a remarkable degree it combines the rugged language of impassioned earnestness and the rhythmical smoothness of polished verse.—It is impossible not to admire the versification and deprecate the morals of BRET HARTE's poetry. The *Echoes of the Foot-Hills* (J. R. Osgood and Co.) are distinguished by both the beauty in form and the falsehood in substance which characterize his previous poems. No genius can make true poetry of such a story of crime as "For the King," or ennoble the drunken negligence of the peon engineer by depicting his late endeavor at atonement. The charity that covers such sins with a robe of poetic beauty is not Christian charity.

The real forcefulness in Rev. T. DE WITT TALMAGE's *Sports that Kill* (Harper and Brothers)—and no one who reads the book or who recalls the sensation produced by the original preaching of the sermons will question that they are forceful—consists in the fact that they are the vigorous expression of a gathered but long-pent-up moral sense. That Mr. Talmage will abolish the theatre he certainly does not expect, and perhaps does not even desire. That

the discussion which he has been the occasion, not the cause, of provoking will do something toward driving from the boards the prurient dramas of late so successful is a consummation devoutly to be wished for. As a means to this end this little volume will be welcomed even by those who dissent from its extreme conclusions, and whose literary taste is outraged by its sometimes too vigorous rhetoric.—Whether *Modern Christianity a Civilized Heathenism*, by the author of *A Fight at Dame Europa's School* (William F. Gill and Co.), is intended as a satire on Christianity, or on its corruptions and the worldliness and selfishness which assume the profession of Christianity as a cover, is not clear. As a satire on the shams and hypocrisies of society it is trenchant, and at least some justification is made out for the assumption of the title of the book, that modern Christianity is a civilized heathenism. But in depicting the life which he satirizes the author exhibits much greater power than in comprehending the life which Christ came to inspire, or in setting forth the principles which should govern the professed disciples of Christ in maintaining it. That the Hindoo heathen should utterly pervert the teachings of Jesus Christ is not strange; that he should accept for his theory of life the crude philosophy and cruder rhetoric of some of the less intelligent of Christ's

followers is quite according to the natural order of things. But the author does so in his preface; and this, on the part of a man who assumes to set the world right in its misapprehensions of Christianity, is inexcusable.—*Christianity and Science* (Robert Carter and Brothers) is an unfortunate misnomer of the book which it entitles, which is a series of lectures delivered in New York by Dr. A. P. PEABODY on the Ely foundation of the Union Theological Seminary, the object of the lectures being to set forth the authenticity and credibility of the Scripture miracles and prophecy. The relations of Christianity to modern science are not discussed. While not presenting any thing especially new, these lectures put the arguments for historical Christianity in a clear and compact form, relieved from the burden of a minute scholasticism which they are too often compelled to carry.

John Paul's Book (Columbian Book Company) is avowedly made up of his previous contributions to the newspaper press, put together with little or no pretense of arrangement. They are labeled on the title-page, "moral and instructive," but this must be because they are not immoral nor debasing. The volume is really 600 pages of fun, most of it belonging to the order of burlesque, and a good deal of it to the order of grotesque, but all of it good-natured and hearty.

Editor's Scientific Record.

SUMMARY OF SCIENTIFIC PROGRESS.

IN *Astronomy* we have to note during December the gratifying success of most of the parties dispatched to observe the transit of Venus. Many of these have not been heard from, but, thanks to the great extension of telegraphic communication, enough is known to warrant astronomers in expecting most satisfactory results when the observations shall have been finally discussed. The exact amount of work done at each station is not yet known, but only that of the eight American stations. All those heard from have had weather good enough to obtain at least fair observations. Professor Hall, U.S.N., at Wladivostok, Siberia, observed all of the contacts, and obtained a small number of photographs; Mr. Davidson, United States Coast Survey, at Nagasaki, Japan, observed three of the contacts (both the internal contacts), and obtained photographs; Professor Watson, of Michigan University, at Pekin, China, has not been heard from, but no fears are entertained for the success of his party on account of clouds, as Pekin has an unusually clear winter atmosphere. If one of the dust-storms which occasionally occur at this point has not interfered with the work, we may count on good results from Pekin. Professor C. A. Young, of Dartmouth College, is attached to this party, and is the only American who will attempt the observation of the spectroscopic contacts. It may be noted that Professor Watson in his leisure moments resumed his accustomed habit of discovering asteroids, and on October 10 found one of the eleventh magnitude, observations of which he has transmitted to America. This undoubtedly is the first asteroid discovered in China, and will receive the

number 188. The English parties in Egypt and India seem to have had good success, and we may infer from the meagre telegrams which have reached us that only five out of the twenty-seven Russian parties have been wholly unsuccessful. Of the French and German expeditions little is known. The observations in the southern hemisphere seem to have been generally more full than was expected, Professor Harkness, U.S.N., having taken at Hobart-Town, Tasmania, 118 photographs, while Professor Peters secured 247. It is not known whether he obtained observations of the contacts or not. From the American, English, and German parties on Kerguelen Island nothing will be heard until their arrival at some port homeward bound.

M. Violle has recently published the results of some further researches on the effective temperature of the sun and upon the true mean temperature of the solar surface. His results are of much interest, in view of the widely varying conclusions at which various astronomers and physicists have arrived. He defines the true temperature of the sun to be "the temperature which must be possessed by a body of the same apparent diameter as the sun, in order that, endowed with an emissive power equal to the mean emissive power of the solar surface, it may emit in the same time the same quantity of heat as the sun." Allowing the assumption that the mean emissive power of the sun is sensibly equal to that of steel in fusion, M. Violle concludes that the true temperature of the sun is 2000°.

The last bright comet (Coggia's) has likewise been attentively observed, and Mr. A. Cowper Ranyard, F.R.A.S., from his observations has been led to the inference that this comet is cer-

tainly not entirely composed of incandescent gas. If it were merely a fine dust dispersing the sun's rays, we should expect its light to be strongly polarized. From the absence of polarization Mr. Ranyard concludes that either the fine dust is incandescent, or that the individual particles, be they solid or liquid, which go to make up the continuous spectrum of portions of the tail, are large compared with the wave length of the light.

Mr. Christie, first assistant in the Royal Observatory at Greenwich, has also published his spectroscopic observations on Coggia's comet. He has compared its spectrum with that of dioxide of carbon, in the manner first adopted by Huggins. The spark was obtained from an induction coil, without the use of a Leyden-jar, and under these conditions the spectra of the carbon and of the comet were very similar. In the spectrum of the comet two bright bands were found on every occasion to be sensibly coincident with the two brighter bands of the dioxide of carbon. On the 7th of July the coma gave in addition to these bands a faint continuous spectrum. The spectrum of the nucleus was continuous, but it appeared to contain numerous bright bands, and three or four *dark* lines were seen on several occasions. Of these one appeared to lie between D and E, another on the blue side of b, and a third near F.

As a contribution to physical astronomy, Mr. Knobel gives a series of twenty-four drawings of Jupiter, made between February 17 and June 1, 1874. It is understood that Dr. Lohse, assistant at the observatory at Bothkamp, is making a similar series, and that he intends to submit all published drawings to a thorough discussion, with a view to determining the laws of the winds which must produce the rapid changes observed on the surface of Jupiter.

In *Nature* for December 3, 1874, we find an account of the Proceedings of the Royal Society of Victoria for 1870, 1871, and 1872, from which it appears that Australia is taking an active part in astronomical research. Mr. Ellery, the director of the Melbourne Observatory, gives an account of the great reflector (four feet speculum) mounted there, and says that although his hopes were not fully realized in regard to it, it equals, if it does not excel, any other of its size.

The nebula in Argus, which has been supposed to be variable, has been examined by both Ellery and his predecessor, Le Sueur, and although a comparison of the drawings of these gentlemen indicates a vast change in it, yet there are reasons for supposing the change to have been not so enormous. Mr. Ellery's original report will be looked for with eagerness, as the whole question of the change in this or any other nebula appears to be, as yet, unsettled.

Mr. Macgeorge has given in this volume of Proceedings a diagram of the small stars near Sirius. He finds eight small companions within eighty-two seconds of arc (estimated from a copy of his drawings) of the large star.

We shall look to the large telescopes of this country to confirm or controvert this discovery. We have at least four which should show some of these faint companions.

One of the most famous of the binary stars of short period is 70 *Ophiuchi*, and its orbit has been frequently calculated, not without showing annoying discrepancies between theory and

observation. Sir John Herschel, Encke, Bessel, Powell, Jacob, and others have published elements of this orbit, differing largely in the most interesting element, viz., the time of revolution, which varies from 73 years (Encke) to 112 years (Jacob).

M. Flammarion has recently published his researches on this orbit, which were undertaken at a fortunate time, as the star has completed a whole revolution since its discovery by Sir William Herschel in 1779, and he finds its period to be 92.77 years. Admitting the parallax of this star to have been exactly determined ($0.168''$), its distance from the earth is 1,400,000 times that of the sun; the distance between the two components of the binary star is a little less than the distance of Neptune from the sun; the velocity of the star in its orbit is about 80,000 feet per second (nearly six miles), which is about one and one-half times greater than Neptune's orbit velocity; and the mass of the two stars is about three times that of our sun. These results are probably good approximations to the truth, and they show that our double-star observers may well give some of their attention to making a few good measures each year of this binary.

Dr. Carl Behrmann has recently had published his atlas of the stars visible to the naked eye between the south pole and twenty degrees of south declination, including 2844 stars. It contains 7 stars of the first magnitude, 21 of the second, 56 of the third, 123 of the fourth, 468 of the fifth, 1654 of the sixth, with 20 nebulae, cumuli, and variable stars. The whole work was completed, so far as observation was concerned, in less than ten months, and it is largely compiled from the older star catalogues. One evidence of the short time spent on its preparation is that the author notes but four variable stars. It is, however, valuable as the best southern atlas extant.

The Smithsonian Institution has just published a most important research in theoretical astronomy, by Professor Newcomb, U.S.N., "on the general integrals of planetary motion," which is an elaboration of novel methods first proposed by him in two papers previously published. It is a general and fundamental statement of the position of theoretical astronomy in regard to its most important problems, and leads to several general theorems of the greatest value.

We may mention in this connection that Professor Newcomb is now in Europe for the purpose of making experiments on various kinds of optical glass, with the view of selecting the most fit to be used in the construction of the great telescope to be erected on some elevated point in the Sierra Nevada of California. The great liberality of Mr. Lick, of San Francisco, appears to be supplemented with scientific caution on the part of his advisers, and the astronomical world can reasonably hope that science may receive great benefits from his magnificent gift.

The attention of all interested in *Geology* has been directed within the last two months to the explorations of Professor Marsh in the Mauvaises Terres, south of the Black Hills. The account of the professor's intercourse with the Indians, and the exposures endured by his party in their search for "bones," has already been given by the daily papers, and forms really a most interesting and, in some features, amusing story. Of

the scientific results of the expedition we have as yet only the general account (*American Journal of Science*) of the immense lake basins of tertiary age extending far to the south and east of the Black Hills. A description of the extinct fauna of this region, including most conspicuously the huge Brontotheridæ, can be given only when the large amount of material accumulated, and now in New Haven, has been thoroughly studied.

The geological occurrence of the *diamonds* of South Africa has been often described, but some new points of interest are brought out in a recent paper read before the Geological Society of London by Professor Maskelyne and Dr. Flight. They have found the rock at Du Toit's Pan and other similar diggings to have a soft, decomposed character, consisting of a soapy steatite-like magma, with a hydrated bronzite, crystals of new vermiculite mineral, called Vaalite, opaline silica, and other non-essential constituents. This rock has been extensively metamorphosed and fractured, and in many places broken through by dikes of an igneous diorite. It is asserted that "*the diamonds occur more plentifully, if not exclusively,*" in the neighborhood of these dikes, or near them in the strata of the hydrous rock through which the igneous material has been ejected. In confirmation of this view the writers urge the distinctive character of the diamonds in different localities, and their sharp, unabraded character. *How* the diamonds have been formed can hardly be explained, though it is a point of considerable interest, if it may be accepted, that the metamorphosed bronzite rock, possibly at places of its contact with carbonaceous shales, was the original home of the diamond.

Geologists as well as metallurgists are much interested in the announcement of the discovery of a rich deposit of copper ore in New Mexico, principally in the vicinity of the White Mountain Indian Reservation, the mass being apparently almost inexhaustible, while the ease of smelting and reducing is very great.

The geological surveys of States continue to be prosecuted, although field work in most of them is suspended for the winter. A valuable document has lately been published by Mr. G. C. Brodhead, State Geologist of Missouri, containing a great deal of information in reference to the industrial resources of that State, which, as is well known, is very rich in many valuable minerals.

Geography.—Nothing of special importance in this department has come to light since our last record, although public interest continues to be excited by the vigorous preparations under way on the part of the British government in fitting out an expedition for polar research. The arrangements, well advanced under the direction of Admiral Osborne, render it likely that at as early a period as practicable in the coming summer two vessels will set out on their mission. One of these is to be a steam whaler originally built for arctic navigation, and will be strengthened and improved in every practicable way. The British government has made application to the United States for permission to use the stores which were deposited by the *Polaris* party, and it is probable that the request will be granted.

As already announced, Captain Nares, of the *Challenger*, is to be in command of the polar

expedition, his claim to the position consisting not only in the experience he has had during the *Challenger* exploration, but also in the fact that he was a member of the British arctic party on board the *Resolute*, under command of Captain M'Clintock, when he did excellent service. Of the preparations for the new Austrian polar exploration but little has been announced.

In connection with matters related to the arctic regions, we may refer to a new view presented by Professor Karsten in reference to the cause of the mildness of the climate of Norway during the winter season. This, in his opinion, is not the result of the superficial action of the Gulf Stream, according to Dr. Petermann, or even of the general movement of the ocean to the northeast, as maintained by Dr. Carpenter, but is produced by a current of warm water which leaves the Baltic at the approach of winter.

The United States steamer *Tuscarora* has again reached Honolulu, having completed the line of soundings recently undertaken between San Francisco and the Sandwich Islands, and finding that line to be even better adapted to the purpose of a telegraphic cable than the route from San Diego to the same point. At a considerable distance to the east of the Sandwich Islands a submarine conical mountain was met with, which, with a base of scarcely more than five miles in diameter, rose abruptly from several thousand fathoms to within 320 fathoms of the surface.

The various parties which have been occupied during the past summer in the exploration of the Western Territories, principally under the charge of Professor Hayden, Lieutenant Wheeler, and Major Powell, have all returned to Washington, and are busily engaged in making up their reports. It is understood that many interesting facts have been developed in regard to the physical and natural history of the regions visited.

A recent number of *Petermann's Journal* contains a notice by Dr. Loew of the explorations of Lieutenant Wheeler in 1873, with a map of the same.

Some interesting items of news in regard to explorations in Africa have recently been announced, the most important being those from the Cameron expedition, under date of May 16. Lieutenant Cameron states that he has definitely ascertained that Lake Tanganyika really empties into the Lualaba of Livingstone, and that it is certainly identical with the Congo.

Colonel Gordon has pushed forward his work in connection with the exploration of the Albert Nyanza very efficiently, having at the date of September 5 reached Gondokoro, his sectional steamer having been carried to the foot of the falls below the lake.

The details of the "Forrest" exploration in Australia are also announced, this gentleman having succeeded in making a journey of 2000 miles across a portion of that continent, near the parallel of 26°. He finds the greater part of the country to be an unmitigated desert, involving very great labor and hardships in passing over it. Other portions, however, were well adapted to European immigration.

Ethnology.—Mr. William H. Dall sends to the National Museum a finer collection than ever of prehistoric and historic material gathered during his last trip to Alaska. Among them

are snuff-boxes, scrapers, and tubes, fire-sticks, throwing-sticks, fish and bird spears, implements of all branches of Esquimaux handicraft, ivory gaming implements and trinkets, hats, boots, wood and ivory household vessels, sledge harness and equipments, musical instruments, and charms. The prehistoric series contains bone, wood, and slate objects, the uses of which we are able in some measure to determine by comparison with articles of known function.

All lovers of American ethnology will hear with profound pleasure of Mr. Shea's continuation of his "Library of American Linguistics." The new series will commence with *A Grammar and Dictionary of the Language of the Hidatsa (Gros Ventres)*, by Washington Matthews, Assistant Surgeon, U.S.A.

So many criticisms have appeared upon Mr. H. H. Bancroft's *Native Races of the Pacific States* that we have only space to say, without necessarily indorsing all of the author's conclusions, that it is a model of patient research, which reminds us of Rawlinson's *Five Great Monarchies*.

Professor Hartt contributes an illustrated article to a recent number of the *Popular Science Monthly*, which is only the precursor of a more extended treatise, wherein he most ingeniously traces the growth of the idea of ornament, and accounts for the recurrence of similar forms in places most remote, and among peoples far differently civilized, upon principles founded in the structure of the eye. He refers most especially to pottery which he has discovered during his last tour in South America, drawing attention to the striking resemblance between the designs thereon and those on Greek and Etruscan vases.

The *Academy* gives an account of "a new pile dwelling lately discovered at the Swiss hamlet of Vingelz, not far from Biel, where, at a depth of only about three or four feet below the surface, a platform has been found resting upon piles, and composed of beams nearly a foot thick."

At the meeting of the Anthropological Institute of London, November 24, a communication on "Ruins in the Neighborhood of Palmyra," by Mr. C. Cotesworth, was read, describing among other things the discovery of ruined towers, some of which contained skulls and other human remains. Professor Busk recognized their likeness to some bones brought from Palmyra by Captain Burton.

Mr. J. Walhouse read a paper before the Anthropological Institute of London "On the Existence of a Leaf-wearing Tribe on the West Coast of India." They are the Koragars, a tribe numbering only a few hundreds. The custom is confined to the women, who wear aprons of woven twigs and green leaves over the usual garment, in order to bring them good luck. They were originally of the slave caste, and adhere to this practice as a relic of that servitude of which it was formerly a badge.

Some interesting contributions have lately been made to our knowledge of the manner of sepulture among the original people of the United States. One of these has reference to a peculiar custom in North Carolina, where the body was covered with clay and a fire built upon this, which not only consumed the body itself, but converted the clay into a hard sarcophagus case.

Another mode of incineration, which appears

to have been practiced in Indiana, consisted in placing the body in an oven-shaped receptacle of clay, with the necessary amount of fuel, and burning it up in that manner, leaving the ashes and the remains of the body inside the oven.

In *Zoology*, Professor Huxley has just published in *Nature* a very condensed classification of the animal kingdom, based principally on embryological data. With Haeckel he divides animals into two divisions: *Protozoa*, or one-celled animals, and *Metazoa*, or many-celled animals. The *Metazoa*, comprising all the animals higher than the *Protozoa* (the latter embracing the rhizopods, infusoria, etc.), are divided into those which develop an alimentary canal, accompanied by a differentiation of the body wall into two layers (*Gastrea*), and those in which an alimentary canal is never formed, as in the cestoid worms and their allies, the *Acanthocephala*. All other animals are embraced in the first category. Next above the *Protozoa* come the sponges, then the coelenterates (polyps and hydroids), and the *Scolecimorpha* or low worms, embracing the *Turbellaria*, *Nemotoidea*, *Nematoda*, leeches, the *Oligochaeta*, and probably the *Rotifera* and *Gephyrea*. Then come the *Echinodermata*, and above them a group (*Schizocala*) embracing the mollusks, which he regards as little more than a modification of annelids without division into segments, and the annelids and arthropods, crustacea, and insects. He leaves it doubtful whether the *Brachiopoda* or *Polyzoa* belong to this division, or with *Echinodermata*, etc. (*Enterocala*). In a third division (*Epicala*) are placed the tunicates and vertebrates.

It will be seen that this is a complete overturning of the Cuvierian system of classification, so much in vogue in this country, but well-nigh abandoned in Germany and England.

An interesting memoir on that curious polyp, the *Umbellula*, has been received from Mr. Lindahl, of Stockholm. It is a sea-pen, with a remarkably long stalk, some two feet in length. The species are of great rarity, occurring at great depths off Spitzbergen, in Baffin Bay, in North Greenland, off Cape Finisterre, and in Banks Sea.

An illustrated account of the colossal cuttle-fishes of the North Atlantic appears in the *American Naturalist*, from the pen of Professor Verrill. A figure of the famous monk-fish, as it is called on the coast of Denmark, is given, mostly from photographs, and it is the first time that one of these gigantic creatures has been figured. The body was seven feet long, exclusive of the arms.

The butterflies of Costa Rica are enumerated by Messrs. Butler and Druce, and six new species described in the Proceedings of the Zoological Society of London.

In the same journal some interesting notes on the respiration of some species of Indian fresh-water fishes found near Calcutta are offered by Mr. Dobson. The notes refer to those fishes which breathe atmospheric air as well as the air mixed with water. These fishes in some species ascend to the surface of the pool or stream for air every minute or two, the *Anabas* going oftener, and becoming sooner asphyxiated when retained under water, than any other. The faculty of living out of water, says Mr. Dobson, when the gills are kept in a moistened condition only,

in some cases for days, is not alone a wonderful provision of nature, enabling these animals to resist the prolonged droughts of the countries in which they live, but the natives are thereby able to transport them alive for a long distance, and thus maintain a supply of fresh fish in a country where fish taken in the morning are often unfit for use by breakfast-time.

A paper has been published on the respiration of the loach, or *Cobitis fossilis* of Europe. This animal has long been known to have the habit of rising to the surface of the water and taking in bubbles of air. It has been ascertained that the alimentary canal serves the purpose of a respiratory organ, and that the air-bladder proper is possibly nothing more than a resonant chamber.

In the same journal (Proceedings of the Zoological Society of London) is a monograph of the genus *Saxicola*, or Chats, by Messrs. Blandford and Dresser. Mr. Harting describes a new species of *Tringa* from Alaska, in which, however, he proves to have been anticipated by Dr. Coues. Mr. Garrod discusses some points in the anatomy of the pigeons, and Mr. H. Saunders remarks on the gray-capped gulls.

A valuable contribution toward knowledge of American mammals has lately been made by Dr. Coues in the form of a monograph on the murids of the United States, in which the doubtful species are carefully criticised, and some new ones added. This monograph is a precursor to part of a new and very extended work on the mammals of North America, by Dr. Gill, of the Smithsonian Institution, and Dr. Coues, and which is to consist not only of a full account of the osteology and external characters of the families, genera, and species, but also to include copious biographical notes, and intended to be for the mammals of the country what the recent work by Messrs. Baird, Brewer, and Ridgway is for the birds.

As another contribution to the systematic accounts of entire groups of animals in the United States, we may refer to Professor Cope's labors upon American reptiles. He has recently prepared a complete list of all the species, which will be followed by a very exhaustive treatise.

Dr. Hunt, of Philadelphia, communicates some notes in regard to the food of a mastodon found in New York, from which we learn that it evidently browsed upon the grasses and weeds bordering the courses of streams.

Several species of serpents have lately been added to the fauna of Florida, one of them new, under the name of *Helicops alleni*; another, *Elaps distans*, previously known only to Arizona. This last instance adds another to show the very intimate zoological relation between Florida and Arizona—a fact which is somewhat difficult of explanation according to any of the received views of the present or past physical geography of North America.

Professor R. Owen finds evidence of a sirenian mammal, which he calls *Eotherium aegyptiacum*, in the eocene nummulitic rocks near Cairo. This sirenian was probably allied to the recent form known as *Halitherium*.

The report of Dr. Hayden on the surveys of the Territories contains a large amount of matter relating to the zoology of Colorado, Utah, etc., while collections of considerable extent were brought in by the naturalists attached to Wheel-

er's Geographical Survey of the Territories, conducted by the War Department.

In *Botany* we have to notice a work by Dr. Robert Hartig, entitled *Wichtige Krankheiten der Waldbäume*, in which the author gives a complete list of all fungi which attack the forest trees of Germany, and descriptions of those coming under his own observation. Many of the same diseases are found in our own forests. Among the injurious fungi mentioned by Hartig, but never seen by him, is *Æcidium conarum*, found by Du Bary in the Thuringian Forest. It has been found on the cones of *Abies excelsa*, the Norway spruce, near Boston, during the last summer. A useful book to botanical students is the *Botanischer Jahresbericht*, by L. Just, published in Berlin. The object of this compilation, which is under the direction of such experts as Askanasy, Pfizer, and Schroeter, is to furnish an abstract of all works on botany which have appeared during the year, including even those in the Russian and Polish languages, and to give a summary of all new species.

The results of the dredgings of the United States Fish Commission at Peak's Island, Maine, and Noank, Connecticut, have succeeded in overthrowing the theory of Harvey and others that Cape Cod is the dividing line between a strongly marked Northern and an equally characteristic Southern flora. That view was apparently confirmed by the dredgings at Wood's Hole, where almost no Northern forms occur. At Noank, however, and in Long Island Sound several plants, particularly *Euthora cristata*, showed that some species peculiar to the North are found in Southern localities where the water is cold. The fact that *Laminaria dermatodea* is abundant in Portland Harbor would suggest that the Newfoundland flora comes farther southward than was supposed. An interesting addition has been made to the Florida marine flora in the shape of two species heretofore known from the Red Sea, *Sargassum dentifolium* and *Cystoseira myrica*.

A recent examination of the rose plant from which the greater part of the attar of roses is manufactured has shown that it belongs to the variety called the *Rosa damascena*, or Damascus rose.

Among the events of *Agricultural* interest during the early winter have been the annual meetings of several State societies and boards of agriculture. While the Transactions of these meetings contain considerable material of little practical and still less scientific value, many of the papers read are useful contributions to our scientific knowledge, and the number and worth of these increase from year to year. Some of these organizations have already come to be with us, what similar ones have long been in Europe, among the most potent agencies in furthering agricultural science.

At the meeting of the Massachusetts Board of Agriculture, December 1-3, were delivered, among others, addresses by Professor Arnold on Milk, President Chadbourne on Mental Faculties of Domestic Animals, Secretary Flint on the South Carolina Phosphate Beds, Professor Stockbridge on Agricultural Experiments, and President Clark on some Phenomena of Plant Growth. President Clark's experiments with the "Amherst squash in harness," and on the flow of sap in plants, have been successful in exciting popu-

lar interest, if not in gaining the entire commendation of students of science as new and accurate investigation. This meeting was one of unusual interest and usefulness.

The same may be said of the annual convention of the Connecticut Board of Agriculture, December 16-18. The chief theme of discussion was the production and management of milk. Addresses were made by Secretary Gold and Mr. Hart on the Production and Treatment of Milk, Hon. X. A. Willard on Dairy Management, T. D. Douglass on Butter-making, Dr. Sturtevant on the Milk Product as affected by Feed, Professor Atwater on Results of European Experiments upon the Effect of Fodder on Milk Production, Hon. Francis Gillette on the Immortality of Animals, and by Mr. P. M. Augur on Fruit-culture.

The establishment of an experiment station in Connecticut, a movement toward which had been initiated in the previous annual meeting, was discussed with considerable enthusiasm. The committee appointed a year previously for furthering the project reported that meetings had been held in various parts of the State to bring the subject before the people, who had responded with hearty approbation. Petitions with some seven or eight hundred signers had been presented to the State Legislature asking for favorable action. A bill providing for an annual appropriation of \$8000 for the establishment and maintenance of an experiment station had been brought before the Legislature, and after a debate had been laid over for further consideration until the next session, which convenes in May, 1875.

Pending this action of the Legislature, the members of the convention showed their earnestness in the matter by subscribing nearly \$400, which sum it was proposed to increase to \$1000, to be devoted to investigations in agricultural chemistry, and particularly to the analyses of fertilizers, in the interests of the farmers of the State of Connecticut. Mr. Orange Judd, as one of the trustees of the Wesleyan University, assured for this work the free use of the chemical laboratory of that institution, which offer was seconded by one on the part of Professor Atwater to devote gratuitously his own services, aided by those of Professor Johnson, to the superintendence and execution of the work.

Apropos of the subject of fertilizer analysis, an interesting bit of experience is reported from the Massachusetts Agricultural College. A potash fertilizer purchased of a dealer in Boston was certified to contain thirty-two per cent. of potash. An analysis by Professor Goessmann showed an actual content of only eight per cent.

The article by Professor Storer, "On the Importance as Plant Food of the Nitrogen of Vegetable Mould," published in the third part of the Bulletin of the Bussey Institution, to which brief reference has been already made in these columns, is one of great scientific value. The object of this paper is to enforce and, in part, to explain the fact that the nitrogen of vegetable mould, as in loam and peat, which in the process of decomposition of the latter has not yet reached the form of ammonia or nitric acid—in other words, the organic nitrogen of the soil—is, under certain conditions, in a measure, at least, available as plant food. This fact is supported by a large number

of experiments on the growth of plants in pots containing various kinds and mixtures of soils, carried out during the past three years by Professor Storer, as well as by numerous others, which he cites from various authorities. Professor Storer discusses the circumstances under which the soil nitrogen becomes available to the plant, and throws out suggestions which have a very important bearing upon the much-vexed question of nitrification, and go far to explain and harmonize the conflicting views and results of experiments upon the weighty subject of the sources of supply of nitrogen to plants. These labors of Professor Storer are among the most valuable contributions to agricultural science ever made on this side of the Atlantic.

An important advance has lately been made in regard to the history of the potato disease by Professor Du Bary, which, it is thought, may be of importance in suggesting measures for preventing the propagation of this pest. The matter of the potato fungus has been well worked out for some years past, with the exception of its resting-place during the winter, and the possible manner by which it can make its appearance in the spring or summer. It is now believed that its nidus during the season in question is to be found in clover or certain other fodder plants which enter into the composition of manures, and that by a proper microscopic criticism of such manures the danger of introducing the germs of the disease in any particular region may be greatly obviated.

Mr. Grote, of Buffalo, makes an important suggestion in regard to the natural history of the cotton-worm which does so much damage to the cotton crop in the South. He is of the opinion that it does not originate in the United States, but comes from South and Central America in great flights. These settle upon the growing plants, and lay eggs, which develop into the caterpillar so destructive to the cotton interest. He believes that the eggs laid by the progeny of this brood all perish in the winter with the plants themselves, and that the renewal can only occur by a new flight from the South. The occurrence of this pest in connection with the cotton plant in the United States, in his opinion, dates back only to a short period before the late war.

The continued spread of the phylloxera in France excites the gravest apprehensions on account of the momentous consequences involved to the grape culture of the country. Every number of the *Comptes Rendus* is occupied very largely by propositions looking toward a claim for the \$20,000 offered by the government for an efficient method of preventing its ravages. A recent writer gives it as his opinion that the trouble is caused largely by the practical extermination of small birds in France on the part of the so-called sportsmen of that country. It is not, perhaps, that the phylloxera itself is devoured by the birds, but that other insects, which are more accessible to them, and which, in consequence of their diminution, can prosecute their ravages undisturbed, and thus weaken and exhaust the vine plant, and render it a more easy prey to the parasite.

Under the head of *Pisciculture* and the *Fisheries* we have to record the great success experienced by the United States authorities in securing spawn of the salmon in California and Maine, in

hatching out that obtained from the former, of which a large percentage of the young fish has already been deposited in the waters of the United States. A successful transfer of the living young has been made to the waters of the Colorado River in Texas and to those of Lake Pontchartrain, Louisiana, in addition to many points in Ohio, Indiana, Illinois, Michigan, Iowa, Wisconsin, Minnesota, Utah, and all the Northern and Middle States, as well as in Maryland, West Virginia, Virginia, and North Carolina.

A curious fact in connection with the artificial culture of salmon has lately come to light, as related by Mr. Dousman, of Wisconsin. This gentleman received some years ago some salmon eggs from the United States establishment in Maine to be hatched by him and distributed in the waters of Wisconsin. In transferring them a few of the fry were left behind, and in the past autumn, while securing the eggs from his spawning trout, Mr. Dousman found three salmon, one female and two males. From the female, which was only five inches in length, he obtained 200 apparently fertile eggs, which were impregnated by the milt of the male (seven inches long), and placed in a hatching box. The result of the experiment will be looked for with great interest for the purpose of ascertaining whether a new and diminutive race of salmon may not thereby be obtained.

In this connection we may refer to the experiments by Fitzinger upon the eggs of hybrid salmon as obtained in Europe by crossing the salmon and the trout. These have been subjected by him to a critical investigation, and it was found that they develop quite satisfactorily up to the stage when the eye-specks show, but do not go beyond this point, and consequently no fertile hybrid race can be expected. The successive generations may, however, be kept up advantageously, as the hybrids do not leave the rivers, and grow with much greater rapidity on the same amount of food than the parent species.

A movement has lately been initiated for the transfer of trout and salmon to the Cape of Good Hope, as also to renew experiments in transporting salmon eggs to Australia and New Zealand. The trout thus transferred have succeeded admirably in the last-mentioned countries, while the result of the salmon experiments is not at all satisfactory. It is somewhat questionable whether the temperature of the water at the Cape of Good Hope is such as to permit a successful result, but its initiators sagaciously maintain that if this be secured, the benefits will warrant any reasonable amount of expense, while the loss will be trifling if the effort fail.

Something may be learned of the importance of the measures now being taken on the part of the United States and the States themselves looking toward stocking the rivers of this country with salmon, shad, and other useful food fishes, from the report of the Food Inspector of the city of Washington for the year ending October 1, 1874. This gentleman, Mr. C. Ludington, informs us that the total inspections of fish offered for sale in the markets of Washington alone amounted in that year to no less than 11,000,000 pounds, of which a large proportion consisted of herring and shad. Of the latter there were 628,000, and 6,500,000 of the former, besides

large numbers of striped bass and other river fishes.

After several years of unsuccessful effort in France to restore the oyster fisheries, we are informed that the results of the last season have been quite satisfactory. The oyster, as is well known, produces a great number of young during its spawning season. The great difficulty, however, is to retain these on the oyster beds where they are produced. A concurrence of favorable circumstances appears to be necessary, particularly with reference to the oceanic currents, and an abundance of objects to which they may adhere, a perfect cleanness of the surface for adherence, and other more or less uncertain conditions. It is now stated that this problem has been solved by introducing to the beds at about the time of spawning a number of sticks or other objects coated with an adhesive substance, to which the spat may attach itself. Much less trouble is experienced in the United States in this connection, the object being accomplished by throwing upon the beds clean oyster-shells at the critical time.

The practical failure of the fur-seal fisheries in the North Atlantic during 1874 has induced action on the part of European governments looking toward some international arrangement for the protection of this interest, and it is probable that the period of capture will be changed to the time between the beginning or middle of April and the middle of May or the beginning of June, and that a fine of many thousands of dollars will be imposed by each government upon such of its citizens as shall violate the order on this subject.

In the field of *Engineering* we may record for the month several noteworthy items. The 16th of December witnessed the completion of the Brooklyn tower of the East River Bridge. Its total height is placed at 268 feet.

The tunnel through the Musconetcong Mountain, which has been in progress for over two years, is reported as upon the eve of completion. The final blast in the headings was made on the 16th of December, effecting the connection between the two parts of the tunnel. The work is located in Northern New Jersey, on the line of the Easton and Perth Amboy Railroad—a continuation of the Lehigh Valley Railroad—the line, when completed, constituting a connecting link between the Lehigh Valley and its northern prolongation, on the one hand, and tide-water, on the other. The tunnel proper is about a mile in length, not including the long open cuts at either end.

The company engaged in the construction of the St. Gothard Tunnel has laid before the Swiss Federal Council its estimates for the third year's work, which commenced on the 1st of October, 1874. This estimate, which has been approved, fixes the progress to be made during this period at 1922 meters, which, added to the 2453 meters driven the first two years, will make a total of 4375 meters by the 30th of September, 1875.

The Cheap Transportation Convention, which met during the present month at Richmond, afforded the opportunity of bringing out a vast amount of information concerning rail and water lines, the best routes from North to South, and West to East. The feature of the meeting was the able and interesting report of Mr. Southall, of Virginia, on the James River and Kanawha

Canal, connecting the waters of the Mississippi Valley with those of the Atlantic, a scheme which has already been discussed upon in these columns. In an address on existing railroads the president of the convention pointed out a number of abuses incident to the general management of lines in this country, and urged that the most effectual remedy for the existing evils is competition, and this would be found in the construction of an exclusive freight road from the grain-growing sections of the West to the seaboard, which, inasmuch as it would demonstrate how cheaply freight could be carried by rail, would compel existing roads to abolish the abuses which are absorbing the revenues of the present system.

Upon the most reliable information we may record to date the completion of 1808 miles of new railroads in the United States during the year 1874, against 8925 miles completed in 1873, and 7340 miles in 1872. Complete returns up to the close of the year will doubtless slightly swell the figures for 1874. The increase is estimated to be about 2.5 per cent., the number of miles of our railroad at the beginning of the year being 70,650.

Experiments have been in progress at Sandy Hook, with the purpose of determining the practicability of altering a number of smooth-bore guns into rifled pieces of smaller bore, by the insertion of a wrought-iron core. If successful, it is understood that some 4000 smooth-bore guns now in government hands will be so altered, and thus greatly improved in efficiency.

The annual statement of the Keeper of the Mining Records of the United Kingdom for 1873 has just appeared, from which we present the accompanying figures, showing the mineral produce of the United Kingdom during the period named.

	Tons.	
Coal	187,814,747	80
Iron ore	15,877,499	76
Copper ore	80,128.5	68
Tin ore	14,884.8	85
Lead ore	73,600.5	67
Zinc ore	12,800	66
Iron pyrites	95,994	86
Amalgam	5,428.8	84
Clay (fire and other) and shale	1,788,000	60
Salt	1,788,000	60

The total value of the minerals produced in the United Kingdom in 1873 equals £59,479,488. From the above there were manufactured, pig-iron, 5,546,451 tons; tin, 9973 tons; copper, 5240 tons; lead, 54,255 tons; zinc, 4471 tons; other metals to the value of £136,077—making the total value of metals produced from British ores in 1873 £31,409,878, showing a decrease of £580,000 on the figures of 1872.

In *Technology* we may note that much interest is at present aroused by the system of Bessemer for making steel direct from the ore. The process is effected by the employment of a gas furnace of peculiar construction, which is susceptible of a great variety of uses. The foreign journals likewise contain very favorable comments on the efficiency of the process of freeing cast iron from phosphorus, first suggested, we believe, by Professor Schaeffer, of Freiberg, by the application of a fused mixture of chloride of calcium and common salt to the molten iron in the puddling furnace. The process is represented to yield a superior bar-iron from phosphated cast iron at practically no increase of cost.

In connection with the future of the Bessemer steel industry of this country we note with much interest from a leading iron paper that the existence in Virginia of large deposits of iron ores of great purity and richness, fully equaling if not surpassing those of Lake Superior, has been fully established. These deposits, moreover, are said to be readily and cheaply accessible to the iron-works east of the Alleghenies. The great difficulty with which the Bessemer industry of this country has had to contend is that of securing ores of sufficient purity at reasonable price, and thus far it has been dependant partly upon foreign sources, though chiefly upon the ores of Lake Superior and Missouri.

A new industry that, besides utilizing one of the waste products of the mills, gives employment to quite a number of men has lately sprung up in Pittsburg. The article is called "brown coke," and is obtained from the ashes of the furnace ash-pits. The coarse particles are first separated from the fine ashes with a rake, and the lumps thrown into a tank of water, when the coke that is fit for use floats on its surface, the heavy ash and cinder sinking to the bottom. It is eagerly sought after by the forger-men, who use it largely.

Bronces incrustes is the name given to a new style of bronze or copper work ornamented with gold and silver, and manufactured by the celebrated house of Christofle and Co., in Paris.

Dingler publishes the fact that an artificial animal charcoal possessing very fair decolorizing power can be prepared by saturating lumps of pumice-stone with fresh ox blood, and then heating the mass in a closed vessel until the evolution of combustible gases ceases. Before using this substitute, however, it is recommended that it be washed in water to remove certain soluble salts that are contained therein.

Some recent improvements in photography are of great interest. A process of reproducing negatives has been devised, by which a plate is coated in the dark with dextrin 4 parts, glucose 4, bichromate of potash 2, and water 100, and, when dry, exposed to light under the negative to be copied. After a few seconds' exposure, it is removed again to the dark room and dusted with finely powdered graphite, which brings out the picture. If the plate after exposure is sprinkled with emery of different grades, beginning with the coarsest, the more viscous portions are covered by the larger particles, while the parts most acted on by the light retain only the finest. The plate is then hardened by exposure to light, and an impression taken from it in soft metal, which yields an electrotype possessing the proper grain for copper-plate printing.

In a similar connection we must notice that M.M. Delachanal and Mermat have designed a continuous light for photographic purposes by the combustion of nitric oxide and bisulphide of carbon, the eminent actinic value of which has long been familiar to physicists.

A very remarkable fact, if verified, is the observation of M. Choquart, lately communicated to the French Academy, that the magnet exercises a decided influence upon the spectra of various substances. The spectra of sulphur and selenium under the magnetic influence are said to become quite pale, and finally to disappear, while the opposite effect is produced in the case of

chlorine and bromine. The effect, the author says, is so rapid as to seem magical.

Under the head of *Materia Medica*, *Therapeutics*, and *Hygiene* we may refer to the statement of Dr. Schmidt in reference to the well-known and much-dreaded disease known as *diabetes mellitus*, and the result of a disorganization of the brain—a condition to which students are particularly liable. It is maintained by Dr. Schmidt that in no case coming within the scope of his extended experience and study has this disease been developed excepting as hereditary, and that in every instance a predisposition existed, as the inheritance from some ancestor who had been affected by it within one or two generations.

Laségue, in a paper on therapeutics and hot baths, informs us that the beneficial results of such applications may be secured, without any of the evils sometimes arising, by the precaution of having the bath warmer at the end of the operation than at the beginning, the temperature in no case to exceed 115° to 118° , and the time of exposure limited to a few minutes.

Napier mentions what he considers to be a new process in dental surgery. Taking the ground that the extirpation of the nerve is very objec-

tionable in preparing the stumps for the insertion of artificial teeth, he files down the teeth, with an occasional application of nitric acid to the surface, for the purpose of deadening the nerve. He has found as the result of several experiments that teeth cauterized in this way retain the vitality of the nerve, greatly to the improvement of their general health and condition.

Necrology.—Among the deaths since our last Summary we have to record, for the United States, those of Dr. J. V. Z. Blaney, of Chicago, and Dr. Gideon Lincecum, of Texas; Mr. F. Von Kittlitz and Dr. Friedrich Rochleder, for Germany; Sir William Jardine, Lady Hooker, Dr. Edwin Smith, and Dr. Archibald Campbell, for England; and Ferdinand Bayan and L. P. Rousseau, for France.

We desire to correct an error which through oversight crept into the Editor's Scientific Record published in our December issue. It was there stated that the length of railways throughout the world exceeds 2,000,000 miles. The correct statement would read, "The number of miles of railway throughout the world exceeds 200,000."

Editor's Historical Record.

POLITICAL.

OUR Record is closed on the 22d of January. —Congress, after the holiday recess, met January 5. On the 19th of January Senator Sherman submitted a report from the committee of conference to amend the existing customs and revenue laws. The report, which was agreed to by the Senate, was substantially the same as that presented last session, except that the duty on hops had been raised to eight cents per pound, and that the sections relating to tobacco and the sales of bonds had been stricken out. The report was agreed to by the House January 21.

The House, January 7, passed, by a vote of 186 to 99, the Senate bill for the resumption of specie payments, the provisions of which were given in our last Record. The bill has received the President's signature. On the 12th a bill was passed by the House removing the limitation restricting the capital of gold banks to \$1,000,000.

The Naval Appropriation Bill from the House was passed by the Senate January 18. It appropriates a little over \$16,000,000.

The House Committee on Elections, January 19, reported a resolution recommending the expulsion of George Q. Cannon, Delegate from the Territory of Utah.

A resolution was adopted by the House, December 18, permitting the select committee on the condition of the South to proceed either as a committee or sub-committee to Louisiana to make investigations. In accordance with this resolution, the select committee appointed a sub-committee, consisting of Charles Foster, William Walter Phelps, and Clarkson N. Potter. The committee left Washington on the 26th of December, and were in New Orleans January 4, when the Louisiana Legislature attempted to organize itself. The State-house was guarded directly by the police, and more remotely by United States

troops, under the command of General De Trobriand. The Returning Board had returned fifty-three Republicans and fifty Democrats, leaving five contested seats, the proper occupants of which were to be decided by the Legislature. After the roll-call of members there was an irregular organization attempted by the Conservatives, who, by an informal vote, placed L. A. Wiltz in the chair. The five Conservative members whose seats were contested were in like manner admitted to seats. L. A. Wiltz was then elected permanent Speaker. Some confusion ensuing, the Speaker called upon General De Trobriand to clear the lobby, which the general did. Shortly afterward General De Trobriand received orders from Governor Kellogg to eject the five Conservatives whose names had not been returned by the Returning Board. He ejected these members. The Democrats then retired from the hall in a body. At 9 P.M. General Sheridan assumed command of the Department of the Gulf.

The Congressional investigating committee returned to Washington shortly after the events just narrated, and on the 15th their report was submitted to the House. During their eight days' stay in New Orleans they examined over ninety-five witnesses. The committee report that the acting members of the Returning Board were all Republicans. The returns of the last election made by the Commissioners of Elections gave the Conservatives a majority of twenty-nine members in the Legislature. In three instances there were protests accompanying the returns. The Returning Board, after a session of several weeks, returned fifty-three Republicans and fifty Democrats. In one parish (Rapides) three Conservatives were elected, and the returns were accompanied by an affidavit of the United States Supervisors that the election was in all re-

spects full, fair, and free. The Returning Board gave the seats of that parish to Republican members. In regard to the charge of intimidation of Republican voters, the committee concludes that it is not borne out by the facts before it. The depressed condition of commerce is alluded to, and the blame laid upon the Kellogg government, which is only upheld by the Federal military. The White League of New Orleans, according to this report, is an organization comprised of different clubs, numbering between 2500 and 2800, the members of which provide their own arms. The *émeute* of September 14 was caused by the seizure, without process of law, of arms purchased by the members. The report concludes with an account, substantially the same as we have given, of the events of January 4.

This report was indorsed by the full committee, but it was determined to have a more thorough investigation.

Prior to the submission of this report the President had, January 18, sent a message to Congress in reply to a request for information in regard to the Federal interference with the organization of the Louisiana Legislature. The President dwells upon the long career of lawlessness in New Orleans, explains his recognition of the Kellogg government as a necessity in the absence of any definite Congressional policy upon the subject, shows how and why the Federal forces were present in New Orleans January 4, acting presumably under orders already given on the basis of the Governor's application in September, and constituting the only force upon which both parties could rely for the preservation of peace.

"Nobody was disturbed by the military who had a legal right at that time to occupy a seat in the Legislature. That the Democratic minority of the House undertook to seize its organization by fraud and violence; that in this attempt they trampled under foot law; that they undertook to make persons not returned as elected, members, so as to create a majority; that they acted under a preconcerted plan, and under false pretenses introduced into the hall a body of men to support their pretensions by force if necessary; and that conflict, disorder, and riotous proceedings followed, are facts that seem to be well established. And I am credibly informed that these violent proceedings were a part of a premeditated plan to have the House organized in this way, recognize what has been called the M'Enery Senate, then to depose Governor Kellogg, and so revolutionize the State government. Whether it was wrong for the Governor, at the request of a majority of the members returned as elected to the House, to use such means as were in his power to defeat those lawless and revolutionary proceedings, is perhaps a debatable question, but it is quite certain that there would have been no trouble if they who now complain of illegal interference had allowed the House to be organized in a lawful and regular manner. When those who inaugurated disorder and anarchy disavow harsh proceedings, it will be time enough to condemn those who by such means as they have prevented the success of their lawless and desperate schemes."

On the 4th of March the terms of twenty-five Senators expire. Seventeen of these retiring Senators are Republicans, three Independents, and five Democrats. The following new Senators have been elected: Newton Booth, from California; William W. Eaton, from Connecticut; W. P. Whyte and Robert E. Withers, from Virginia; B. K. Bruce, from Mississippi; A. G. Thurman (re-elected), from Ohio; S. B. Maxey, from Texas; George F. Edmunds (re-elected), from Vermont; William A. Wallace, from Pennsylvania; Francis Kernan, from New York; ex-Governor Theodore Randolph, from New Jersey;

H. L. Dawes, from Massachusetts; Thomas F. Bayard, from Delaware; J. E. M'Donald, from Indiana; General F. M. Cockrell, from Missouri, to succeed Carl Schurz; Hannibal Hamlin (re-elected), from Maine; William Sharon, from Nevada; A. S. Paddock, from Nebraska.

The New Hampshire Democratic State Convention, at Concord, January 5, nominated Hiram R. Roberts for Governor.

The Connecticut State Republican Convention, at New Haven, January 20, nominated James L. Greene for Governor.

The number of immigrants arriving at the port of New York in 1874 was 149,762.

With the new year came a new dynasty for Spain. Alfonso XII., son of the ex-Queen Isabella, was proclaimed king, and was supported by the army and navy. A regency was formed under the Presidency of Canovas Delcastillo. The new king's ministry was announced as follows: Minister of Foreign Affairs, Castro; of Justice, Cardenas; of War, Jovellar; of Finance, Salaverria; of Marine, Molins; of the Interior, Robledo; of Commerce, Orovio; of the Colonies, Ayala.

President M'Mahon sent a message to the French Assembly, January 6, urgently requesting the passage of a bill creating a Second Chamber, provision for the maintenance of the *statu quo* until 1880 in the event of M'Mahon's death before the expiration of his term of office, and, after the organization of the Second Chamber, a decision from both Chambers as to the government which shall succeed the Septennate.

DISASTERS.

December 24.—Colliery explosion in North Staffordshire, England. Twenty miners killed. —Railway accident at Woodstock, Oxfordshire, England. Express train thrown down an embankment. Thirty persons killed and eighty wounded.

December 28.—Tidings received in London of the destruction by fire, November 17, of the emigrant ship *Cospatrick*, bound from London to Auckland. Of five hundred souls on board only three are known to have survived.

OBITUARY.

December 28.—In Cambridge, Massachusetts, James Walker, D.D., formerly President of Harvard College, aged eighty years.

December 26.—In Fitchburg, Massachusetts, the Hon. Alvah Crocker, member of Congress from Massachusetts, aged seventy-three years.

December 28.—In New York, the Hon. Gerrit Smith, aged seventy-eight years.

December 29.—In New York, General Morgan L. Smith, aged fifty-six years.

January 12.—In Louisville, Kentucky, Thomas E. Bramlette, ex-Governor of that State.

January 18.—In New York, William H. Aspinwall, merchant, in his sixty-seventh year.

December 8.—In Paris, Baron E. C. G. Wappers, the distinguished Belgian artist, aged seventy-one years.

December 29.—Death announced of the Spanish statesman, Joaquin Baldomero Espartero.

December 31.—In France, Ledru Rollin, aged sixty-six years.

January 1.—In London, England, Mrs. J. Lothrop Motley, wife of the American historian.

Editor's Dinner.

MARCH, month of "many weathers," wildly comes
In hall, and snow, and rain, and threatening
hums,

And floods; while often at his cottage door
The shepherd stands, to hear the distant roar
Loosed from the rushing mills and river locks,
With thundering sound and overpowering shocks.
From bank to bank, along the meadow lea,
The river spreads, and shines a little sea;
While in the pale sunlight a watery brood
Of swooping white birds flock about the flood.

THE following amusing incident in the early history of Braintree, Massachusetts, was related by the Hon. Charles Francis Adams in an address delivered at the dedication of the Town-hall of that town in 1858:

When the British chieftain, General Gage, seeking to overawe the people of Massachusetts, sent out through the courts warrants to obtain juries to use in restoring the impeached Chief Justice Oliver, the people of Braintree took instant measures to obtain possession of all these obnoxious papers within the limits of the town. Accordingly about two hundred gathered one Sunday evening for the purpose of securing those papers, then in the hands of the deputy-sheriff. Having made the necessary arrangements, they secured that officer and compelled him to deliver up the warrants. They then made a great fire, around which they stood in a circle while the obnoxious documents were committed to the flames; but after all was done, when a vote was called whether they should huzzah, it passed in the negative, because it was *Sunday*, and they went home in silence.

It may not be generally known that the town of Braintree originally embraced the present towns of Randolph and Quincy, and that John Adams and John Quincy Adams were both raised before the separation.

In the present town of Braintree resides M——, a manufacturer of heavy carriages and heavy mechanical work of all sorts, which has been shipped to all parts of the world. His extensive business relations have given him a keen insight into human nature. A few years ago, while traveling on the cars in New York, he fell in with a very affable but high-flown gentleman, who was ostensibly acquainted with every thing worth knowing. After conversing a while relative to mechanical work, the gentleman asked M—— where he was from.

"Braintree, Massachusetts," was the reply.

"Braintree? Braintree?" was the rejoinder.

"It must be an unimportant place. I think I never heard of it before."

"Ah? astonishing," quietly remarked M——.

"It is the only town in the United States that ever produced two Presidents."

THE name of John Brown may be suggestive of a soul that is marching on, but this time his earthly mission is not ended, and he lives in an inland town in Maine. He is habitually poor, but he always takes a complacent view of life. Some are of the opinion that his heart is not very keenly susceptible to the ties of nature. We recall him now in his most significant character, going along the street at a pacing gait, with his

wood-saw on his shoulder, and always humming, to the old "Forty-niner's" tune of *Susannah*, the following syllabical euphony: "Rum-tum-dum-de-dar-de-o, rum-tum-tier-di-do," etc.

During the last war John had three sons in the army, named Fernando, James, and Henry. Fernando was taken prisoner and conveyed to Libby Prison, James was killed outright, and Henry lost an eye in one of the battles. John was returning home from the village, where he had received letters informing him of the above facts, when he was met by a waggish neighbor, and the following conversation ensued between them:

"Well, John, you been to the village?"

"Yes."

"What's the news?"

"Oh, not much of any thing, only I've heard from the boys, and Jim's got laid out."

"What! you don't mean he's killed?"

"Yes, Sir; and Hen's got one of his eyes knocked out, and Fernan's down there in prison. I don't expect to ever see him again. Rum-tum-dum-de-dar-de-o," etc.

MR. B—— was a noted penny-a-liner who had written much in the way of novelettes, and earned quite an extensive reputation in this field in his younger days. A few years ago he was one day reviewing the incidents of his literary career with an old friend, when he remarked, "I have during my literary life received a great many puffs and flattering notices from the press."

"And that, of course," said the friend, "was very gratifying."

"You will say remarkably so," was the reply. "when I tell you that, with one exception, I wrote them all myself!"

OLD Deacon Roberts was worked up to a high state of enthusiasm in a revival. He was exhorting the unconverted to flee from the wrath to come before it was too late; for, said he, "the Lord is here now, and He may not be here again for twenty years."

THIS from a correspondent at Rivière du Loup, Canada:

When the Grand Trunk Railway of Canada was completed, in 1860, many of the farmers had never heard of, much less seen, a railway, but it soon got reported around that passengers could travel by it, and even cattle. A backwoodsman who was indebted to a country merchant was *pushed* by the latter for payment of the amount due, and the only means of liquidating the debt was by taking a fat ox to the Quebec market. For this purpose he tied his ox to the back of his cart, and drove to the railway station, a distance of nine miles. On surveying the train and seeing an iron railing around the platform of the hind car, he concluded that *that* was the place to tie his ox, which he accordingly did, taking a place in a second-class car himself forward. Presently the train began to move off slowly. The speed increased; quicker and quicker it went. The poor man got very fidgety, the speed still increasing, until large drops of sweat became visible on his brow. By

this time the conductor had reached his car to collect the tickets. Nearly out of breath, the man ran to him, exclaiming,

"My dear conductor, my ox will never be able to keep up to this pace; it is not possible."

"Your ox! Keep up to this pace! What do you mean? I don't understand you. Have you oxen on board?"

"Not on board, of course. I tied him to the railing of the hind car."

"You tied your ox to the railing of the hind car? Who told you to do so?"

"No one; but that is the way we always do in the country."

Of course the conductor could not stop his train before reaching the next station, when, needless to say, on looking for the ox, they found attached to the rope a pair of horns, with a small portion of the neck.

Mr. Bergh could scarcely call this cruelty to animals, as it was not intended.

The humane conductor made a collection among the passengers on the spot, realising a larger amount than the ox would have brought at market, which he presented to the crest-fallen farmer, who immediately returned home, vowing he would never have oxen taken to market by railway again. He has kept his word, and to this day he leads his ox to market behind his own cart.

KEENNESS at repartee often comes from out-of-the-way corners of the world. It was the custom of the loafers of a certain village to meet every day in an old chamber to play euchre. Prominent among them were Gardner and Robinson. One day, while an interesting game was going forward, Gardner remarked that he could always tell what cards Robinson held by his appearance.

"Oh," said Robinson, "you've been studying human nature, haven't you?"

"Oh no," was the reply; "I've been studying the brute creation."

For the remainder of that day Gardner occupied the place of old John Willots: no one dared to "tackle" him.

A story of Edward Walpole: who, being told one day that the confectioners had a way of discharging the ink from old parchment by a chemical process, and then making the parchment into isinglass for their jellies, said, "Then I find a man may now eat his deeds as well as his words." This has been very unfairly, like a great many other bon mots, attributed to James Smith.

DEAR DRAWER,—Why does not Mr. Bergh take New Jersey in hand? Think of this. One chilly day, not long ago, while passing through the corridor of the Cooper Institute, we noticed a solemn-looking individual carrying a peculiar-looking basket, from which proceeded curious sounds. Being "from the country" ourselves, we recognized the sounds as resembling the peep of young chickens, but of chickens in difficulty—chickens to whom life could have but few attractions. We stopped, and looked into the basket, where there were indeed a dozen or so young chickens; but such discouraged-looking specimens we never in our whole barn-yard experience beheld. They had about two feathers

among them, their bills were long and brown, and they looked altogether as if life was a burden, and they regretted not having been eaten in omelet shape.

"Where in the world did these chickens come from in the winter?" we asked.

The solemn individual looked at the little scraps of misery in the basket, and gave his hat a shove back on his head. Then he said, with an air of mild superiority,

"I comes from Chersey, and I makes dem mit steam!"

Now, dear Drawer, isn't this an outrage? Darwin, Huxley, and the rest aren't a circumstance to it. This Jerseyman didn't even mention his having a steam incubator, but claimed the whole process—the origin of species—himself. Here is his portrait.

"I COMES FROM CHERSEY, AND I MAKES DEM MIT STEAM."

A few more Ulster stories, after the manner of Dean Ramsey:

A prosperous trader in the north of Ireland, who was of humble origin, but who had made a large fortune in business, retained in the days of his opulence much of the homely manner and style of speech of his earlier years. On one occasion he gave a grand dinner party in honor of a young friend who had come home from abroad. Every thing was in first-class style. The table was loaded with plenty, the sideboard was glittering with plate. The servants had removed the silver dish-covers and exposed to view a most tempting repast, when the hospitable host spoiled the effect of the whole by calling out from one end of the table to his young guest, who was seated at the other end,

"Master W——, dear, do you see any thing there that you'd like to ate?"

Fancy the effect on his very stylish daughters!

At a fisherman's feast in an Ulster sea-port a gentleman was seated next to an "old salt,"

who, before he would begin his dinner, insisted upon having some of every kind of meat that was on the table put all together upon his plate, which was thus loaded with an incongruous mess of fish, flesh, fowl, and vegetables, all in the one heap. The gentleman asked his neighbor why he did this, and suggested that it would be better for him to eat the different sorts of food separately. But the son of Neptune saw no necessity for any such distinction. He said:

"Do you think I keep separate shelves for them down below? Let them all go into the hold together."

TOWARD the close of the last century a young Presbyterian minister who had just commenced housekeeping was one day entertaining a few clerical friends. After dinner whisky punch was, as usual, introduced, but the young host was anxious to avoid even the possibility of excess, and therefore before the carouse had proceeded beyond the second tumbler he ordered in a quantity of buttermilk whey, or "caudle," by way of a conclusion to the entertainment. The innovation was not acceptable to the old stagers, one of whom, after partaking of the new beverage, expressed his feelings in the following impromptu:

I've not had of grog
What would warm my noddle;
I'm swelled up like a frog:
Brother, curse your candle!

At these post-prandial potations great allowance was made for what was said and done by the reverend participators. A minister was once charged in Synod with having made a certain statement. He asked when he had done so. He was told that he had made it "after dinner." "Oh, then," said he, coolly, in reply, "I must have been in jest." The validity of the excuse was not called in question.

PRUDENCE of a different kind from the foregoing was manifested by another Presbyterian minister, who, when asked at his ordination if he intended to become a subscriber to the Widows' Fund of his Church, answered that "he would wait until he got the widow first." The young man was unmarried, and he evidently meant that he would defer his subscription until he had got a wife, that being the germ out of which his future widow must grow.

THE *Tribune* has a very clever, bright correspondent at Paris, Arsène Houssaye, poet, author, and art critic, who, although sixty years old, is as crisp and cheery as a youth of twenty. He is one of the literary celebrities of France. In a recent letter he gives the following very Frenchy anecdote:

"You have heard that all Paris is to be seen at first representations, but this is incorrect. There is little more than the Paris of art and literature. This is by no means the 'upper ten thousand.' When I was young, Ma'amselle Rachel, who ruled the house of Molière, had me made director of the French Theatre. I gave there a hundred new plays. I therefore had an opportunity of studying the fanatical *habitudes* of first representations. I soon saw that with the exception of a score of celebrities and a dozen ladies of society, the house belonged by

the nature of things to criticism and its ladies. There were plenty of marriages of the Twenty-first District, from which you must not infer that the women were especially pretty. On the contrary, one could not help asking how those men whose trade it is to be clever, and who must have passed through the Temple of Taste of Montesquieu, should have chosen companions so ugly. One thinks of the speech of the husband who surprised a languishing lover at the knees of his wife, who was monstrously ugly: "Ah, monsieur! and to think that you were not obliged to do it."

Our genial Methodist brother, Dr. Hurst, in his new book, *Life in the Fatherland*, is brimful of good things. One of the most entertaining chapters is devoted to illustrations of the quaint and grotesque features of German life, under the title of "Oddities of the Newspaper, Home, and Grave-yard." Here are a few samples of the best:

A father announces the death of his child in the *Riesengebirge Bote* newspaper in this fashion:

After an illness extending over many years it has pleased God to take up my dearly beloved youngest daughter, Anna, into His heavenly kingdom, where we shall inter her soulless corpse on Thursday next, at 9 o'clock.
Master Carpenter J. Son—

A Leipzig paper contained this singular obituary:

To-day death tore away from us for the third time our only child.
L. A. V. and Frau.

Turning from death to matrimony, we find the following solicitation in the *Vienna Presse*:

A soldier, forty years old, sound and strong, is tired of living alone, and would like to marry. He wishes a wife twenty-five years old, affectionate, talented, and finely educated. Since he possesses nothing but his position, a fortune is perfectly necessary. But since he is thoroughly opposed to making love for money, he takes this way of making his wants known.

Such a topic, however, can not be expected to submit always to the dull method of prose, as these lines from a Dantzic paper show:

Four men, in the best of years (not aged),
With gold and land, and never yet engaged,
Who've never fished for any maiden fair,
And whose acquaintance here has been too rare,
Who long to put themselves 'neath love's soft sway,
And seek in this—a very well known way—
Here perfect strangers in this little city,
Four modest, brave, and good young girls, and pretty,
As little wives to carry home from here;
Therefore we beg our readers not to fear,
But send addresses, as is oft the case,
With portrait, to this paper's printing-place:
Fortune with them we do not seek possession,
And hereby vow to act with strict discretion.

But such overtures are not confined to one sex, if we may judge from this advertisement in the *Berlin Intelligenz Blatt*:

A young lady of good exterior and pleasant appearance wishes to marry a gentleman of just the same way of thinking.

The *Rheinische Zeitung*, in 1869, furnished this testimony to the qualifications of an executioner of the eighteenth century:

I hereby certify that the executioner of Tecklenburg, Joest Heinrich Stolheust, brother of the executioner Jügermann, some time ago beheaded with skill and to my especial pleasure Heinrich Schuerkamp, who was imprisoned in the Hellenborg; and immediately after, during the time my brother was Syndicus, skillfully hanged a person named Rötter, above the masses; also that in similar duties people will be well served by him. Signed the 9th day of June, 1700.

In the same line is the following scale of fees given to mediæval executioners of Darmstadt and Bessungen, as published in a number of German papers of the olden times :

	Fl. Kr.
To boll a malefactor in oil.....	24 00
To quarter a living person.....	15 00
To execute a person with the sword.....	15 80
To lay the body on the wheel.....	5 60
To stick the head of the same on a pole.....	5 00
To rend a man into four parts.....	18 00
To hang a man or any delinquent.....	10 00
To bury the body.....	1 00
To burn a man alive.....	14 00
To wait upon a torture, if so called.....	2 00
To place in a Spanish boot.....	2 00
To place a delinquent in the rack.....	5 00
To put a person in the iron collar.....	1 00
To scourge one with rods.....	8 80
To brand the gallows upon the back, or upon the forehead or cheeks.....	5 00
To cut off a person's nose or ears.....	5 00
To lead a person out of the country.....	1 80

In addition to these charges the executioner was gratuitously boarded, and usually received some *douceurs* besides.

Here are some quaint little mottoes taken from above the doorways of the houses in the Black Forest, Harz Mountains, and Tyrolese Alps :

The Lord this dwelling be about,
And bless all who go in and out.

Another :

The old folks to me they say
The times grow worse from day to day.
But I say no !
I put it so :
The times are just the times we've always had :
It is the people who have grown so bad !

This is less hopeful :

To please all men's a vain endeavor,
And so it must remain forever.
The reason true I'll tell to you :
The heads are far too many,
The brains are far too few.

Here is a strange mixture of piety and pelf :

I love the Lord, and trust his promise true :
I make new hats and dye the old ones too.

Over the door of an inn is the following :

Come within and sit thee down :
Hast no cash ? be off full soon !
Come within, dear guest, I pray,
If thou hast wherewithal to pay.

Another landlord gives us this :

The kind of guest that I love best
Will have a friendly talk ;
Will eat and drink and pay his score,
And then away will walk.

This one from Lower Saxony :

If your purse is filled with gold,
Blessed be your entrance here ;
Blessed be your going out,
If you pay your wine and beer.

The quaint and simple methods of recording on the graves the manner in which the departed met their death are familiar objects to travelers in the Tyrol. For instance, near Meran this epitaph is inscribed on a tablet which bears the picture of a man's head peeping out from under an avalanche, and a little Tyrolese scampering off to the left :

Here died Martin Kausch :
The avalanche came and rolled
Upon his body, and made him cold.
Also Jörg under it was bound,
But to-day is lively and sound !

The following is found in the heart of the mountains. A picture painted in glowing colors on the smooth face of a rock represents a furious ox running his horns into a man, with this result :

By the thrust of ox's horn
Came I into heaven's bourne,
All so quickly did I die,
Wife and children leave must I ;
But in eternity rest I now,
All through thee, thou wild beast, thou !

Among the newer inscriptions in Austria is the following, over the grave of the common goods carrier between St. Gilgen and Salzburg. He went by the name of "St. Gilgen Bote," and died in 1869 :

Here rests in God
The dead St. Gilgen Bote ;
To him be gracious, Lord,
As he would be
If he wert Thou,
And Thou St. Gilgen Bote !

During the reign of the reforming Emperor Joseph II. of Austria the following was found on a wall :

A friend of arms,
A foe to priests,
A hypocrite
Our Kaiser is !

The emperor, to catch the author, caused it to be torn down, and this to be put in its place :

The first is true,
The second plain ;
Of need the third,
And to the author fifty ducats are due.

But the trap failed, as is shown by this answer, which appeared on the following day :

Four are we—
Pen, ink, paper, and I ;
Each other we shall not betray,
So the Kaiser his ducats may keep.

The following authentic anecdote of the late Thaddeus Stevens (contributed by a prominent ex-member of Congress) contains a grain of pure Attic salt, which some of those who are in the habit of searching The Drawer for that condiment may relish :

Time—the close of the "long session" of the Fortieth Congress, July 27, 1868. *Place*—office of the Sergeant-at-Arms of the House of Representatives, Washington. *Dramatis Personæ*—a group of impecunious M.C.'s, waiting to draw their arrears of pay.

Seated on a lounge in the background were John F. Driggs, then representing the Lake Superior mining district of Michigan, and Thaddeus Stevens, of Pennsylvania. The "Old Commoner" was then on the very verge of the grave, "nigh to death's door," as he himself expressed it (he died two weeks afterward); but although his shrunken frame gave painful evidence of "natural force abated," his eye—that lustrous orb that glittered from out the cavernous depths beneath the beetling brow of a massive forehead like the "black diamond" in the mine—"was not dim."

Driggs was particularly jubilant over the passage of a bill imposing a higher rate of duty on copper, in which his constituents were deeply interested, and Mr. Stevens, in his habitual vein of sarcastic humor, was "chaffing" him about it,

alleging, among other things, that he had got his bill through by bribery. (This was in allusion to some nuggets of virgin copper, rudely moulded into the form of paper-weights, which Driggs had distributed among members with whom he was personally intimate as souvenirs of the mineral wealth of his district.)

Upon that hint of "bribery" spake Mr. Stevens's colleague from the Berks County district: "By-the-way, Mr. Stevens, Driggs gave me one of those paper-weights, and I voted for his bill. Tell me—your experience is so much greater than mine—can I take it home with me and keep it without being accused of accepting a bribe?"

"Well, yes," was the reply, uttered with all the gravity of a judge pronouncing an "opinion," "you can keep it as it is, but, as you value your good name, don't have it coined into pennies!"

Nor twenty miles from Boston resides Mr. Q——, a refined gentleman of the old school, with an illustrious ancestry and a name closely associated with the culture and reform of our country during the last half century. Mr. Q—— once had in his employ, as foreman of his farm, a very good and faithful man, named

Packard. He also had a neighbor, named Lewis, who was a very disagreeable man, with an uncomfortable temper, and between this neighbor and Packard existed a chronic state of unpleasantness. One day words between the two waxed so hot that Packard "went for" the neighbor and gave him what he termed "a sound thrashing."

Of course Mr. Q—— heard of this, and he sent for Packard to come into his study in the evening, and at the appointed hour the latter made his appearance.

"Mr. Packard," said his employer, "I understand you have had some trouble with Mr. Lewis."

"Yes, he made me so mad that I couldn't help licking him."

"Well, Mr. Packard, I don't like to have any thing of this sort occur. It gives a bad sound, and hereafter you must try and control yourself, and not let your passions run away with you."

Packard received this reproof with becoming deference, bowed, and was passing through the door, when he was stopped by Mr. Q——.

"Wait a moment, Mr. Packard. If at any time you get so you can't get along, and feel as if you ~~want~~ lick somebody, I had rather you would lick Mr. Lewis than any one else. That is all."

THE WAY TO KEEP APPLES.

HARPER'S NEW MONTHLY MAGAZINE.

No. CCXCIX.—APRIL, 1875.—Vol. L.

THE FRENCH BROAD.

SUMMER BLEICHING IN WESTERN NORTH CAROLINA.

"WHAT is it?" asked Uncle Jack.

"A river," replied Ermine.

"Very well," said the old gentleman. Then, after a moment, "Where is it?"

"In Western North Carolina."

"Very well," said the old gentleman again, taking up his newspaper. "Pray don't forget my slippers."

Later in the day, however, he took me aside.

"Do you know any thing about this Western North Carolina, Miss Martha?" he asked.

"Only how it looks on the map, Sir."

"And how does it look?"

"Black in the face with mountains."

"Apoplectic?"

"Decidedly. Bald Mountain, you remember, had a stroke not long since."

"Are we going *there*?" asked Uncle Jack, resignedly.

"I don't think any one knows, Sir, exactly where we are going except Ermine," I replied.

We found it at Ashville. I use the word found because it was a regular game of hide-and-seek, in which the knolls, the river, and ourselves took part. It begins life down on the South Carolina border, and runs almost due north, placidly taking in small streams, and concealing its ultimate purposes with a

delicate art worthy of Undine's watery relations. Near Ashville is the trysting-place where it meets the Swannano on its way down from the Blue Ridge, but so cunningly is it all managed that no road, no path, will take you there, and unless you have the spirit and the boots of a pioneer you will miss the wedding. Having neither, we yet went, driven by the fiat of Ermine.

"I said I would witness this meeting of the waters," she began. Then, putting out a slender foot incased in a stern little double-soled boot, "Thus do I leave my mark upon the strand?"

"Upon the mud," said Uncle Jack.

"Witness, my friends," continued Ermine, "this is the majority of our river. Its life, so far, has been but awkward growing. It has had no definite character; no one could tell what it might come to—a swampy, a stony, or a bucolic and grassy end. Having received the Swannano, however, it now for the first time feels its strength. My friends, let us return. Later in the day we will view it from the summit of that fern-covered hill behind the town."

"Beaucatcher Knob," said Uncle Jack.

"I never hear that country-farmer name," replied Ermine. "I make it a point to not hear such titles in my rambles through Ar-

The view from the Knob is one of the few that linger in memory distinct as a painted picture. As yet it is unknown to the world at large, but it will be famous some day, when the eager artists and tourists discover this hidden region locked up behind mountain walls whose peaks seem to thrust back scornfully the railroads that would penetrate within. So far they have stood at bay, these magnificent cloud-capped ranges, defying the world. Behind the Knob rise the rounded summits of the Blue Ridge, angularly blue always both in sunshine and in storm. Sitting on the grass-grown earthworks of the old Confederate fort that crowned the summit, one faces the west, glorious in sunset tints. In the north rise near and dark peaks leading toward the Black Mountain and its lonely grave. No man had ever a grander sepulchre than Elisha Mitchell, who lost his life while exploring this lofty range. The mountaineers buried him on the peak, whose height, as measured by his own hand, is cut in the rough stone at the head of the grave—6711 feet, the highest summit east of the Mississippi. The government signal station that once stood near has been abandoned and burned.

Looking from the Knob toward the west, we saw a crowd of peaks, apparently endless, fading away into the horizon on the far Tennessee border. But the southwest holds the *genius loci*, the god who guards the valley—Mount Pisgah, solemn, grand old peak, dominant in its gaunt majesty, although one hundred and eighty brother summits are in sight, and the Cold Mountain beyond is counted higher.

"Physically, perhaps, but not spiritually," said Ermine. "Pisgah is the king, the native-born god of the valley."

As the sun sank behind the mountains down into Tennessee the one gap in the massive western wall, the gap guarded by Pisgah, began to grow purple and soft, like a beautiful pass into some better country. Looking through, far beyond we saw a distant mountain all tinged with gold.

"And the building of the wall of it was of jasper, and the city was pure gold," said Uncle Jack.

"Ashville is a very pretty village, scattered over a valley of knolls," said Ermine, summing up her observations that evening. "Every man has an alp for his private resi-

dence, and giants walk the streets. One fine-looking young man I saw yesterday came up to the second-story windows."

"He is exactly six feet seven inches; I inquired," said practical Uncle Jack.

"The stages coming and going are picturesque," continued Ermine, unheeding the interruption; "the Eagle Hotel chicken is tender and unlimited; the cobble-stones are original; the Ashville dog is a mountain animal, a sort of 'merry Swiss boy;' and the teams are a regular menagerie, an ox and a mule behind, a small malicious steer and a particularly large and melancholy horse in front."

"And over and around all," I added, "is spread the most magnificent scenery to be found in the old States—scenery which has remained undiscovered, while the White

said Ermine. "One might live months in Ashville without once seeing the gleam of her silver draperies as she flits through the valley, so hidden is her path."

"Wait till she gets around the corner and you will see a change," said a voice behind us. We turned. "Major Ray!" exclaimed Uncle Jack, extending his hand cordially.

"Myself in person," replied the officer. "Cause, furlough; purpose, fishing; scene, French Broad. And you?"

"Ditto, without the fishing," replied Ermine, taking the blue-coated arm with her graceful nonchalance. (Ermine had a way of taking a person's arm.)

"I like fishing," announced Uncle Jack, in a general way.

"A tent, you know, and hammocks," pursued the officer, as we strolled back to the village; "trouting and books and pipes.

and a darky cook, one of those old fellows who can put two sticks together and give you a dinner fit for a prince."

"I'll go, Sir; say not another word—I'll go," said Uncle Jack, breezily.

"Without an invitation, uncle?"

"A truce to conventionalities, Miss Stuart. Was not my description seductively arranged to entrap not only your uncle Jack, but all of you?" said the officer, gallantly. (It was indeed, but not the only thing arranged, I thought. People do not turn up on bridges over the French Broad by chance.)

"Thank you," replied Ermine, sweetly; "nothing could be more charming. Uncle will enjoy the fishing so much, and you and I, Miss Martha, can swing in the hammocks and read the books, while the perfection of a cook serves coffee eight times a day in Sevres cups. Then at night, telling stories around the camp fire in the tent—how romantic! Just what I have always dreamed."

"But the fire won't be in the tent, you know, niece."

"On this occasion it will be," pursued Ermine, calmly. "It was always so in my dreams."

"Then they must have been choked with smoke in your dreams, my dear."

The Major started the next morning, and we followed two days later, finding, as he had said, a great change in our river around the corner. It rushed along with tremendous speed, roaring over rocks, boiling in little pools below, swirling back again in long eddies, a rampant, fit way for itself through mountains, and dash nothing should stop Ocean. The French of the head waters seems to take its cue the latter river. On first north, then west Tennessee pursues a path by going south across the whole of its own State and well down into Alabama, as though intent on seeking the Gulf of Mexico at Pensacola, then, suddenly seized with hesitation, it meanders off vaguely toward the west, makes a little detour into Mississippi, considers a while, and finding itself once more on the Tennessee border, away it goes

straight to the north, crossing the whole State a second time, and even voyaging up seventy miles into Kentucky before it decides where it really wants to go, and, passing by the Great River with characteristic willfulness, enters the Ohio at last. We traveled slowly, loitering along the bank, stopping to gather flowers, to make very bad sketches, to drink from the ice-cold springs, to follow the brooks up their wild gorges and find the hidden falls whose voices came down to the road below, and ever and always to gaze and gaze upon the mountain walls, the rugged rocks, the islands, and the rushing, foaming river. Our road was narrow, cut out from the rock itself at the water's edge, and often the cliffs above seemed toppling over on us, so far did they lean forward, massive and bare. In places the river flowed through what might well be called a cañon. Sheerly rose the perpendicular granite walls from the water's edge, inclosing us and our pigmy road as in a gigantic well, only a little slice of blue sky far above remaining as a link between us and the outside world. It seemed as though we should never see corn fields and the broad heavens again, unless the rock that aided Sindbad the Sailor would come to our rescue.

Uncle Jack remained placid, but we saw "fishing" in his eyes.

"He will be off with the Major to-morrow, Ermine, and we shall be left alone," I said.

"A REGULAR MENAGERIE."

"If he is off, some one else will be on, Miss Martha."

"Surely you do not expect to meet any body in this remote place?"

"No," replied Ermine, idly swinging to and fro in the loop of a giant wild grape-vine; "I never expect any body—it is too much trouble—but they always come, nevertheless."

They did. That night we stopped at Alexander's, and found the Major awaiting us. He had pitched his tents a mile below, and came to meet us with a string of trout. With that singular mania for citizens' clothes which seems to afflict all our army officers, he had attired himself in a commonplace suit, with colored shirt and an old straw hat. Not a bright button remained, not an inch of blue. Uncle Jack examined the fish with enthusiasm.

"At dawn to-morrow," he said.

"What did I tell you, Ermine?" I said, in an under-tone, being left in a carriage drawn by two wild horses, with no other guardian than a constantly smiling and irresponsible darky named Zip, the road meanwhile but one inch wider than our wheels, and ponderous mountain wagons, drawn by oxen, thinking nothing of coming crashing and creaking around every corner. This was too much for me. After supper we strolled down toward the encampment, meeting the three-horse Tennessee stage on its way to Ashville. Two passengers were on top with the driver.

"Yes, Herr Frool," the elder man was saying, in a loud metallic voice that reminded one of tin scrapings, "the valleys of the White Mountain group are scarcely one thousand feet above the sea-level, while here, the very basin of the French Broad, along which we are now journeying, has an average elevation of more than two thousand feet."

"E-es it poss-ible?" ejaculated the companion.

"Professor Macquoid!" I exclaimed.

It was indeed that learned man himself, and with him a young German: "Herr Frool, a recent acquisition to the ranks of the foreign artists who have made this New World their home," explained the Professor.

They dismounted, returning with us to Alexander's, where they were to pass the night.

"What did I tell you?" said Ermine, when, late in the evening, we went to our room.

"But they are going on early in the morning."

"Are they?" said Miss Stuart. She was sitting before the little glass, brush in hand, her golden hair rippling over her shoulders. Her back was toward me, but I noticed that the reflection smiled. I gave it up immediately.

"Professor Macquoid is no doubt a learned man," I began, "and it is true that I did meet him in Florida last winter; still, the acquaintance was but slight, and—"

"Uncle Jack has long known him," said Ermine, brushing calmly on.

"And as to this Herr Frole—"

"Freulig is the name, Miss Martha."

"Well, Frolick, then. I don't know any thing about him."

"Do you want to know?" said Ermine, setting the stern little boots outside the door.

The next morning it was decided at the breakfast-table that we should stay a day or two at Alexander's in order that Uncle Jack might go a-fishing. The Professor had observed a remarkable dip in the strata near by, and the necessary measurements would detain him some time in the neighborhood. Miss Stuart, he observed, was interested in geology, and "Herr Frool, to whom I am showing some of the wonders of our country, Miss Martha, will be, no doubt, charmed to assist you in your search for ferns."

"Furrens?" repeated the artist.

"Yes, ferns," I replied, warming at the mention of my favorite subject; "little leaves, you know—leaves, not flowers, but *leaves*, growing on the rocks—*leaves*."

"Ah, yes, de leafs—I paint him," said the young German, vaguely. "You like leafs?"

"Indeed she does like them, Herr Fryle," said Uncle Jack, who, in high spirits, was preparing fishing tackle. "She is never happy unless she has a polly-stick-'em, or a polly-poddy, or something of the kind."

"E-es it poss-ible?" said the painter, evidently in a maze as to the meaning of these remarkable new words. Afterward I heard

him saying softly over to himself, "bolly," "bolly," "bolly-boddy," as if trying them. Soon the Major appeared with fishing-rod, basket, and a barefooted aboriginal boy. "He knows the bank whereon the wild thyme grows, and will pilot us thither. Ladies, pray honor the river-side tent with your presence at dinner, and inspect our spoil," said our disguised soldier.

"Will the perfection of a cook serve coffee?" asked Ermine.

"He will, fair lady. Ah, Professor, I will bid you good-by now; the stage will soon be round."

"A remarkable dip in the strata near by may compel me to remain some days in this vicinity, Sir. I shall therefore have the pleasure of seeing you again," said the learned man.

"Indeed! I am rejoiced to hear it. May I not, then, hope that you too will honor my tent with your presence to-day, you and your friend Mr.—Mr. Frawl?"

"Freulig," ejaculated the painter.

The Professor accepted with alacrity, and the fishermen started down the road, the barefooted boy who "knew the bank" going on before.

"Strange, isn't it," remarked Ermine, in her silvery voice, as we leaned over the piazza, "how suddenly an officer grows commonplace in citizen's clothes?" (When we reached the fishing ground I noticed that the Major had exchanged the old straw for his artillery cap.)

Left to ourselves, we strolled along the road down stream gathering flowers and idly talking. "I am going to climb up to the top of that rock," announced Ermine, suddenly; "I see a rosy cloud of flowers peeping over."

"The *Rhododendron maximum*," said the Professor—"a plant rarely found north of Pennsylvania, although growing here in thickets sometimes miles in extent. Miss Stuart, the rocks look slippery: allow me to assist you. The corolla is bell-shaped—(Have the goodness to pick up my glasses, Herr Frool)—bell-shaped, and about an inch broad—(In a moment, Miss Stuart, I shall be able to assist you if you will wait)—the color varying from rose to purple, greenish in the throat—"

"Greenish in the throat—horrible!" said Ermine from above, disappearing over the top of the rocks as she spoke.

The Professor meanwhile had stopped with his face to the cliff, clinging in a somewhat spread-out condition to four different projections; a branch had knocked his tall hat down over one eye and nearly blinded him. "Herr Frool!" he called down, "Herr Frool! will you have the goodness to step up and adjust my hat?"

The Herr, being long and lithe, stepped up, and having adjusted the hat, stepped on; we saw him no more.

"Which way did Miss Stuart go?" inquired the Professor, calling down again. Flattened against the rock, he could not look up without endangering his balance.

"More to the right," I answered, putting on my glasses. "You have selected the steepest part of the cliff, Sir."

"Such has ever been my custom, madam; the path of science is the path of difficulty," replied the Professor from his perch.

"Don't you think you had better come down?" I said, watching his movements nervously. "Surely it would be better to come down rather than to fall down."

"Are you aware, madam, that I have ascended the Alps?"

"But this is more than the Alps, for you are climbing straight up toward a ledge which ends in a smooth perpendicular wall, Sir; I can see it quite plainly from here."

RHODODENDRONS.

But the Professor, having cut loose from two of his pinnacles, made no reply, and I watched him execute a flank movement with some trepidation. Perceiving, however, that his hold was tenacious, his very feet seeming to cling like claws, I gave up the watch, and wandered on along the rocky shore, looking for ferns and finding many, including the delicate little purple-stemmed *Pellaea*, or cliff-brake. Meeting an advance-guard of beech-ferns coming down a gorge, I, too, in my enthusiasm was moved to climb. Before I began, however, I looked back; the Professor was still squirming up.

Is there any thing in the vegetable kingdom more beautiful than the plummy green grace of ferns? Like moonlight to the noon-day sunshine, like Schubert's serenade on the violoncello to Rubinstein's Russian Hymn played by a full orchestra, like Undine to one of the French stage heroines of the day, so are the forest ferns to the ranks of the garden flowers. Robed over in green, wild, shy, and beautiful, they nestle behind the rocks, wave by the brook-sides, and hide in the still dark glens, and the lovers of ferns are bound together the world over by that very tie that they do love them, needing no other introduction—reason sufficient for friendship between strangers, between the working gardener and the millionaire. Although a beginner, with unskilled eyes, I collected along the French Broad twelve different kinds—the polypody, the maiden-hair, the bracken, the *Cheilanthes*, the cliff-brake, the dainty little ebony *Asplenium*, th-

lady-fern, the *Filix-mas*, the beech-fern, the *Cystopteris*, the martial *Polystichum acrostichoides*, and the *Mystery*, so called because it positively refused to show me any seeds, so that I could not analyze it. Climbing on, half-way up the gorge I found a plateau of ferns so luxuriant, so beautiful, that I wished I might turn into tiny *Tommeline*, of the old fairy tale, and live down in the miniature tropic forest. Coming out at last on the top of the cliff, and wandering along at random, I saw again the blaze of the rhododendrons. There in the heart of the rose-colored thicket sat Ermine, her hat thrown off, and her hands buried in blossoms.

"Herr Freulig is giving me some lessons," she said; but I saw no pencils, and I thought it looked the other way.

"Don't let me interrupt," I said, using the phrase which always signifies the deliberate intention of interrupting as much as possible. I sat down on a rock near by and began arranging my ferns. The young German sighed—(a German's sigh seems to come from the heels of his boots)—and I had the satisfaction of perceiving that the "lessons," whatever they had been, were at an end. Ermine, however, sat dreamily enjoying the rosy radiance numindful of any change; plucking the blossoms idly, she let them fall around her until she was covered with bloom.

"What destruction, Ermine!"

"Are they not happy so?" she answered.

"Ah!" sighed the young German.

It was nearly noon before we left the rho-

dodendrons. Going back along the cliff, we descended through the gorge of ferns, and reaching the road, strolled on down stream toward the camp.

"I wonder what has become of the Professor," I said, remembering where I had last seen him.

"Probably measuring the dip somewhere," replied Ermine.

"I left him measuring it after a fashion of his own," I said, laughing. "I only hope he got safely down again."

"E-es there danger?" inquired the artist. "I veel ho-law."

He ho-lawed, and presently we heard a sound in reply. I call it a "sound" because it was not the ordinary shout or halloo; it was more like a dignified and long-drawn "ahem." We followed the sound, and going back around the curve, discovered the Professor seated on the very ledge I had noticed, an uncomfortable little shelf with a bare granite wall rising perpendicularly behind it.

"Ah, Professor," said Ermine, calling up in her silvery voice, "how it delights me to see a real enthusiasm in the cause of science! Two hours on that ledge might have seemed tedious to any ordinary mortal; but to you—what secrets has not the eternal rock whispered in your ear?"

"I breengs heem," said the young German, swinging himself up by an easier way; and presently we saw him walking out on the narrow ledge to his friend's assistance.

But the Professor could not walk; vertigo, he explained, had seized him—the result of an overworked brain.

"R-ropes we haf not; and to carry e-es not poss-sible. You moste cr-rawl," said the Herr.

So back went the procession down the narrow ledge, the Professor crawling on his hands and knees, and his friend on the outside, tiptoeing along where there was scarcely room for a foot-hold, in order to guard against "the vertigo." For my part, I went down behind the rocks to laugh; but Ermine was equal to the occasion. Claspings her lovely hands, she went forward to meet the rescued man. "Oh, Professor!" she entreated; "we know your love for Science, yet we can not yield you entirely to her; do not, I beg, stay so long away from us again!"

The Professor thought he would not.

On a shady point we found our tent, and on the rocks in the river our fishermen, their number increased by an additional man and boy. "How they look, out on those rocks!" remarked Ermine, with the little drawl she affects at times. (Now I knew Ermine's conversational pitfalls of old: she did not say "how well," or "how ill," simply "how." The Professor, however, fell in at once.)

"Very undignified, truly," he said, supposing he was assenting.

"Yes, ver' undig," repeated the artist.

"Fishing, as an amusement, I have always condemned," continued the learned man. "It is a wanton destruction of animal life, accompanied by undue exposure to the elements; the boats, or as in this case the rocks, are apt to be singularly moist, and the effort of keeping the mind concentrated upon a stick called a rod is a waste of the nervous power."

"Do you think so?" said Ermine, languidly.

Seeing us on the bank, the fishermen came ashore, and the perfection began his savory work.

Dinner was served on the rocks at the door of the tent, and the Professor, having partaken heartily, waxed eloquent. "These mountains, my friends"—(why do we always hate a man who begins with 'my friends?')—"form the eastern margin of our continent," he began, "extending from Vermont to Alabama; the coast follows their direction, curving in at Hatteras as they trend off to the westward. The rocks in this neighborhood belong to the most ancient of the azoic series. In the language of an eloquent spokesman among our band of geologists, 'As North America is the eldest born of the continents, so the Black Mountain is the eldest born of its giant brotherhood, and was the first to emerge from the face of the water when the command went forth, Let the dry land appear!' In the group of the

White Mountains, Mount Washington is the only one that rises above six thousand feet, while here there are peaks in all directions that rise above that height—yes, Sir, above that height," he continued, looking around the circle and sternly fixing the fact upon the artist, whose attention had wandered off toward Ermine.

"E-es it poss-sible!" said the Herr, hastily returning to earth again. He had no idea where the White Mountains were—(the mountains seemed to be all white or black in America); but never mind.

"Is the Bald Mountain in sight?" inquired Uncle Jack, beginning on a fresh trout.

"There are in this region many Bald Mountains so called—"

"But I mean *the* Bald, the volcano, you know, Professor."

"I beg your pardon, Sir, but I do not know," replied the learned man, with dignity; "and science is also silent."

"Probably because she don't know either," replied Uncle Jack.

"Nobody knows," said the Major; "the people in the neighborhood of the mountain less than the outside public, who at least gained some idea, however incorrect, from the New York reporters who sat on the fences all around within sight of the peak, and dated their letters fancifully 'in the shadow of the Bald.'"

"I am tired of hearing about that mountain," said Ermine. "Who cares for a doubtful volcano? If it wants to be fiery, why does it not stop this long-drawn preparation, and go to work in earnest? It might accomplish something then besides rumbling. A wearing set they are from whom people are always 'expecting' great things; they generally remain, as Bulwer says, 'mere promising young men,' or volcanoes, to the last. And now for those hammocks."

They were brought out from the tent, and soon swung from low-down branches near the water.

"Come, Miss Martha," said Ermine.

Personally, I am not very fond of a hammock; it is almost impossible to get in; and once in, it is entirely impossible to get out, at least with dignity; this "bounding in" one reads about is difficult to accomplish at my age! I did not bound, I climbed, assisted by the united strength of Uncle Jack, the Major, the Professor, and the artist. When we had finished our labors, all five of us, and I found myself safely in, Ermine issued her orders:

"Please go into the tent and take your nap, Uncle Jack. Professor, you will read aloud to us, I know. Herr Freulig, may I ask you to set my hammock swinging?"

She might indeed. Deftly attaching a rope to the tasseled net-work, the artist sat down under a pine and solemnly swung the tree-cradle to and fro, his large owl-like blue

eyes fixed upon the lovely picture before him.

"And I?" said the Major.

"Go and smoke—a good way off, please. They never smoked in Arcadia, you know," replied the lady.

The Major went; but several wild flowers lost their heads en route, switched off remorselessly by a little branch he happened to carry.

"Oh, not that book, please," said Ermine, as the Professor brought out his pocket Guyot; "the little volume on the rock, where the page is turned down. And pray sit over there behind us; poetry sounds so much sweeter from a distance."

"When buttercups are blossoming,
The poets sang, 'tis best to wed,"

began the Professor, in his tin-scraping voice. The river rushed by almost at our feet, and the sounds of the forest grew clearer. The old cook had finished his labors and fallen asleep in the sun. Ermine swung on in her hammock, her eyes fixed dreamily upon the opposite shore.

"Whereast our footsteps turned aside
From lord and lady of degree,
And bore us to that brave countree,
Where merrily we now abide,
That proud and humble, poor and grand,
Enchanted, golden, gypsy-land—
The Valley of Bohemia,"

read the Professor, and then I too fell asleep. Time passed (at least I supposed it passed, although I knew nothing about it). I came

slowly back from the purple oblivion mountains, hearing while yet afar off the same rhythmic chant that echoed after me when departing.

"Yet still the same old dance and song
We found, the kindly blithesome throng,
And joys of Bohemia,"

said a silvery voice, which surely was not the Professor's. I opened my eyes, and lo! a change. The Professor had disappeared, the artist was not, the rope trailed idly on the ground; it was Ermine who read. To herself? I raised my head softly. On the other side, half concealed by the hammock, I saw part of an artillery cap, and the fragrance of a cigar rose in the air. I went to sleep again immediately. It seems they did smoke in Arcadia after all.

"In the name of common-sense where have you been, Ermine?" I exclaimed, the next morning, when upon first opening my eyes I discovered my companion taking off her gypsy hat.

"Across the river, Miss Martha."

"But it is not daylight yet."

"The sun rose over the cliffs half an hour ago."

"Whom did you go with?"

"A boy; the one who knew the bank."

"What did you go for?"

"An object."

"What did you go in?"

"A cooner."

"A what?"

"A cooner. Put on your wrapper and step to the piazza door; I will show you both the cooner and the object."

Somewhat sleepily I obeyed, seeing the opposite cliffs tipped in sunshine, the dark river below, and floating on its surface a long, narrow, singularly shaped boat, its forward end raking the air; in the stern sat a man using a pole to sweep his craft along as an Indian uses his paddle.

"That boat is a cooner," said Ermine, "and that man is the object."

"Who is he?" I demanded.

"Haven't the slightest idea," replied Ermine, beginning to rebraid her hair.

The young artist came to the breakfast-table portfolio in hand.

"Here it e-es, Mees Herrminia," he said, eagerly, placing a drawing in Ermine's hand. "You haf tell me to do it; I take de yesterday of afternoon, and feenish dis morn."

I looked over Ermine's shoulder. It was a sketch taken a mile back on the road toward Ashville, a point we had noticed on our way out; one of the singular, huge, boat-shaped mountain wagons was drawn up on the curve. "Excellent!" I exclaimed; "the identical keel up behind! What the mountaineers gain by having their wagons tilted forward at such an angle I can not imagine; but perhaps they model them after the sun-bonnets of their wives."

Enter the Professor, carrying a large waiter covered with fragments of rock. "I obtained them all, Miss Stuart—with difficulty, I admit. Still, I obtained them, and in such a cause I am proud to exhaust myself. I will enumerate and describe the specimens to you whenever you please."

"I am so much obliged to you," replied Ermine. "Professor Macquoid was kind enough to devote yesterday afternoon to collecting specimens of all the native rocks for my benefit," she continued, turning to me.

"Very kind indeed," I replied. "Did they study geology, do you think, in Bohemia, Ermine?"

After breakfast, as we were all sitting on the piazza, the Major came up the road, rod in hand. (He was in undress uniform now from head to foot, the gallant array of the red-legged branch of the service.)

Uncle Jack was ready, eager for another day's sport.

"Wait, uncle, please," said Ermine, placidly; "I am going too."

"You are going too!" repeated the chorus, in astonishment.

"Yes. You all looked so delightfully insecure out on those rocks yesterday that I have longed to go ever since. I feel sure" (turning to the Major) "that you will take good care of me."

The Professor sat with his tray of specimens before him; he did not quite understand. Had he not given a decisive opinion against fishing only the day before? But the young artist sighed, and folded up his sketch. Now I did not care much about the disappointment of the Professor—(what is the reason that, femininely speaking, we never do care much about "the Professor?" does that honored title rob a man of all his natural aspirations toward romance?)—but the simple-hearted, solemn young Herr should not be, I resolved, so summarily dismissed. It was only too evident that Ermine was planning for a whole day with the army; this I would defeat!

"Let us all go," I suggested, affably. "Come, Professor, and you too, Herr Freu-

lig. I will order dinner sent down to the tent."

"Well," said Uncle Jack, dubiously, "Frool might do it, and possibly Ermine, if she took a fancy; but how you and the Professor are going to climb out on those rocks, Miss Martha—"

But the Professor threw on his tall hat with *abandon*. "I will be a child for to-day," he cried, with enthusiasm. "Why should we labor always? For once let us be butterflies, happy butterflies!"

"Yes, de booter-fly," repeated the artist, thinking he was getting on admirably with his English.

Rods and lines were procured, and our party started down the road, Ermine in front with the Major.

"I should so much like to fish out of a cooner. Do you know any one about here who has a cooner?" she said, when we had reached the place, and were preparing to climb out to the rocks.

"Why, there was one back at Alexander's," said Uncle Jack. "Why didn't you speak before, Ermine? It has been lying there in front of the house ever since we arrived."

"Has it?" said Ermine, as innocently as though she had never seen it, much less crossed the river in it at sunrise.

"Shall I go back and get it?" asked the Major.

"Oh no; I could not think of putting you to so much trouble. See! there is a cooner now; I wonder who is in it?"

We all looked.

"My friend of yesterday, I declare," said good-natured Uncle Jack. "Hallo, there! come this way, will you?"

"Oh, uncle!"

"Why, I thought that was what you wanted, puss. But hush! here he comes."

The cooner—a mountain pronunciation of the word canoe—came slowly toward us; it was thirty feet long, barely wide enough for one person, flat-bottomed, and unpainted, a species of dug-out, although carefully shaped and planed. The man within managed the long pole skillfully, and soon floated alongside of our rock. The Major, a little vexed at the turn affairs had taken, stepped forward.

"If you will be kind enough to lend me your boat, Sir—" he began. Then stopping suddenly, "Why, Phil!" he exclaimed, "is that you?" and sprang into the cooner with extended hands.

The stranger was a man of about thirty-five years, thin and prematurely old, with close-cut brown hair and brown eyes. He was dressed in the common blue jean of the country, and instead of a coat he wore a jacket belted in at the waist like a blouse. An old military cape of Confederate gray lay in the bottom of the cooner. He smiled and

returned the Major's greeting, if not with equal excitement, at least with equal cordiality.

"To think now that you should have been over on that rock all yesterday morning—for it was you, wasn't it?—without any recognition on my part, Phil!"

"You were too far off to see my face, George."

"You did not recognize me, of course?"

"No; I heard them call you Major, and once I thought I caught the sound of a familiar name. But I was not sure, and—and, I am not what I was, George," he added, just indicating the crutch by his side with a sad little gesture.

"Come right ashore, old fellow," cried the Major, with a sudden moisture in his dark eyes; "we'll kill the fatted calf and talk over the old days. Ladies, let me introduce to you my friend Philip Romer. We were classmates at West Point in '59."

The man took off his coarse straw hat. "I beg your pardon, ladies," he said. "I did not observe you in the shadow: my eyesight is clouded."

By this time, of course, I had discovered that Ermine's plans had not been for "a day with the army," after all; and as for consolation, evidently the Major was as much in need of it as the Herr. Here I was, however, and a long, uncomfortable day on the rocks opened before me. My only comfort lay in the thought that Ermine's sunrise-on-the-river tableau had been wasted. The man in the cooner with his dimmed eyes had probably not even seen her.

Uncle Jack, quite excited by this meeting, had climbed down to the water's edge. "But you steered the boat straight up to us when I shouted," he said, looking with sympathizing curiosity at the fine brown eyes which showed no trace of blindness.

"I guided myself by the sound of your voice, Sir; and I know every inch of the river about here. It gives me my only amusement. I won't go ashore now, George, but I will try to come and see you before you leave the neighborhood. You are at Alexander's, I suppose?"

"No, I am right here at this tent, where you will take dinner with us this noon, I hope."

"You wanted my boat—"

"It was I, Captain," said Ermine, coming forward into the sunshine. "I felt a sudden fancy to try a cooner; but now, of course—"

"You will immediately get in," interposed the Major, offering her his hand. She did not refuse, but stepping lightly in, sat down on the bottom.

"You should have this end seat," said Philip Romer, trying to rise with the aid of his crutch.

"Pray do not," said Ermine, earnestly,

leaning forward and laying her hand upon his arm; "I am well placed as I am. Push off, please."

The stranger obeyed, and the long, narrow cooner floated out toward deep water.

"Don't go far away," called out Uncle Jack, uneasily.

"Needen be oneasy, Sah; de Cap'n he knows de ribber, Sah, and manage de cooner like a fiddle-string, Sah," said the old cook, who had watched the scene from his camp fire near by.

"You know him, then?" said Uncle Jack.

"Spects I do, Sah; libe across thar in a log-cabin, Sah. My ole cousin Pomp he libe with him, Sah. Ben thar more'n eight years, Sah."

"Poor Phil!" said the Major, as we slowly returned to our preparations for fishing. "He left us and joined the Southern army, being a South Carolina boy. I have heard nothing of him all these years."

"He haf no leg, and he haf not see well mit his eyes," said the artist; "I feels fur heem moche peety."

"Superfluous, Herr Frool, superfluous," said the Professor, sternly. "Are you aware, Sir, that we have at the North fifteen thousand men with one leg only?"

"Feefteen t'ousand von-leg mans? E-es it poss-sible!" ejaculated the artist.

My fishing consisted principally in sitting on a safe rock near the shore reading some newspaper items about the mountain country. (I always try to read up while on the ground, having discovered that a line on the spot is worth two volumes away.) I learned, in the first place, that Buncombe County, where we then were, was named from Colonel Buncombe, a gallant officer of the Revolution; over the door of the family mansion once stood this legend,

"To Buncombe Hall
Welcome all."

It was a Congressional representative of this mountain neighborhood who made himself and his district immortal by "only talking for Buncombe." Close upon this information came the fact that in 1871 Buncombe took the first premium for tobacco at the Virginia State Fair, surpassing even the celebrated yield of the Danville region. Buncombe apples were giants of their kind, weighing from twenty-five to thirty ounces, and measuring fourteen and sixteen inches in circumference. (I was not surprised at this, having seen the men who eat them.) The Catawba grape originated in Buncombe, on Cane Creek, a branch of the French Broad. In the surrounding region there were sixty mountain peaks more than six thousand feet high, and thirty-nine over five thousand feet. I had read as far as this, and was beginning on the climate, when the Professor fell in. Herr Freulig, who was sit-

ting on the shore making a sketch, dropped his pencils. "E-es it—" he began; and then seeing the tall hat disappearing under the water, he made a dash across the rocks to save his friend. But the Major had already scooped him out and landed him on a slippery knob, where he sat dripping from every angle. The tall hat, however, was hopelessly gone, voyaging down toward the Tennessee line.

"You had better go back to the house immediately, Professor," shouted Uncle Jack from his rock; "you will have a chill unless you do. And you'd better run all the way—on the double-quick, you know."

But the Professor did not know.

"I veel go mit," said the young German, with his ready good nature. But seeing his eyes wandering regretfully toward his sketch, I interfered, and finally we sent off our learned friend under the care of the negro cook. The pace was a gentle amble.

"What did he try to fish for?" said Uncle Jack, in a disgusted tone. "Do you suppose trout are going to bite when a man sits there like a scarecrow in black clothes, tall hat, and prunella gaiters?"

Ermine came back after a time, and the Major took her place in the cooner. She did not care to fish, however, but went off to swing in the hammock. "No, keep your place, Herr Freulig," she said, as the young artist rose to accompany her. "By-the-way, can you sketch heads?" she added, carelessly. "Why not throw in the cooner and Captain Romer from this point? There is a very fine view here."

The artist set to work upon a new design.

I went on with the climate, and discovered that while in New England two hundred and fifty out of every thousand deaths are from consumption, in Minnesota and California one hundred and fifty, and in Florida fifty, here, even with an almost total lack of luxuries, the proportion was only thirty in the thousand. I was musing upon this, and wondering whether an abundance of luxuries might not do away with any necessity of dying at all, when Herr Freulig brought out his sketch for my criticism—a Hercules fiercely glaring from an Olympian cooner. "But the Captain is slighter, younger, than this," I said.

Half an hour later out he came to my rock again with another sketch, this time an Antinous, fair and radiant.

"But the Captain is older and darker," I said.

"I haf not well see heem," apologized the young German, "but Mees Herrminia she say he haf a fery fine few."

"A what?"

"A fery fine few—few, you know. What you call heem?—dis;" and he drew a profile on the side of the paper.

"Oh?" I said, "you mean a profile. Miss Stuart said the view from here was very fine, but she meant the scenery."

"Did she?" said the Herr, doubtfully. "I thought she mean heem." (So did I.)

"He will be with us at dinner," I continued, aloud, "and then you can look at him."

He did look indeed. His large light blue eyes, solemn as an owl's, fixed themselves upon the stranger's face with the persistent artist stare.

"Come, come, Mr. Frowl," said Uncle Jack at last, in an under-tone, "pray eat your dinner. Why do you look at the man so?"

"Mees Herrminia she say he haf a fery fine few," replied the artist; but fortunately no one understood him.

We were all very gay at dinner. There was something so pathetic in the man sitting there with his crutch and his uncertain vision, something so mournful in this unexpected meeting with an old comrade full of health and strength, prosperous and honored, while he had lost all, that of necessity we were very gay—perhaps to keep ourselves from the other extreme. Mr. Romer (for he had said, quietly, "I have no title now") listened to our stories, smiled when we laughed, and bore his part pleasantly as the talk went round the table, or rather the rock on which our cloth was spread. But after the meal was over, and Uncle Jack had gone into the tent to take his nap, and the artist, having gazed his fill, had withdrawn with pencils and paper for another attempt, "Come, George," he said, "I want to hear all about the boys. Are any of them dead?"

"All but four, Phil."

"Where did they die?"

"Fair Oaks, Gettysburg, Chancellorsville, and Drury's Bluff."

"I lost my leg at Gettysburg. Were you there?"

"Yes."

"Strange, isn't it? that we two, who were— But never mind. You escaped unhurt, George?"

"Yes, thank God!"

"Thank Him indeed," said the stranger, baring his head. As he sat there in the afternoon sunshine, I remembered what Ermine had said. Yes, he had a noble head and fine outline, but he stooped slightly, and all his movements were slow and weary. The two talked on, asking questions, hearing and telling little histories of old comrades, too often chronicled as "dead."

"And you, Phil?" asked the Major at last.

"You see me: there is nothing more to add," replied the other.

I glanced at my companion, suggesting with my eyes that we should leave the friends alone together.

"No," said Ermine, replying aloud, "why should we go? Not unless Captain Romer wishes it." For she persisted in using the

title, and very beautiful did she look as, with an unwonted flush on her cheeks and a softened light in her steel-blue eyes, she sat leaning against an old pine-tree. I almost wished he might see her, see her as I did, with every tinge and outline. Perhaps he did; perhaps at times the mist over his eyes dissolved.

At any rate, he said, gently, "Do not go; it is so long since I have heard ladies' voices!"

"Where is your sister, Phil?" asked the Major. (He too had seen the flush on Ermine's cheeks, and bravely made way for the victor, the poor, maimed, unconscious victor.)

"She is dead, George. Nay, do not apologize; we are most of us dead down here," said Romer, with a shadowy smile. "She married a Georgian. He was shot at Gaines's Mill, and she did not long survive him. Mother died too that winter. It was a hard winter with us. Since then I have been alone."

There was a silence. "Why do you not go to Charleston or Richmond? You are buried alive here, old fellow."

"What can I do there? After I left the hospital I tried for a whole year to get some employment, and failed. Nobody wants a cripple. I did fill a small clerkship for a few months, but when my eyes began to fail—the trouble is connected in some way with an old wound near the spine—I lost even that. I am but a useless hulk, George. I can not dig, to beg I am ashamed. And so I came up to these mountains."

"And you live here?"

"Yes, in a cabin across the river. I have a little field where my man Pomp raises corn and potatoes; and then we can fish, you know. Wood costs us nothing, and—don't laugh, George!—but I have learned to knit."

"Knit?"

"Yes, stockings and other things. We trade them off for supplies. I can knit quite well now, and—and the people about here are very kind," concluded the Confederate soldier, simply. We did not laugh; we could not for tears.

The next day we drove on down the river to Warm Springs. In the carriage by my side, on the comfortable back seat, rode Philip Romer, while Uncle Jack and Ermine sat opposite. We had all so insisted that he had found no room for excuse. The Major accompanied us on horseback, and the Professor was some miles behind, in the stage. Herr Freulig had with difficulty obtained a mule, and now rode wherever that animal preferred, sometimes far ahead, sometimes off on side tracks up gorges, but generally close behind, the mule's head in uncomfortable proximity to my backbone. We met several country-women on horseback, going

to town, with the usual white sack hung over the saddle behind.

"Now those sun-bonnets and calico dresses, if ugly, are at least comfortable," said Ermine; "but the riding dresses of the class next above are something unique both in ugliness and total want of fitness as to place and circumstance. The grim-faced wife of a well-to-do farmer, riding into town on horseback, clad in a green delaine flounced dress, a broad cotton lace collar low down on her collar-bones, and a small bonnet perched on the back of her head, with a brown veil dangling down behind, is—"

"Worth coming to see," said Uncle Jack.

"Perhaps you are right, uncle. But a bonnet on horseback! Then the brown veil! Will any one explain to me why it is that in the country a veil always seems to be considered a trimming for the bonnet? In all my rambles through Arcadia I don't know that I have ever seen a veil down fair and square over the face, city fashion, where it belongs."

"Country women are sensible, and like the sunshine, niece."

"Then why wear a veil at all?"

"There are noble hearts under those gaunt, ungraceful exteriors that excite your mirth, Miss Stuart," said Philip Romer. "Those very women will come over the mountains from miles away, when you are ill, and nurse you tenderly for pure charity's sake. When the winter is hard they will share with you and bake you a cake from their last meal. They will spin their wool and dye and weave, and make you clothes from the cloth. This jacket I wear was such a gift. You must excuse its homeliness, for it is all I have."

The river grew more wildly beautiful with every western mile; the cliffs on each side were higher, towering above us almost perpendicularly hundreds of feet, with high mountains directly behind them. The swift current sped forward, now foaming over scattered rocks, now sweeping in one unbroken sheet over a smooth ledge with the green tints of Niagara, then suddenly becoming as still as a mill-pond, as if determined to surprise us. Passing Laurel Creek, with the Walnut Mountain behind, we came in sight of Mountain Island, a single mountain, around whose rocky base the river flows in two streams with a tremendous rush and bustle, as though proud of its conquest from the haughty shore. The island is one rock-mass, rising boldly from the water, and as our carriage wound along the little road on shore we were obliged to throw back our heads and look up, in order to see its top, with the trees against the sky.

"There is no island in the Rhine at all equal to this," said Uncle Jack, with enthusiasm.

"But it wants a castle, uncle."

"It would not be difficult to build one," said Philip Romer. "You could take the granite right out of the island itself, and labor is cheap here. Your vassals could defend you from attack by land or by water, Miss Stuart."

"And how much must I pay for my island?"

"About twenty-five cents an acre, or less. You would have no competitors," replied the soldier, smiling.

"And the title?"

"Excellent; it comes straight down from Adam."

"Behold, I will build me a castle on this unknown mountain island," said Ermine, gazing up at the rocky heights. "Hither shall come my few congenial souls who never make calls, or go to dinner parties, or read Macdonald's novels. We would have some of Boughton's pictures, and some of Winslow Homer's, and just one of those inscrutably smiling heads from the Cesnola collection to remind us that there is plenty more of life after this one is over. We would have Rhine wine, and George Eliot, and Mendelssohn, and heliotrope, and little cakes with raisins in them. No one should play games, or tell any body else what he or she 'ought to do,' and every body should be perfectly happy."

"Sejed, Prince of Ethiopia," I began, "resolved to have three days of uninterrupted happiness—"

"Begone with your ancient fables!" said Ermine. "This is the New World, and this shall be my Bohemia."

"Beyond, the magic valley lay,
With glimpse of shimmering stream and fall,
And here, between twin turrets, ran,
Built o'er with arch and barbican,
The entrance to Bohemia."

"The question is," said Uncle Jack, "when they got in finally, did they have a good time?"

"How was it with you, uncle?"

"WILDLY BEAUTIFUL."

"Do you mean to insinuate, Miss Puss—"

"Only a youthful excursion, uncle. The atmosphere of Bohemia is so kindly; it lingers around you yet."

"Peter's Rock," said the Major, reining in his horse alongside. "It is early. Shall we not rest here a while?" (He was but human, and he had ridden a long time alone.)

So we descended and inspected Peter's Rock with great gravity, Philip Romer remaining in the carriage.

"And who was Peter?" inquired Ermine.

She had taken the Major's arm immediately, with one of her sweetest smiles. The Major would have answered gladly had he known, or had an appropriate fiction occurred to him in time; but he could think of nothing save Mother Goose's celebrated pumpkin eater.

"Yes, who was Peter?" said Uncle Jack.

"Who was he, dis Pete?" echoed the Herr, who had at last alighted safely from his mule.

A countryman was coming up the road with an ox team.

NORTH CAROLINA INDIANS.

"I shall ask him," said Ermine, stepping forward. "Is this Peter's Rock, Sir?"

"Ya-as," replied the man, staring solemnly at our party.

"And who was Peter?"

"Wa'al," said the man, reflecting, "I reckon he was an Injun."

"But Peter is not an Indian name?"

"Oh, the whites gave 'em all sorts of names, marm. This Peter he come out on that thar rock with his bows an' arrers, an' he shot some whites a-comin' along the bank goin' west."

"Why?"

"Didn't want 'em thar, I reckon; said 'twas Injun country. What mout be yer name, folks, an' whar be yer from?"

"Our family name is Dolce-far-niente, and we are from Bohemia," replied Ermine.

"Never heard of it. Is it fur away?"

"Friend, the glimmering glories of our land are far, yet ever close at hand. Will you go with us?"

"Wa'al, no; I reckon I can't jee now. Yer see, I'm goin' to Ashville. But yourn must be a mighty nice country, I reckon," replied the mountaineer, stimulated to unwonted praises by the lovely vision of Ermine; then, seized with sudden embarrassment, he urged on his team and disappeared.

"No doubt he will often tell of the singular people he met on the river, who said they came from Bohemia," remarked Ermine, laughing. "But we have our legend. What a picture it would make! Herr Freulig, look at that rock, and imagine the noble form of the Indian chieftain on the summit outlined against the sky, his arrow aimed at the destroyers of his race?"

"Of hees race, yee," replied the artist, eagerly. "I makes heem, Miss Herrminia. Here e-es de r-roke, so;" and seating himself on a log, he began sketching rapidly.

While we were loitering in the shade we heard the rumble of the stage behind us, and presently it came into view jolting over the rocky road. The yellow face of the Professor looked from one of the windows. "I will alight," he said, seeing us. "Driver, do you hear? I will alight. There being no one in the coach save myself," he explained, as he climbed slowly down, "I have been most unpleasantly jolted. I assure you, ladies, that I have bounded up and down like a rubber ball. It is but a short distance to the Springs; I will walk."

Ermine was sitting in a little leafy nook with the Major. The Professor, always serenely confident, directed his steps thither.

"Who was Peter?" demanded Ermine, barring the entrance with a long wand of mountain ivy.

"Who was Peter?" repeated the Professor, in a bewildered tone.

"Yes; this is his rock, you know. I can allow no one to enter until he has solved my riddle."

The learned man invested himself with all his gallantry as with a garment. "Fair Sphinx," he replied, affecting with some trouble a playful smile, "your orders shall be obeyed. Know, then, that it was a—geologist named Peter, an ardent votary of science, who, penetrating into these unknown mountains, measured that rock, and—and—"

"Fell over," suggested the Major.

"And was killed," concluded Uncle Jack. "They always are, you know. That is one comfort about geologists."

"But the mountaineers, who in this case must have been Indians, in their enthusiastic admiration for science, made him a solitary grave on the top of the rock, where he now lies alone with—with the sky," I added.

"Precisely what I was about to say," observed the Professor, bowing airily to us all.

"How beautiful!" said Ermine, enthusiastically; "and above all, how new! Science hath gilded the rock. Imagine the lonely figure of the geologist suspended by a rope, engaged in the noble work of measuring. Sublime!" And taking the Major's arm again, she walked off down the road, leaving the learned man to the exclusive enjoyment of the little leafy nook.

But Herr Freulig sat dejectedly on his

log; his pencil had stopped. "I moeste alter," I heard him murmur; "it e-es not Indeens at all." And the rubber came into play.

After another half hour spent on the shore we drove on toward the Springs, leaving the Professor walking youthfully along, with an impromptu alpenstock. He had replaced his lost hat with an old straw, purchased from a rich wagoner who had two, and this head-gear he had adorned with a large bunch of rhododendrons, as much as to say, "I too can be pastoral;" he wore it tilted over on one side, and hummed to himself as he walked. The tune was *Old Hundred*; but never mind.

"Why should this foaming, rapid river be burdened with such a name?" said Ermine, as we drove on, each curve showing us new vistas of grandeur and beauty. "French Broad!—you have to take two breaths to finish it! The river is neither broad nor French that I can see."

"It was named by a party of hunters," said Philip Romer. "They were exploring the mountains, and the first river they met they called the Broad, the next they called Second Broad, and the third Main Broad; finding still a fourth, they called it French's

CASCADE NEAR WARM SPRINGS, NORTH CAROLINA.

Broad, after their captain, whose name was French."

"What a poverty-stricken set of minds!" said Ermine. "Why could they not take the Indian names? Or if they must baptize things for themselves, they should at least have chosen a characteristic ugliness. They managed these things better along the Great Lakes. What grand names are Thunder Bay and Porphyry Point! What unwritten stories of the past belong to Misery River and Death's Door! Then, descending to the

rude, every-day life of the hunter, what could be better than Knife River, Kettle Point, and Pie Island? For my part, I have always cherished a liking for the man who sent that Lake Huron town down to posterity labeled 'Bad Axe.' No doubt it commemorated the day when, alone on the edge of the boundless forest, the struggling settler found that his axe, the most precious treasure of the pioneer, was a bad one."

"The Indian name of the French Broad is Tockeste, the Racing River," said the soldier.

"There," said Ermine, "that is what I mean. How entirely appropriate! The Indians were poets."

"Did you know that some of the Cherokees still reside in the State?" continued Philip. "Their settlement is not very far from here—more to the south. I suppose they are by far the wildest Indians left within the borders of the old States. These mountains still give them many a free hunting ground. Singularly enough, too, they are not without their public spirit. Before the war, when the mountain people were trying to

build a railroad through their country, these redskins brought out their shovels and picks, and actually graded and prepared voluntarily two miles of the road near their village. It still remains there in fair order, although the road is but a ghost."

"I have noticed a phantom pursuing us all the way from the other side of the Blue Ridge," said Uncle Jack. "Ruined culverts, half-excavated tunnels, shadowy grading, and lines of levels. I have even fancied that I heard a spirit whistle."

"The ghost of the poor mountain railroad, Sir. Swindlers made off with all the money, and the robbed mountaineers gloomily make fences of the ties—all that is left to them."

"By-the-way, Captain Romer, can you tell us who Peter was?" said Ermine, as we drove on. "We were discussing the subject at the rock. So far, he has been an Indian chief and a geologist."

"He was neither, Miss Stuart," replied Philip, with ready invention. "He was a British officer, under Cornwallis, who, falling madly in love with a beautiful maiden on the march along the Carolina coast, deserted and fled to these mountains. On

at rock, a miniature his cabin, and there until death suddenly ung wife, and subal-ft alone. It is said nbalmed with spices ark, Indian fashion, in one of those pine-often at sunset Peter the edge of the cliff, d mournfully on the aloft by the green emained of his love."

"That," said Ermine, "is by far the best, and is adopted from this time forth. Herr Freulig" (for the mule was close at my backbone again), "did you hear that? He must be sitting on the edge of the cliff—in his uniform, of course—with his eyes fixed upon the dark object swaying in the green far above. The very thing for a sketch! I don't know that I ever met a finer subject straying around loose in Arcadia."

"E—es it—" began the artist, trying to take out his

portfolio on the spot. Then, slowly shaking his head, he stopped, and dismounting from his innle, tied that playful animal to a tree. The last I saw of him he was sharpening his numerous pencils.

The approach to Warm Springs is very lovely. Crossing the river on a long bridge, we drove up to the large hotel which stands here alone, maintained in the heart of the wilderness by the maimed and the halt and the blind who come here to bathe in the magical waters. The springs bubble up from the ground in a large pool near the river's edge; the temperature of the water varies from ninety-eight to one hundred and two degrees Fahrenheit. Although, unlike the Virginia resorts, the Warm Springs of North Carolina are scarcely known at

the North, they are well patronized by the people of Tennessee, Alabama, and Mississippi, and of the surrounding country. As we drove up to the entrance the long piazza was gay with ladies attired in the bright colors the Southerners love so well. The universal black, so fashionable at the North, is hardly seen at the South except in mourning, and when accepted in a modified form is always lighted up with some sash or knot of gay ribbons.

"Tropical," said Ermine, alighting.

The Major had ridden by himself during the latter part of the afternoon. Once or twice we saw him, but he seemed lost in thought. As we sat on the piazza in the evening, however, he disburdened himself of his load. "I have finally unearthed the story of Peter's Rock, Miss Stuart," he began, with a careless air. "It seems Peter was a negro, and when Stoneman rode through from Tennessee, he gave them warning with a flaming torch, standing on the top of the rock—"

"Ah!" interrupted Herr Freulig, excitedly; "it e-es too moche. I haf make heem

LAST GLIMPSE OF THE FRENCH BROAD.

von Indeen, I haf make heem von geologer, I haf make heem a Breetish officer, and now you wants me to make heem a neeg! I can no more."

I burst into an irrepressible fit of laughter as the unhappy Herr concluded the story of his wrongs. The sketch of the "Breetish officer" was accepted and ratified on the spot, and Ermine resolved herself into a consoler-general. The Major's story remains unfinished to this day.

Our river pilgrimage was drawing to a close; four miles to the west ran the Tennessee line, and beyond were the low countries and railroads. Professor Macquoid concluded to try the effect of his rhododendron hat and alpenstock in the neighborhood of Warm Springs for a few days, Ermine remaining singularly blind to their shepherd-like charm. He mentioned that he had discovered a remarkable dip in the neighborhood, which he thought it his duty to measure. (The Professor, it was understood, was engaged upon the composition of a Great Work.) Herr Freulig was of course obliged to remain with his traveling com-

panion; but I overheard Ermine saying something about "next winter," and I thought I caught a glimpse of a sketch in her hand which looked very much like that "fery fine few."

The Major was going as far as Chattanooga, and Philip Romer said he would accompany us to the State line, and then return homeward on his friend's horse.

"But can you?" I asked, remembering the narrow road and the fords.

"The horse knows the way, and all the people about here know me, Miss Martha," said the soldier, smiling. "I am not entirely blind yet; I can see a little."

Then, as we were all silent through our great compassion for him, he turned the tide of talk into another channel. "Do you see that road across the river?" he asked. "It goes to Greenville, twenty-five miles distant. In that little village, on the 4th of September, 1864, died John Morgan the raider, shot through the heart in a garden, his place of refuge having been discovered and pointed out by a woman."

"He was a bold rider," said Ermine, gently.

"I beg your pardon, niece," began Uncle Jack in some heat; "John Morgan was a rebel, and deserved his—" Then remembering Philip Romer, he paused suddenly.

"The fortunes of war, Sir. He took his fate into his own hands; we all did that, and must now bear the consequences," said the Confederate soldier, quietly.

Some distance below Warm Springs we found Paint Rock—a singular cliff marked

with streaks of a dark red color, supposed by the imaginative to be Indian picture-writing.

"Are we in the Great Smoky Mountains?" asked Ermine.

"In their very heart, Miss Stuart; all the peaks you see belong to that chain. You are going through with the French Broad, which has cut a pathway for itself to the low countries."

We lingered on the border, but the farewells came at last. "Good-by," we said, and found ourselves strangely saddened by the breaking of this tie of a day. The Major had many a plan for future meetings with his old comrade, and he detailed them all with his hearty cordiality. Philip Romer listened, but I noticed that he did not echo the confident hope.

The Major helped him to mount, and turned the horse's head in the right direction. "Good-by," we said again, and our carriage started westward. At a curve in the road we all looked back. The solitary figure was riding slowly up into the dark cañon of the French Broad; another moment and it was lost in the pine-trees.

Beyond the mountains the river loses its wildness; tranquilly it flows along on its way to the Tennessee, and our last view of it was fair and peaceful. We heard the whistle of the locomotive, and the cars bore us rapidly away; but we watched as long as we could see them the peaks of the Great Smoky, and thought silently of that solitary figure riding back along the bank of the wild French Broad.

THE FOLLOWER.

We have a youngster in the house,
A little man of ten,
Who dearest to his mother is
Of all God's little men.
In-doors and out he clings to her;
He follows up and down;
He steals his slender hand in hers;
He plucks her by the gown.
"Why do you cling to me so, child?
You track me every where;
You never let me be alone."
And he with serious air
Answered, as closer still he drew,
"My feet were made to follow you."

Two years before the boy was born
Another child, of seven,
Whom Heaven had lent to us a while,
Went back again to Heaven.
He came to fill his brother's place,
And bless our failing years;
The good God sent him down in love
To dry our useless tears.
I think so, mother, for I hear
In what the child has said
A meaning that he knows not of,
A message from the dead.
He answered wiser than he knew,
"My feet were made to follow you."

Come here, my child, and sit with me,
Your head upon my breast;
You are the last of all my sons,
And you must be the best.
How much I love you, you may guess,
When, grown a man like me,
You sit as I am sitting now,
Your child upon your knee.
Think of me then, and what I said
(And practiced when I could),
"'Tis something to be wise and great,
'Tis better to be good.
Oh, say to all things good and true,
'My feet were made to follow you!'"

Come here, my wife, and sit by me,
And place your hand in mine
(And yours, my child): while I have you
'Tis wicked to repine.
We've had our share of sorrows, love;
We've had our graves to fill;
But, thank the good God overhead,
We have each other still!
We've nothing in the world besides,
For we are only three:
Mother and child, my wife and child,
How dear you are to me!
I know—indeed, I always knew,
My feet were made to follow you!

CARICATURES OF THE REFORMATION.

LUTHER INSPIRED BY SATAN.

BEHOLD in this strange, rude picture* a device of contemporary caricature to cast ridicule upon the movement of which Martin Luther was the conspicuous figure. It is reduced from a large wood-cut which appeared in Germany at the crisis of the lion-hearted reformer's career, the year of his appearance at the Diet of Worms, when he said to disenchanted friends, "If I knew there were as many devils at Worms as there are tiles upon the houses, I would go." The intention of the artist is obvious; but in addition to the leading purpose, he desired, as Mr. Chatto conjectures, to remind his public of the nasal drawl of the preaching friars of the time, for which they were as proverbial as were the Puritans of London in Cromwell's day. Such is the poverty of human invention that the idea of this caricature has been employed several times since Luther's time—even as recently as 1873, when a London draughtsman made it serve his turn in the contentions of party politics.

The best humorous talent of Christendom, whether it wrought with pencil or with pen, whether it avowed or veiled its sympathy with reform, was on Luther's side. It prepared the way for his coming, co-operated with him during his lifetime, carried on his work after he was gone, and continues it to the present hour.

Recent investigators tell us, indeed, that

the Reformation began in laughter, which the Church itself nourished and sanctioned. M. Viollet-le-Duc, author of the *Dictionnaire d'Architecture*, discourses upon the gradual change which church decorators of the Middle Ages effected in the figure of the devil. Upon edifices erected before the year 1000 there are few traces of the devil, and upon those of much earlier date none at all; but from the eleventh century he "begins to play an important rôle," artists striving which should give him the most hideous form. No one was then audacious enough to take liberties with a being so potent, so awful, so real, the competitor and antagonist of the Almighty Lord of Heaven and Earth. But mortals must laugh, and familiarity produces its well-known effect. In the eyes of men of the world the devil became gradually less terrible and more grotesque, became occasionally ridiculous, often contemptible, sometimes foolish. His tricks are met by tricks more cunning than his own; he is duped, and retires discomfited. Before Luther appeared on the scene the painters and sculptors, not to mention the authors and poets, had made progress in reducing the devil from the grade of an antagonist of deity and arch enemy of men to that of a cunning and amusing deceiver of simpletons. "The great devil," as the author just mentioned remarks, "sculptured over the door of the Autun Cathedral in the twelfth century is a frightful being, well designed to strike terror to unformed souls; but the young devils carved in base-reliefs of the fifteenth century are more comic than terrible, and it is evident that the artists who executed them cared very little for the wicked tricks of the Evil Spirit." We may be sure that the artist who could sketch the devil fiddling upon a pair of bellows with a kitchen dipper had outgrown the horror which that personage had once excited in all minds. Such a sketch is here reproduced from a Flemish MS. in the library of Cam-

But this could not be said of the great mass of Christian people for centuries after. Luther, as the reader is aware, speaks of the devil with as absolute an assurance of his existence, activity, and nearness as if he were a member of his own household. God, he once said, mocks and scorns the devil by putting under his nose such a weak creature as man; and at other times he dwelt upon the hardness of the conflict which the devil

* From *A Treatise on Wood-Engraving*. By JACKSON and CHATTO. London: 1866. Page 263.

OLDEST DRAWING IN THE BRITISH MUSEUM.

has to maintain. "It were not good for us to know how earnestly the holy angels strive for us against the devil, or how hard a combat it is. If we could see for how many angels one devil makes work, we should be in despair." Many devils, he remarks with curious certainty, are in forests, in waters, in wildernesses, in dark pooly places, ready to hurt and prejudice people; and there are some in the thick black clouds, which cause hail, lightnings, and thunderings, and poison the air, the pastures, and grounds. He derides the philosophers and physicians who say that these things have merely natural causes; and as to the witches who torment honest people, and spoil their eggs, milk, and butter, "I should have no compassion upon them—I would burn them all." The Table Talk of the great reformer is full of such robust credulity.

Luther represented, as much as he reformed, his age and country. In these utterances of his we discern the spirit against which the humor and gayety of art had to contend, and over which it has gained a tardy victory, not yet complete. Let us keep in mind also that in those twilight ages, as in all ages, there were the two contending influences which we now call "the world" and "the church." In other words, there were people who took the devil lightly, as they did all invisible and spiritual things, and there were people who dreaded the devil in every "dark pooly place," and to whom nothing could be a jest which appertained to him. Humorous art has in it healing and admonition for both these classes.

It was in those centuries, also, that men of the world learned to laugh at the clergy, and, again, not without clerical encouragement. In the brilliantly illuminated religious manuscripts of the two centuries preceding Luther, along with other ludicrous and absurd images, of which specimens have been given, we find many pictures in which

the vices of the religious orders are exhibited. The oldest drawing in the British Museum, one of the only two that bear the date 1320, shows us two devils tossing a monk headlong from a bridge into a rough and rapid river, an act which they perform in a manner not calculated to excite serious thoughts in modern minds.

In the old Strasburg Cathedral there was a brass door, made in 1545, upon which was engraved a convent with a procession of monks issuing from it bearing the cross and banners.

The foremost figure of this procession was a monk carrying a girl upon his shoulders. This was not the coarse fling of an enemy. It was not the scoff of an Erasmus, who said once, "These paunchy monks are called *fathers*, and they take good care to deserve the name." It was engraven on the eternal brass of a religious edifice for the warning and edification of the faithful.

Nothing more surprises the modern reader than the frequency and severity with which the clergy of those centuries were denounced and satirized, as well by themselves as by others. A Church which showed itself sensitive to the least taint of what it deemed heresy appears to have beheld with indifference the exhibition of its moral delinquencies—nay, taken the lead in exposing them. It was a clergyman who said, in the Council of Siena, fifty years before Luther was born: "We see to-day priests who are usurers, wine-shop keepers, merchants, governors of castles, notaries, stewards, and debauch brokers. The only trade which they have not yet commenced is that of executioner. The bishops surpass Epicurus himself in sensuality, and it is between the courses of a banquet that they discuss the authority of the Pope and that of the Council." The same speaker related that St. Bridget, being in St. Peter's at Rome, looked up in a religious ecstasy, and saw the nave filled with mitred hogs. She asked the Lord to explain this fantastic vision. "These," replied the Lord, "are the bishops and abbés of to-day." M. Champfleury, the first living authority on subjects of this nature, declares that the manuscript Bibles of the century preceding Luther are so filled with pictures exhibiting monks and nuns in equivocal circumstances that he was only puzzled to decide which specimens were most suitable to give his readers an adequate idea of them.

From mere gayety of heart, from the exuberant jollity of a well-beneficed scholar,

whose future was secure and whose time was all his own, some of the higher clergy appear to have jested upon themselves and their office. Two finely engraved seals have been found in France, one dating as far back as 1300, which represent monkeys arrayed in the vestments of a Church dignitary. Upon one of them the monkey wears the hood and holds the staff of an abbot, and upon the other the animal appears in the character of a bishop.

One of these seals is known to have been executed at the express order of an abbot. The other, a copy of which is given here,

BISHOP'S SEAL.

was found in the ruins of an ancient chateau of Picardy, and bears the inscription, "LE: SCEL: DE: L'UECQUE: DE: LA: CYTE: DE: PINON"—"The seal of the bishop of the city of Pinon." This interesting relic was at first thought to be the work of some scoffing Huguenot, but there can now be no doubt of its having been the merry conceit of the personage whose title it bears. The discovery of the record relating to the monkey seal of the abbot, showing it to have been ordered and paid for by the actual head of a great monastery, throws light upon all the grotesque ornamentation of those centuries. It suggests to us also the idea that the clergy joined in the general ridicule of their order as much from a sense of the ludicrous as from conviction of its justice. In the British Museum there is a religious manuscript of the thirteenth century, splendidly illuminated, one of the initial letters of which represents a young friar drawing wine from a cask in a cellar, that contains several humorous points. With his left hand he holds the great wine-jug, into which the liquid is running from the barrel; with his right he lifts to his lips a bowlful of the wine, and from the same hand dangle the large keys of the cellar. If this was intended as a hint to the younger brethren how they ought not to behave when sent to the cellar for wine,

the artist evidently felt also the comic absurdity of the situation.

The vast cellars still to be seen under ancient monasteries and priories, as well as the kitchens, not less spacious, and supported by archways of the most massive masonry, tell a tale of the habits of the religious orders which is abundantly confirmed in the records and literature of the time. "Capuchins," says the old French doggerel, "drink poorly, Benedictines deeply, Dominicans pint after pint, but Franciscans drink the cellar dry." The great number of old taverns in Europe named the Mitre, the Church, the Chapel-Bell, St. Dominic, and other ecclesiastical names point to the conclusion that the class which professed to dispense good cheer for the soul were not averse to good cheer for the body.*

If the clergy led the merriment caused by their own excesses, we can not wonder they should have had many followers. In the popular tales of the time, which have been gathered and made accessible in recent years, we find the priest, the monk, the nun, the abbot, often figuring in absurd situations, rarely in creditable ones. The priest seems to have been regarded as the satirist's fair game, the common butt of the jester. In one of these stories a butcher, returning home from a fair, asks a night's lodging at the house of a priest, who churlishly refuses it. The butcher, returning, offers in recompense to kill one of his fine fat sheep for supper, and to leave behind him all the meat not eaten. On this condition he is received, and the family enjoy an excellent supper in his society. After supper he wins the favor first of the priest's concubine and afterward of the maid-servant by secretly promising to each of them the skin of the sheep. In the morning, after he has gone, a prodigious uproar arises, the priest and the two women each vehemently claiming the skin, in the midst of which it is discovered that the butcher had stolen the sheep from the priest's own flock.

From a merry tale of these ages a jest was taken which to-day forms one of the stock dialogues of our negro minstrel bands. The story was apparently designed to show the sorry stuff of which priests were sometimes made. A farmer sends a lout of a son to college, intending to make a priest of him, and the lad was examined as to the extent of his knowledge. "Isaac had two sons, Esau and Jacob," said the examiner: "who was Jacob's father?" The candidate, being unable to answer this question, is sent home to his tutor with a letter relating his discomfiture. "Thou fool and ass-head!" exclaims the tutor. "Dost thou not know Tom Miller of Oseney?" "Yes,"

* *History of Sign-Boards.* By LARWOOD and HORTON. London. Page 313.

answered the hopeful scholar. "Then thou knowest he had two sons, Tom and Jack: who is Jack's father?" "Tom Miller." Back goes the youth to college with a letter to the examiner, who, for the tutor's sake, gives him another chance, and asks once more who was Jacob's father. "Marry!" cries the candidate, "I can tell you now: that was Tom Miller of Oseney."

We must be cautious in drawing inferences from the popular literature of a period, since there is in the unformed mind a propensity to circulate amusing scandal, and the satirist is apt to aim his shaft at characters and actions which are exceptional, not representative. In some of the less frequented nooks of Europe, where the tone of mind among the people has not materially changed since the fifteenth century, we still find priests the constant theme of scandal. The Tyrolese, for example, as some readers may have observed, are profuse in their votive offerings, and indefatigable in their pilgrimages, processions, and observances—the most superstitious people in Europe; but a recent writer tells us that they "have a large collection of anecdotes, humorous and scandalous, about their priests, and they take infinite delight in telling them." They are not pious, as the writer remarks, "but magpious." The Tyrolese may judge their priests correctly, but credulity is credulity. A person who believes in magpious humbug may be expected to lend greedy ears to comic scandal, and what the Tyrolese do to-day, their ancestors may have done when Luther was a school-boy.

But of late years the exact, methodical records of the past, the laws, law-books, and trials, which are now recognized to be among the most trustworthy guides to a correct interpretation of antiquity, have been diligently scrutinized, and we learn from them that it was among the commonest of criminal events for clergymen, in the time of Edward III. of England, to take part in acts of brigandage. A band of fifty men, for example, broke into the park and warren of a lady, the Countess of Lincoln, killed her game, cut down two thousand pounds' worth of timber, and carried it off. In the list of the accused are the names of two abbots and a prior. Several chaplains were in a band of knights and squires who entered an inclosure belonging to the Archbishop of Canterbury, drove off his cattle, cut down his trees, harvested his wheat, and marched away with their booty. In a band of seventy who committed a similar outrage at Carlton there were five parsons. Two parsons were accused of assisting to break into the Earl of Northampton's park and driving off his cattle. The prior of Bolton was charged with a robbery of horses, cattle, sheep, and pigs. Five clergy-

men were in the band that damaged the Bishop of Durham's park to the extent of a thousand pounds. These examples and others were drawn from a single roll of parchment of the year 1348; and that roll, itself one of three, is only one of many sources of information. The author of the *History of Crime* explains that the rolls of that year consist of more than one hundred and twenty skins of parchment, among which there are few that do not contain a reference to some lawless act committed by knights or priests, or by a band consisting of both.*

This is record, not gossip, not literature; and it may serve to indicate the basis of truth there was for the countless allusions to the dissoluteness of the clergy in the popular writings and pictures of the century that formed Luther and the Lutherans.

It is scarcely possible in the compass of an article to convey an idea of the burst of laughter that broke the long spell of superstitious terror, and opened the minds of men to receive the better light. Such works as the *Decameron* of Boccaccio, which to modern readers is only interesting as showing what indecency could be read and uttered by fine ladies and gentlemen on a picnic in 1350, had one character that harmonized with the new influence. Their tone was utterly at variance with the voice of the priest. The clergy, self-indulgent, preached self-denial; practicing vice, they exaggerated human guilt. But the ladies and gentlemen of the *Decameron*, while practicing virtue, made light of vice, and brought off the graceful profligate victorious. Later was circulated in every land and tongue the merry tale of *Reynard the Fox*, which children still cherish among the choicest of their literary treasures. Reynard, who appears in the sculptures of so many convents and in the illuminations of so many pious manuscripts, whom monks loved better than their missal, exhibits the same moral: witty wickedness triumphant over brute strength. The fox cheats the wolf, deludes the bear, lies to King Lion, turns monk, gallops headlong up and down the commandments, only to be at last taken into the highest favor by the king and made Prime Minister. It is not necessary to discover allegory in this tale. What made it potent against the spell of priestly influence was the innocent and boisterous merriment which it excited, amidst which the gloom evoked by priestly arts began to break away. Innocent mirth, next to immortal truth, is the thing most hostile to whatever is mingled with religion which is hostile to the interests of human nature.

And *Reynard*, we must remember, was

* *History of Crime in England*. By L. O. PIER. London: 1878. Page 248.

PASTOR AND FLOCK.

(From the window of a French church, 16th century.)

only the best and gayest of a large class of similar fables that circulated during the childhood of Columbus and of Luther. In one of the Latin stories given by Mr. Wright in his *Selection*, we have an account of the death and burial of the wolf, the hero of the tale, which makes a most profane use of sacred objects and rites, though it was written by a priest. The holy-water was carried by the hare, hedgehogs bore the candles, goats rang the bell, moles dug the grave, foxes carried the bier, the bear celebrated mass, the ox read the gospel, and the ass the epistle. When the burial was complete the animals sat down to a splendid banquet, and wished for another grand funeral. Mark the moral drawn by the priestly author: "So it frequently happens that when some rich man, an extortionist or a usurer, dies, the abbot or prior of a convent of beasts [i. e., of men living like beasts] causes them to assemble. For it commonly happens that in a great convent of black or white monks [Benedictines or Augustinians] there are none but beasts—lions by their pride, foxes by their craftiness, bears by their voracity, stinking goats by their incontinence, asses by their sluggishness, hedgehogs by their asperity, hares by their timidity (because they were cowardly when there was no fear), and oxen by their laborious cultivation of their land." Unquestionably this author belonged to another order than those named in his tirade.

A book with original life in it becomes usually the progenitor of a line of books. Brandt's *Skip of Fools*, which was published when Luther was eleven years old, gave rise to a literature. As soon as it appeared it kindled the zeal of a noted preacher of Strasburg, Jacob Geiler by name, who turned Brandt's gentle satire into fierce invective, which he directed chiefly against the monks. The black friars, he said, were the

devil, the white friars his dame, and the others were their chickens. The qualities of a good monk, he declared, were an almighty belly, an ass's back, and a raven's mouth. From the pulpit, on another occasion, he foretold a coming reformation in the Church, adding that he did not expect to live to see it, though some that heard him might. The monks taunted him with looking into the *Skip of Fools* for his texts instead of the Scripture; but the people heard him eagerly, and one of his pupils gave the public a series of his homely, biting sermons, illustrated by wood-cuts, which ran through edition after edition. Badius, a noted scholar of the time, was another who imitated the *Skip of Fools*, in a series of satirical pieces entitled *The Boats of Foolish Women*, in which the follies of the ladies of the period were ridiculed.

Among the great number of works which the *Skip of Fools* suggested, there was one which directly and powerfully prepared the way for Luther. Erasmus, while residing in England, from 1497 to 1506, Luther being still a student, read Brandt's work, and was stirred by it to write his *Praise of Folly*, which, under the most transparent disguise, is chiefly a satire upon the ecclesiastics of the day. We may at least say that it is only in the passages aimed at them that the author is at his best. Before Luther had begun to think of the abuses of the Church, Erasmus, in this little work, derided the credulous Christians who thought to escape mischance all day by paying devotion to St. Christopher in the morning, and laughed at the soldiers who expected to come out of battle with a whole skin if they had but taken the precaution to "mumble over a set prayer before the picture of St. Barbara." He jested upon the English who had constructed a gigantic figure of their patron saint (St. George) as large as the images of the pagan Hercules; only the saint was mounted upon a horse in splendid trappings, "very gloriously accoutred," which the people scarcely refrained from worshipping. But observe this passage in the very spirit of Luther, though written fifteen years before the great reformer publicly denounced indulgences:

"What shall I say of such as cry up and maintain the cheat of pardons and indulgences? who by these compute the time of each soul's residence in purgatory, and assign them a longer or shorter continuance, according as they purchase more or fewer of these paltry pardons and salable exemptions?.....By this easy way of purchasing pardon any notorious highwayman, any plundering soldier, or any bribe-taking judge shall disburse some part of their unjust gains, and so think all their grossest impieties sufficiently atoned for.....And what can be more ridiculous than for some

SALE OF INDULGENCES.

MILAN, 1520.

CONTRAST TO GOD.

practiced not merely by the vulgar, but by "such proficients in religion as one might well expect should have more wit." He ridicules the notion of each country and place being under the special protection of a patron saint, as well as the kindred absurdity of calling upon one saint to cure a toothache, upon another to restore lost goods, upon another to protect seamen, and upon another to guard cows and sheep. Nor does he refrain from reflecting upon the homage paid to the Virgin Mary, "whose blind devotees think it manners now to place the mother before the Son." He utterly scorns and reviles the folly of hanging up offerings at the shrines of saints for their imaginary aid in getting the donors out of trouble or danger. The responsibility of all this folly and delusion he boldly assigns to the priests, who gain money by them. "They blacken the darkness and promote the delusion, wisely foreseeing that the people (like cows which never give down their milk so well as when they are gently stroked) would part with less if they knew more." If any serious and wise man, he adds, should tell the people that a pious life is the only way of securing a peaceful death, that repentance and amendment alone can procure pardon, and that the best devotion to a saint is to imitate his example, there would be a very different estimate put upon masses, fastings, and other austerities. Erasmus saw this prophecy fulfilled before many years had rolled over his head.

It is, however, in his chapters upon the amazingly ridiculous subtleties of the monastic theology of his time that Erasmus gives us his most exquisite fooling. Here he becomes, indeed, the merry Erasmus who was so welcome at English Cambridge, at Paris, at Rome, in Germany, in Holland, wherever there were good scholars and good fellows. He pretends to approach this part of his subject with fear; for divines, he says, are generally very hot and passionate, and when provoked they set upon a man in full cry, and hurl at him the thunders of excommunication, that being their spiritual weapon to wound such as lift up a hand against them. But he plucks up courage, and proceeds to discourse upon the puerilities which absorbed their minds. Among the theological questions which they delighted to discuss were such as these: the precise manner in which original sin was derived from our first parents; whether time was an element in the supernatural generation of our Lord; whether it would be a thing possible for the first person in the Trinity to hate the second; whether God, who took our nature upon Him in the form of a man, could as well have become a woman, a beast, an herb, or a stone; and if He could, how could He have then preached the gospel, or been nailed to the cross? whether if St. Peter had

others to be confident of going to heaven by repeating daily those seven verses out of the Psalms?"

These "fooleries," which Erasmus characterizes as most gross and absurd, he says are

celebrated the eucharist at the time when our Saviour was upon the cross, the consecrated bread would have been transubstantiated into the same body that remained on the tree; whether, in Christ's corporal presence in the sacramental wafer, His humanity was not abstracted from His Godhead; whether, after the resurrection, we shall carnally eat and drink as we do in this life; how it is possible, in the transubstantiation, for one body to be in several places at the same time; which is the greater sin, to kill a hundred men, or for a cobbler to set one stitch in a shoe on Sunday? Such subtleties as these alternated with curious and minute delineations of purgatory, heaven, and hell, their divisions, subdivisions, degrees, and qualities.

He heaps ridicule also upon the public preaching of those profound theologians. It was mere stage-playing; and their delivery was the very acme of the droll and the absurd. "Good Lord! how mimical are their gestures! What heights and falls in their voice! What toning, what bawling, what singing, what squeaking, what grimaces, what making of mouths, what apes' faces and distorting of their countenances!" And their matter was even more ridiculous than their manner. One of these absurd divines, discoursing upon the name of Jesus, subtly pretended to discover a revelation of the Trinity in the very letters of which the name was composed. It was declined only in three cases. That was one mysterious coincidence. Then the nominative ended in S, the accusative in M, and the ablative in U, which obviously indicated Summus, the beginning, Medius, the middle, and Ultimus, the end of all things. Other examples he gives of the same profound nature. Nor did the different orders of monks escape his lash. He dwelt upon the preposterous importance they attached to trifling details of dress and ceremonial. "They must be very critical in the precise number of their knots, in the tying on of their sandals, of what precise colors their respective habits should be made, and of what stuff, how broad and long their girdles, how big and in what fashion their hoods, whether their bald crowns be of the right cut to a hair's-breadth, how many hours they must sleep, and at what minute rise to prayers."

In this manner he proceeds for many a sprightly page, rising from monks to bishops and cardinals, and from them to popes, "who pretend themselves Christ's vicars," while resembling the Lord in nothing. Luther never went farther, never was bolder or more biting, than Erasmus in this essay. But all went for nothing with the great leader of reform, because Erasmus ever refused to abandon the Church and cast in his lot openly with the reformers. Luther calls him "a mere Momus," who laughed at Catholic and Prot-

CHURCH, THE TRUE LIGHT.—MOMUS, ABOUT 1534.

estant alike, and looked upon the Christian religion itself very much as Lucian did upon the Greek. "Whenever I pray," said Luther, once, "I pray for a curse upon Erasmus." It was certainly a significant fact that in the heat of that contest Erasmus

should have given the world a translation of Lucian. But he was a great, wise, genial soul, whose fame will brighten as that age becomes more justly and familiarly known to us.

The first place in the annals of such a warfare belongs of right to the soldiers who took their lives in their hands and went forth to meet the foe in the open field, braving torture, infamy, and death for the cause. Such were Luther and his followers. But there is a place in human memory for the philosopher and the humorist who first made the contest possible, and then rendered it shorter and easier.

When Luther began the immortal part of his public career in 1517 by nailing to the church door his ninety-five theses against the sale of indulgences, wood-engraving was an art which had been practiced nearly a century. He found also, as we have seen, a public accustomed to satirical writings illustrated by wood-cuts. The great Holbein illustrated Erasmus's *Praise of Folly*. Brandt's *Ship of Fools*, as well as the litter of works which it called forth, was even profusely illustrated. Caricatures as distinct works, though usually accompanied with abundant verbal commentary, were familiar objects. Among the curiosities which Luther himself brought from Rome in 1510, some years before he began his special work, was a caricature suggested by the *Ship of Fools*, showing how the Pope had "fooled the whole world with his superstitions and idolatries." He showed it to the Prince Elector of Saxony at the time. The picture exhibited a little ship filled with monks, friars, and priests casting lines to people swimming in the sea, while in the stern sat comfortably the Pope with his cardinals and bishops, overshadowed and covered by the Holy Ghost, who was looking up to heaven, and through whose help alone the drowning wretches were saved.

In talking about the picture many years after, Luther said, "These and the like fooleries we then believed as articles of faith." He had not reached the point when he could talk at his own table of the cardinals as "peevish milksops, effeminate, unlearned blockheads, whom the Pope places in all kingdoms, where they lie lolling in kings' courts among the ladies and women."

Finding this weapon of caricature ready made to his hands, he used it freely, as did also his friends and his foes. He was himself a caricaturist. When Pope Clement VII. seemed disposed to meet the reformers half-way, and proposed a council to that end, Luther wrote a pamphlet ridiculing the scheme, and to give more force to his satire he "caused a picture to be drawn" and placed in the title-page. It was not a work describable to the fastidious ears of our century, unless we leave part of the description

PAPA, DOCTOR THEOLOGIE ET MAGISTER FIDELI

"A long-eared ass can with the Bagpipes cope
As well as with Theology the Pope."

GERMANY, 1545.

in Latin. The Pope was seated on a lofty throne surrounded by cardinals having foxes' tails, and seeming "*surreum et decorem repurgare*." In the *Table-Talk* we read also of a picture being brought to Luther in which the Pope and Judas were represented hanging to the purse and keys. "Twill vex the Pope horribly," said Luther, "that he whom emperors and kings have worshiped should now be figured hanging upon his own picklocks." The picture above, in which the Pope is exhibited with an ass's head performing on the bagpipes, was entirely in the taste of Luther. "The Pope's decretals," he once said, "are naught; he that drew them up was an ass." No word was too contemptuous for the papacy. "Pope, cardinals, and bishops," said he, "are a pack of guzzling, stuffing wretches; rich, wallowing in wealth and laziness, resting secure in their power, and never thinking of accomplishing God's will."

The famous pamphlet of caricatures published in 1521 by Luther's friend and follower, Lucas Cranach, contains pictures that we could easily believe Luther himself suggested. The object was to exhibit to the eyes of the people of Germany the contrast between the religion inculcated by the lowly Jesus and the pompous worldliness of the papacy. There was a picture on each page which nearly filled it, and at the bottom there were a few lines in German of explanation, the engraving on the page to the left representing an incident in the life of Christ, and the page to the right a feature of the papal system at variance with it. Thus on the first page was shown Jesus, in humble attitude and simple raiment, refusing honors and dignities, and on the page

THE POPE CAST INTO HELL.
(Lucas Cranach, 1521.)

opposite the Pope, cardinals, and bishops, with warriors, cannon, and forts, assuming lordship over kings. On another page Christ was seen crowned with thorns by the scoffing soldiers, and on the opposite page the Pope wearing his triple crown, and seated on his throne, an object of adoration to his court. On another was shown Christ washing the feet of His disciples, in contrast to the Pope presenting his toe to an emperor to be kissed. At length we have Christ ascending to heaven with a glorious escort of angels, and on the other page the Pope hurled headlong to hell, accompanied by devils, with some of his own monks already in the flames waiting to receive him. This concluding picture may serve as a specimen of a series that must have told powerfully on the side of reform.*

These pictorial pamphlets were an important part of the stock in trade of the colporteurs who pervaded the villages and byways of Germany during Luther's lifetime, selling the sermons of the reformers, homely satiric verses, and broadside caricatures. The simplicity and directness of the caricatures of that age reflected perfectly both the character and the methods of Luther. One picture of Hans Sachs's has been preserved, which was designed as an illustration of the words of Christ: "I am the door. He that entereth not by the door into the sheepfold, but climbeth up some other way, the same is a thief and a robber." The honest Sachs shows us a lofty, well-built barn, with a very steep roof, on the very top of which

sits the Pope crowned with his tiara. To him cardinals and bishops are directing people, and urging them to climb up the steep and slippery height. Two monks have done so, and are getting in at a high window. At the open door of the edifice stands the Lord, with a halo round His head, inviting a humble inquirer to enter freely. Nothing was farther from the popular caricaturists of that age than to allegorize a doctrine or a moral lesson; on the contrary, it was their habit to interpret allegory in the most absurdly literal manner. Observe, for example, the treatment of the subject contained in the words, "How wilt thou say to thy brother, Let me pull out the mote out of thine eye, and, behold, a beam is in thine own eye?"

The marriage of Luther in 1525 was followed by a burst of caricature. The idea of a priest marrying excited then, as it does now in a Catholic mind, a sense of ludicrous incongruity. It is as though the words married priest were a contradiction in terms, and the relation implied by them was a sort of manifest incompatibility, half comic, half disgusting. The spectacle occasionally presented in a Protestant church of a clergyman ordained and married in the same hour is so opposed to the Catholic conception of the priesthood that some Catholics can only express their sense of it by laughter. Equally amazing and equally ludicrous to them is the more frequent case of missionaries coming home to be married, or young missionaries married in the evening and setting out for their station the next morning. We observe that some of Luther's nearest friends—nay, Luther himself—saw something both

* From *A History of Caricature*. By THOMAS WRIGHT. London: 1864. Page 254.

"THE BEAM THAT IS IN THINE OWN EYE."—A.D. 1540.

LUTHER TRIUMPHANT.—PARIS, 1525.

ridiculous and contemptible in his marriage, particularly in the haste with which it was concluded, and the disparity in the ages of the pair, Luther being forty-two and his wife twenty-six. "My marriage," wrote Luther, "has made me so despicable that I hope my humiliation will rejoice the angels and vex the devils." And Melancthon, while doing his best to restore his leader's self-respect, expressed the hope that the "accident" might be of use in humbling Luther a little in the midst of a success perilous to his good sense. Luther was not long abased. We find him soon justifying the act, which was among the boldest and wisest of his life, as a tribute of obedience to his aged father, who "required it in hopes of issue," and as a practical confirmation of what he had himself taught. He speaks gayly of "my rib, Kate," and declared once that he would not exchange his wife for the kingdom of France or the wealth of Venice.

But the caricaturists were not soon weary of the theme. Readers at all familiar with the manners of that age do not need to be told that few of the efforts of their free pencils will bear reproduction now. Besides exhibiting the pair carousing, dancing, romping, caressing, and in various situations supposed to be ridiculous, the satirists harped a good deal upon the old prophecy that Antichrist would be the offspring of a monk and a nun. "If that is the case," said Erasmus, "how many thousands of Antichrists there are in the world already!" Luther was evidently of the same opinion, for he gave full credit to the story of six thousand infants' skulls having been found at the bottom of a pond near a convent, as well as to that of "twelve great pots, in each of which was the carcass of an infant," discovered under

the cellars of another convent. But then Luther was among the most credulous of men.

The marriage of the monk and the nun gave only a brief advantage to the enemies of reform. The great German artists of that generation were friends of Luther. No name is more distinguished in the early annals of German art than Albert Dürer, painter, engraver, sculptor, and author. He did not employ his pencil in furtherance of Luther's cause, nor did he forsake the communion of the ancient Church, but he expressed the warmest sympathy with the objects of the reformer. A report of Luther's death in 1521 struck horror to his soul. "Whether Luther be yet living," he wrote, "or whether his enemies have put him to death, I know not, yet certainly what he has suffered has been for the sake of truth, and because he has reprehended the abuses of unchristian papacy, which strives to fetter Christian liberty with the incumbrance of human ordinances, that we may be robbed of the price of our blood and sweat, and shamefully plundered by idlers, while the sick and needy perish through hunger." These words go to the heart of the controversy.

Holbein, nearly thirty years younger than Dürer, only just coming of age when Luther nailed his theses to the castle church, did more, as the reader has already seen, than express in words his sympathy with reform. The fineness and graphic force of the two specimens of his youthful talent given on previous pages* every reader must have remarked. Only three copies of these pictures

* From *Holbein and his Time*. By ALFRED WOLFF-MANN. Translated by F. E. BURNETT. London: 1872. Pages 241-242.

are known to exist. They appeared at the time when Luther had kindled a general opposition to the sale of indulgences, as well as some ill feeling toward the classic authors so highly esteemed by Erasmus. They are in a peculiar sense Lutheran pictures, and they give expression to the reformer's prejudices and convictions. A third wood-cut of Holbein's is mentioned by Woltmann, dated 1524, in which the Pope is shown riding in a litter surrounded by an armed escort, and on the other side Christ is seen on an ass, accompanied by his disciples. These three works were Holbein's contribution to the earlier stage of the movement.

This artist was soon drawn away to the splendid court of Henry VIII. of England, where, among other works, he executed his renowned paintings, "The Triumph of Riches" and "The Triumph of Poverty," in both of which there is satire enough to bring them within our subject. Of these stupendous works, each containing seventeen or more life-size figures, every trace has perished except the artist's original sketch of "The Triumph of Riches." But they made a vivid impression upon the two generations which saw them, and we have so many engravings, copies, and descriptions of them that it is almost as if

THE TRIUMPH OF RICHES—HOLBEIN, ABOUT 1528.

will convey to the reader some idea of the harmonious grandeur of the painting, and some notion of the ingenious and friendly nature of its satire upon human life.

In accordance with the custom of the age, the painting bore an explanatory motto in Latin: "Gold is the father of lust and the son of sorrow. He who lacks it laments; he who has it fears." Plutus, the god of wealth, is an old, old man, long past enjoyment, but his foot rests upon sacks of superfluous coin, and an open vessel before him, heaped with money, affords the only pleasures left to him—the sight and conscious possession of the wealth he can never use. Below him Fortuna, a young and lovely woman, scatters money among the people who throng about her, among whom are the portly Sisyphus, Dido's husband, the richest of his people, Themistocles, who stooped to accept wealth from the Persian king, and many others noted in classic story for the part gold played in their lives. Cæsus, Midas, and Tantalus follow on horseback, and, last of all, the unveiled Cleopatra. The careful driver of Plutus's chariot is Ratio—reason. "Faster!" cries one of the crowd, but the charioteer still holds a tight rein. The unruly horses next the chariot, named Interest and Contract, are led by the noble maidens Equity and Justice, and the wild pair in front, Avarice and Deceit, are held in by Generosity and Good Faith. In the rear, hovering over the triumphal band, Nemesis threatens.

The companion picture, "The Triumph of Poverty," had also a Latin motto, to the effect that, while the rich man is ever anxious, "the poor man fears nothing, joyous hope is his portion, and he learns to serve God by the practice of virtue." In the picture a lean and hungry-looking old woman, Poverty, was seen riding in the lowliest of vehicles, a cart, drawn by two donkeys, Stupidity and Clumsiness, and by two oxen, Negligence and Indolence. Beside her in the cart sits Misfortune. A meagre and forlorn crowd surround and follow them. But the slow-moving team is guided by the four blooming girls, Moderation, Diligence, Alertness, and Toil, of whom the last is the one most abounding in vigor and health. The reins are held by Hope, her eyes toward heaven. Industry, Memory, and Experience sit behind, giving out to the hungry crowd the means of honorable plenty in the form of flails, axes, squares, and hammers.

These human and cheerful works stand in the waste of that age of wrathful controversy and irrational devotion like green islands in the desert, a rest to the eye and a solace to the mind.

When Luther was face to face with the hierarchy at the Diet of Worms, Calvin, a French boy of twelve, was already a sharer in the worldly advantage which the hier-

archy could bestow upon its favorites. He held a benefice in the cathedral of Noyon, his native town, and at seventeen he drew additional revenue from a curacy in a neighboring parish. The tonsured boy owed this ridiculous preferment to the circumstance that his father, being secretary to the bishop of the diocese, was sure to be at hand when the bishop happened to have a good thing to give away. In all probability Jean Calvin would have died an archbishop or a cardinal if he had remained in the Church of his ancestors, for he possessed the two requisites for advancement—fervent zeal for the Church and access to the bestowers of its prizes. At Paris, however, whither he was sent by his father to pursue his studies, a shy, intense, devout lad, already thin and

CALVIN BRANDED.—PARIS.

sallow with fasting and study, the light of the Reformation broke upon him. Like Luther, he long resisted it, and still longer hoped to see a reformation in the Church, not outside of its pale. The Church never had a more devoted son. Not Luther himself loved it more. "I was so obstinately given to the superstitions of popery," he said long after, "that it seemed impossible I should ever be pulled out of the deep mire."

He struggled out at length. Observe one of the results of his conversion in the picture on this page, in which a slander of the day is preserved for our inspection.*

Gross and filthy calumny was one of the familiar weapons in the theological con-

* From *Musee de la Caricature en France*. Paris: 1884.

Servetus was a Spanish physician, of blameless life and warm convictions, who rejected the doctrine of the Trinity. Catholic and Protestant equally abhorred him, and Protestant Geneva seized the opportunity to show the world its attachment to the true faith by burning a man whom Rome was also burning to burn. It was a hideous scene—a virtuous and devoted Unitarian expiring in the flames after enduring the extremest anguish for thirty minutes, and crying, from the depths of his torment, "Jesus, thou Son of the eternal God, have mercy on me!" But it was not Calvin who burned him. It was the century. It was imper-

CALVIN AT THE BURNING OF SERVETUS.

fects of that century. Both sides employed it—Luther and Calvin not less than others—for it belonged to that age to hate and hence to misinterpret opponents. "Search the records of the city of Noyon, in Picardie," wrote Stapleton, an eminent controversialist on the Catholic side, and professor in a Catholic college in Calvin's own day, "and read again that Jean Calvin, convicted of a crime" (infamous and unmentionable), "by the very element sentence of the bishop and magistrate was branded with an iron lily on the shoulders." The records have been searched; nothing of the kind is to be found in them; but the picture was drawn and scattered over France. Precisely the same charge was made against Luther. That both the reformers died of infamous diseases was another of the scandals of the time. In reading these controversies it is convenient to keep in mind the remark of the collector of the Calvin pictures: "When two theologians accuse one another, both of them lie." One of these calumnies drew from Calvin a celebrated retort. "They accuse me," said he, "of having no children. In every land there are Christians who are my children."

Another caricature, which is given above, representing Calvin at the burning of Servetus, had only too much foundation in truth.

The reformer was not indeed present at the burning, but he caused the arrest of the victim, drew up the charges, furnished part of the testimony that convicted him, consented to and approved his execution.

Man had not reached the civilization which admits, allows, welcomes, and honors disinterested conviction. It were as unjust to blame Calvin for burning Servetus as it is to hold the Roman Catholic Church of the present day responsible for the Inquisition of three centuries ago. It was Man that was guilty of all those stupid and abominable cruelties. Luther, the man of his period, honestly declared that if he were the Lord God, and saw kings, princes, bishops, and judges so little mindful of his Son, he would "knock the world to pieces." If Calvin had not burned Servetus, Servetus might have burned Calvin, and the Pope would have been happy to burn both.

One of the best caricatures—perhaps the very best—which the Reformation called forth was suggested by the dissensions that arose between the followers of Luther and Calvin when both of them were in the grave. It might have amused the very persons caricatured. We can fancy Lutherans, Calvinists, and Catholics all laughing together at the spectacle of the two reformers holding the Pope by the ear, and with their other hands fighting one another, Luther clawing at Calvin's beard, and Calvin hurling a Bible at Luther's head.

On the same sheet in the original drawing a second picture was given, in which a shepherd was seen on his knees, surrounded by his flock, addressing the Lord, who is visible in the sky. Underneath is written, "The Lord is my Shepherd; He will never forsake me." The work has an additional interest

worshippers, was obliged to laugh, whereupon the gaping throng cried out, "A miracle! a miracle! Our good lord St. Francis moves!" But a cunning old friar, who knew when miracles might and might not be rationally expected in that convent, ran into the chapel and drew out the merry saint, and the brothers laid their knotted cords so vigorously across his naked shoulders that he had a lively sense of not being made of wood. That was Rabelais! He was a natural laugh-compeller. He laughed at every thing, and set his countrymen laughing at every thing. But there were no men who oftener provoked his derision than the monks. "How is it?" asks one of his merry men, "that people exclude monks from all good companies, calling them feast-troublers, mariners of mirth, and disturbers of all civil conversation, as bees drive away the drones from their hives?" The hero answers this question in three pages of most Rabelaisian abuse, of which only a very few lines are quotable. "Your monk," he says, "is like a monkey in a house. He does not watch like a dog, nor plow like the

GALVIN, LUTHER, AND THE POPE.—PARIS, 1600.

as showing how early the French began to excel in caricature. In the German and English caricatures of that period there are no existing specimens which equal this one in effective simplicity.

Perhaps the all-pervading influence of Rabelais in that age may have made French satire more good-humored. After all attempts to discover in the works of Rabelais hidden allusions to the great personages and events of his time, we must remain of the opinion that he was a fun-maker pure and simple, a court-fool to his century. The anecdote related of his convent life seems to give us the key both to his character and his writings. The incident has often been used in comedy since Rabelais employed it. On the festival of St. Francis, to whom his convent was dedicated, when the country people came in, laden with votive offerings, to pray before the image of the saint, young Rabelais removed the image from its dimly lighted recess and mounted himself upon the pedestal, attired in suitable costume. Group after group of awkward rustics approached and paid their homage. Rabelais at length, overcome by the ridiculous demeanor of the

ox, nor give wool like the sheep, nor carry like the horse; he only spoils and defiles all things. Monks disquiet all their neighborhood with a tingle-tangle jangling of bells, and mumble out great store of psalms, legends, and paternosters without thinking upon or apprehending the meaning of what they say, which truly is a mocking of God." There is no single theme to which Rabelais, the favorite of bishops, oftener returns than this, and his boisterous satire had its effect upon the course of events in Europe, as well as upon French art and literature.

The English caricatures that have come down to us from the era of the Reformation betray far more earnestness than humor or ingenuity. There is one in the British Museum which figures in so many books, and continued to do duty for so many years, that the inroads of the worms in the wood-cut can be traced in the prints of different dates. It represents King Henry VIII. receiving a Bible from Archbishop Cranmer and Lord Cromwell. The burly monarch, seated upon his throne, takes the book from their hands, while he tramples upon Pope Clement lying prostrate at his

feet, the tiara broken and fallen off, the triple cross lying on the ground. Cardinal Pole, with the aid of another dignitary, is trying to get the Pope on his feet again. A monk is holding the Pope's horse, and other monks stand dismayed at the spectacle. This picture was executed in 1537, but, as we learn from the catalogue, the deterioration of the block and "the working of worms in the wood" prove that the impression in the Museum was taken in 1631.*

The martyrdom of the reformers in 1555, under Queen Mary of bloody memory, furnished subjects for the satiric pen and pencil as soon as the accession of Elizabeth made it safe to treat them. But there is no spirit of fun in the pictures. They are as serious and grim as the events that suggested them. In one we see a lamb suspended before an altar, which the Bishop of Winchester (Gardiner), with his wolf's head, is beginning to devour; and on the ground lie six slain lambs, named *Houperus*, *Cranmerus*, *Bradfordus*, *Rydlerus*, *Rogerus*, and *Latimerus*. Three reformers put a rope round Gardiner's neck, saying, "*We will not this felow to raigne over us*;" and on the other side of him two bishops with wolves' heads mitred, and having sheep-skins on their shoulders, are drinking from chalices. Behind Gardiner are several men attached by rings through their noses to a rope round his waist. The devil appears above, holding a scroll, on which is written, "*Youe are my verye chyl dren in that youe have slayne the prophetes. For even I from the begynning was a murtherer.*" On the altar lie two books, one open and the other shut. On the open book we read, "*Christ alone is not sufficient without our sacrifice.*" The only window in the edifice, a small round one, is closed and barred. Many of the figures in this elaborate piece utter severe animadversion upon opponents; but none of them is scurrilous and indecent, except the mitred wolf, who is so remarkably plain-spoken that the compiler of the catalogue was obliged to suppress several of his words.

The English caricaturists of that age seem to have felt it their duty to exhibit the entire case between Catholic and Protestant in each broadside, with all the litigants on both sides, terrestrial and celestial, all the points in both arguments, and sometimes the whole history of the controversy from the beginning. The great expanse of the picture was obscured with the number of remarks streaming from the mouths of the persons depicted, and there was often at the bottom of the engraving prose and verse enough to fill two or three of these pages. Such extensive works call to mind the sermons of the following century, when preach-

ers endeavored on each occasion to declare, as they said, "the *whole* counsel of God;" so that if one individual present had never heard the Gospel before, and should never hear it again, he would hear enough for salvation in that one discourse.

Another of these martyrdom prints may claim brief notice. Two companies of martyrs are seen, one composed of the bishops, and the other of less distinguished persons, between whom there is a heap of burning fagots. Nearly all the figures say something, and the space under the picture is filled with verses. Cranmer, with the Bible in his left hand, holds his right in the fire, exclaiming, "*Burne, unworthie right hand!*" Latimer cries, "*Lord, Lord, receive my spirit!*" Philpot, pointing to a book which he holds, says, "*I will pay my vowes in thee, O Smithfield!*" The other characters utter their dying words. The verses are rough, but full of the resolute enthusiasm of the age:

"First, Christian Cranmer, who (at first tho folld),
And so subscribing to a recantation,
Gods grace recouering him, hee, quick recoil'd,
And made his hand lth flames make explation.
Saing, burne faint-hand, burne first, 'tis thy due merit.
And dying, cryde, Lord Jesus take my spirit.

"Next, lovely Latimer, godly and grave,
Himselfe, Christs old tride souldier, plaine displaid,
Who stoutly at the stake did him behave,
And to blest Ridley (gone before) hee saide,
Goe on blest brother, for I followe, neere,
This day wee'le light a light, shall aye burne cleare.

"Whom when religious, reverend Ridley spide,
Deere heart (sayes hee) bee cheerful in y' Lord;
Who never (yet) his helpe to his denye'd,
And, hee will us support & strength afford,
Or suage y' flame, thus, to the stake fast tide,
They, constantly Christs blessed Martyres dyde.

"Blest Bradford also comming to the stake,
Cheerfully tooke a faggott in his hand:
Kist it, &, thus, unto a young-man spake,
W^{ch} with him, chained, to y^e stake did stand,
Take courage (brother) wee shal haue this night,
A blessed supper wth the Lord of Light.

"Admir'd was Doctor Tallers faith & grace,
Who under-went greate hardship spight and spleene;
One, basely, threw a Faggot in his face,
W^{ch} made y^e blood ore all his face bee seene;
Another, barbarously beate out his braines,
Whilst, at y^e stake his corps was bound wth chaines."

In many of the English pictures of that period the intention of the draughtsman is only made apparent by the explanatory words at the bottom. In one of these a friar is seen holding a chalice to a man who stretches out his hands to receive it. From the chalice a winged cockatrice is rising. There is also a man who stabs another while embracing him. The quaint words below explain the device: "The man which standeth lyke a Prophet signifieth godliness; the Fryer, treason; the cup with the Serpent,

* *Catalogue of Prints and Drawings in the British Museum. Division I, Vol. L. London: 1870. Page 2.*

Poyson; the other which striketh with the sword, Murder; and he that is wounded is Peace." In another of these pictures we see an ass dressed in a judge's robes seated on the bench. Before him is the prisoner, led away by a priest and another man. At one side a friar is seen in conversation with a layman. No one could make any thing of this if the artist had not obligingly appended these words: "The Asse signifieth Wrathfull Justice; the man that is drawn away, Truth; those that draweth Truth by the armes, Flatterers; the Frier, Lies; and the associate with the Frier, Perjury." In another drawing the artist shows us the Pope seated in a chair, with his foot on the face of a prostrate man, and in his hand a drawn sword, directing an executioner who is in the act of beheading a prisoner. In the distance are three men kneeling in prayer. The explanation is this: "The Pope is Oppression; the man which killeth is Crueltie; those which are a-killing, Constant Religion; the three kneeling, Love, Furtherance, and Truth to the Gospel." In one of these crude productions a parson is exhibited preaching in a pulpit, from which two ecclesiastics are dragging him by the beard to the stake outside. Explanation in this instance is not so necessary, but we have it, nevertheless: "He which preacheth in the pulpit signifieth godly zeale and a furtherer of the gospel; and the two which are plucking him out of his place are the enemies of God's Word, threatening by fire to consume the professors of the same; and that company which (sit) still are *Nullifidians*, such as are of no religion, not regarding any doctrine, so they may bee quiet to live after their owne willes and mindes." Another picture shows us a figure seated on a rainbow, the world at his feet, up the sides of which a pope and a cardinal are climbing. In the middle is the devil tumbling off head-

long. The world is upheld by Death, who sits by the mouth of hell. This is the explanation: "He which sitteth on the rayne-bowe signifieth Christ, and the sword in his hand signifieth his wrath against the wycked; the round compasse, the worlde; and those two climbing, the one a pope, the other a cardinall, striving who shall be highest; and the Divell which falleth headlong downe is Lucifer, whiche through pride fel; he whiche holdeth the world is Death, standing in the entrance of hell to receyve all superbiuous liuers."

In another print is represented a Roman soldier riding on a boar, and bearing a banner, on which is painted the Pope with his insignia. A man stabs himself and tears his hair, and behind him is a raving woman. This picture has a blunt signification: "The bore signifieth Wrath, and the man on his back Mischief; the Pope in the flag Destruction, and the flag Uncertaine Religion, turning and chaunging with every blaste of winde; the man killing himselfe, Desperation; the woman, Madness."

There are fourteen specimens in this quaint manner in the collection of the British Museum, all executed and published in the early part of the reign of Elizabeth. As art, they are naught. As part of the record of a great age, they have their value.

Germany, England, and France fought the battle of the Reformation—two victors and one vanquished. From Italy in that age we have one specimen of caricature, but it was executed by Titian. He drew a burlesque of the Laocoon to ridicule a school of artists in Rome, who, as he thought, extolled too highly the ancient sculptures, and because they could not succeed in coloring, insisted that correctness of form was the chief thing in art. Since Titian's day parodies of the Laocoon have been among the stock devices of the caricaturists of all nations.

SUNRISE ON LATMOS.

"TORCH-LIKE SHE CAME TO HIM, A KINDLED SOUL."

ERYXION slumbered on a lonely hill
 Touched by the moon more silvery than others—
 Slept deep and dreamless in the starlight fair:
 But quitting the white heaven, a goddess came
 Upon the sylvan ambush of his rest;
 Torch-like she came to him, a kindled soul:
 Her flushing limbs made warm the pale moon-
 beam,
 And sudden flowers brake and bloomed around,
 Unfolding to that effluence divine,
 While yet he waked not to the thrilling joy;
 She kissed, she clasped the hunter's breathing form,
 More lovely than the forms on bright Olympus,
 Transcendent fair: alas, yet mortal too!

But now a cool light rose above the hills
 In solemn beauty on the Samian shore.
 Loud caroling, a blithe upspringing bird
 Arrowed into the dawning, his clear voice
 Ebbing and falling as he won the sky,
 And waning, vanished in the luminous pearl
 Transfused with airy amethystine flame
 That filled the heaven below the morning-star.
 Diana rose; and like the soaring bird,
 She held her way where morning's magic spread
 Ethereal floating films of fretted gold
 Beneath the splendor of soft Lucifer,
 A flock of pure light pulsing in the dawn
 Beyond the solemn and unfooted sea.

ANGELICA KAUFFMAN.

Angelica Kauffman

IN the old fairy tales of the trials of the beautiful princesses we are always told that at their birth some fairy was inadvertently omitted when the guests were bidden to the christening, and that, arriving after all the others had bestowed their gifts of beauty, wit, wealth, etc., she would nullify all hopes of a happy, successful life either by withholding a desired quality or by predicting some dire misfortune, generally to be a fatal mistake in the choosing of a lover; and then all the beneficent fairies exerted their skill to avert the evil consequences, not always with entire success. There is perhaps some hidden meaning and warning in these old tales, a shrewd insight into the mistakes lovers make in the most eventful period of their lives; for even the queen of the fairies fell in love with an ass's head,

and endowed it with beauty and wit; and to this day Puck or Cupid certainly contrives to throw a glamour over the loved one, and causes a blindness of perception, if not of sight, in the one who loves. At such times—and Dr. Johnson, observing this, suggested that marriages should be arranged by uninterested third parties—reason is dethroned, judgment takes wing, and the poor princesses rush blindly and madly on their fate, and our gifted Angelica was one of the most unfortunate of princesses in this respect.

Jean Joseph Kauffman was originally from Vorarlberg, in Tyrol, and belonged to that class of wandering artists who, traveling from place to place, are ready to do any thing in the way of painting by which to gain a living. His talents were of the most mediocre order, and there is no work of any

"MOTHER AND CHILD,"—[FROM A PAINTING BY ANGELICA KAUFFMAN.]

merit of his extant, or at least any thing that can be authentically attributed to his brush. In the course of his wanderings he came to Coire, the chief town in the Grisons, there met Cléophe Lutz, fell in love with her, and they married; and at Coire, in 1741, was born to him a daughter, whom the happy parents named Maria Anna Angelica. After a residence of some years in Coire, Kauffman again resumed his vagabondage, now, however, accompanied by his wife and daughter. Though a poor artist in both senses, he cherished the profoundest veneration for art, and taught Angelica to regard

artists as the peers of kings, and excited her love and admiration for painters by wonderful tales of the lives of the great masters; he early instructed her, so far as he was able, in drawing and pastel painting, and the pupil soon excelling the master, she, when only a child of nine, used to aid him in the decorations of the Swiss churches, as he rested for a time in his journeys in the different villages.

The Bishop of Como, hearing of Kauffman in his capacity of church decorator, required his services for a church in his diocese, and thither the family went in 1752. Angelica

was now eleven, and for the last year had essayed her skill in taking pastel portraits. The bishop, hearing of the talent of the young artist, himself sat to her. Her success was so marked, and his praises of her genius so unstinted, that she did not lack for sitters among the many strangers visiting Como. While here Angelica pursued her studies, and, besides her painting, began music, for by nature she was endowed with an exquisite voice and correct ear, and her parents always tried to give her the very best instruction their means permitted; and that she was a good student and profited by her opportunities is evident from the praises of her acquirements in later years by competent critics, and her education was of a higher order than was ordinarily in those days deemed essential for a woman.

Work failing Kauffman after two years living in Como, the family again started on their travels, generally performed on foot, and this time they turned toward Italy, and settled at Milan, where he found sufficient work as an assistant to other more successful artists. It was a good move for Angelica, for here for the first time she was in an artistic atmosphere, and surrounded by works of art worthy of study and imitation, not living among those who regarded her own childish efforts as works of wondrous skill. Then, too, she was able to study under competent masters, and paid so much attention to music, made such progress, and developed so much talent that it was often mooted among her friends whether she had not better prosecute her studies with reference to making "the stage" her profession. In Milan the family remained for years, and Angelica, under the most favorable circumstances, grew to womanhood. An advantageous offer was tendered to her to make her *début* in opera at Milan, and she was tempted to accept it, and not without great hesitation finally wisely decided that she was not fitted for such a life, and determined to devote her energies to perfecting herself as an artist. She copied some pictures belonging to Robert of Modena, then Governor of Milan, with such spirit and delicacy that he was charmed, declared himself her patron, and she soon became a favorite artist with the court; but the death of his wife making her father desirous of leaving Milan, he accepted an offer from the Bishop of Constance to undertake the decoration of a church at Schwarzenberg, and Angelica for that church painted in fresco the Twelve Apostles, the first original work she had attempted.

In 1761 the father and daughter began a journey through Italy, living successively at Florence, Parma, Rome, Bologna, Naples, Venice. While in Florence Angelica began to try her skill at etching, her earliest work

in that line bearing date 1762; in 1763 she etched two pictures, evidently of the Neapolitan school—one the portrait of an artist, pencil in hand, the other a student reading a book. In 1764 the two went to Rome, and there remained over a year, Angelica diligently studying perspective. Here she formed the friendship of Winckelmann and Raphael Mengs. She painted Winckelmann's portrait, and was indebted to him for much good counsel. In a letter written to his friend Franck in 1764, he says:

"I have just been painted by a stranger, a young person of rare merit. She is very eminent in portraits in oil. Mine is a half-length, and she has also made an etching of it as a present to me. She speaks Italian as well as German, and expresses herself with the same facility in French and English, on which account she paints all the English who visit Rome. She sings with a taste which ranks her among our greatest virtuose. Her name is Angelica Kauffman."

Near the close of the year 1765 Angelica removed from Rome to Bologna, and while there executed what is acknowledged to be her finest etching—the picture of a young girl arranging her hair, with her face averted from the spectator. She spent one or two months in Naples painting portraits, which were her specialty, and early in 1766 journeyed to Venice, where she was fêted both as artist and woman, and was highly esteemed by the English visitors on account of her skill in flattering portraits and yet preserving the likeness, the English, as a rule, caring more for portrait-painting than other artistic works. Lady Wentworth, who had for many years lived in Venice, and was about to return home, persuaded the father and daughter to go with her, promising Angelica great success as a portrait-painter in England. The trio arrived in London in June, 1766, and a brilliant and successful career seemed opening before Angelica. She was then in her prime, and without positive regular beauty of feature, was yet extremely attractive. Her graceful figure, expressive face, charming manners, exquisitely trained voice, added to her skill as an artist both in painting and music—for her fame had preceded her—all contributed to her success. She soon became "the rage" in the London fashionable world, and every where one heard of "the beautiful, accomplished Miss Kauffman;" the aristocracy extended to her their patronage, and her musical talents gained her the entrée into many a drawing-room from which, had she been famous only as an artist, she would have been rigorously excluded. She soon became intimate with Sir Joshua Reynolds, then the authority in England on art matters, and there is no doubt that he aided her with instruction and criticism, for there was a marked difference in her manner of handling the brush in the pictures painted by her during her stay in England and those of previous years.

The year after her arrival she was chosen by the Duchess of Brunswick, sister of George III., to paint her portrait, and so pleased was the duchess with the picture that she presented the artist at court, and recommended her to the king in such flattering terms that he requested Angelica to paint for him the queen and his son. Now that she had received the approbation of royalty, Angelica was overrun with commissions at her own prices, and her hopes of fame and fortune were in a fair way to be realized. Nor were lovers wanting: Fuseli was one of her suitors, and if popular report can be relied on, Sir Joshua himself not only once, but several times, sought to gain her hand and heart, and for love of her never married. There are frequent notes of visits to "Miss Angelica" in his diary, "appointments with Miss Angelica;" once he speaks of her as "Miss Angel," and adds the cabalistic word "Flori:" as one biographer suggests, must not this have been intended to remind him that he had proffered or was to proffer some gallant attention? He twice painted her likeness, and he sat to her twice himself. Of her portrait of him at Saltram, the poet of the *Advertiser* fulsomely wrote:

"When the likeness she hath done of thee,
O Reynolds, with astonishment we see,
Forced to submit, with all our pride, we own
Such strength, such harmony, excelled by none,
And thou outvalued by thyself alone."

Nollekens declares her to be a sad coquette. Another writer asserts that she was very sentimental. "At one time she professed to be enamored of Nathaniel Dance, then to her next sitter would disclose that she was dying of love for Sir Joshua." Of her superabundance of sentiment one of her letters is an exemplification, for, once writing to a friend, she says:

"You ask me why Como is ever in my thoughts. It was at Como that, in my happy youth, I tasted the first real enjoyment of life. I thought myself in the midst of the luxuries of fairy-land. I saw the archer, too, young Love, in the act of letting fly an arrow pointed at my breast; but I, a maiden fancy-free, avoided the shaft; it fell harmless."

And much more in the same strain. If it be remembered that at the time she speaks of she was a mere child, leaving Como before she was quite thirteen, it will be seen that her fancy rather than memory drew this picture. The gift the unbidden christening guest denied Angelica was undoubtedly judgment, and that inestimable dower, common-sense; for now when every body and every circumstance conspired to render her career one of unalloyed prosperity, by her own lack of judgment she marred her entire life.

About this time—in the latter part of the year 1767—there suddenly appeared in London society a young man calling himself Count de Horn, claiming alliance with the

THE TOILET.—[AN STORY BY ANGELICA KAUFFMAN.]

"THE TOILET."—[AN STORY BY ANGELICA KAUFFMAN.]

noble families of Sweden; and his birth and rank being passports, he was soon made welcome every where among the fashionable set then ruling society. He especially selected Angelica as the recipient of his attentions, and being young, handsome, and fluent of speech, she, though no longer a young girl to be dazzled by honeyed compliments, lent a too willing ear to his flatteries and protestations. He confided to her that he was the victim of some vaguely hinted at persecution at home, that his love for her, though ardent, must not be openly spoken of, and implored her to consent to a secret marriage. The romance of the affair appealed strongly to Angelica's sentimental nature, and in an evil hour she yielded, and secretly, without witnesses, was married to her beloved count. Within a few days a rumor, starting no one could trace from whom, arose that Count de Horn was an impostor—a courier who had assumed the title of a nobleman. The tale spread with rapidity, and, alas for Angelica! was found to be true. In despair she avowed her folly, the pseudo-count fled, and through the power and influence of friends at court the marriage was declared annulled, February 10, 1771.

Such is the tale as usually told; but there are different versions. A woman so conspicuous as Angelica Kauffman, both by reason of her talents and exceptional success in her profession, could not have so romantic an adventure without its exciting wide-spread interest, and finding many listeners to any and every rumor which professed to explain the mystery of the unfortunate marriage.

Then there seemed no sufficient reason why an intriguer should have singled her out as his victim. She was not beautiful enough, though undeniably attractive and charming, to make him by her charms lose his head; not young, for she was twenty-seven; not rich enough to make her modest competence a prize worth risking exposure for, as Count de Horn certainly did. There was some hidden motive for his pursuit of her. Besides, he was in no way punished for his fraud upon her, and disappeared as suddenly and mysteriously as he had appeared upon the scene—vanished into the obscurity from which he had emerged. Then, was the mere fact of his marrying under an assumed name sufficient ground for annulling the contract? If so, why then have recourse to courtly interference? Was there not some special reason why such powerful influence was brought to bear in her favor to free her from a tie she had voluntarily entered into? All these and many other questions of a like nature were earnestly discussed; hints, suspicions, guesses, were rife; and at last it was generally agreed that she had been the victim of some deceit that was never intended to have been carried so far, and that there were reasons not to be made public why she had been so favored in having with so little publicity the marriage dissolved.

The question still remained, Who was her persecutor? Evidently some angry lover, and except in the *dénouement*, the *Lady of Lyons* would seem to have been founded on Angelica's love experience, though Count de Horn was no Claude. A writer in the *Westminster Review* undertakes to make the author of Angelica's misfortune a certain mysterious Lord E——, who, years before, meeting Angelica when a young girl on one of her many journeys with her father, tried, after the manner of those licentious times, to gain her love, but was repulsed. Years afterward, when he again met her in London, a woman fascinating and courted, he renewed his offers, and was a second time rejected, this time with undisguised scorn. Smarting under this second repulse, he arranged the plot with the false count, with what result we have seen. This seems like an effort to quiet conjecture, for no trace of the mysterious Lord E—— among her acquaintances can be found; though, giving a different name—Lord Shelton—Wailly has taken the same idea in his novel, *Angelica Kauffman*. Such a tale could not escape the keen eye of the romance writer; but Wailly's account must not be deemed any more historically correct or accurate in facts than were the historical novels of the prolific L. Mühlbach. There is a judicious blending of truth and fiction in Wailly's novel, making it hard to distinguish the kernel from the chaff; but Angelica is scarcely drawn with as flattering a pen as one could wish.

The French, who in their biographical notices aim at exactness, and always try to write with and from authority, give substantially the general account, but with a different hero. They state it was an English painter of eminent position who thus meanly sought to revenge himself on Angelica for a rejected love; the name they generally omit; but one writer, bolder than the rest, explicitly asserts the painter to be none other than Sir Joshua Reynolds.

If this is the fact, it would account for the extreme interest and influence he exerted to free her from a marriage (which was not intended to be the result of the trick, had not her precipitancy and romantic nature outrun expectation) so repugnant; and yet, on the other hand, if she knew Sir Joshua to be the author of her trouble, would she still have desired and relied on his friendship, as she certainly did during the rest of her stay in England? Unable to solve the enigma, it being one where the actors having prudently refrained from explaining it, the only data for the public being such crumbs of evidence as will inevitably fall and be gathered up by the curiosity-monger, but having presented both versions of the tale, the reader is left to choose the one most pleasing to his fancy. All writers of Angelica's life agree in there being some secret about the sudden appearance, marriage, and disappearance of the so-called count, which was never cleared up, and never, evidently, intended to be, as those to whom it was known died and made no sign; so, as in the Byron scandal, there is ample room for conjecture. If Reynolds were indeed her secret enemy, he afterward did all in his power to further her claims to recognition and power, and perhaps it would be more charitable to let the unknown Lord E—— suffer from such a slur on his manhood than the great painter.

Angelica's friends showed no lack of sympathy for her, and she turned with feverish eagerness to her art, and worked unceasingly. At the close of the same year, 1768, the Royal Academy was started, and she was chosen one of the original thirty-six members—a great honor at that time—and her paintings occupied prominent positions at the exhibition. At this time she painted her best picture, the portrait of the Duchess of Richmond, and the famous one of the celebrated Duchess of Devonshire and the Duchess of Duncannon seated in a park, side by side, holding caressingly each other by the hand. Her portraits were always flattered; it was asserted she never could paint an ugly person, and her poses of her sitters were apt to be affected. She attached great importance to the flow of the drapery—so much so that Sir Joshua once said to her, "Your sitters could walk without disarranging their draperies"—a compliment of which she was very proud.

"BLINDMAN'S-BUFF."—[FROM A PAINTING BY ANGELICA KAUFFMAN.]

She now became ambitious to excel as a historical painter, but she never produced any really meritorious work. In 1770 she exhibited "Vortigern and Rowena," "Hector upbraiding Paris," "Cleopatra at Marc Antony's Tomb;" but in all she undertook her mannerisms were evident. Her touch was delicate, her coloring dainty, resembling pastel. There is no vigor either in the conception or execution of her paintings. As an eminent French critic says of her, "Elle affadit tout ce qu'elle touche." By the English she was differently estimated, at least then, for when the plan was broached of decorating the bare walls of St. Paul's, among the painters selected, viz., Sir Joshua, West, Bray, and Cipriani, Angelica was also chosen. The scheme took shape, the subjects were discussed, and not only did the dean consent, but gave his hearty approbation, when the Bishop of London, who had been applied to for his assent, answered the dean in the following curt note:

"My good friend,—I have already been informed that such an affair is in contemplation, but while I live and have the power, I will never suffer the doors of the metropolitan church to be opened to the introduction of popery."

Sir Joshua Reynolds, as the head of the

Academy, to become a member of which was deemed a privilege, incurred the enmity of artists whose pictures had been rejected; and Hone, in 1775, smarting under some fancied wrong, exhibited a picture called "The Pictorial Conjuror displaying the whole Art of Optical Deception." Sir Joshua, as an old man, is, with a child beside him, and armed with a conjurer's wand, performing incantations, and has conjured up a number of spirits who are floating about him. These spirits were likenesses of Sir Joshua's admirers, and one was a faithful portrait of Angelica. Comment was made on this fact; and Hone, finding public opinion against him, denied the likeness, and wrote to Angelica declaring that nothing could be farther from his intention than to ridicule her.

In the course of years Angelica realized a handsome fortune. Her paintings and etchings always found eager buyers; and her unfortunate marriage being apparently forgotten, though in reality it was still the theme of gossip, and by her the mortification was always keenly felt, she lived in England, fêted and courted, until the year 1781; then, her father's health failing, they decided to return to Italy. But before she left England she consented to marry An-

tonio Zucchi, a Venetian by birth, an old friend of her father's, who had long lived in London. The prospect of losing her father and being alone in the world was one she could not face, and the quiet affection of Zucchi, which had surrounded her for many years, had become necessary to her, and, unostentatiously and with but few guests bidden, they were married near the end of the year, and started for Italy. They stopped at Schwarzenfeld, where her father had relatives, and there he died the following season, and the married pair then went to Venice, where Angelica painted her large work, "Leonardo dying in the Arms of Francis." After a short stay in Venice, the Zucchis proceeded to Rome, and here, though she no longer found Winckelmann and Mengs, her old friends, their absence was supplied by the hosts of new admirers who flocked around her.

Raphael Mengs—who wrote of her, "As an artist she is the pride of the female sex in all times and all nations; nothing is wanting, composition, coloring, fancy, all are here"—had died some two years before, and she sorely missed his appreciation and regard. Among the new friends were Goethe, Herder, Klopstock, Gessner, who were frequent visitors at her studio, and all of whom write of her in flattering terms. Her charming manners and graceful coquetties still exerted their old accustomed glamour over all who came in contact with her. Goethe, in one of his letters, writes, "The good Angelica has a remarkable and, for a woman, really unheard of talent." In his book on Winckelmann he says of her: "The light and pleasing in form and color, in design and execution, distinguish the numerous works of our artist. No living painter excels her in dignity or in the delicate taste with which she handles the pencil." Other art critics have judged her less favorably, the most notable one being Fuseli, though perhaps some allowance should be made for his being a rejected lover as well as a captious critic. In his notes to Pilkington, under the title of Zucchi, the only instance where she is not spoken of in biographical sketches by her maiden name, he writes:

"The writer of this article, who was honored by the friendship of Angelica, and cherishes her memory, has no wish to contradict those who make success the standard of genius, and as their heroine equaled the greatest names in the first, suppose she was on a level with them in powers. Angelica pleased, and deserved to please, the age in which she lived and the race for which she wrought. The Germans, with as much patriotism at least as judgment, have styled her 'the paintress of minds'; nor can this be wondered at from a nation who in Mengs flatter themselves to possess an artist equal to Raffaello.... Her heroes are all the men to whom she thought she could have submitted, though him perhaps she never found, and to his fancied manner of acting and feeling she, of course, submitted the passions of the subject. Her heroines are herself, and, while suavity of counte-

nance and alluring graces shall be able to divert the general eye from the sterner demands of character and expression, can never fail to please."

Later critics side with Fuseli that the charm of Angelica's works was due to the personal feeling excited by the artist rather than to any real merit in her productions. Yet while she lived her name was a passport to success, and as late as 1794 the English publishers sought permission to add weight to the merits of their annuals by calling them by her name, and having illustrations from her fertile pencil. One, bound by Roger Payne, entitled *Angelica's Ladies' Library*, illustrated by her and Bunbury, and dedicated to her Majesty, printed for "Mrs. Harlow, bookseller to her Majesty," is in the writer's possession. Angelica's illustrations are, the frontispiece, "Marmontel's Shepherdess of the Alps," "Gualtherius and Griselda." The pictures are better than the reading matter; certainly the women of that day fared badly in the mental food prepared exclusively for them. Among the articles are "Moore's Fables for the Female Sex," and various letters of advice to wives and daughters. Among the latter is one from Lady Pennington to her daughter, where the following books are the ones she is desired to read: "Tillotson's, Hadley's, Sherlock's, Clarke's, Seed's sermons; Locke; Mason on Self-Knowledge; Young's Night Thoughts; Seneca's Morals; Cicero's works; Collier's Antoninus, Epictetus, Leonidas; Pope's Essay on Man; Rapin's History; Hook's Roman History; Potter's Antiquities; The Spectator; The Guardian; Thompson's Seasons; Pope's Translations," etc.; and then follows: "Novels and romances never give yourself the trouble to read. Many of them contain some few good morals; they are not worth picking out of the rubbish intermixed. It is like searching for a few small diamonds among mountains of dirt and trash, which when found are too inconsiderable to answer the pains of coming at them; therefore I advise you never to meddle with this tribe of scribblers." What girl of sixteen nowadays would care for such a list and such advice, and would either read the one or follow the other?

After fourteen years of quiet happiness Antonio Zucchi died, and soon after Angelica lost the greater part of her fortune; but she wrote to a friend who offered assistance, "Poverty does not daunt me, but this solitude kills me." She resolutely set to work again, but her health and spirits suffered from her isolation; sympathy and approbation were necessary to her; and though she had friends, she suffered keenly from loneliness. There was no one to whom she was first in affection, and she had all her life been the object of devoted affection, first to her father, then to her husband. She sought change of scene, and visited

"THE SKETCHER."—[FROM A PAINTING BY ANGELICA KAUFFMAN.]

Florence, Venice, etc., but with no good effect upon her health, and again returned to her beloved Rome, where she lived in retirement. When, at the end of the century, the French entered Rome, General Lespignasse sent her word she should be exempted from the necessity of furnishing lodging and rations for the soldiery. She thanked him, and asked to be allowed, in token of her appreciation of his kindness, to paint his portrait. This was one of the last of her finished works. She was soon after seized with a lingering disease; and a prey to weakness, pain, and loneliness, she, after a few years of languishing, died, November, 1807. She shared the inevitable lot: "Some days must be dark and dreary;" and with her trouble and sorrow came in age, when there is less strength to stand up against adversity.

The members of the "Academy of St. Luke's" took charge of the funeral ceremonies. The artists and connoisseurs in Rome followed her coffin, and she was buried in S. Andrea delle Fratte; and in order to render her fitting homage, behind her coffin were borne, as was the custom of honoring the great masters, her last two works.

Many skillful engravers, among them Bartolozzi, Daw, Bettelini, have engraved her compositions, which are to be found all over Europe, from Ireland to Russia, where, in the "Hermitage" collection, are some of the best specimens. In the Louvre is a painting of "A Mother and Child," only recently engraved. At Florence, in the same gallery with the portraits of Madame Le Brun and Maria Tintoretto, is Angelica's likeness painted by herself, an engraving from which heads this article. She makes herself less regularly beautiful than do Reynolds and Grosse in their portraits, and she is probably truer to nature, for she was German by descent, and in consequence her features lacked the sharp, clear outline of the English type of beauty.

Among her jottings in note-books, of which she was fond, was found the following wise resolve, which is worthy of being remembered:

"One day when I found difficulty in portraying the head of Jehovah, as I felt it should be to be correct, I said to myself, 'I will never again try to express supernatural things by the aid of human inspiration only; I will wait for them until I find myself in heaven, if indeed I am able to continue there my painting.'"

RAPE OF THE GAMP.

THE THIRD MATE OF THE "ADRIATIC."

CHAPTER XXI.
SOMETHING WRONG.

FIVE years have passed since the confession which Mr. Lane made to his friend on the first day of January, 185-. Shortly after that interesting incident, Mr. Lane, under the auspices of Dr. Phelps, entered himself at the college in Oxford of which his friend was an ornament. There he resided for the space of about four years, strove the academical strife, and at length

graduated there, although no such name as that of Lane had been registered on the college boards. In short, Mr. Lane had ceased to exist, and Bedford Lyte (*in propria persona*) had resumed the battle of life.

Of the sixth year one month is gone after those sixty months, and another moon is on the wane. The English clipper ship *Adriatic*, of 3000 tons burden, is homeward-bound, with a strong northerly wind on her larboard quarter, with yards well braced, and every available square foot of canvas draw-

ing its utmost. A magnified ideal racer, she rushes forward, showing speed and strength at every stride, as she reaches superbly from wave to wave, and tosses aside their watery crests, which glitter about her bows in never-ending rainbows.

One little circumstance is noticed by the solitary passenger who paces her clean poop deck. To this we shall presently have occasion to refer. He is not a seaman by profession, but having an artist's eye for the hull and rigging of a ship, and that mysterious sympathy for power which always exists in a strong man, he has wandered up and down the numerous wharves of New York and strayed among her forests of masts without experiencing a more hearty glow of admiration for any vessel than for the one whose deck he now patrols.

The intention of this passenger was to cross in the *Aspasia*, a large mail steamboat which sailed a day or two before the *Adriatic*. But it so happened that a maladroit little bird, an old and familiar companion, had escaped from the window of his hotel, and no consideration would induce him to abandon it. No sooner had the *Aspasia* sailed than the truant (after apparently innumerable futile attempts) discovered its master's open window, and calmly returned to its allegiance. When we record the bird's name as "Thomas," it will not be necessary to state that the single passenger on board the *Adriatic* was Bedford Lyte.

"We may be a week longer," he murmured to himself, pacing the narrow deck, "but I doubt if we shall. I should like to sail on a clean ship which beat a dirty steamer. No Cunard or Collins could pass us at this rate. Thirteen knots the mate gave by the last reckoning; but we have been making far more than that for the last thirty-six hours, according to our longitude. Let me see: thirteen knots are just fifteen statute miles. They could hardly beat that. I know the mail steamboat I went to Vera Cruz in could not."

The passenger, though no sailor, was a fair mathematician and navigator, and Captain M'Leod, of the *Adriatic*, was any thing but averse to comparing his longitude with that of his passenger after their noontide observations.

Again the passenger struggled with some troublesome compunctions which suggested that steamers cross the Atlantic in shorter time than sailing vessels. "She has waited five years for me, and won't throw me over for five days now," he muttered, not quite with a tone of conviction, for a letter which seemed to burn in the breast pocket of his pilot coat implied that, whatever the perils of the deep might be, at least equal dangers beset his absence from the coasts of Albion. "It is trying her too severely," he continued, tramping up and down the windward

side of the deck with such creaking, angry sea-boots that the second mate, vainly trying to sleep below, mentally consigned him to the tender mercies of David Jones—"trying her too severely. I always was a brute. I have always hit my hardest where another man would touch most softly. I ought to have abandoned Tommy and taken the *Aspasia*. It was madness to risk losing her for a tomtit."

Finding no outlet for his angry impatience in any possible action, the strong man became rigidly statuesque, and perambulated the small space with fierce though silent energy, a moving petrification.

The wind freshened, still blowing from the north. It was the first mate's watch, and at six bells (3 P.M.) he came on the poop and gave orders for shortening sail.

"How do you like the blasts of Boreas, Mr. Lux?" he facetiously observed, and furled the top-gallant sails, the mainsail, and the jib, reefed the top-sails, and so made the ship "snug," as he called it, under reefed top-sails, a foresail, and a foretop-mast staysail.

"But she'll have to be *snuggerer* yet afore long, or I'm a Dutchman," cynically observed the third mate, who was steering the ship, being the only man on board who could do it singly.

Poor Bedford was so bewildered by the mate's dark classical allusions, and the relative merits of "snug" and "snuggerer," that his attention was partially distracted from his proper woe and fixed upon the dangers of the deep.

The helmsman, who evidently had no si-necure, though he handled the huge wheel with a masterly touch, and was provided with a possible ally in the person of a sailor who shambled about to leeward, regarded the passenger with less contempt than the sons of Neptune generally bestow on "land-lubbers." He was Lyte's equal in size and strength, though decidedly not his superior in grace. Older than the captain, and probably a better seaman than any on board, he ranked little higher than a mere "able seaman" in the ocean hierarchy. Perhaps as he stood there, not by any means neglecting his duty, but unavoidably looking at the man who passed and repassed him so often in his stern and restless patrol, he saw in his face and mien some indication of the struggle within him, and remembered in his own rude career some hour when his mind had been torn with a conflict of fear, doubt, or self-reproach, to which the perils of his vocation were as mere daily chances. Whether from previous observation or some such present reflection, he now looked at the passenger with a keen interest. The latter returned the look, and gradually entertained a hearty respect for a man of such evident power and gallant bearing.

"How is it you are alone at the wheel in

"FAR-OFF COUSINS IN THE COFFEE-ROOM OF THE CASTLE HOTEL."—[SEE PAGE 688.]

such a heavy sea?" he asked, observing the manifest labor of his position.

Solemnly expectorating behind the wheel, as if he had intended to deliver an oration, Mr. Crays jerked his head toward the amphibious person to leeward, and then, with something between a wink and a blink, devoted his powers exclusively to the compass and the helm. At this moment another sailor brought the binnacle lamp, already lighted, and placed it in its position; but Lyte noticed that Crays scarcely saw him, steering on solemnly, and considering the access of a lamp to the compass no more than we

notice the rising or glimmering of a star at night.

Perhaps a little piqued at the man's reticence, Lyte stood and looked at the compass for a minute by the new light of the binnacle lamp, then at Mr. Crays, observing the effort which his control of the wheel cost him, and then said, "Why is she so heavy in hand?"

The helmsman cocked his eye, shifted the plug of tobacco in his mouth, and looked knowing, but tacitly declined to converse.

Rather pleased now and amused at his persistence, Lyte was withdrawing by the

companion ladder, when the amphibious one shuffled up to him, and with a scrape remarked, "Muster Crays ee wunt spee-uk at t' wheel." Then he shuffled away again, and the passenger retired, wondering whether the apologist came from Somerset, Dorset, or Devonshire. Thus even the current of events at sea will serve to distract a lover's reverie.

At eight bells, that is, at 4 o'clock P.M., as the sun was sinking toward the horizon behind the good ship *Adriatic* in a great blaze of crimson cloud, Mr. Lyte requested the steward's boy (a colored man about fifty years of age) to ask Mr. Crays to step into his cabin, which that mariner shortly did.

"You see, I am anxious, Mr. Crays," said the passenger to his guest. The reader will understand that the third mate had no quarters among the gods in this part of the ship. Mr. Lyte continued: "I asked you why she was so heavy in hand. I am no seaman, but— Will you oblige me by taking a nip with me?" Whereupon Mr. Crays took his noggin of rum like a man, and Mr. Lyte took another, each blinking at the other in true nautical style. "But, as I was saying, you were too busy to answer me. Now why does not the ship answer the helm more easily? I am terribly anxious to be at home."

"You see, Sir," the third mate replied, "she be a sight too deep in the water."

So speaking, and wiping his mouth with the back of his brawny hand, the mariner bowed and withdrew.

"Another west-country man," said Mr. Lyte to himself, having obtained little further information except a confirmation of his own opinion. But pursuing Mr. Crays to the main-deck, and finding him hesitating about a favorable moment for making the rush forward, he urged the question. "Is there any thing wrong with her?" he asked.

"Best ship out of London dock," was the curt answer.

"Any thing wrong with her cargo?" the passenger persisted.

"Good enough, for that matter," replied Mr. Crays, "but rayther too much of it. Wheat in bulk, you know." Then, as the water rushed out at the lee scuppers, he made his advance gallantly, and was soured from head to foot with the crest of an ill-disposed wave which took that opportunity of dashing over the bulwarks.

"Poor old devil!" the passenger calmly observed, rather enjoying the immersion of his taciturn friend.

Mr. Lyte was the only passenger on board the *Adriatic*. After completing his university course at Oxford he had accepted an engagement to Mexico as correspondent of a London review, and was returning to England by way of New York. The delicacy which prevents a passenger in every instance from asking impertinent questions

about the ship to which he has intrusted his life and his personalty was in this case doubled by the fact that his passage was a gratuitous act of courtesy extended to him by a mercantile firm (agents of the London owners) whose acquaintance he had made during his brief stay in the Island City.

The circumstance which had attracted his notice before Mr. Crays's reluctant admission was the extraordinary depth of the ship in the water. Even in the smooth sea through which they had sped their way for the first few days the water had continually gurgled in at the scuppers on one side and out at the scuppers on the other side, washing across the main-deck in a manner more conducive to cleanliness than security. Latterly they had enjoyed a strong leading wind, with only a moderately heavy sea, and though the ship leaned over to leeward much less than Lyte's previous experience had led him to anticipate, yet now and again the summit of a wave curled over her bulwarks and flooded the decks from poop to fore-castle. The poop and fore-castle decks were so lofty that they remained comparatively dry. But even a landsman could see at a glance that a vessel encountering only moderate weather ought not to be half under water. And certain angry murmurs of the crew, to which it was impossible to remain deaf, had aggravated Lyte's suspicions of *something wrong*.

Already he had ventured on a faint and delicate hint to Captain McLeod, who had received and hitherto uniformly treated him in the friendly spirit suggested by the very terms of his passage. The captain's testy answer to that hint had absolutely convinced him of impending danger. It was clear to an unprejudiced observer that the captain, being a fifth-part owner of ship and cargo, was reluctant to admit the overloading of his vessel, and yet was perceptibly annoyed at the avaricious policy which had overridden his judgment and sent him to sea in charge of an enterprise involving so much property and so many lives beyond his own.

With regard to the particular advantages or disadvantages of "wheat in bulk" as a cargo Mr. Lyte had hitherto obtained no experience, and the etiquette of his position rendered the asking of any questions a delicate matter. Mr. Crays's reticence, added to the captain's manifest testiness, made it clear that his duty to himself and all concerned now imposed silence upon him. Why "wheat in bulk," that is, in one undivided mass, in the hold of a sound strong ship should be more dangerous than wheat in sacks, he was at a loss to apprehend. Above the hold, or "between decks," there was, as it seemed to him, a whole cargo of quite another character. This consisted entirely of American clocks, packed two dozen in a case, and also some heavier cases containing

sewing-machines. This upper cargo occupied the region inhabited by passengers in an emigrant ship, and had been stowed while Mr. Lyte was putting his effects on board and making his little arrangements for the voyage. The freight both on wheat and machinery was so high and space so valuable that no ship's stores, and no water except in the iron tank forward, had been placed below. The main-deck under the bulwarks was lined with double rows of casks of fresh-water and barrels of provisions firmly lashed together, and, as it seemed to the passenger, impregnable to the assaults of wind or wave. The poop deck, however, and the forecastle, though separated by the entire length of quarter and main decks, like two islands with an angry sea between, were free both of waves and artificial incumbrances. In a word, the good ship *Adriatic*, from mast-head to keel, was one to cause the breast of a landsman to glow with admiration; and despite her rigidity and unseemly depth in the water, Mr. Lyte would have constantly and sincerely thanked the Messrs. Dearborn for giving him this passage had it not been for a tiresome letter which kindled agony in his breast.

After clear and bright weather, with a fair or leading wind from Sandy Hook, they had encountered fogs off the Newfoundland Banks, and were as yet hardly clear of these dubious shallows. At eight o'clock in the morning, however cold it might be, the passenger used to emerge from the cuddy door, and have a dozen buckets of sea-water pitched over him from the poop deck above. This, far from being irksome labor, was a bit of fun for the sailors while washing decks. With help of an occasional chat with Captain M'Leod and the mate, and his observation and calculations at noon, and his perusal of some novels purchased of Messrs. Harper before leaving New York, he managed to pass the short wintry days, and at night would lean over the taffrail, smoking his old wooden pipe, and fondling that quaint tomtit, which had become so familiar with his irregular hours as to roost indifferently by night or day. To his astonishment one evening as he leaned over the lee rail a hand heavy as his own was laid on his shoulder. He knew that M'Leod was pacing the deck to windward; but they had not been overfriendly since his inconsiderate question.

"Mr. Lyte," said the captain, generously, "you thought me a bit crabbed with you, day before yesterday, when you asked me a question. So I was. A man don't like to be catechised in that way."

"I most sincerely apologize, captain. The truth is, I am such a landlubber that I don't know how to behave as a gentleman on board ship."

"Stow that, Mr. Lyte," the captain replied. "It strikes me you won't act otherwise than gentleman-like at sea or on land. I may not be exactly a gentleman myself, but I know one when I come across him, and—"

"Pray stow that, captain," Lyte broke in; "you surely can not take me for a sham swell. I work for my living almost as hard as you do, and never hope to travel with a better gentleman than you are."

"I know something about you from Messrs. Dearborn," M'Leod rejoined; "and my own wife's brother is a fellow of one of those colleges, though not half the man you are. I ought not to have cut up rough with you the other day. I can remember many a time asking my brother-in-law questions about his colleges and colleagues, and thinking him a very little-minded man for seeming a bit impatient with me because I pushed him with questions on what was A B C to him, but Greek to me. The truth is, I'm a kinder put out with this overlading of the ship. It was done against my judgment, and ain't doing justice to me nor the ship."

"I take what you say as a generous expression of good-will and confidence," said Lyte; "and if you have an opportunity of putting it to proof, I hope you'll find me worthy of it."

"Well, Mr. Lyte, there's no saying what may happen," the captain replied, somewhat moodily; and then repeated, "there's no saying what may happen. Things don't look so ship-shape as I could wish. But I have a rare good ship's company. The three mates, boatswain, carpenter, two boys, and four able seamen have stuck by me for these ten or twelve voyages." Then turning sharply on the passenger, and betraying a remarkable mixture of resolution and hesitation in his keen black eyes, M'Leod suddenly asked, "Do you hear them growling at all?"

For a few moments Lyte hesitated, with downcast eyes, and probably those few moments were sufficient to convey an unspoken affirmative to the skipper's ready apprehension. But still he waited as if for an answer, to prove his man; and Lyte said, meeting his eyes calmly and firmly, "I don't walk about your deck eavesdropping, Mr. M'Leod; but I don't mind saying that since I have seen how deep the ship is in the water, and how stubborn to her helm, I have regretted being your guest, for I have an object in reaching home."

"So have I, Lyte," said the honest seaman, again laying the heavy hand on his shoulder. "I have a wife and a little girl on the coast of Sussex, and I should be loath to leave them for good and all. Come down to my cabin and have a quiet glass with me."

And down the two veterans, the sturdy

sailor and no less sturdy landsman, went. Before they parted that night the latter understood something about "wheat in bulk" and its disadvantages, or rather the disadvantages of those who carried it beneath their feet as cargo. Unlike wheat in sacks, which retained its position however the ship might lurch, "wheat in bulk" was apt to shift to starboard or to larboard in some sudden lurch, when its own mass and weight would force it to maintain that new level, so hostile to the well-being of the vessel in which it lay, like an imperfectly digested repast in the abdomen of a suffering giant. But if the vessel should admit an insidious rivulet of water through one of its thousand seams, this horrible mass would swell and swell, still refusing to move, but distending its awful bulk until the sides of the doomed ship (forced open from within) gaped wider and wider to receive the all-devouring ocean. Mr. Lyte had also learned why American clocks should be placed between decks instead of in the hold, and how it was that an officer who was part owner of the ship he commanded was unable to control the tonnage of her cargo. But beyond and even below these mysteries he reluctantly discovered that his honest captain was a secret devotee of Bacchus.

At midnight, when the watches changed, M'Leod went on deck for a few minutes to leave his orders with the officer of the watch, and Mr. Lyte ran the gantlet of the scudding spray which swept the main-deck, making his way forward to smoke his last pipe on the fore-castle with the man "on the look-out." A certain delicacy of feeling prevented him from even allowing further conversation on the subject of their common danger; and when the genuine British growler manifested itself in his companion, Mr. Lyte cut him short, saying, "You ought to have protested before she sailed if you saw any thing wrong. The best thing to be done now is for us all to pull together, and if any thing *does* go wrong, to pull it right again." "Old Blowhard," as this look-out man was denominated, stared at his companion in the dim moonlight with a puzzled wonder, until, as they approached the after limit of the fore-castle in their short promenade, a heavy sea struck the ship on her weather quarter, shaking her from stem to stern, and a considerable portion of the crest lashed both their faces with its briny scourge, blinding them to every thing except the necessity of self-preservation, which they immediately recognized by clutching hold of the nearest rope and crouching till the shock had subsided.

"And I should like to know what *you call that!*" retorted Mr. Blowhard, as if Lyte had previously been naming all the animals in Noah's ark.

"You have more experience of foul weath-

er than I have. What do you call it?" asked the landsman.

"Foul weather and *foul play!* Them's what I call it. And d——d bad steerin' too, gettin' her into the trough of the sea like that."

"I could have told that Mr. Crays was not at the wheel myself; but what *do* you mean by 'foul play?' We're all on board the same ship."

"But *the howners ain't,*" bellowed Mr. Blowhard. "They gammons a man into signing articles for the return voyage, and then loads her down to the water's edge to come home in Febru-airy acrost the o-cean."

"But the captain's on board," the passenger mildly remonstrated.

"I didn't say as he warn't," savagely retorted the mariner. "Though he is a fifth-part howner. The ship's insured. The cargo's insured. *Es's* insured. And what's more, he lushes within a hinch!" By which latter laconic form of words the seaman merely expressed his recognition of the dismal fact which Mr. Lyte had already been constrained to admit. So they parted in melancholy concord, and with mutual respect.

The *Adriatic* being on the port or larboard tack, Mr. Lyte's cabin being on the larboard side of the ship, and his berth on the same side of his cabin, he was liable literally to tumble out of bed if the ship should lean overmuch to leeward, or particularly if she should lurch suddenly in that direction, especially as the steward in his hospitable zeal had accommodated the guest with two thick mattresses, thus raising his recumbent body almost to a level with the summit of his bed-board. As yet, however, the ship, with a strong breeze, rising at times to half a gale, abeam, i. e., at right angles to her course, had sped majestically on her way, deviating from the vertical and horizontal lines but little until this evening. The mercury, however, had been going steadily down for twelve hours or more; and though the pale moon was doing her best to illuminate the shroud of mist which hung over the sea, other indications of a coming storm were not wanting to an observant eye. "Tuck yourself in tight; you'll have a bit of a roll before morning, if I'm not mistaken," the captain had said to him when they parted. But Bedford Lyte was accustomed to inconvenience, and only thought about storms and tempests as the possible means of delaying his arrival at an English port. If only the gale were favorable, it might blow, so far as he cared, until their balance of life or death should hang poised in the crest of every billow, so long as they could only run before it, fly before it, outstrip the fastest mail steamer, and distance the very sea-birds in their flight. The only thing he dreaded was heaving to and consequent delay.

The landsman had tucked himself tightly in, and was by the exercise of a strong effort gradually falling into the arms of Morpheus, when he suddenly became conscious of a very different fall. However it may have happened, he was involved, head-foremost, like a netted lion, among the legs and lashings of the long cuddy table, and the door of his own cabin was playing a tattoo on the calves of his legs, which protruded across the space between the table and the bulk-head.

Crawling back again ignominiously to his retreat, and relighting his swinging lamp, Mr. Lyte took Frank Browne's last letter from the pocket of his pilot coat, and spent a restless hour in reading it and poring over its contents. Fool that he was not to have left America two days before by the *Aspasia*, that fast mail-boat which always accomplished the voyage in twelve days, sometimes in ten!

The letter certainly contained much to distress him; and now that he came to look at it calmly, as he said to himself, but really less calmly than before, he was amazed at the frivolity which had beset him in New York, and had induced him to let the *Aspasia* sail without him. Then his eye turned to the innocent cause of that delay with anger: perhaps the first time he had so looked upon it during all those years. And now the age and infirmity, the unwavering fidelity and constant love, of the little creature disarmed his wrath, as it stood roosting on one leg in its ridiculous manner, with head under its wing, like a ball of fluff, on the rail which supported the curtain of his berth.

"Poor little Tom!" he exclaimed, relenting. "True friend and faithful companion! And never played me a trick before in all my wanderings. He is getting old and stupid; and the multitude of the windows, all so exactly alike, in the hotel confused him. No doubt he flew to a hundred wrong ones in succession, and found them shut, or saw strange faces within, and went back disconsolately to those bleak skeletons of trees, where he would have died if I had left him. Perhaps the climate of Mexico has affected his brain. Never mind, Tommy!

"You and I are old:
Old age hath yet his honor and his toll:
Death closes all."

Remarkable and almost superstitious as his trust in the bird's preternatural instincts had hitherto been, it did not once occur to him now that any benefit should accrue to him from having missed the steam-ship and sailed in this half-doomed *Adriatic*. On the contrary, each time he read and re-read Frank's letter he regretted the delay more and more, and cursed his own carelessness for letting the bird fly out of window in the midst of a crowded city, and from such a difficult window to distinguish among others.

But before looking over the distressed passenger's shoulder and reading his letter, we must flit to other scenes and incidents of an earlier date.

CHAPTER XXII.

HIM! WHY, HIM!

FOR a long time past there had no longer been any unpleasantness between the Brownes of Pedlington and Bedford Lyte, as the possessor of that once-hated name. To tell how this happy reconciliation came about is our present office. That epileptic attack which broke down the resistance of the sturdy old lawyer on a certain Christmas-day some five years ago was followed by a terrible prostration which at first affected, or seemed to affect, mind and body. The doctors (and we may be sure that plenty of these learned wights attended his temporary couch in Dover) were decidedly of opinion that this was likely to result *either* in a very alarming crisis *or* in an ultimate tendency to yield to a very judicious and energetic treatment extending over a period of twelve or eighteen months. A tremendous gun of the largest calibre was telegraphed for. He came from the metropolis, and was, Frank declared, only distinguishable from the Pedlington and Dover authorities by the superior ticking of his pocket chronometer, which was furnished with a complete system of second-hands, and fingers indicating fractions of seconds. After a profound and costly consultation these magicians declined to state which of the above results would supervene, or how soon, or even whether either of these results, or any thing else, would certainly ensue. But the doctor with the great watch and the fabulous fee hinted to Frank that he would be unwise to neglect any little documentary arrangements (usual in such cases) while the patient retained some use of his mental faculties and right arm.

Thereupon all the Brownes were summoned, by telegraph and otherwise, and, as the custom of their family is when any member of it is about to die, assembled from the four corners of the county, from the hills of Surrey and the downs of Sussex. They came from Pedlington, from Brownleigh, from Farfield, from Tiddenden and Benterden and the remoter regions, until every bedroom in the old Castle Hotel at Dover was engaged for a Mr. Browne. The reader will understand that these good old-fashioned Tory families still patronize "The Castle." The new and meretricious "Lord Warden Hotel" is for your traveling Americans, Russians, and Frenchmen, or mere English waifs and strays.

So about a baker's dozen of far-off cousins, including Uncle Robert, the head of the family, from Brownleigh, sat down lugubriously to greasy mutton-chops and damp potatoes at the common table in the frouzy old respectable coffee-room. I say lugubriously, although a grim hilarity usually prevails on these occasions, because a deadly feud existed and almost raged between every member of this affectionate group. Robert Browne, Esquire, of Brownleigh, had especially infuriated each one of his connections and relatives, remote or near, by charging his estate in order to bestow upon that insidious warrior, Robert Browne junior, a lieutenant and adjutant in her Majesty's —th Regiment of Infantry, an annuity of £200 per annum. One Mr. Browne, a lawyer from Tiddenden, devoured all his smoky mutton without salt because the waiter had placed the salt-cellar near an obnoxious young clergyman, the Rev. Timothy Browne, from Benterden. Not even about the weather would they converse, although it happened to be execrable, and they were all damp; and the waiter, who was more or less acquainted with each one of them severally, made two or three feeble attempts to kindle a glimmer of intercourse on this pleasing topic. The ferocious dignity with which the youthful ecclesiastic said his "grace before meat," alone, and standing with folded palms, seeing that all the others fell to unceremoniously (which they only did to annoy him, each being accustomed on other occasions to the same ceremony), was a study worthy of Hogarth.

After this dismal repast they each went in turn, glided into the dark chamber, stared at their dying relative, took up his unresisting hand, held it for a moment, then dropped it like a hot potato, and shuffled out of the room with an awkward and guilty aspect, as if each one had surreptitiously pocketed a silver spoon. It had been stipulated by Mrs. Browne beforehand that not a word should be spoken. He was not strong enough to bear it, she said; the fact being that he had quarreled with every one of them except Uncle Robert, to whom alone he now gave his blessing, calling him a "dear fellow." The honest elder brother shed a tear as he dropped the hand, but none the less looked guilty and uneasy as he left the audience chamber. One exception to the general behavior shone out in the case of the young clergyman. Long-coated, severe-cravatted, smug, prim, sleek, and carrying a book with a gilt cross upon it, he commenced a pious address to his dying uncle.

"Take him away," gently observed the invalid, turning to the wall. "Take him away. I never could bear the sight of him."

And Mrs. Browne led him out, dimly con-

scious that he was alluding to pearls and a quadruped not famous for cleanliness or gratitude.

These were Walter Browne's funeral obsequies. Yet it is only fair to add that not one of these gentlemen expected a shilling from him. Amiable and affectionate each in his own household, it was the habit of the family to quarrel among its remoter members during life, and at the portal of death to draw a veil mournfully over the preceding disagreement.

The good man had long ago made up his mind as to the disposition of his worldly affairs. As every wise man does, he made his last will and testament when sound in body and clear in brain. So strongly did he feel this duty that not even the severe calamity which had befallen Blanche would induce him to meddle with a will once made. No codicils for him, or chancery suits for his family. Let Blanche live with her mother. Let Frank save a remnant of her fortune if possible. If not, let it be. By no means let Frank prosecute that scoundrel George Baily. His sin would find him out; and probably Blanche would forgive him in the end, if the man had ever loved her at all, or she him. These were some of Mr. Browne's funeral observations. But not all.

Calling the family whose acquaintance we have made in their native town round his bedside, he said: "There is one reparation I would make before I leave a world of blunders, of lies, of trust and distrust alike misplaced. I wish every member of my own family now present to join in this solemn act of justice."

Janet here crept to his side, knelt down, and seized his pale hand. Mrs. Browne, who was sitting there, made way for her, still bending over her child and her husband's hand.

"A noble young man," Mr. Browne went on, "has been calumniated to us by one whom I would speak of more severely if Blanche had not already suffered unjustly. Bedford Lyte, whose name I forbade in my house for twelve years, was utterly misrepresented to us, he and his conduct, by George Baily."

How Janet squeezed and kissed that pale hand, and how Frank's and Albert's eyebrows went up and up, for neither of the young men knew yet who Mr. Lane was.

Mr. Browne continued: "I have, thank God, been able to sift the matter before I die. Your mother has in her desk Lady Balbry's written admission that her son, Sir Thomas, ruined that poor girl who visited us once, and whom Captain Lyte allowed us to call Eleanor Baily—for shame to his memory!"

Now Albert's forehead threatened entirely to disappear, so high did his scanty eyebrows ascend to his glossy poll.

"She was," resumed the sick man, "a prenuptial child of poor Mrs. Baily."

If he had said *Poluphloisboio Thalasses*, Janet would have had quite as distinct an apprehension of his meaning. All she knew or cared to know (and it was already intuitively known) was that her lover was going to be justified.

"Bedford Lyte, poor fellow," Mr. Browne resumed, "did actually kill Sir Thomas Babbly for ruining that girl. But in the mean time—do you understand me, Frank?—I say, between the baronet's villainy to the girl, and his being killed by Bedford Lyte, the young man had been most basely tricked into marrying the girl himself."

The stout old Briton fell back exhausted here; and though the great revelation had not come, a kind of prescience, or at least premonition of it, was breaking upon them all. Although Janet was no more enlightened than the rest, her behavior seemed to lead to a true solution of the mystery. Mrs. Browne was in the secret, and though trembling for her husband, was anxious to see this act of justice accomplished. She presented him with a wine-glassful of strong beef tea, and then another of port-wine, after which he resumed:

"If that wretched girl is living, I say with sorrow she is still his lawful wife."

Here Albert, taking advantage of another pause induced by his father's weakness, solemnly interposed: "Frank and Robert"—for the Marauder was there, but so depressed and subdued in the presence of this sorrow that all his vivacity was gone—"Frank and Robert, what did I say? *Wrong there was. Why should we put it all into one scale? And again, I should be sorry to see any sister of mine as easy with gentlemen as Miss Baily was.* Now you see. Who was right?" But neither of his former antagonists cared now to enter into the lists with Albert.

Mr. Browne continued: "This brave and generous though foolish youth has grown up a brave, generous, and foolish man. Less than a month ago, George Baily, who when a mere lad had entered into this vile plot with his father, produced what they had secreted from the captain, namely, a rescript of General Lyte's will, perfect and perfectly executed. He offered this to Bedford Lyte for a price. The young man chastised him in the presence of a servant, and destroyed this indisputable will, by which he knew himself his grandfather's heir, in the presence of three persons. By that act, Janet, my dear, this young man, in the flower of his youth, has lawfully given you of his own free-will that which Captain Lyte only gave you unlawfully on his death-bed. I objected to the first bequest. I always disliked Captain Lyte's will. This gift I can not cavil at. The young man is very noble—very noble!"

Poor little Janet, still kneeling dejectedly at her father's bedside and holding his hand, in which from time to time she buried her face, saw not whither all this mystery was tending. "I always *knew* he must be a duck," she sobbed—"a real duck! But, all the same, I shall give him back his fortune when I come of age."

A faint smile again played over the dying man's face. He took his hand from hers, and laid it gently on the beautiful head nestling at his side, on which a furtive glimmer of sunshine played and reminded him of the glad old days of Pedlington.

Again speaking, with the light of that smile on his face, he said, "You won't beat that man in generosity, my Janet; but come now quickly, for I am weary: *who do you think Mr. Lane is?*"

This question fell literally like a thunderbolt at the feet of all present. Doubtless mysterious combinations and coincidences had begun to direct their thoughts in the right groove. But not one present except his wife really knew or was prepared to divine the old man's secret. He looked round at them all with a more benignant and joyous smile than they remembered even in his day of health and strength. Only Albert had already suspected the truth, and then abandoned it in bewilderment.

"HIM!" cried Janet at last, defiant of Lindley Murray, and starting up with blushing cheeks and flashing sapphire eyes. "HIM! Why, HIM, of course!" Then she knelt down again, coaxing her father's poor pallid hand.

Mrs. Browne patted her comely, shapely head, decked with its masses of loose golden hair.

"Oh, the wicked Tulip!" Nelly softly exclaimed.

CHAPTER XXIII.

THE LAST FEATHER.

THERE was much sweetness at that time to temper the bitter of Janet's trial; yet when we recollect that though a just and honest man, utterly above fraud or chicanery, and steering his stubborn way as well as he knew how through the shoals of life, Mr. Browne had systematically indulged his daughters, and while sneering at any enthusiastic occupation for girls, had encouraged them both with purse and countenance in mere pleasure-seeking of an innocent kind, it would be in the last degree unjust to expect on her part any matured powers of endurance or self-control. Puzzled now between Mr. Lane and Bedford Lyte, and having a profound respect for the man whom she knew as Mr. Lane, almost independently of her love for him, and quite independently of what she had recently learned of

Bedford Lyte, she took refuge from her difficulty in calling her lover "Sir." This was all arranged, of course, in her secret council-chamber, and there adding together her reasons to respect the two men, to love the former (Mr. Lane), and to pity the latter (Bedford Lyte), she achieved a splendid feminine ideal, and called it "Sir." There was something grotesquely interesting about this innocent and lovely girl. Those of our readers who follow up this brief chronicle to its close will be perhaps more interested in her and in her fate at its end than during its earlier stages, and will wish to know somewhat of her married life. But before long we shall find her, yielding to her own ungovernable impulses, in imminent risk of never reaching the connubial epoch.

It was evident enough that "Sir" had never loved any one but her. Having, as her most truthful father said, been tricked into marrying that wretched Eleanor, he could not now get rid of her. Janet well understood that a man of delicate feeling would not drag a woman from the seclusion of a cloister to undergo the exposure of a trial for divorce. "Well," she said to herself, "I can wait. I love him. I adore him. My noble, my generous, brave Sir. And *he* loves *me*. 'He was dazzled by my beauty!' Oh, how splendid! Who else *could* have said any thing so exquisite? I could *die* when I think of it. Oh! oh!" These ecstasies, which would have been pretty acting if vented in public, were merely Janet's secret reveries.

But before long all the world was indignant with Walter Browne, Esquire, solicitor, of Pedlington; especially those gentlemen who had secured the reversions of the clerkships to the Justices of the Peace, to the Peddle Navigation Company, to the Turnpike Trust, to the County Lunatic Asylum, to the Peddlebourne Union, and to the Kent Conservative Superior Hop Cultivation Association, all of which Mr. Browne held, and continued to hold, though Death had knocked at his door with bony and importunate knuckles, and though (what was perhaps quite as important) Frank Browne had calmly stated that all the clerkships might go to—some obscure region—for him. •

But his relations were even more infuriated, his far-off cousins, and remote step-uncles and nephews, who had eaten the dolorous mutton at Dover, "the funeral-baked meats" of anticipation. After collecting round him all the paraphernalia of death, robing himself, as it were, in the pomp and panoply of coming dissolution, and actually giving a death-bed audience to his kith and kin, this old violator of conservative traditions had deliberately convalesced, and had gone back to his clerkships and emoluments at Pedlington just as if nothing had happened. Frank went so far as to inform

Mr. Lyte, of Baliol College, Oxford, that a certain great London physician's watch had left off ticking, and was expected never to tick again, when its proprietor became aware of this recovery. Had Mr. Browne only remained deaf and dumb or blind (let us say), or imbecile and incapable, or paralytic in one side and a portion of the other, or given some such hostage to death and the doctors, his partial recovery would have been endurable. But for a man who had undertaken to give up the ghost to retain it in this surreptitious manner was contrary to the good old usages of conservative society. Thus a Tory, however stanch, may outlive his own reputation. Mr. Walter Browne, hitherto unimpeachable, was now a renegade from the Tory ranks of respectable death in the command of a Tory doctor. His cousin, the surgeon at Farfield, called him "an old body-snatcher." The severe ecclesiastic dubbed him "a Lazarus." And even his own most gentle and loving wife fancied that he had outwitted and made fools of a large and most respectable body of people. But Frank, to his infinite credit, laughed all this nonsense to scorn, made fun individually and collectively of the whole tribe, and showed that some petty motive, which he ruthlessly exposed and derided, was at the bottom of this peevishness to which every one except honest Uncle Robert and their own little household had become a victim.

Mr. Browne's recovery might have achieved one benefit to his kith and kin. If they could only have combined and consorted for any purpose under the sun, they would now have done so, in the glow of their indignation, to abolish forever the foolish custom of clustering like vultures about a dying relative, taking up a sick man's hand and dropping it as if it were a hot potato, and then sneaking out of his presence like petty larcenists.

Whatever his remoter kindred might do or leave undone, all the family at Pedlington returned to their filial allegiance, and placed Bedford Lyte (the man whom they already loved, now in possession of a name which they had learned to dread) upon a pinnacle of love and esteem. The sad feature in the case was that now, for these five years, he never would come near them. Dr. Phelps, now one of Mr. Browne's favorites, had often visited him at Oxford, and had traveled with him in Europe. Captain Fuller, who had sensibly transferred his affections to Nelly, frequently visited Lyte at Oxford, and received him at Watermead. Frank visited him twice, at long intervals. Hubert twice at shorter intervals; but to Pedlington he never came. "He must have heard of the disease among the tulip bulbs in Kent," said Nelly. Suns set; moons waned. The former rose, the latter were restored again, as the poet observes. Then it all hap-

pened over again and again. At last the course of nature waxed exceedingly monotonous, and the social order flat, stale, and unprofitable to Janet. She had no work to do, except those everlasting gloves and shirt buttons of Frank's, and certain pretty little needle tricks that will not occupy the heart or mind. She could not (after the manner of her kind) enjoy from time to time the innocent excitement of wondering, before a ball or picnic, about some possible lover, and regulating her own behavior (real or imaginary) toward the mysterious *inconnu*. Nor could she, as an honest girl, deliberately ogle, entrap, grab, strangle, and scrunch the bones of any unsuspecting lover, as a spider uses a fly, knowing all the time that she could award him no other treatment when caught. Novels were utterly vapid to her perceptions unless they portrayed a character like her "Sir;" if they did so, it drove her mad to read them. And how could she live without love, now that love had so absorbed and swallowed up her former life that she could not remember it, and wondered how she had dragged on her existence from day to day and week to week without it? Yet not being any longer able to live without this elixir of life, how was the supply of it to be maintained within her? Would love continue to subsist on one little recollection, like the widow on her cruse of oil? Alas! alas! The cruet was already failing—had failed almost, and was well-nigh empty; so she thought. Her heart was heavy and weary within her, and sick with hope deferred and sore with vain regrets.

To see Nelly loving and loved, as she did daily now, really and steadfastly loved by a true and loyal man (though she had rejected him herself), was maddening. Now that Nelly had occupied that forlorn fortress, his heart, she was almost tempted to flirt with Captain Fuller from sheer mischief and a splenetic desire to inflict a wrong upon that obdurate "Sir" who left her to suffer beyond her power of endurance, to wait beyond her patience, to exhaust her fortitude, to sin, if she would, without a word of comfort, support, or counsel from his lips. And all for what? Some sullen ghost of barren honor, some verbal, perhaps legal, bond to one whom he never had and never could love. Oh, how she would like to get at that cruel woman, that Eleanor, and stab her to the heart!—drive the dagger home, as she had read in some old legend, till the haft struck against her ribs!

It is not too much to say that at times she was carried away by a passionate desire to commit this crime, and thought herself in serious danger of yielding to the temptation and making that homicidal expedition to the quaint old Belgian city. But with regard to Bedford Lyte, she so longed and grew

sick of vainly longing for him and his love that after two years of it she would assuredly have thrown patience to the winds, abandoned all conventional restraints, and gone to him, had she not too clearly foreseen how he would act. She would have gone to him and said, "Here I am, Sir. Here is your poor little Janet, to whom you gave a fortune, but whose heart you took away. Only let me stay and be near you always. Do not send me back, Sir."

Not only did she desire to do this foolish thing, but would actually have done it had she not seen, as in a vision, his calm relentless frown, more in sorrow than in anger, but still immovable even by her tears and cajoleries—had she not heard, as in a trance, his voice pronouncing her sentence of banishment, which would then have been irreversible. He would have taken her back, as cold and hard as a statue himself, and given her up to humiliation and despair. Yes, he would assuredly give her up and banish her forever on account of that ghost of barren honor, that legal fiction, which bound him to a woman who was *not* his wife. "For I am his true wife," she would aver to her own heart, "in virtue of this love that I bear to him." From this she would draw some comfort. "And does he not love me?" she would ask herself. "Am I not his own little girl, to whom he gave this splendid fortune, which I thought so little of before, so much now? He would not give it to any one else, only to me. Twelve thousand five hundred pounds! So much! why, the interest alone is four hundred and six pounds five shillings a year, and I have already saved five hundred pounds to give Nelly when she is married. He gave it to me. He loves me. I heard him say so. I heard. I was listening at the door." Then she repeated to herself those delicious words which she had overheard at the door of Frank's bedroom. That was her one luxury, poor little innocent. She had not even the green cotton umbrella now. But she had one little gift, only one. How she did treasure it! in what a system of bags it dwelt! First leather (*chamois*), then one of silk, then holland, double and wadded between, then velvet, embroidered and fringed and beaded, with the monogram S. J. work-upon it.

Frank had been spending a few days at Oxford with his friend. The days, few in number, were past, but not a word of Janet had been spoken, except in the first general inquiry about the health of "the young ladies." Since then every other member of the Browne family had, at one time or another, come on the *tapis* and been talked of, but Frank could see that Janet was a sealed book in the memory of Lyte. Just as they had seated themselves in the carriage which had been ordered to take the Adonis with his morocco bags and valises, his canes and

his traveling wrappers, to the station, Frank said, in his usual indifferent drawl, "Oh, ah! by-the-way, Lyte, I forgot that *fleur d'Italie*. Could you drive me past a perfumer's? Janet wants a bottle of that new scent, and all the places in London will be closed when I pass through to-night."

At the words "Janet wants," something inside Bedford's waistcoat gave such a bound that a button nearly flew off. Before Frank had finished his argument, Mr. Lyte's head and shoulders were out of the window. In another minute the carriage stopped, and he sprang out, saying, "Sit still and take care of the traps. I won't be two minutes." In about that time they were again on the move.

"Oh yes. Thank you very much. How much was it?" Frank inquires.

"Never you mind," said Lyte, abruptly. "Give it her from me. Any one can give a lady a bottle of scent."

"But it isn't every one who can, and I never met another man who would, give a girl a nice fortune; though I have encountered two or three who would *take* one if they could get it, and put up with the girl to boot."

This was the first intimation which Lyte had received that the Brownes knew of his generosity in destroying his grandfather's will, although he had been informed of the change of feeling which Mr. Browne had expressed toward the once hated Bedford Lyte when the lawyer was supposed to be dying. He had feared that any such knowledge would distress them, and hoped it would never reach their ears. But Frank went on ruthlessly: "We all know of your noble-hearted generosity, my good fellow, and repent the cruel injustice we had formerly done you. But you will do me the justice to remember how heartily I wished Mr. Lane to marry Janet, and so recover the fortune I wanted to keep from Bedford Lyte."

"I shall not forget it in a hurry."

"And I need hardly tell you how I wish it could be so still. I can not give up hope. Surely you could get a divorce. Janet is the same, only more beautiful than ever. The men rave about her. But I don't want this feeling to consume her, Lyte. I care more for Janet than the money, though you may think me mercenary."

The murder was out now at the last moment.

"May you not be mistaken about her feeling?" asked Lyte, as the carriage was checked at the door of the station.

"No. She tells me a good deal, and I see more."

When Frank had consigned every thing except a favorite dressing-case to a porter, and taken his ticket, Lyte said, eagerly, "It must be starved out, Frank. She is young, and will yet form a strong, healthy regard

for another man. It is impossible for me to drag *that poor creature* from the privacy of her convent, and parade her old shame and misery before the world. And if that were done, I could not marry. Only death can sever that bond. Give Janet that bottle of scent from yourself, and you can pay me when we meet again. The train is off now. Good-by."

Frank was borne away from his benefactor with a sore heart and a measure of anger in it. His regard for Lyte was sincere, but he growled at him as a Quixotic pedant, not being able to rise to the moral level which was the other man's natural atmosphere. That little bottle, however, was Janet's treasure. She had wheedled the secret out of Frank. "I love her, I love her," the dumb bottle seemed to say whenever she looked at it.

* * * * *

The four years of Lyte's Oxford career passed quickly enough with him, though not without constant effort, as time will pass to a man with manifold and absorbing interests. It must be a very different thing to be a young lady in a torpid country town. First and foremost stood his intellectual struggle, in which he was even more strenuously engaged than those who saw his exterior calm imagined to be the case. This could not and did not cure him of love, but was so exacting to his powers and satisfying to that love of conflict and excitement which rules within a strong man as to preclude all danger of love-sickness. Not that the possibility of love-sickness was absolutely removed from Lyte's path, as he would have discovered in double-quick time had he yielded to intellectual languor. Often in those sad, silent, solitary night-watches, when the mind of a man strays from its nearer interests and goes back pitifully to those dearer ones which are as lost, the memory of Janet Browne, endued with that irresistible fascination which had mastered him in former days, came and stood before him in all its old power of beauty and sweetness. Sooth to say, at those times the strong man was nearly overcome. The vision would appear before him as the fair girl herself had done on a certain night in the little tea-room during her mother's evening party. Silently it always seemed to stand and appeal to him by its aspect. Yet did he never forget that her voice in speaking was low and sweet, like the breath of summer among dewy leaves. But with all his might he would put these visions away from him, and force his mind into its wonted groove, and urge it along with the power of his trained will, until these images were chased away from the retina of his imagination and the danger past. How different it was perforce with her!

Then, in addition to his studies, and in

wholesome relief of the strain upon his mental faculties, Bedford Lyte had his boating, swimming, and running to occupy much time and attention, to call into action and expend much superfluous energy, and afford a useful vent for the enthusiasm of his disposition. Being a large and powerful man as well as a skillful oarsman, he rowed for the first year as No. 4 in his college eight-oared boat, which gained several places on the river during the college races. The next year he was picked out of his own boat on account of his splendid style and great strength to row No. 4 in the second university boat, which was preparing to supplement any gaps in the first boat, then training for the great race with Cambridge. At first he declined this honor, but, being pressed, acceded to the wishes of his friends merely to assist in perfecting the second or subsidiary boat. At the same time he positively asserted that in no case would he join the racing crew. After about four weeks of training, however, he found his mind rather invigorated than exhausted by the severe physical exercise and the enforced regular hours, and having measured out his book work, and found that he could do as much as before, ceded that point. The No. 4 originally chosen for the first boat, a man his equal in style and strength, but younger and less vigorous in constitution, began to spit blood, as is often the case under a too severe trial of the powers of endurance. So Bedford Lyte went into the racing crew, and rowed in two successive years in the great university race on the Thames.

Being thus continually in good bodily condition, his college mates, who were proud of their champion, urged him to enter for the university athletic sports, in which he more than once gained distinction for himself and them. The training necessary for these exploits, which occasionally proves too severe for a minor, whose vital energy may not be equal to his muscular strength, was really of permanent service to Lyte both intellectually and physically. It obliged him to abandon that pernicious habit of working at night into which he had fallen, and habituated him to a simple regular dietetic system, besides endowing him with a hearty and unfailing appetite. All these things are inimical to any excesses of a fertile imagination.

But we should hardly have entered so fully into these retrospective details were it not that these distinctions, even more perhaps than the academical honors gained by her hero, brought the name of Bedford Lyte in all its glory so continually before Janet as to keep her in a kind of intermittent fever of enthusiasm and suspense. For weeks before a university boat-race she would wear nothing but Oxford blue. Before the great event came off she could have laid violent

hands on any person who sported the paler (Cambridge) hue. After each of her hero's victories she would subside into a week's delicious serenity, and take to her bosom any acquaintance who had been interested in the losing boat. She made Frank subscribe to the *Oxford Chronicle*, from which paper and from the *Times* she would cut out every paragraph which chronicled the name and achievements of her lover. Though terribly jealous of all these pursuits, which she was shrewd enough to perceive must keep his faculties pretty well occupied without hankering after her, yet she gloried in his triumphs a thousand times more than if they had been her own, and would go and sit with poor old Graves (who was failing fast, having received his death-blow from the opening and consecration of the Pedlington Cemetery), to whom she would explain as well as she could the meaning of it all, and upon whom she bestowed enough tobacco to last him for another threescore years and ten.

"I can't make it out nohow," Tobias would say, when his bewildering little visitor had taken herself off. "She carries on as if master had given up his learning and turned waterman. And this 'ere baccy ain't like what master's baccy was. Times is sadly altered."

But for Janet, whatever "Sir" did was glorious and splendid in her eyes, though the doing it might weaken her hold upon his memory. She literally despised all other men in her mental comparison of them with him, and believed him to be the most profound scholar and peerless Paladin who ever dazzled a benighted world. Moreover—and this was the most delicious assurance of all—she knew that if he was, in his romantic sense of honor, depriving her even of his friendship and fraternal regard, it was not because any other girl had fascinated or could fascinate him. Of this she was absolutely certain. He only kept away because her spell upon him was too potent, because he was afraid of loving her "not wisely, but too well."

Before every long vacation and every Christmas vacation went forth a kind and friendly invitation from the Brownes of Pedlington to the Oxford student. Yet he never came. Frank went to him twice during those four years, Hubert went to him twice, and each brought back little crumbs of comfort for Janet. She had formed quite an attachment for Dr. Phelps, too, and that genius contrived to impart some morsels of gratification and relief to her weary spirit. Just after passing his Sandhurst examination and being gazetted to a regiment, Bertie had rushed up to Oxford, brimful of his good news. Not finding Mr. Lane (as he still called his old friend) in his sitting-room, he burst into the bedroom, where it

so happened that the triptych under the crucifix was open, and arrested his attention. The skulls, the pickled stomach, and the preserved brain were gone, and a very beautiful picture had usurped their place. This painting *malgré lui* arrested his attention, and he stood before it transfixed with admiration and astonishment and delight. His host surprised him before it. Ingenuously blushing, Hubert apologized for being in the bedroom, and explained.

"What do you think of it?" asked Bedford.

"Exact! wonderful!" exclaimed Hubert.

"Why, my dear boy, it's the Blessed Virgin!"

"Oh!" cried the youthful warrior, perplexed. But on his return to Pedlington he told Janet what he had seen, swore it was a likeness of her, pure and simple. "And flatters you most divinely," he added.

Janet was in ecstasies. "Where did he get it? Who did it? What a duck the artist must be! When could he have seen me? But is it really like?"

"To answer a few dozen of your questions in a bunch," Bertie rejoined: "the artist never saw you, but conceived the idea literally—so Mr. Lane assured me—and painted head and hair and all that while it was fresh in his mind's eye, intending to fill in the accessories and sell it to a monastery as a picture of the Virgin Mary. But Mr. Lane saw it on his easel (in Dresden, I think it was) and bought it. And a pretty sum he gave for it, I expect."

Mr. Browne, who had almost entirely recovered his own vigor, entertained an increasing respect for the young man whom he had once abhorred, thinking it both wise and generous of him to persist in refusing the invitations which he still thought proper to have sent twice each year without fail. To one Lyte would write and say he was in rigid training for some Corinthian games, and would be executed by lynch-law if he dared to move from Oxford; to another that only the day before its receipt he had engaged to go on the Continent with a friend, or on a walking tour in Wales, or somewhere, and with some purpose incompatible with a visit to Kent.

All this time, however, Eleanor Baily, as they still called her in their secret conclave, was alive, and it was therefore right and honorable on the part of her unfortunate husband to keep away from another young lady whose charms had already proved too much for him. But by a strange and, as it at first seemed to Janet, by a providential coincidence, in the very week after Bedford's final examination at Oxford, while he and all his friends were waiting in breathless suspense for the *lists* to be issued and his academical fate made known, news of Eleanor Baily's death in the nunnery in

Belgium came to Pedlington. Mr. Browne would have concealed it a while, but Miss Lyte wrote to Janet and told her with a crow of delight. Then the class lists appeared, and Bedford Lyte was *facile princeps*, the Senior Classic of his year, thus verifying Martin's ancient avowal that "Mr. Lane" was "no end of a scholar." That young gentleman, who had faithfully adhered to his old master, and made fair progress in the face of his difficulties, was enrolled among the third class in classical honors.

Janet was in a flutter of expectation. Would he come at last? Not Martin. She knew too well that Martin would come. He still worshiped the boards on which she capered with "the light fantastic toe;" for Janet had continued to appear at balls, though with a somewhat forlorn and Lenten aspect. Martin came, flushed with his virgin honors, to lay them at her feet, but "Sir" neither came nor wrote. "They'll give him a fellowship now, you know. They want to have him for classical lecturer," said Martin. Janet stamped and blushed and frowned. She wouldn't take the heir of Plumstead Manor, with his third class. She wanted the Senior Classic, and the biggest man in the university boat. But "those horrid old frumps" *did* make Mr. Lyte a fellow, and offered him the lectureship, which he declined, and went incontinently off to Mexico as a war correspondent. This was the climax of Janet's woe, the last feather which broke the camel's back.

SHINNECOCK.

"WELL, Rachel," said my father, as she handed him the pickles at our Sunday dinner, "what is your opinion of the revival?"

It took some excitement to break through the usual taciturnity of Aunt Rachel in the presence of several persons.

"The Lord must be amazin' good if He takes such people as some I know to His bosom. The way that David did act! Oh dear, if people only knew—"

"Why, what have you got against David?—a man of your own tribe. I never heard you speak so before."

"Oh, nothin' against him, of course," said Aunt Rachel, glancing quickly around the table. "But when I see some people I know about experiencin' religion, I wonder why the Lord don't send thunder and lightning and blast them."

It was a sentiment more noticeable as coming from a woman who had few thoughts and great command of her tongue. No questions were able to extract from her any thing further on the subject; she was plainly annoyed at having spoken at all.

She was nurse, housekeeper, aunt, every thing but a relative—one of those persons

who gravitated into an undefined position in a family wherein want of blood-relationship only strengthened her power. Small, withered, heavily featured, and with straight black hair against a yellow skin, she might have passed for a white woman with strangers; but her blood was chiefly Indian, just touched, perhaps, with white. Her tribe, the Shinnecocks, which still lingered on the government reservation farms, was not without a strong admixture of negro blood, and acknowledged in Aunt Rachel the last of their chief's race. She was proud of the fact, and not ill pleased when, with half-jocular pride, a neighbor would point her out as Princess of the Shinnecocks. But there was little virtue in the distinction, as she, poor soul, was well aware. She seldom saw her tribe, and indeed took small pains to conceal that she regarded them as inferior beings.

Until the foolish age when boys judge fairy tales food fit only for babes we drew from Aunt Rachel at times and hours such marvelous tales of spirit and witch as would shake us with delight. Or again it might be an Indian goblin story which she was repeating. The blood would curdle in our hearts as the earnest speaker, strong with the simplicity of one who believes, brought the reality of her demon face to face with her hearers.

A favorite was the horrid tale of ghosts that haunt the spot where the pirate Kidd buried his treasure. The luckless sailors who assisted at that burial never saw their ship again. In revenge their murdered ghosts rise on certain nights, and taking Kidd into their midst, torture him above his hidden gold until the morning dawns.

At each repetition of this story some choking voice in the silent audience would ask, "Where is the gold?" Then Aunt Rachel would point mysteriously with shriveled fingers to the southeast, where lies the line of sand hills that dike the bay from the ocean.

"A man who went to spy those sperits was found dead the followin' mornin'."

With such warning words ended Aunt Rachel's most popular story.

"And how did you like the exercises, Miss Miriam?" said my father, turning to our young boarder, who sat against the light from one of the square windows netted across by lead-work of the little panes.

"I went away as soon as they began. They were horrid. I won't stay to such scenes. We know where we went, don't we?"

She played her bright eyes at me as one amuses a child by giving it an idea of its own importance. That was the only reason I was not grateful for a recognition.

The utter quiet of our village, inland and yet by the sea, may have been a rest, or per-

haps our coal-black windmill, unlike any other building in the land, and the ancient Huguenot house in which we lived, may have pleased her undeveloped taste for the picturesque. Every summer she passed three months with us at Southampton, where the corn stands high upon the level fields, the snow lies but a little while among the stubble, and the Atlantic bellows with subdued melody upon the distant beach. I did not see why she should have returned with a habit of treating me like a child.

I was fifteen, and strong for my age. Many is the hour I have rowed her about our bay: fair Shinnecock, with its dark red light-house on the land side, and the long strip of rolling dunes fencing out the sea upon the other. Many a time in sail-boat have I carried her out the rushing inlet, till she grew afraid of the spiteful waves, and begged to put about. Then, because I could not say it, I would look her in the eyes and try to make her understand that I would do any thing for her sake. Her indifference irritated me, and still I wondered why she acted as if I were a child.

That evening as we sat on the door-stone of the old house, while the yellow glow faded on the line of elms across the broad main street, it was announced that young Dr. Gray was to arrive the next morning. All eyes turned toward Miriam, who reddened slightly as she sat swinging her feet in the low casement window.

"We hear he has been very attentive," some one said.

"Oh," said Miriam, lightly, "he is very nice, but not rich enough for me. Oh no! Not that I mean to say," she added, getting still redder, "that I could have him if I would."

"How rich is he, Miriam?" I asked.

"Why, how should I know? Two or three thousand a year, I suppose. But that's not enough for me, I can tell you that."

Three thousand a year! What powers could amass such a sum to bring it to Miriam and demand her hand? If I should turn robber I could not hope to get so much. I buried my face in my hands, and gave up to a despair which was not lightened by the few hateful tears that would force their way through my fingers.

One by one the others stepped into the house, until we two were left alone. Presently Miriam was sitting beside me and had put her arm about my neck.

"Why are you so sad, little boy?" she asked, not unkindly. Yet "little boy" was a name she knew I detested.

I made no answer, and she put her cheek against mine. She had always spoken of my cheeks as soft like velvet; now she still seemed to like to rub her own sweet face against mine, although her next word was about to hurt me.

"Not half as soft as they used to be," she murmured to herself.

I stole my arms timidly around her, while sullenness yielded to the flood of delight.

"Let us go sailing to-morrow afternoon," I whispered at last, just for something to say, lest she should rise up and go in-doors.

"Very well. No! I forgot: I can't."

I looked up quickly, suspecting the absent-minded smile on her lips.

"I know why," said I, angrily. "That Dr. Gray is coming!"

"Supposing you attend to your own affairs," said Miriam, in mock vexation, but smiling with pleasure. "Have you ever seen him?" she asked, after a pause, during which I had got still closer to her, as if nearer by I could cool my poor young pulses.

"No," said I, faintly. "What is he like?"

Alas! by nature the most reticent of boys, I was the safest of all listeners. For Miriam I would hear any thing, conceal any thing, do any thing she wished.

The kisses and warm embraces with which she interrupted her description of the newcomer were all intended for him; that I knew; but it was not for one of my years to realize it so far as to counteract its effect. I clung to her with a tempest of kisses, until even her attention was roused.

"I don't like you when you are so violent," she said at last, putting me away.

"Miriam," said I, "you told us you wouldn't marry that Dr. Gray because he wasn't rich. Would you marry some one who had ever so much money?"

"Yes, of course I would. But he'd have to be awfully rich and young—and come quickly too. I give him one year."

"Will you marry me, Miriam, if I get awfully rich within a year?" said I.

On the point of bursting into a laugh, Miriam freed herself from my arms and stood up, her full young chin dimpling with amusement. Her mind changed; dropping me a low courtesy, she replied, with a twitching face,

"If within the year your Excellency can bring me Captain Kidd's treasure, I shall be your bride."

She marched dramatically into the house.

I wandered off down the wide grassy street, now bare of villagers, and wrestled hard with all manner of impossible schemes.

"What is the use of being a seventh son, as Aunt Rachel says, if I can not find a treasure and keep Miriam?"

I was, indeed, the seventh son of a seventh son. When, contrary to my fathers' command, Aunt Rachel had mentioned the fact, she had taken pains to impress on my mind the advantages to be derived from such a birth. Yet beyond some singular coincidences in my early life, now almost forgotten, nothing had ever presented itself to me in a supernatural light. Aunt

Rachel knew so much, she might have done better herself. My distress was real; I really suffered; but a boy can not fight off sleep. It was not long before sleep proved itself stronger than love for Miriam.

When Dr. Gray came he was so much at ease, and accepted every thing so much as a matter of course, that I could be neither sullen nor disobliging. We three would go on sailing and rowing parties together, and as the young doctor could not manage boats, I was the one to sail and pull, filled with a grim pleasure at serving Miriam in a way my rival could not.

While she was with him she was very silent, but kept her blue-gray eyes fixed upon him from under the slant of her heavy eyelids, as if she could not see enough of him. People wondered at the quiet that had fallen on the restless, saucy girl. I was nearer. Sometimes of an evening she would come flying out of the house and fairly overwhelm me with kisses, as if the restraint were too much. I see now that she was passionately in love. I could not then appreciate the full sweetness of her lips, but it was enough to make me sure that if I were rich, she would rather stay with me. But still each night I slept a boy's dreamless sleep, and every day I dreamed awake about the cruel treasure she had demanded so lightly as the only way to her.

At last the revolving thought and ever-heaping excitement began to have their effect. At night, and more than twice, I saw each of these two visions:

Appeared a narrow bit of beach, on which I stood, but what was to the right hand or the left, whether it was the sea-shore or not, I could not remember. Before me rose a sand dune of some steepness, which I felt called upon to ascend, because there was something for me at the top, but the sand slid back as fast as I stepped forward.

The second dream came again and again. I was looking out to sea, although from the mast-head of a sloop, when I perceived I was in fact among the dead branches of a tree, and at my feet rested an iron box. I feared to move among the dangerous limbs, bent down to touch the box, fell, and awoke with a cry.

Here at least was something tangible. I was a seventh son: why should not my dreams come true? The following week was spent in search of the bare sand hill I had seen in my vision.

I was brought up to a waking realization of danger one day, when Aunt Rachel talked very earnestly with some one in the hall. She spoke so low I could not hear any thing except Miriam's name.

"What is it?" I asked, when the third person moved away.

"Oh, nothin'!" said Aunt Rachel, in her usual plaintive voice. "Miss Miriam's en-

gaged to Dr. Gray, and they're to be married next month. Why, what's the matter with the boy?"

In the agony of my heart I turned and left the house. The wildest thoughts chased themselves through my mind, as I laid desperately about for relief. If it came to such a pass as that, Captain Kidd and his ghosts must be found.

Just at that moment David, the Shinnecock, opened our garden gate and rolled heavily into the street. It was an unusual sight, but I was occupied with the sudden doubt whether, after all, Aunt Rachel, being a woman, might not have made a mistake about the ghost. It occurred to me to get certainty from David.

I looked upon him with some awe, first as being an Indian, then as one who had experienced religion so powerfully at the last revival that the village still talked.

A big, heavy-shouldered man with straight black hair, light yellow complexion, and a broad nose stood before me. His eyes lay deep in the sockets, and fixed me alarmingly, as I shifted from one foot to the other in my embarrassment.

"David," said I at length, "what is the truth about the ghosts over there on the Reach? Are there any such things?"

"Ghosts?" said David, very far down in his throat. "Plenty of them. Why, they tore a man to pieces there one night just about ten years ago. Don't you ever get caught over there after night-fall, that's all. No one 'll ever know what's become of you."

David was thoroughly in earnest; he made his warning so impressive that I felt no powers should induce me to set foot on the Reach. But then there was Miriam, and there were the stories of so many eye-witnesses who had got away safe. At length I was determined to go that night to the beach and creep upon the ghosts. I did not believe firmly in them, but it was my only chance, and no stone should be left unturned.

Seeking Aunt Rachel again, to learn if possible more definite directions to the place, I was told that she had gone to her room, and, as was her custom now and then, had given strict word not to disturb her, nor to call her in the morning. When Aunt Rachel was ill she hid herself.

I did not go to bed, but sat in my window looking out in the direction of the Reach, which I knew was now throwing longer and longer jagged shadows up and across the bay. It was Saturday night. I wondered how I should bear the sight of ghosts, if ghosts I should meet.

The evening was silent, with a rising mist. Every thing around was so familiar and home-like that fear seemed out of place. I stole from the house, and hastening down

the long street and out upon the sandy road, gained the salt pastures and the water. There taking a small flat-boat, I sculled out upon the smooth glassy tide.

I had reached the middle before I began to examine the haunted range. It may have been a low sound that first awakened my attention; at any rate, I raised my eyes and fixed them upon one spot on the dark outline which seemed lighter than the rest. The moon could not be rising in that quarter. As I neared the sedgy land I both saw and heard something mysterious.

Cautiously I stole across the meadow and flat brushy plain inward from the sand hills toward a faint glare and murmur that rose and fell on the beach beyond. The sharp grass tortured my bare feet; mosquitoes in swarms fastened upon my trembling flesh; but on I pressed, until, reaching the base of the hills, I stooped low and perceived against the dark sky darker figures, one on each of two high sand hills on either side of a slight depression to my left. But their faces were turned seaward. I knew at a glance they were watchers who had forgot their charge in interest in the affairs below. To learn what that occupation was, an unquenchable curiosity drove me forward in spite of an agony of fear.

Throwing myself on my knees, I began to crawl along just where the loose stones from some great tide, sweeping through the pass between the hills, had drawn a sterile border to the spare grass on the slope. I shook in every limb. In the dim light that foretold the moon every object took a fearful look. The white shells scattered here and there were bleared eyes calling attention. A water-soaked log half buried in the sand was a strange reptile waiting to crawl upon me. The brittle stalks of twisted bush scattered by the winds writhed before me like serpents in fantastic shapes. I fancied I could hear my hair rise on end with the hiss of electricity; but still I could not go back.

The murmur had swelled into a confused chant; the gleam defined itself into fire-light behind the hills. With hand and foot I pushed myself over the sand where the high grass leaned over until a flat valley between three hills came full in view. There I perceived what astonished me all the more because I had never even read of such a scene.

A mighty fire shook its glare over the irregular triangle of the converging hills. Close beside the flames, sometimes breaking and encircling them, wheeled a ring of horrible figures, male and female, covered with grotesque patterns in brilliant paint. A stalwart leader danced in the centre. In one hand he shook a rod decked with bells and feathers; in the other he held a round wooden cylinder highly painted, to which

he now and then referred. I glanced at the guard on the opposite hill-top, and saw, to my terror, that I was full in his sight. Parting the high wiry grass beside me, I slid into cover of the border, and lay still. To sink myself still further from view I carefully pushed away the sand from under me while I gazed. Then, with my face on the smooth sand between two tufts of grass, I could view the proceedings without likelihood of being seen. But all the while terror kept knocking at my heart and bidding me begone.

The maniac dancers upon whom I looked seemed at times to be laboring under tremendous excitement, and again would appear solemn and awe-struck. The leader chanted alone, glancing now and then at the painted cylinder in his hand, whereupon the ring would take up the chorus, and according to its tenor would dance slow and solemnly, or tear around in fierce excitement. At times certain of the women, who were of all ages, some blooming, others wrinkled hags, seized with convulsive fits, would distort themselves in a horrible manner; others dropped into the circle and rolled upon the ground, the ring closing and whirling as before.

As the trouble of the first impression began to wear off, I saw that with the exception of a narrow loin-cloth, all these figures were nude, their paints having relieved them at first sight of their bareness. The words they chanted were gibberish, they themselves looked black in contrast with the high colors of their decoration, and in build were heavy—something like negroes; but they were not negroes. Gradually I fought through my amazement enough to begin to catch here and there a tone, an expression, a turn of head that was—that was indeed familiar. The truth was dawning. It came with a flash when one figure fastened my attention—Aunt Rachel's!

If it be supposed that this discovery struck me with horror, let such a supposition go. Rather, as I remember it, the ever-present fear for my own safety was overcome by a boyish delight. I did not see the fact in all its bearings while the novelty amused me. But fear was only transferred. These were not strangers from whom I might expect instant death, but neighbors and acquaintance, whose secret meet I had invaded. Such intrusion could not be passed over, for the leader, dressed in feathers and whirling the fringed rod—who was he but David, the richest farmer of the government reservation? And the old woman frantically tossing her lean arms, was she not treated with an unusual respect in the village because with her ended the royal blood of the chiefs of the Shinnecocks? On the following Sabbath, when that medicine-man who was now leaping naked in the fire-light should walk

solemnly to meeting, dressed in solid broad-cloth, would it do to have it whispered that rites of some mysterious kind ever claimed his secret presence?

The frenzy of the dancers seemed to have reached a climax. They seized one another for I know not what further madness, when a voice above me gave a great shout. The fire was quenched as if the ground had swallowed it up, and I was seized, dragged from my lurking-place, and hurried blind-fold to the lower ground.

An utter silence fell, during which I remember how loudly the waves, unheard before, crashed upon the shore. It is not probable that I fainted; I was stupid with terror. I know that after a little whispering I saw the light flash up for a moment through the hand clasped across my eyes. Then the peculiar Indian cry of recognition sounded from every side, and all was still again.

After a while a voice began to speak in an unknown tongue, at first low, then louder and more excitedly. The words were evidently approved by several present; only a woman's voice answered in what seemed pleading or warning. It was Aunt Rachel's. There was danger for me in the first voice, and defense in that of the woman. More and more violent grew the discussion, until Aunt Rachel placed herself by my side and screamed her strange words against her opponent.

It was not hard to imagine that my death was the subject; in the discussion, however, English words began to mix in with the outlandish tongue. From sentences here and there I gathered that I was to be considered a victim plainly detailed by their gods for sacrifice. The reality of my peril was such that I became more dead than alive. Gaining at last a tongue, I begged for mercy.

To their credit be it told, the band listened quietly to my words. I told them why I happened upon them, and how I had resolved to find the treasure, also that I knew of its whereabouts. As the mention of this seemed to win a response from one or two, I caught at it like a drowning man.

"What good will my death do you?" I cried. "Rather let us all plan to discover this wealth. I have dreamed where the great captain stowed his gold, and when we've found it we shall all be rich."

This I heard was making a sensation. Aunt Rachel took the word on her own tongue, and seemed to gain adherents as she continued. Presently I heard the leader answer and shake his medicine-stick. A few beats sounded on a little drum, the fire blazed up once more, my guard dropped his hand from my eyes and formed in the ring, which began its chanting again in a low key.

The leader now began to lash himself into a frenzy. Aunt Rachel stood by and translated one or two important sentences that, mixed with incoherent words, fell now and then from his lips.

"The great chief comes to the buried tree.
He hides his box in the buried tree,"
was the burden of one long paroxysm.

"The buried tree, the buried tree!"
chanted the chorus.

"I see the top of the buried tree,"
was the next intelligible utterance.

"The swift tide wears against the root.
Hurry! the tide will take the box."

At this the prophet fell into a state of unconsciousness. The ring was broken. The band gathered around with hungry eyes, fierce from the recent frenzy, demanding an explanation.

"The treasure is yonder!" I cried, in an ecstasy of fear and excitement, pointing in the direction of the inlet.

Little was said while I led the way along the wet beach under the brilliant moon. Fear had left me, although I walked a prisoner in the midst of the band. I felt that I had divined the gold. When we reached the inlet, a high sand hill rose upon the left, at whose base the tide was hurrying out to sea. I faced toward it, and perceived my dream. I pointed to the hill.

"Stop!" cried the leader, in a hoarse voice. "You have not taken oath! You have been saved from death, but if you ever should breathe a word of what you have seen, death will come surely and quickly. You must swear, and become one of our tribe."

At such a moment it would have been madness to hesitate. I swore what they wished, and led the way up the slope.

In the memory of many the hill had once been a long one, stretching eastward, but the inlet eating its way in a southwesterly direction, had gradually undermined and cut away all but a small portion. On that we stood, and beneath our feet must rest, if my dream said right, the hidden booty of the robber Kidd.

The moment was not auspicious for talk. I gave one look around. Shinnecock Light shone out steadfast; behind, to the right, the moon had shouldered under a cloud, and the ocean lay mysterious; to the left and rear the inlet hurried its dark waters to the sea, past the steep bank. Flinging myself down, I measured one man's length upon the sand, and began to dig with a piece of drift-wood I had picked up on the way. Seized with a hopeful sympathy, the others set to work with like implements, but not a word was said.

We had worked thus about five minutes, when an exclamation brought every one to his feet. A man broke a branch from the

hollow he had formed, and waved it over his head.

"I see the top of the buried tree,"
he chanted, in guttural tones.

This set us to work with fury. We soon had a large pit scooped out, and really began to open up branches of an upright tree. A cry from the leader stopped the work. He stood erect, leaving his rude shovel sticking in the sand.

We all gathered around David. He said no word, but we knew he had found it. He motioned us to scrape away the sand. When it was done, there lay exposed the broad top of a chest, barred with rusty iron, and ragged with nails of brass, where an outer casing of wood must have rotted off.

So there it lay, after all, greatly to my surprise as I reflected, but evidently not to that of the Shinnecocks.

"It is my privilege to open this," I cried, suddenly starting into life. I seized the log used by David, and driving it far into the sand, began to pry at the box. One or two eager hands lent their power to mine, and with a determined push the rusty mass flew up.

It was a mere shell, a rusted lid. All below it was solid sand.

When I recovered consciousness it was to feel that I had been seized and cast into a swiftly running tide. I attempted to stem it, but before I could look about me I was swept out of sight of the dark land.

This, then, was the end. I was to die among these cold waves, each one like the other, far away where no one would know how I expired. I did not think of Miriam. It was to every one else but her that my heart went out. I began to calculate how long I could keep afloat. The morning was not far distant; but, alas! too far to find me alive.

Despairingly I raised myself on the top of a wave and gazed about. What was that great white mass that followed me? A sail? The acute agony of suspense during the next few minutes was forgotten when the sloop, following the main current off the inlet, swept along close beside me, and I caught the edge of the boat that trailed behind her stern.

I was saved, but a prisoner for a voyage to the fishing banks. When the mill saw me again, Aunt Rachel gave a scream of delight. Then she put her hand on my mouth.

"Remember your oath," she said.

"What do I care for the oath?" said I. "I am no blab. Where is Miriam?"

"Why, it was kind of sudden," said she, in her old complaining voice. "But Miriam and Dr. Gray they were married last month. There! there! Why, you take it real to heart, don't you?"

I had burst into an unmanly fit of tears.

THE STONE AGE IN EUROPE.

By CHARLES RAU.

THE MAMMOTH.

I.—THE DRIFT.

ALL races of the earth, it is now well understood, were at a certain period of their existence so little advanced in the arts of civilization that necessity compelled them to employ wood, bone, horn, shells, but especially *stone*, as the materials for manufacturing their simple tools, weapons, and objects of personal adornment. This period, doubtless every where of long duration, is called the *Stone Age*. It preceded in Europe, and probably in certain parts of Asia and Africa, the introduction of *bronze*, which is a mixture of copper and tin, the latter metal usually forming about one-tenth of the composition; and bronze again was finally superseded by *iron*, the most important of all metals, and the great lever of civilization. Thus we have for the Old World three succeeding phases of human development, the Ages of Stone, Bronze, and Iron, which demonstrate that man slowly and gradually emerged from a condition of utter barbarism, and ultimately, after long-continued struggles, advanced toward the highest state of modern refinement. It is supposed by many persons who have not paid sufficient attention to the subject that the Stone Age was a state of existence common to the whole population of the Old World during a certain period of remote antiquity. This is an error which needs correction. The same age which was an Age of Stone in one part of the Eastern hemisphere may have been an Age of Metal in another. Thus certain nations of Europe may have been so far advanced that they used bronze, while others, as yet unacquaint-

ed with metallurgy, continued to employ stone and other available materials in the fabrication of their implements. The various degrees of technical ability attained by the aboriginal inhabitants of the American continent at the time of its discovery may be adduced as an illustration. The North American Indians north of Mexico lived, as every one knows, in an Age of Stone, fashioning out of this material their arrow and spear heads, hatchets, cutting implements, agricultural tools, and smoking utensils. It is true, they employed copper to a limited extent

for similar purposes, chiefly, however, for objects of ornament. Yet they had no knowledge of melting that metal; they simply hammered masses of native copper, obtained from the shores of Lake Superior, into the required shapes, and consequently treated copper as malleable stone. The more civilized Mexicans and Peruvians, on the other hand, were skillful workers in various metals, such as gold, silver, copper, and tin, the last two of which they melted together, thus producing bronze, a composition, as experience taught them, much harder than pure copper. Yet even these more advanced nations of America, notwithstanding their knowledge and frequent application of bronze, still continued to use to a great extent tools and weapons of stone at the time when their countries were invaded by the Spaniards, who consequently witnessed that curious epoch in American civilization which may be called the transition from the Age of Stone to that of Bronze. The wretched inhabitants of Tierra del Fuego are even now living in an Age of Stone, and so were many of the remote North American tribes not long ago, before the wave of emigration from the East had reached them. As for iron, no facts have come to light which would indicate that the extraction of this metal from its ores was practiced by any of the nations and tribes of America. The introduction of iron in this continent is coeval with the arrival of colonists from Europe. In the Old World, likewise, the introduction of bronze caused nowhere a sudden discontinuance of the manufacture and use of stone instruments, a fact proved by their

frequent occurrence in burial-places and other deposits of the Bronze Age; and even in times when the superior qualities of iron were already known, implements of stone had not yet entirely fallen into disuse. We lay some stress on these facts, lest the reader might be led into the error of looking upon the three ages as sharply defined phases in the development of man in the Eastern hemisphere.

Among the recent results of archaeological investigation in Europe which are especially calculated to throw light on the primitive condition of man, we mention first the discovery of rude flint implements associated with the bones of extinct animals, such as the mammoth, the rhinoceros, and others, in the undisturbed drift deposits along certain rivers in France and England. The drift beds inclosing those implements and animal remains are formed by layers of sand, gravel, and loam, which extend along the slopes of river valleys, and reach sometimes to a height of two hundred feet above the present water-levels, although their usual elevation does not exceed forty feet. These beds of drift evidently were not deposited by the sea, but by former or still existing rivers, for the shells which they contain belong to land and fresh-water species, and not to such as inhabit the sea. The materials composing them, moreover, consist of fragments of the same rocks which occur in the areas drained by the rivers themselves, a circumstance affording another proof of their having been deposited by these waters. The latter, of course, had formerly a greater expanse and ran at much higher levels, indicated in each case by the height of the deposits along their banks. Hence the enormous time may be inferred which it required to excavate the present river-channels. The climate of Europe, there can be little doubt, was much colder when those deposits were in progress of forming than it is at present. Every spring, consequently, the melting of the accumulated masses of ice and snow caused the rivers to rise to considerable heights, flooding extensive portions of the adjacent country, deepening the river-channels, and spreading over the valleys the *débris* of the surface, together with the remains of animals destroyed by the floods.

The knowledge of the occurrence of flint tools in such strata dates as far back as the beginning of the last century; but the importance attached to the subject was then overlooked, and only at the present time the full significance of these unpretending relics of by-gone ages has been duly recognized. The celebrated Cuvier, it is well known, denied, or, to say the least, doubted, the existence of fossil human remains, and his authority fixed, as it were, the opinion of men of science; for it is a general experience

that prominent investigators leave not only their achievements, but likewise their errors, as inheritances to the world.

About 1715 a spear-head-shaped flint implement, still preserved in the British Museum, was found with the skeleton of an elephant in the gravel on which London stands, and at the beginning of the present century Mr. John Frere discovered many flint articles of similar form in a fresh-water formation near Hoxne, Suffolk, in conjunction with the jaw-bone and teeth of what he called "an enormous unknown animal," which proved to be an elephant. The flint implements occurred in this place in great number, about five or six in a square yard, and the manner in which they lay seemed to favor the conclusion that they had been manufactured on the spot. The formation consisted of stratified loam and gravel, the latter containing the flint tools and the fossil bones. The bed of loam was employed at the time of Mr. Frere in the fabrication of brick, and even about 1860, when some English geologists examined the locality, the extraction of clay was still going on in the same brick-pit, and it was ascertained, moreover, that the layers still yielded from time to time these instruments of flint.

Mr. Frere's discovery, however, was little heeded at the time when it occurred, and soon vanished from the memory of men of science, until it was brought again to their notice many years afterward, when Boucher de Perthes made known the important results of his investigations. This enthusiastic and indefatigable French savant began in 1841 his examination of the gravel beds in the valley of the Somme, at Menchecourt, near Abbeville, Picardy, during which he found in these strata a great number of flint tools of antique type, in connection with the remains of the mammoth and other extinct quadrupeds, under circumstances which warranted the conclusion that the manufacturers of the tools and those animals lived at the same period. Instigated by the success of Boucher de Perthes, Dr. Rigollot, of Amiens, in the same valley, searched the drift beds near that place, especially those of St. Acheul, in the suburbs of Amiens, and collected in the course of a few years several hundred specimens of flint tools, resembling in the rudeness of their make those from the gravel-pits of Abbeville. Though flint implements of similar character were afterward found in corresponding deposits in France, and quite frequently in England, those of the valley of the Somme, on account of their abundance, have attracted the greatest share of attention, and therefore have become types of the whole class.

The prevailing geological formation in the north of France, and especially in Pio-

ard, is the chalk, containing here as elsewhere those well-known nodules of flint, the formerly much-sought material of which, before the introduction of percussion-caps and lucifer-matches, gun-flints and "strike-a-lights" were manufactured. In times long past, before the district of the Somme exhibited its present geological features, tertiary deposits, chiefly of a sandy character, covered these cretaceous rocks. The tertiary strata, however, mostly have been carried away by the action of water, and their materials, converted by solution and attrition into clayey substance, sand, and gravel, settled, with other *débris*, upon the denuded chalk, and thus contributed to the formation of the drift in the valley, through which the river has scooped its channel. The valley is about a mile wide between Amiens and Abbeville, and increases in width as it approaches the British Channel, into which the Somme empties.

At Menchecourt, near Abbeville, where Boucher de Perthes discovered the first flint tools, sometimes twenty or thirty feet below the surface of the soil, Sir Charles Lyell has pointed out three distinct layers, which we will describe in a few words, proceeding in descending order:

1. Brown clay, with angular flints, and occasionally chalk rubble, unstratified, following the slope of the hill, of very varying thickness, from two to five feet and upward.

2. Calcareous loam, buff-colored, resembling loess, for the most part unstratified, in some places with slight traces of stratification, containing fresh-water and land shells, with bones of elephants, etc.; thickness about fifteen feet.

3. Alternations of beds of gravel, marl, and sand, with fresh-water and land shells, and in some of the lower sands a mixture of marine shells; also bones of elephant, rhinoceros, etc., and flint implements; thickness about twelve feet.

This third layer rests immediately upon the chalk. The mixture of fluviatile and marine shells observed in it proves, according to Lyell, that the sea sometimes gained upon the river, whether at high tides or when the fresh-water was less in quantity during the dry season, and sometimes, perhaps, when the land was slightly depressed in level. All these accidents might occur again and again at the mouth of any river, and give rise to alternations of fluviatile and marine strata.

The flint implements themselves are very rude, and obviously indicative of the low and barbarous

state of those who fashioned them. They were split from the nodules of flint so frequently occurring in the chalk; some of them even exhibit portions of the chalky crust which always surrounds these flinty bodies. The two prevailing forms of the flint tools are those of roughly wrought spear-heads and of oval or almond-shaped disks, sharpened around their edges, the latter kind being denominated "hatchets," from their resemblance to stone hatchet blades still in use among very low tribes of savages. The implements of the spear-head type are more abundant at Amiens, while the so-called hatchets prevail near Abbeville. Besides these, numerous flakes of various shapes and sizes occur in the drift of the Somme, which were in most cases the result of a single blow, being split off during the process of fashioning the more finished tools already mentioned. Many of these flakes doubtless served for cutting, scraping, and other kindred purposes. The shape of the implements designated as hatchets and spear-heads depended, in all probability, much on the original outline of the chalk-flints from which they were manufactured. These nodules are mostly of a roundish or elongated form; and in making their tools the ancient people of the Somme Valley knocked two of them to-

development of the rude hatchet of the drift.

It must be particularly stated that none of the implements found in the river drift are provided with ground edges, and that no other process but that of chipping was employed in shaping them. The art of grinding and polishing utensils of stone belongs to a much later phase of the European Stone Age, when a variety of characteristic and well-defined tools and weapons had superseded the primitive productions of the savage men who were coeval with the extinct animals. Archaeologists therefore divide the European Stone Age into a period of chipped and one of ground stone, or, technically speaking, into a *palæolithic* (old-stone) and a *neolithic* (new-stone) period.

DRIFT IMPLEMENT FROM ST. AGNEUL, AMIENS (HALF SIZE).

gether until flattish fragments of suitable size came off, which they brought into the required shape by blows aimed at their circumference. Hence many of the implements are not exactly of the oval or spear-like form, but present shapes intermediate between them. As a rule, the narrower or more pointed end of these instruments is the one adapted for cutting. The tools of the spear-head type usually vary in length from six to eight inches, though larger ones have been found. Many of them seem to have been used with the hand, the end opposite the pointed part being often thick and massive to facilitate handling; and in some the lower end has not been fashioned at all, but has been left in its original state, when the form of the flint presented a suitable handle. Others, which are worked thinner at the lower end, perhaps were fastened to poles, and thus actually served as spear-heads.

Considering the strength and character of the quadrupeds surrounding these primeval people, it seems hardly probable that they could have dispensed with long weapons for attack and defense. A number of the implements called hatchets were inserted, it is believed, in cleft sticks, and fastened with the sinews or hides of animals, thus fulfilling the purpose which their name implies. Such primitive weapons were common among many races in various parts of the world, as they are, indeed, even in our days among the natives of Australia; and the grooved North American stone tomahawk, around which a withe was bent for a handle, presents but a higher

od. These distinctions will be more minutely explained hereafter.

The appearance of the drift implements indicates their high antiquity. Originally split from a dull dark gray flint, their surfaces are now altered in various ways, according to the character of the matrix which inclosed them. Those that are found in chalky or siliceous sands have a polished, glossy appearance, altogether different from that of newly broken flint; others, taken from ochrous or ferruginous sands, are stained with yellow or brown colors; in some beds they appear white and porcelain-like, and in others they are covered with a calcareous film. Occasionally the surface of the flint tools is marked with those dark moss or tree-like figures called *dendrites*, which owe their origin to infiltrations of oxides of iron and manganese; and though these markings furnish no proof of very high antiquity, having been noticed on bones obtained from later Roman graves, they are nevertheless, says Lyell, a useful test of antiquity when suspicions are entertained of the workmen having forged the hatchets they offer

FLINT FLAKE FROM MONTIERS, AMIENS (HALF SIZE).

for sale. Generally speaking, the flint tools exhibit the same alterations of surface which characterize the flint pebbles found in connection with them. It is evident, therefore, that both were deposited at the same period.

Though we have already attempted to indicate some of the probable uses to which the flint tools were applied, it must not be inferred that people in as low a state as the drift men were particularly choice in the employment of their scanty utensils, which, on the contrary, as we may suppose, had to serve for various purposes as the exigencies of the moment required. "It is useless," says Sir John Lubbock, "to speculate upon the use made of these rude yet venerable weapons. Almost as well might we ask, to what use could they not be applied? Numerous and specialized as are our modern instruments, who would care to describe the exact use of a knife? But the primitive savage had no such choice of tools. We see before us perhaps the whole contents of his workshop; and with these implements, rude as they seem to us, he may have cut down trees, scooped them out into canoes, grubbed up roots, attacked his enemies, killed and cut up his food, made holes through the ice in winter, prepared fire-wood, etc."

The implements just described constitute the only remains of human industry thus far found in the river drift of Picardy, although it may be presumed that the primeval people of the Somme Valley employed various objects made of wood, bone, and horn; but these, being less durable than the almost indestructible flint, have perished. Strange enough, there is some reason for the supposition that the men who once dwelt in this region, notwithstanding their extremely low state, already evinced that love for personal adornment which seems to be innate in human nature, and has been met even among the least advanced of mankind. There occurs in the cretaceous formation a small globular petrification, *Coscinopora globularis*,

*COSCINOPORA
GLOBULARIS*
(NATURAL SIZE).

which is either provided by nature with a hole passing through its middle, or has frequently on two opposite sides small cavities, the beginnings, as it were, of perforations, the material being softer and more spongy in the direction of the axis. Thus nature furnished objects which already presented beads, or could easily be converted into such, and it seems that the men of the drift actually employed them as ornaments; for Dr. Rigollot, in searching the gravel beds of Amiens, often found

DRIFT IMPLEMENT FROM ICKLINGHAM, SUFFOLK (HALF SIZE).

small groups or heaps of them in one place, all perforated, just as if they had been strung together at the time when they were brought to the spot. The writer has in his possession a number of such petrifications, exhibiting perfect as well as incipient perforations, obtained from the chalk of the Baltic island of Rügen, where they are supposed to have been used in the same manner by the ancient inhabitants.

During the years following the important discoveries of Boncher de Perthes and Dr. Rigollot, drift implements analogous to those of the Somme have been found in various parts of England, often in association with the remains of extinct animals, and thus furnishing, in corroboration of the results obtained by the French savants, the evidence of man's co-existence with creatures belonging to a long-lost fauna. The English implements occur, according to Mr. John Evans, "in beds of gravel, sand, and clay, for the most part on the slopes of existing river valleys, though occasionally at considerable distances from any stream of water, and in some rare cases not thus imbedded, but lying on the surface of the ground." Having gone into some detail in describing the drift tools of Picardy, we can not enter in this sketch upon the subject of similar British implements, but must refer the reader to Mr. John Evans's excellent work on the *Ancient Stone Implements, Weapons, and Ornaments of Great Britain*, in which the various river valleys and other localities yielding drift implements are enumerated, and the implements themselves carefully figured and described.

We must now proceed to give some ac-

SKELETON OF GIANTIC IRISH DEER.

count of the principal animals, extinct as well as still living, that co-existed with man during the drift, in order to show more clearly what position human beings occupied in that remote period.

THE MAMMOTH (*Elephas primigenius*).—An elephant of huge size, with enormous tusks, much more curved than those of existing species. The remains of this animal, which became extinct in Europe at so early a period that not the slightest tradition of its former existence has survived, are found in the Old World from the northernmost parts of Siberia to the extreme west of Europe; it ranged as far southward as the north of Italy, but does not seem to have existed south of the Pyrenees. Bones of the mammoth also occur in North America, from Behring Strait to South Carolina. These elephants abounded in Siberia, where their carcasses repeatedly have been found imbedded in ice, the flesh and skin still well preserved. Toward the beginning of this century a Tungusian hunter discovered one inclosed by ice near the mouth of the river Lena. He waited until the animal had become exposed by the melting of its icy shroud, and then cut off its tusks, which he sold for fifty rubles. The flesh of the body

afforded for some time food to the dogs kept by the people of the neighborhood, and to white bears, wolves, foxes, and other wild beasts, until finally Mr. Adama, a member of the Academy of St. Petersburg, who traveled in that direction, put a stop to these ravages, and took pains to save the remains from further destruction. The skeleton was almost complete, excepting a fore-leg which the animals of prey had carried off. "According to the assertion of the Tungusian discoverer," says Professor Owen, "the animal was so fat that its belly hung down below the joints of the knees. This mammoth was a male, with a long mane on the neck; the tail was much mutilated, only eight out of the twenty-eight caudal vertebrae remaining; the proboscis was gone, but the places of the insertion of its muscles were visible on the skull; the skin, of which about three-fourths were saved, was of a dark gray color, covered with a reddish wool, and coarse long black hairs. The dampness of the spot where the animal had lain so long had in some degree destroyed the hair. The entire skeleton, from the fore part of the skull to the end of the mutilated tail, measured sixteen feet four inches; its height was nine feet four inches. The tusks measured

along the curve nine feet six inches, and in a straight line from the base to the point three feet seven inches. Mr. Adams detached the skin on the side on which the animal had lain, which was well preserved; the weight of the skin was such that ten persons found great difficulty in transporting it to the shore. After this the ground was dug in different places to ascertain whether any of its bones were buried, but principally to collect all the hairs which the white bears had trod into the ground while devouring the flesh, and more than thirty-six pounds' weight of hair was thus recovered. The tusks were purchased at Yakutsk, and the whole then expedited to St. Petersburg; the skeleton is now mounted in the Museum of the Petropolitan Academy."

Mammoth bones are found in great number in Siberia, and the tusks form a valuable article of commerce, furnishing the so-called fossil ivory. Thousands of tusks have been collected and used in turning, yet others are still procured and sold in great plenty. The mammoth roamed in large herds over the plains of Siberia, where it fed on the leaves of spruce and fir, and even crushed twigs of considerable size between its powerful molars. This animal, it is believed by some, existed for a long time in Northern Asia before it found its way to Europe, in which continent it does not seem to have lived prior to the period of the drift. Other species of elephants, among them the *Elephas antiquus*, existed during the drift time, but their remains occur less frequently than those of the mammoth.

THE WOOLLY-HAIRED RHINOCEROS (*Rhinoceros tiberianus*).—An extinct animal whose remains occur mostly associated with those of the mammoth, showing that their range was nearly the same. It was frequent in Siberia, whence it seems to have emigrated to Europe with the mammoth. In its habits it resembled the last-named animal, feeding on leaves and boughs, and was likewise covered with a fur of combined wool and hair. The latter fact admits of no doubt, preserved specimens of this rhinoceros having been found imbedded in Siberian ice. This creature was large of

SKULL OF CAVE-BEAR.

body, but so short-legged that its belly must have nearly touched the ground. It carried two horns upon a nose supported by an osseous septum. Several species of rhinoceros lived at the epoch under notice, among which the woolly-haired is most frequently mentioned.

THE HIPPOPOTAMUS.—Probably represented by several species during the drift. One of them, the *Hippopotamus major*, was not uncommon.

THE CAVE-BEAR (*Ursus spelæus*).—The remains of this animal, as will be seen hereafter, are very frequent in caves; hence the name. They abound in Central Europe, especially in Germany, and in the southern parts of Russia, occurring also in Italy and Spain. The cave-bear, an earlier inhabitant of Europe than the mammoth, was a huge animal, surpassing in size the North American grizzly, and must have possessed great strength, though it has been inferred from the absence of the so-called gap-teeth in this species that it may have been less ferocious than its size would indicate. It is doubtful whether the cave-bear was the progenitor of any of the existing species of bear. Future investigations and comparisons probably will settle that point. Another bear of the period under notice, the *Ursus prisca*, is supposed by some to survive in the grizzly bear of this country.

THE CAVE-LION, perhaps more properly called cave-tiger (*Felis spelæus*).—An extinct animal, superior in size and strength to any of the present species of lions and tigers.

THE CAVE-HYENA (*Hyena spelæa*).—Resembled the spotted hyena of the Cape, but was larger and more powerful.

THE URUS (*Bos primigenius*).—A large bovine, which became extinct in recent times. Cæsar describes these animals, which abounded at his time in the Hercynian Forest, in Germany, in the following terms: "They nearly equal the elephant in bulk, but in color, shape, and kind resemble a bull. They are of uncommon strength and swiftness, and spare neither man nor beast

that comes in their way. They are taken and slain by means of pits dug on purpose. This way of hunting is frequent among the youth of Germany, and serves to inure them to fatigue. They who kill the greatest number, and produce their horns in public as a proof, are in high reputation with their countrymen. It is found impossible to tame them or to conquer their fierceness, though taken ever so young. Their horns, both in largeness, figure, and kind, differ much from those of our bulls. The natives preserve them with great care, tip their edges with silver, and use them instead of cups on their most solemn festivals." They were hunted, according to the *Nibelungen Lied* of the twelfth century, in the forests near Worms, and are said to have still existed in Germany during the sixteenth century, soon after which they seem to have totally disappeared. These animals co-existed with the mammoth and the woolly rhinoceros, and their geographical distribution was extensive, remains of them occurring throughout Europe: in England, Denmark, Sweden, France, Germany, Italy, Spain, and even, it is said, in Northern Africa. The race is now extinct, unless it has survived, as some have suggested, in the large Frisian oxen, or the wild cattle of Chillingham, in England.

THE AUROCHS, OR BISON (*Bison europæus*).—Another large bovine, resembling the North American bison, erroneously called buffalo. The aurochs seems to have existed in Europe long before the arrival of the mammoth and the woolly rhinoceros. Remains are found in England, France, Germany, Switzerland, and Denmark. Pliny and Seneca speak of it as existing in the great forests of Germany, but Cæsar gives no account of the animal, which is, however, mentioned, by the side of the urus, in the *Nibelungen Lied*, and was still hunted, it is said, in Prussia down to the year 1775, after which it became extinct in Germany. These bisons would have totally disappeared from Europe but for the care of the Russian government, which preserves a herd of them in a forest of Lithuania, guarding against their destruction by strict laws. A few also occur wild in the Caucasus Mountains.

THE MUSK-OX, OR MUSK-SHEEP (*Ovibos moschatus*).—Now totally extinct in the Old World, but still inhabiting in herds the arctic regions of America, seldom wandering farther south than the sixty-eighth parallel. It is a horned animal of the size of very small cattle, and clad in a dense fur of long silky hair. Remains are found in Central Europe, and rarely in England.

THE GIGANTIC IRISH DEER (*Megaceros hibernicus*).—This beautiful stag, which once inhabited Germany, France, Italy, and England, but especially Ireland, had entirely disappeared before historical times. A mys-

terious animal mentioned as the *schelch* in the *Nibelungen Lied* has been thought to be identical with the Irish deer; yet this is an opinion unsupported by any evidence. Its bones are said to occur often in peat bogs; but Professor Owen, who made numerous inquiries on the subject, believes that the remains generally are met in a shell marl underlying the peat. The Irish deer seems to have lived in Europe as early as the tertiary period. The animal was ten feet four inches high, and carried on its small head magnificent antlers, measuring eleven feet between their tips.*

To this list should be added the reindeer, which played a very conspicuous part in the prehistoric times of Europe, the horse, stag, elk, hog, and likewise numerous smaller animals which lived at the period under consideration, as proved by collateral evidence, though their bones, on account of their inferior size, have not been preserved in the river gravel; and it may be stated here that only the larger and more solid bones of the elephant and hippopotamus, the ox, horse, and stag, are found in these deposits. The fauna of the European drift comprised, besides the extinct mammalians, such as the mammoth, rhinoceros, Irish deer, etc., most of the now existing species, and was consequently richer and more varied than that of the present day.

The climate of Europe, as we already observed, must have been more rigorous at that period than at present. Yet the cavellion, hyena, hippopotamus, elephant, rhinoceros, etc., would seem to indicate a warm rather than a cold climate. In order to anticipate this objection, which is likely to suggest itself to the reader, we will repeat that the elephant and rhinoceros of that period, unlike the almost hairless species of our days, were covered with a dense fur consisting of wool and hair, which enabled them to endure an arctic temperature. The tiger of Southern Asia has been seen in Siberia as far north as the fifty-second degree; and in the north of Africa hyenas are known to prowl about the highest regions of the Atlas Mountains, where during winter a severe cold, with ice and snow, is reigning. Of the extinct carnivores, moreover, the bones only have been found, and nothing is known of their external covering, which may have been suited to a cold temperature. The reindeer, essentially a northern animal both in the Old World and in North America, has long ceased to live in the west of Europe, and has retreated to the coldest part of that continent, while the musk-ox, entirely extinct in Europe, survives only in the snow regions of North America, ranging, it is be-

* A fine skeleton of the fossil Irish deer is to be seen in the Central Park Museum of Natural History. It was presented to the museum by Professor Albert S. Bickmore.

lieved, even higher toward the pole than the reindeer. Lastly, we have to mention, as characteristic of the European drift, the glutton, lemming, rat-hare (*lagomys*), and pouched marmot, all of them now inhabitants of cold countries.

All these facts, to which others of similar purport could be added if it were deemed necessary, are indicative of a rigorous temperature during the time when the river gravels were deposited, and such a state is perfectly corroborated by geological evidence, as we will try to explain in a few words.

The quaternary formation, to which the deposits of river gravel belong, is geologically the most recent one, although it extended over an immense period of time. It was preceded by the tertiary epoch, during which a milder temperature reigned, as indicated by the character of the then existing plants and animals. "The end of the tertiary period," says Professor Vogt, "which we do not separate from the present by a sharply defined line, but by a broad transitional margin, was doubtless distinguished by a somewhat warmer climate than that which at present obtains in Central Europe. While in the middle of the tertiary period palms were growing in Switzerland, and high Californian pine-trees in Iceland, the end of the tertiary period was marked by a number of evergreen plants, with a temperature in Switzerland like that of Italy." Toward the end of the tertiary period a change in the physical condition of the earth was effected by a general refrigeration, which, of course, exerted a powerful and modifying influence on the organic beings then in existence. Under the influence of various causes not yet sufficiently recognized, large portions of Europe, Asia, and America became covered with huge masses of ice, while the lower lands of the continents were flooded by glacial waters. This remarkable change constituted an epoch of extremely long duration, until at length the glaciers melted, and a milder temperature was gradually restored. Land and water were then somewhat differently distributed in Europe: the Baltic, for instance, is supposed to have communicated with the White Sea and the Sea of Kara, and England perhaps was still connected with the main-land of Europe, and Denmark with Norway. Many curious phenomena, such as the transportation of boulders and the formation of loess, are connected with this so-called *Glacial Period*,*

* Some geologists believe in two glacial epochs separated by a period of milder temperature. Mr. James Geikie has published in the course of this year (1874) a work entitled *The Great Ice Age, and its Relation to the Antiquity of Man*, in which he advances views differing from those held by many other geologists. He is of opinion that certain animals whose remains occur commingled in river gravels and cave deposits can not have been contemporary inhabitants of the same

an exposition of which belongs to geology, and, of course, can not be attempted in this place. For our purpose it suffices to have alluded to the circumstance which produced toward the end of the tertiary period that change in the temperature which permitted animals now belonging to northern climates to subsist in Western Europe; for though the tool and bone bearing gravels so often mentioned in these pages probably were not deposited during the glacial period, but somewhat later, it is evident that its after-effect was then still keenly operating.

Surrounded by an animal world such as we have described, under an inclement sky, lived the first human beings of whom any tangible tokens have been left.* They subsisted by hunting and fishing, but represented, beyond question, the lowest type of that condition of human existence. Archaeologists are accustomed to infer the social state of prehistoric populations from the productions of their mechanical skill; and here we behold in the west of Europe a race of men who used the most primitive weapons ever found, and with these wretched arms, some of which were attached to clubs and poles, they fought the beasts of the field and met each other in deadly combat. They were unacquainted, as it appears, with the use of bows and arrows, and with the manufacture of pottery. Indeed, they lived in the lowest stage of the Stone Age, which age, at later periods, has furnished a variety of tools and weapons remarkable for the skill, and even for the sense of elegance, of those who made them.

Human remains were long sought in vain in the tool and bone bearing strata of the Somme Valley, and many were the reasons given to account for their absence. It was said, for instance, that the number of human beings living at the drift period must have been small in comparison with that of the animals of the same epoch, the severe struggle for existence not permitting the race to multiply in a rapid ratio; and the comparative smallness of human bones, moreover,

localities of Europe, and he therefore believes in alternate changes or oscillations of climate, which permitted tropical and northern species of animals to inhabit certain districts at *different periods*, when the temperature was congenial to their respective natural habits. Southern quadrupeds, like the hippopotamus, tiger, and hyena, he thinks, can not have lived side by side with the reindeer, musk-ox, mammoth, or woolly rhinoceros; and he rejects the view of those geologists who bridge over this difficulty by assuming that certain animals of the first-named class migrated annually during the severe season to warmer regions, and returned to their old haunts again when milder weather set in. It remains to be seen whether Mr. Geikie's conclusions will be adopted.

* Whether the human race can be traced as far back as the tertiary period is a question which the future will decide. Some slight indications at least of man's presence before the quaternary epoch are not wanting, and the fact may yet be established by incontestable evidence.

was adduced as a ground for their disappearance. At length, however, M. Boucher de Perthes succeeded in finding, at Moulin-Quignon, near Abbeville, a human lower jaw of peculiar shape, which he extracted himself from the stratum immediately above the chalk. The jaw is of the same dark bluish color that characterizes the surrounding sand, as well as the flint tools occurring in the latter. This discovery was followed shortly afterward by that of other human remains at the same place. The jaw-bone of Moulin-Quignon, now preserved in the Museum of Natural History at Paris, has given rise to many discussions among the learned, even to a congress of French and English savants held *in loco*. Generally speaking, French and German anthropologists consider the jaw as a relic belonging to the age of the mammoth and the worked flints, while the savants of England seem to be skeptical in the matter. No doubts, however, are entertained with regard to portions of the human skeleton found in 1868 by Messrs. Bertrand and Reboux in the valley of the Seine, near Clichy and elsewhere near Paris, in the same beds in which implements of the true drift type have been discovered.

We can not quote in this short sketch the computations of geologists concerning the antiquity of the river drift; for these details we must refer to the proper authorities, such as Sir Charles Lyell, Evans, and others. Yet, in conclusion, we will draw the reader's attention to a remarkable circumstance relating to the age of the drift in the valley of the Somme. There extends through a considerable portion of that valley a bed of peat from twenty to thirty feet in thickness, and undoubtedly of later origin than the drift deposits of the same locality. In this peat are found imbedded the bones of quadrupeds and shells, all of the same species now inhabiting Europe; and, further, trunks of the alder and walnut and stems of the hazel, together with nuts of the same. The workmen who cut the peat declare that in the course of their lives none of the hollows which they have found or caused by extracting peat have ever been refilled even to a small extent, and therefore deny that peat grows. This, however, is a mistake, the increment in one generation not being perceptible to an ordinary observer. Near the surface of the peat occur Gallo-Roman remains, and still deeper, weapons of the later Stone Period. But the depth at which these works of art are found can not be considered as a sure test of age, the peat being often so fluid that heavy substances may sink through it by their own weight. In one instance, however, Boucher de Perthes observed several large flat dishes of Roman pottery lying in a horizontal position in the peat, the shape of which must have prevented them from sinking through

the underlying peat. Allowing about fourteen centuries for the growth of the superincumbent vegetable matter, he calculated that the thickness gained in a hundred years would be no more than three French centimeters, or about nine-eighths of an English inch. "This rate of increase," says Sir Charles Lyell, from whom the above statements are taken, "would demand so many thousands of years for the formation of the entire thickness of thirty feet that we must hesitate before adopting it as a chronometric scale."

AMERICAN HUMOR.

By THE HON. S. S. COX.

HUMOR in its literal meaning is moisture. Its derived sense is different; but while it is now a less sluggish element than moisture, we still associate with humor some of its old relations. In old times physicians reckoned several kinds of moisture in the human body—phlegm, blood, cholera, and melancholy. They found one vein particularly made for a laugh to run in, the blood of which being stirred, the man laughed, even if he felt like crying, whether he would or no. Tasso describes in his serious epic, *Jerusalem Delivered*, the death of the knight Ardonio, who, at the taking of Jerusalem, was slain by a Persian lance, which

"Pierced him through the vein
Where Laughter has her fountain and her seat,
So that (a dreadful bane)
He laughed for pain, and laughed himself to death."

The temper of the mind seemed to the old doctors to change as one or the other of these kinds of moisture predominated. Thus the mind received its prevailing tone. As the current of moisture changed from time to time, humor began to mean the present disposition of the man. His characteristic peculiarities seemed to depend on these mercurial influences of the body; and as men

never laugh at that which is common to them all, as they never raise a laugh at their own expense, and as they must laugh, they seized upon the oddities, whims, and the angularities of the "other man," his out-of-the-way talk and conduct, and made these human ficklenesses the sources of jocularity. So humor in our tongue reached its present signification.

It has, however, a more restricted meaning. Various definitions have been given of it. Some consider the essence of humor to be in its serio-jocoseness, as if it were a scarf of mock gravity cast over pleasantry to make it more attractive. But this can be affirmed of humor only in part.

Others confound it with wit. They define humor as the point in which pain and pleasure meet to produce a third element, which partakes of both—a sort of voluptuous torture, like being pinched by a pretty girl. Hence some humor makes us cry, and some makes us laugh. Less prettiness and more pinching bring tears; more prettiness and less pinching, smiles. It is the identity of contraries—candied ill temper, pickled good nature. They hold that contrast alone is the element of humor. This does not square with our theory. Humor has no sting. The humorous man is, from his very sensibility, likely to be gentle and pathetic, but not malignant. He can rain tears as well as bring smiles. The tear, too, may have its prism of humor. But pathos has a law and an orbit of its own, though it may often meet in conjunction with humor.

Hobbes attributed all laughter to a sense of exulting superiority, and even pleasure in the pain of another. That sort of laughter may do for fiends, not for men. Men laugh at wit as well as at humor. So they do at farce. There is much of humor in both wit and farce. They are divided from humor by no very clear lines; yet humor is neither wit nor farce. Wit cuts, humor tickles; farce grins, humor smiles. Wit is polished and sharp, an edge-tool dangerous to handle in the most practiced hands. Humor may be rusty, though never dull. While wit uses the scalpel, brings blood, divides our members, cuts out the gangrene, and oftentimes the healthy parts, humor manipulates gently, or gestures with the playful finger under the ribs of jollity, never drawing blood, but pumping up the moisture until the eyes run over with gladness. Farce, on the other hand, is the caricature of humor. It shakes one rather roughly; disturbs the gentler currents, until they lose their lucid mirthfulness in the muddy rush of broad guffaw.

Wit is not always a desirable quality. The worst men often use it. The devil generally monopolizes it. John Randolph had it and used it. Voltaire, that embodied epigram, curt and unconscionable, wrote and

talked in that vein. The lustre of humor never tingled in his blood nor shed its geniality on his time. He became a thin stick of caustic, withering and blackening whatever it touched. Cervantes, however, wrote in a different vein, and made men merry at the incongruities of the Don and Sancho, while he strove to better human nature. His humor wears the sterling stamp of humanity.

Humor differs only in degree, not in kind. The white man and black man both have

JOLLY DANKY.

fun in them, just as the diamond and charcoal are of the same material—carbon. In one it is crystallized and concentrated; in the other it is diffusive and combustible. Try each under the blow-pipe: the charcoal will glow with plentiful scintillations long before the diamond releases a sparkle of its light.

There are some phases in life which would stir humor in every man of sanity. Not that every one would laugh at the same object, but every one would laugh at some time of his life at some object. What would be a homeopathic pellet of humor to one would furnish another with a ton of fun, and vice versa.

Again, the humor of men differs at different hours of the day and at different epochs of their lives. Men are like some flowers. The common pink is blue early in the morning, and bright pink as the sun advances. Others are white in the morning, pink at noon, and red at sunset, as if they took their hues from the sun in his motions.

Moreover, what is amusing to a boy is puerile to a man, and what is painful to a boy may be pleasant to a man. Who does not remember that nothing was so dreaded by him at school as to be punished by sitting between two girls? But ah! the force of habit and the lapse of time! In after-

shrouded at their birth. Observe those two men on the cars. They buy *Harper's Magazine*. The one begins with the Scientific article, the other begins at the "Drawer end," and reads, like a Hebrew, backward.

There is no law for humor. Like the comet or the cholera, it comes—God only knows whence—and its very orbit is an eccentricity. It is very often humor only because it is exceptional. Queerness is the badge of its genuineness. Undertake to bring it into orbits, measure it by geometry, test it by equations, appreciate it by figures, or square it with roots and logic, and it is off! Its law is to have no law, and all attempts to philosophize about it were as well omitted. We know that it is, that it is different in different minds; but why, it is beyond philosophy to tell.

"Fat men are always humorous," says one who has a theory, and Falstaff is introduced as the illustration. The analogies of nature are pressed into the service of this oleaginous

years we learn to submit to it without shedding a tear!

These varieties must be so from the variety of human vicissitude. An Englishman laughs at the untoward effort of a Frenchman to speak English, though a Frenchman would not laugh at John Bull's awkwardness at French; yet Johnny Crapaud never laughs more than at Bull's snarly airs of assumed consequence. An African bursts into irrepressible glee at the faintest approach of the ludicrous, as if his mind had but one side, and it was all smitten and quivering with jollity; yet the grave Spaniard, his master, composedly smokes his cigarette and twirls his mustache, utterly impervious to the stroke. The one, like jelly, shakes with every motion around; the other is frigid, like ice, and thaws with a cold trickle of pleasure.

This diversity in humor is independent of education. It is not superficial either. No outside show can hide it. The spiritual tentacles are always vital and vibratory in some, ever dormant, if not dead, in others. Some would have a perpetual jubilee of life; their muscles are ever ready to relax at the absurdities of others; they have scouts and sentries ever on the alert; while others are so indifferent about it that it seems as if nature were

theory. Tom Hood is quoted where he says of the Australian soil that "it is so fat that, tickle it with a hoe, and it will laugh with a harvest." But fun and fat do not necessarily go together. Moisture of the muscles and layers of lard have no more to do with humor than meat has with manhood. Little Dr. Holmes would show you that by one turn of his "tread-mill." The beasts which feed most are the dullest. We must reject, then, the adipose theory. If we are to judge of a man's jollity by the juiciness of his body, one would think an

HEAVY AND SOBER.

American to be the jolliest of mortals, for his salivary glands are in perpetual flux.

"Laziness begets laughter," says another theorist. Industrious people are too earnest and serious for jokes. Leisure leads to lev-

ity, and a nation that is always bending its sinews to labor can not unbend them to laugh. This is measurably true, but this will not hold as a general rule. There is something more radical, something too evanescent for apprehension, which determines the humorous temper of the mind. All

LIGHT AND JOLEY.

that we can say is that physical influences may and do modify its development, but the germinal principle in every man is different. What Mozart said of himself and his composing will illustrate what is meant: "I do not know in what my originality consists. Why my productions take that particular form or style which makes them Mozartish is probably owing to the same cause which makes my nose thus and so—makes it, in short, Mozart's nose, and different from other people's." Every man has his own humor as peculiar as his own features.

But as the people of one country may be alike even in their differences of body and mind, so there are peculiarities in the humor of different nations as marked as the geographical peculiarities of their country, or as their food. An Englishman loves roast beef; a German, kront; a Patagonian, red mud; a Kamtchatkan, blubber; a South Sea Islander, cold clergyman; a Peruvian Indian, the abominable chicha; and the American, the weed! Their humorous taste is not less diverse.

To the eye of a comprehensive philosophy every thing is laughable, ludicrous, or ridiculous except that which is the proper attribute and investment of an honest heart and a pure soul. Sir Thomas More, in his ideal commonwealth, says that when the foreign ambassadors came into Utopia, and found that their gold gems and finery produced nothing but laughter, they were amazed. And if we ever have a perfect Utopian society, such amazement will salute every such shoddy and ostentatious adornment. I never doubted the story of an Emperor of Japan who died of immoderate laughter when told that the Americans governed themselves without a king, for to the Japanese sense of humor perhaps no more comical idea is entertainable. Indeed, it has sometimes become farcical to elector and elected, successful and defeated, in this country.

It is alleged that some nations have little or no humor, as the Dutch and Scotch. The solidity of the Dutch prevents a joke from getting through their sevenfold pile of clothing and flesh. As prone as we are in America to divide into parties and sects on every issue, we could never have divided on such a question as divided Holland and Zealand for two centuries. Their whole population were arrayed one against the other in a dispute which arose between two persons at a feast. The Hocks maintained one side, the Kaalbejanos the other. The agitation grew to such a pitch that the nobles and towns took sides. Each were ready to die for their colors, though the world was ready to die laughing at their dullness: and the vexed question was, Whether the cod-fish took the hock, or the hock took the cod-fish.

As to the Scotch, notwithstanding the humor of Burns, Smollett, and Scott, yet I

SERIOUS AND CANNY.

think that Sydney Smith was not far from the truth when he said that it required a surgical operation to get a joke into a Scotch understanding. Indeed, the same idea is conveyed in some of Black's recent Scottish novels.

I am not, however, prepared to agree that their only idea of humor is infinitely distressing, inasmuch as it consists in immoderately laughing at stated, or what I may call geometrical, intervals. If the Scotch were not so "canny," they might be more comically inclined. The possession of keenness and intelligence, and their constant use, render them too serious to jest. They want the ardor and impulses which the Irish have in abundance, and which give to them an unceasing flow of mirth. Ireland makes up for her want of practical sagacity by the wit of her writers, the readiness of her repartees, and the drollery of her bulls. Macaulay hit the white when he said that Ireland was more interesting than prosperous.

Not only is the susceptibility to humor different among different nations, but the humorous objects differ by reason of different customs and habits. There is nothing very laughable to us in the manner in which we at our hotels and railroad depôts gobble down our food, but even an Arab or a Chinese would laugh at the operation if we did not. Yet it is ludicrous to us to see an Arab lady pick out the choice tidbits with which you had loaded your plate, or roll a little ball of hash in her dainty fingers, and by way of especially honoring you, plug your mouth with it unexpectedly; or to see a Chinese with his chopsticks load himself up with boiled rice, and ram it down as we would wad in a gun! It is said that the ladies under the dominion of the Grand Lama, when good-looking, disfigure their faces to preserve them from vanity, I have never seen that recorded of our ladies—Heaven forbid! The idea, however, is as ludicrous as the Tartar custom of pulling a man by the ear when they want him to drink, and keep pulling till he opens his mouth, when they pour down the liquor. I

ARMS AT TABLE.

know a man whose ears do not require to be pulled!

There is nothing very laughable to an American in the shaking of hands, which is every where practiced in our country; but foreigners do find in it much amusement. Yet nothing will be more ridiculous to us than the salutation in Germany, where one may see two big, burly, hairy men rush to each other's embrace and kiss with school-girl fervency. The people of Thibet salute by lolling out the tongue and scratching the right ear, and the Esquimaux by rubbing their noses with their thumb and describing a conic section in the air with their fingers—a custom once practiced by mischievous urchins in our land, but not exactly as a salutatory grace. It is now happily honored in the breach. In Turkey an American travelling with his unveiled wife, even without

A CHINESE GROOM.

the appendages, so usual here, of six small children and seven large trunks and band-boxes, is to them in a funny predicament. On the other hand, what would be funny with us, among the Turks is quite the reverse. An American gives us an instance in his experience in Syria. He was about to mount his mule amidst a crowd of Oriental visitors, and wished to give them an exaggerated idea of American agility. He jumped a little too far, and overshot the mark, coming down on the other side like a diver, with his hands and nose in the mud, his feet caught in the saddle, and his coat skirts cleverly rolled over his head to screen him from what he supposed was a laughing crowd. Yet not a soul smiled, not a sound was heard save a tender grunt of sympathy and demure offers of aid. Now a Turk in America, with baggy breeches and turbaned head, taking a leap over a mule in the streets of an American city, and getting stuck upside down, with his proboscis in a

GERMAN SALUTATION.

rut and his heels in the saddle, would be saluted with something more than a grunt of sympathy and demure offers of aid. We have more humor than dignity; the Turks more dignity than humor. There never was an American who would not sacrifice his courtesy and sympathy to his fun. He must have it, however, well seasoned, and done in a hurry, and its prevailing characteristic must be exaggeration. You saw this illustrated even in the inordinate hopes of so calm and sedate a statesman as Mr. Seward, as to the closing up of our late civil war in sixty days. That was the huge joke of our time. There was a court in General Grant's army which sentenced a man to work ten years on General Butler's Dutch Gap Canal; and it was generally said, if not believed, in the army that Palmer, who made the patented limbe, had purchased 2000 acres of Western land, and planted them with locust and maple, with a view to economize in the future in his manufacture of arms and legs.

AMERICAN SALUTATION.

TARTAR INVITATION TO "SMILE."

restraint. We shall see by-and-by how much force there is in this antecedent probability against our humor.

It is urged as a reason against our having the humorous gift that, as humor flows out of peculiarities of character and conduct, we can not have a national humor original and unique because of our cosmopolitanism; that if we have any humor, it will so partake of the quality of every other people as to be wanting in a distinct American quality.

Let us weigh this statement. It is true that no people were ever so composite as ours. On the Atlantic side the nations of all Europe have a theatre for the blending of their divers tempers, while on the Pacific side the Chinaman and Japanese, with their pig-tails and shorn crowns, lean forward to blend their laughterless physiognomy with the motley groups which people the placers, do the cooking and washing, and build the railroads of the Occident. It was only the other evening the writer addressed a meeting in New York city. It was composed of Hungarian Hebrews mostly. They drank lager, while the band played the *Mulligan Guards*. It was more than *E pluribus* brag, *Erin go unum*!

Our institutions have made us the most affiliative people known to history. It may be that in grafting so many and divers shoots upon our national stock we are overburdening our productive energy, and neutralizing our native temper and tone. But I trust not. The predominant genius is *American*! Like the genius of the Grecian artist, it is eclectic, for out of many models it will educe the highest type, from divers discordances it will develop a comely concordance. Bancroft has said that our land was not more the recipient of the men of all countries than of their ideas. Annihilate the past of any one leading nation of the world, and our destiny would have been changed. Italy and Spain, in the persons of Isabella and Columbus, joined together for the great discovery that opened it for emigration and commerce; France contributed to its independence; the search for the origin of the language we speak carries us to India; our religions are from Palestine; of the hymns sung in our churches some were first heard in Italy, some in the deserts of Arabia, some on the banks of the Euphrates; our arts come from Greece, our jurisprudence from Rome, our maritime code from Russia; England taught us the system of common law, and Ireland the heart to love and defend the constitution of our federation; the noble republic of the United Provinces bequeathed to us the prolific principle of federal union. Our country stands, therefore, more than any other as the realization of the unity of the race. It may be asked, "Where, then, in all this Babel of tongues, jangle of ideas, crosses of race, and confusion of sys-

tems, is there any individual Americanism in our temper, tone, or humor?" Where indeed, I answer, if not in the blending of the many-tinted phases of the varied civilizations which time and sacrifices have furnished for our own exquisite mosaic? It is this absorption of characteristics of every clime and time which makes our society the most incongruous, grotesque, odd, angular, *outré*, and peculiar ever yet known in history. Instead of destroying our peculiar humor, this medley has turned us from the old English channel, where we had ever been copyists, into new channels of our own. Jefferson in his *Rip Van Winkle* could never have played his part so well had he not combined the thin jolly American with the Dutchman. Instead of this unexclusiveness breaking down our humor, it is a resource for it as inexhaustible as it is varied. If the power of man consists in the multitude of his affinities, in the fact that his life is intertwined more with his fellows of every caste, degree, and nation—if he thus become a more complete compend of all time, with all its tastes, affections, whims, and humors—then the American man ought to be more potent in his individuality than any other. From his mind, as from the Forum of ancient Rome, proceed the great avenues north, south, east, and west, to the heart of every other people, multiplying his relations, and drawing to itself all the resources which human nature can furnish. Out of these derivatives from the Old World we have our originals. The greater variety of our life, the more golden are the veins of our humor. From the commingling of heterogeneous customs and languages we shall have a medley full of fun, loud, large, uproarious, and rollicking in exaggerations.

There are elements in our country from which, *a priori*, we may infer that we shall have abundant harvests of humor, if we have them not already. These elements are our Plenty and Freedom. The same reasons given by an old English writer for the variety of the vein in England may be applied to America with even more fitness. I extract their essence thus: 1. The native plenty of the soil: plenty begets wantonness and pride; wantonness is apt to invent, and pride scorns to imitate. 2. Easy government, and liberty of professing opinions: liberty with plenty begets stomach and heart, and stomach will not be restrained. Thus we come to have more that appear what they are. We have more humor, because every man follows his own bent, and takes both pleasure and pride in showing it.

This philosophy will hold every where. Plenty, unless gorged to dyspepsia—and even then it becomes ludicrous—is the very father of fun. Whether plenty has the ribless side or the thin anatomy, laughter lives

in its company. Does not a man "well-to-do" feel good? Is he not more genial? Can he not laugh heartier, invent merrier thoughts? And will he not, if unconstrained by a tyrannic government, let out more of the native peculiarities of his disposition? His independence precludes imitation, and disdains obedience. He is more of an individual sovereign, and in the wrestling of life he will show more muscle and point. Nast's caricatures furnish plentiful illustrations, and the newspapers, in both picture and type, are not less evidences of our unlicensed printing than of our love of the most grotesque fun. If you would deaden humor, put your government to work with the Procrustean bed, and make men all of a length, and you have machines, not men, and no humor.

I do not know but one exception to the rule, and that is the Irish. Rich or poor,

too rich and fat without fair distribution. Our cities show it more than the country. At least we are growing rich in spots. Our watering-places, our hotels, our theatres, our churches, our lectures, our literature, the amenities and luxuries of life, all float on this golden Pactolus; and along with them are the laughing genii who puncture the follies and hold the mirror up to the oddities and fooleries that bubble and effervesce in the wake of this very successful life. Rev. Cream Cheese preaches quite *recherché*, and fashionable religion with lavender-mouchoir wipes away the tears that never flow; but Curtis, the rogue, sits demurely by, and Mrs. Potiphar goes to his canvas, illustrated by his facile humor. Parvenu pride turns up its aristocratic nose at plebeian vocations; but Saxe, the wag, is sliding the genealogical line of the M'Brides through his fingers, and holds up the waxed end with a chuckle. Sanctimonious humanity becomes a Federal Senator. His name is Dillworthy. He promises his constituency immense material advantages on the philanthropic basis, while his friend and admirer, Colonel Mulberry Sellers, warm and genial, eloquent and sanguine, impecunious in purse but a millionaire in promises, rallies to the theatre thousands nightly to roar in laughter over the exaggeration of an extravagant feature in our American society. The genius of Mark Twain in facile caricature proves that there are not only "millions" in a play, but that millions will laugh it into every man's conversation and approval.

There is much of Franklin's shrewd, practical humor disguised under the mask of Josh Billings's sayings. With a Puritan face all severe and sour; without a hearty open laugh to welcome the coming or speed the parting joke; with nothing but an odd pucker of the mouth and an elfish twinkle of the eye; with an inward chuckle which has no outward sign—Billings (aside from the small fun of bad orthography) hits the target of humor in the white when he says that with some people who brag of ancestry their great trouble is their great descent; or when he thanks God for allowing fools to live that wise men may get a living out of them; when he says that wealth won't make a man virtuous, but that there ain't any body who wants to be poor just for the purpose of being good; when he says that when a fellow gets to going down hill, it seems as if every thing was greased for the occasion; or when he gives us his way of keeping a mule in a pasture, by turning it into a meadow adjacent and letting it jump out; or when he has known mules, like men, keep good for six months just to get a good kick at somebody—he makes a species of drollery which even our English reviewers have begun to appreciate, and which does not re-

IRISH GOOD HUMOR.

full or pinched, they must have their jollity. And yet Disraeli called them a melancholy people! Well do I remember the sparkles of merriment let off by the little urchins who ran after the jaunting-car on which I rode out to Donnybrook Fair. They begged, to be sure, and looked wretched, but they won more pennies by their humor than by their looks. All through Ireland, even in their extremities of want, the goodness of Nature seems to have provided them with cheer as an offset to their hard condition. They do not need their fun so much in this land of plenty, but it does not leave them here.

Our people are on a full rush for plenty, but they have their fun as they go. The very rush makes merriment. The excitement throws off electric sparks. The friction makes music. We have been waxing

quire the drawl of bad grammar and spelling. I once had occasion, in a deliberative body, to use Billings's illustration that one hornet, if he felt well, could break up a camp-meeting. The effect amazed me. The application was made; and Billings himself afterward said, "My name will go down to the fewter coupled with the hornet; we will be twins in posterity." The description of the nature of the insect, especially the use it makes of its "business end," of the way it avoids the thousand attempts to "shoo" it and to fight it, and the consequent consternation of a pious body, has in it exaggeration of the raciest kind.

But this kind of humor, like that of Nasby, does not rise to the dignity of literature. It can not compare with Washington Irving, who, in his *Knickerbocker* and other works, has given us the very choicest brand, all sparkling and stimulating. But Irving is too refined, sweet, and shy for general appreciation. Besides, Irving is not an American humorist. He is more English than American, more cosmopolitan than either. Paulding, Hawthorne—alas for our literature! Oh, for one man for America what Richter is to Germany, or Dickens is to England!

Mrs. Stowe has plenty of the genuine indigenous humor in her *Uncle Tom*, which she has almost smothered by her recent horrible revelations of the bad Byronic people.

Our humorous writers, with a few exceptions, are not strictly national. Even Franklin, our first, best humorist, stifled his humor in the Addisonian style. His was too earnest a character to make the humorous trait very prominent; but his sly, shining threads of observation, intertwined into the strong strand of his practical sense, have had their effect on the older men of this generation.

Sam Slick and Jack Downing—they are the caricature of caricatures. We have had printed at Philadelphia a series of works on American humor, giving graphic pictures of the pioneer times of the South, Southwest, and West, which, if purged of their grossness, and artistically inwoven with some genial purpose, would better represent our national idiosyncrasies, with their reckless heroism, quaint extravagances, and novel parlance, than any other portion of our literature.

But, after all, the American humor does not reside altogether in books. It is to be found in our newspapers, with their spicy dialogues, practical jokes, Mrs. Partingtonisms, Artemus Wards, Josh Billingses, Nasbys, Twains, Bret Hartes, and the infinity of little jets of fun on the outside, and measureless ridicule and cuts on the inside, local items, advertisements and all.

There is no time in such an essay as this to run the round of our newspaper humorists. One might begin with Doesticks,

quote Breitmann's Anglo-German verses, turn over the versatilities of Mr. Newell (Orpheus C. Kerr), chuckle at Max Adeler's demure extravaganzas, and the dry jocoseness of the *Danbury News*, roar with Donn Piatt till the Capitol itself echoed the "cave of the winds," or shake with the "Fat Contributor" until the lean earth was larded, and just begin to have an appreciation of the illimitably broad hyperbole which marks our ephemeral newspaper fun.

The Athenian frequented the theatre of Bacchus to hear a play of Aristophanes, wherein the spite and fun of the day were concentrated; the Romans gathered at the Baths of Caracalla to laugh over the gossip and humor of the city. What theatre and bath were to Athens and Rome, the journal is to the American—only more so. In our five thousand American journals, sending out a billion of copies per annum, the American finds a mirror of his own nature, reflecting his opinions and feelings, and those distorted and grotesque images and scenes which are the life of American humor.

All of our prominent representative men have had more or less of this faculty, and use it as the surest talisman to open the popular ear. John P. Hale, ever on a smile with his waggery; General Houston, with his eccentricity; John Van Buren, with his playful sarcasm; D. S. Dickinson, with his trenchant, scriptural, practical, ironical hits; Thomas Corwin, with his inimitable drollery; Thaddeus Stevens, with his dry and biting sarcasm; and Proctor Knott, with his elaborate Duluthiana—had the charm which drew the crowd and held men while they talked. The masses leap to hear a man of humor like Butler, even when his speeches are full charged with diabolism, or to hear a minister like Beecher, and even from the pulpit await the inevitable laugh! It is all the better if it has point; but give the laugh without point, rather than no laugh at all. There is no ruse so common as this, at least in the West, as the *argumentum ad risum*. Turn the laugh on your opponent, Sir Sophist, and though he pile Pelion on Ossa of argument, you have him down! This may seem more creditable to our humor than to our sense. But let us see. One of the utilities of humor is the use made of it by our writers and speakers in what is called the *reductio ad absurdum*. This use may be abused; but we can not spare it for all that, so long as we have so many empirics in medicine, pettifoggers in law, demagogues in politics, pretenders in religion, and snobs in society. Our institutions are favorable to the growth of mushrooms. They grow up in a night around the roots of our wide-spreading freedom. We have theorists without sagacity, philanthropists without morality, and prac-

tical men without sentiment. We have men who pass current for eagles, which a little touch from the point of humor reduces to tomtits. We have vaunting patriots whose patriotism, as of old, is scoundrelism—men who live, ay, who thrive, on the burning indignation that is poured upon them. Such men wither, under ridicule, to their proper dimensions. Ridicule never hurts an honest man. He alone can join in the laugh against himself. It is the Ithuriel spear, however, which makes the devil show himself as he is. Ridicule may not be a good test of truth, as Shaftesbury maintained, but it is not a bad test of falsehood. An old English poet says:

"For he who does not tremble at the sword,
Who quails not with his head upon the block,
Turn but a jest against him, loses heart:
The shafts of wit slip through the stoutest mail;
There is no man alive who can live down
The unextinguishable laughter of mankind."

We are apt to condemn the writer or speaker who applies the touch-stone of absurdity to the shams and rascality of the day, even while we laugh with him. But Attic salt is as useful as Kanawha. The one preserves mess pork, the other moral purity. Even when our humor is misapplied, it is the smoke evidencing the fire of fun which lies beneath the crust of our society. Hence the success of Nast and others with their terrible caricatures.

The general sources of our humor are those from which all people draw, which would make a Laplander laugh as well as an American. These have been frequently catalogued. Let us reproduce a few. The balking of our hopes in trifling matters makes us smile. An unlooked-for accident that is absurd, as when a dandy slips up on an icy pavement, makes us laugh. We laugh at that which is against custom, as at a man in a bonnet. We laugh at the weaknesses of others, as at a politician who brags much and polls a small vote. We laugh at amateur farmers who fail. We laugh at incongruities, as when we see a little man walking arm in arm with a giant; we laugh more if the little man marches with a big bass drum and the big man with a baby drum. We laugh at insignificant distress, as at a lady who loses her lap-dog. We laugh at extravagant pretension which suddenly collapses, as at an orator who soars to a star-lofty climax and breaks down. We laugh at cool impudence, for the ready and courageous invention pleases. We laugh when it is foiled, as at a lawyer in court who gets a saucy cut from a female witness. We laugh at a sudden or stealthy surprise. Young ladies laugh at young men—and that's queer: they can not tell why; but oftentimes the more they like them, the more they laugh at and smile on them. We laugh at what is serious for others, as at a

man looking out of a jail, but never at what seriously affects us, as, for example, if we were in jail. We laugh at disguises, at the dress of foreigners, fops, and slovens. We laugh when we see some men in a clean collar and new coat. We laugh at the meeting of extremes. It is hard to keep children from laughing at deformity, at negroes, at madmen, at fat men, at long, thin men. We laugh often because we ought not to, as in church, from the spontaneous impulse of resistance to sobriety. We laugh at the utter simplicity of some men, and the more so if the laugh is caused by a sudden illustration of it, or by a sudden jerk of the mind to an absurd extreme, as the other day, when an editor, describing the gifted Dr. Holland, said that he would loan money to a man on the collateral notes of an accordion. We laugh—all men laugh, but Americans especially—at the aggrandizement of special foibles of character. Dickens furnishes illustrations of how humorous some pre-eminent trait may be made to seem by a sort of Hogarthian satire on the false perspective. But this exaggeration is not always humorous, for a man may be extravagant with his pencil or in his speech without being humorous, as a man may be prodigal of his means without enjoyment.

But we have in America specific objects of humor—the scheming Yankee, the big, bragging, brave Kentuckian, and the first-family Virginian. We have lawyers on the circuit, as in the Georgia scenes; loafers on a spree, as in Neal's charcoal sketches; politicians in caucus; legislators in session; travelers on cars and steamers; indeed, the history of every American's life is humorous, moving as he does from place to place, and even when he sits down, as restless as the stick which a traveler saw out West that was so crooked it would not lie still!

There is a sympathy running through the American mind of such intensity and excitement in relation to our physical growth and political prominence that our manners, movements, and mind must become intensified. Why, an American can not sit still unless he does it with might and main. He must take an extravagant position. The position of our American in repose expresses an imperturbable confidence in the destiny of his native country, and a wonderful flexibility in the human skeleton.

An American ever takes an extravagant posture. Foreigners laugh at him for it. A foreign tourist says it is utterly impossible to mistake an American for any one else *en route*. He either has his feet upon the seat in front, the back of which he turns over for that purpose, or, if it be occupied, he sits with his knees let into the back of it, chews a quid of tobacco, keeps up a continual spitting, and invariably reads a news-

paper. When at home, he soon tires of sitting still, and paces the floor with restless nervousness.

Now the highest enjoyment of a Frenchman is to hear the last cantatrice in a fashionable opera. The Spaniard's transport reaches its climax when in the arena the matador with skillful thrust stretches his antagonist in the dust. The Neapolitan finds his paradise in the lengthening lusciousness of his macaroni. The German rises to his heaven on the cloud of his dreamful pipe and misty metaphysics. The Englishman grows comfortably ecstatic over roast beef and naval glory. The Turk ascends to his seventh heaven among the hours while he smokes his nargileh and sips his Mocha. The African, with his bango on his knee, is off for the other side of Jordan. The Irishman's chief joy is to take off his frieze at a fair, and, with shillalah whirling, invite any "jintleman to stand before him, or, for the love of God, just to step on the tip and of his coat tail, and be smashed into smithereens." But the American

"Finds not in the wide world a pleasure so sweet
As to sit near the window and tilt up his feet,
Puff away at the Cuba, whose flavor just suits,
And gaze at the world 'twixt the toes of his boots."

Let the American be in motion, there is the same extravagance. The London Times once said of him: "Wherever you see an American, he is going over the ground as fast as he can. In Europe he is a pale and breathless sight-seer, always in rapid transition, as if a ghost were pursuing him; insatiably accumulating stages, as if his life depended on the sum total at the end of the week. He carries the fever of business into the tour; and reckoning up grand sights per score in his mental ledger, he becomes a capitalist in arches, water-falls, glaciers, old columns, Roman relics, lakes, passes, galleries, statues, and hôtels de ville. In his own country he thinks nothing of packing up all his goods, wife, and children, and setting off to-morrow morning for some swamp two thousand miles off, on the Missouri or Mississippi, where every thing whatever, even the rising of the sun, you would think from the looks of the scene, has to take place for the first time. He stays until he has converted the swamp or forest into a fruitful field, and then sets off with his wagon-load again to some place as distant from his last home as from his preceding, to renew his battle with nature, to cut down and build, and create a fresh world for culture."

With all our vanity, energy, and unrest, we are not a dull, cheerless people. Sour-faced fellows, yellow and dyspeptic, are to be met with in our cars and streets; but they are not the type of the American, for he is as ready for a laugh as for a speculation, as fond of a joke as of an office. Wherever the American goes in his tireless round of observation and traffic—whether he breaks the seal which for ages had closed Japan to the world, or wanders through Africa after Livingstone, or roams for gold at the head waters of the Amazon, or for diamonds in Arizona, or among the Black Hills reservations, or at the Cape in Africa, or stands with Kane and Hall on the shores of some newly found sea of the poles, or whether more nearly at home—he leaves his trail on every mountain pass, his axe stroke in every forest; whether

"He's whistling round St. Mary's Falls
Upon his loaded train,
Or leaving on the pictured rocks
His fresh tobacco stain,

he is leaving the rudiments of an empire, the muscle and mind, and the invincible good nature and sense of the humorous, by which he is enabled to mingle with all, and to rule as he mingles.

Wherever he goes he exaggerates his country, his position, his ability; and his humor takes the same size. If he does not enjoy the fun made at his own dilation, he is the cause of its enjoyment by others. What with the great sea-serpents, moon hoaxes, spirit rappings, Shakerism, Barnum's shows, women's rights, free love, cannon concerts, big organs, much-married Mormonism, and other quackeries and extravagances, if we are not ourselves amused, we export amusement in large quantities. An English reviewer says, "America is determined to keep us amused; we are never left long without a startling novelty from the almighty republic."

THE FIRST CENTURY OF THE REPUBLIC.

[Sixth Paper.]

PROGRESS IN MANUFACTURE.

WHAT ARE MANUFACTURES?

IN a general but correct sense all products suitable for use, resulting from the applications, through human hand or brain, of the forces of nature to matter are *manufactures*, and each person who takes part in effecting or directing such applications is a *manufacturer*. Thus the laborer in the field who prepares the soil, scatters the seed, and harvests the grain, the wagoner, the railroad employé, or the sailor who transports it to the mill, are, in truth, as much the makers (*facturers*) of the flour as the men who, standing at the door of the mill, receive the grain, pass it through machinery, and when changed in form pack and deliver it to the consumers. No one of all these intermediaries between the first step in the so-called process of *production*—i. e., the leading or drawing forth (*pro* and *duce*)—and the final use of the product, which we call *consumption*, at any time makes any thing in the sense of creating, but is only the agent, more or less skilled, for directing one or more of a series of movements, each of which differs from the other in degree, but not in kind. For convenience, however, all these movements are economically divided into groups or classes, under such general names as *agriculture*, *mining*, *commerce*, *the fisheries*, and *manufactures*—the last name being more especially applied to designate those movements which have reference to the changing or elaborating, through the aid of machinery, of those forms of product which have been the result of previous movements effected under the departments of agriculture and mining, and to some extent also of the fisheries.

SOURCES OF INFORMATION.

In the sense of the definition, as thus given, there are no available data for making any thing like a complete exhibit of the gradual development of the manufacturing industry of the American people, not only, as might be expected, for so much of the period of their history as is antecedent to the adoption of the Federal Constitution and the full organization and adjustment of the affairs of the new nation, but what is more remarkable, and at the same time not generally known, for so much of the present century also as is antecedent to the year 1850, at which date the government of the United States for the first time, through the census, attempted to ascertain, with even approximative accuracy, the exact industrial statistics of the country. The

requirement of the Federal Constitution (adopted in convention in 1787) that an "enumeration" (of the people) "shall be made within three years after the first meeting of the Congress of the United States, and within every subsequent term of ten years," only contemplated the obtaining of information respecting population for the ulterior purpose of apportioning representation and direct taxation. The returns, accordingly, of the first census, taken in 1790, and of the second census, taken in 1800, afforded no information whatever concerning either the aggregate wealth of the country, the occupations of the people, or the nature and value of their annual product.

In ordering for the third census, that of 1810, Congress, however, for the first time enacted that, in addition to enumerating the people, it should be the duty of the marshals to take also, under the direction of the Secretary of the Treasury, an account of the "several manufacturing establishments and manufactures within their several districts," and set aside for this service the sum of \$30,000, out of an aggregate of \$150,000 previously appropriated for the general purposes of taking the census. This latter sum, although seemingly small, was nevertheless considered to be amply sufficient to cover all the expenses of the *third* census; and in comparison with an expenditure of nearly three and a half millions authorized by Congress in connection with the taking in 1870 of the ninth census, strikingly illustrates the change in all the elements of national development effected between the two periods. As further illustrating the same point, it may be also interesting to note that the report of the first census was comprised in an octavo pamphlet of fifty-two pages, and that of the second census in a folio of seventy-eight pages, while the report of the ninth census required three large quarto volumes of 679, 851, and 806 pages respectively, besides a statistical atlas.

As the first attempt to set forth the condition of American manufacturing industry in detail, the results of the third census were looked for by Congress and the country with no little of interest; but when the industrial returns were sent in they proved so imperfect and discordant that the Committee of Commerce and Manufactures on the part of the House of Representatives, to whom they were referred, reported, through one of its members, that it was impossible to arrange them in any form which would be "alike useful and compendious." In accordance with a joint resolution they were therefore

referred to the Secretary of the Treasury—then Mr. Gallatin—with instructions to place the entire returns in the hands of some person competent to make a digest of them; and for this purpose the Secretary subsequently selected Mr. Tench Coxe, of Philadelphia, who in 1813 submitted a report, which, although from necessity most imperfect, was nevertheless of great interest and value.

In 1820, on the occasion of the taking of the *fourth* census, an effort was again made to obtain statistics of industry; but when the returns came in they were again found so discreditable that the Secretary of State was only constrained by the mandatory character of the law to permit their publication; and the House of Representatives, after debating the propriety of suppressing the entire document, refused to pass a resolution providing for its public distribution.

The result of these two unsuccessful efforts was that in providing for the taking of the *fifth* census the attempt to collect any industrial statistics whatever was wholly abandoned; and although in 1840 schedules for obtaining statistics of industry were issued to the marshals engaged in taking the *sixth* census, the results obtained were regarded as of little or no importance.

The act of 1850, however, under which the *seventh*, *eighth*, and *ninth* censuses of the United States were taken, in the years 1850, 1860, and 1870 respectively, marks an era in the history of American statistics, inasmuch as it not only incorporated provisions of law looking to the obtaining of results of substantial value relative to domestic industry, but also for the first time so insured the official observance of the law that it became possible to recognize the returns to a certain extent as standards for making comparisons and deductions in the future. And for such a result a debt of national gratitude is due, more than to all others, to the Hon. Joseph G. Kennedy, under whose superintendence the work of the censuses of 1850 and of 1860 was chiefly performed.

But commendable as were the returns of the census of 1850, those of 1860 were much more comprehensive and accurate; while the *ninth* census, taken in 1870, under the superintendence of Hon. F. A. Walker, was not only very far superior in every respect to any previous census of the United States, but also compares favorably with any work of the kind previously executed in any country. At the same time it ought to be known that the returns of the ninth census were very far from being as complete and useful as they could and would have been had not personal and partisan spirit, overruling all considerations of national good, mainly on the part of one man, prevented Congress from adopting a new law, carefully prepared by a committee of the House of Representa-

tives (with the assistance of the best statisticians of every department in the country), and subsequently passed by the House almost unanimously, and so compelled the performance of the work under the old law, one of whose provisions required the enumeration and valuation of slaves, when the institution of slavery had for years been abolished.

But in addition to the reports of the census, the materials available for the preparation of a history of American manufacturing industry are exceedingly varied, and if not complete, exact, and accordant, are at least invested with a high degree of interest. For the earlier periods, or for the first one hundred and fifty years of our national history, the few particulars which can now be gathered are to be sought for mainly in colonial statutes and records, private correspondence, minutes of councils and assemblies, local histories, and individual biographies. In 1791 Alexander Hamilton, then Secretary of the Treasury, in obedience to a resolution of Congress, submitted his famous report on domestic manufactures and their relations to the new Federal government, in which, without entering into details, he gave an enumeration of such branches of industry under this head as seemed to him at that time to be permanently established in the country. Hamilton's report was followed in 1813 by the work of Tench Coxe, of Philadelphia, above referred to; while in 1816 Timothy Pitkin, a Representative in Congress from the State of Connecticut from 1808 to 1819, published, under the title of *A Statistical View of the Commerce of the United States, including also an Account of Banks, Manufactures, and Internal Trade*, what at the time of the appearance of the first edition, and long subsequent also to the second edition in 1835, held rank as the most comprehensive and authoritative commercial and statistical work of American origin. At present the most complete repertory of facts concerning the rise and progress of American manufactures is to be found in the work of the late Dr. J. L. Bishop, of Philadelphia, entitled *A History of American Manufactures from 1608 to 1860*—three volumes; in addition to which there have also been from time to time important publications by various authors on specialties of manufactures and the mechanic arts, as Thomas's *History of Printing*, White's *Memoirs of Slater*, Batchelder on the *Cotton Manufacture of the United States*, Munsell's *Chronology of Paper and Paper-making*, as well as numerous statistical reports from special industrial associations, as the American Iron and Steel Association, National Association of American Cotton and Woolen Manufacturers, etc., etc. Within a comparatively recent period, also, many of the States have prepared and published, every five years subsequent to the national cen-

sus, very full details of their local domestic industries; and as the principle that healthy legislation can only flow from an exact knowledge of the condition and wants of the people has gradually obtained public recognition, the establishment of distinct bureaus of statistics, reporting every year with great minuteness of detail the particulars of all important industrial occupations, is beginning to be regarded as an indispensable adjunct of all State governments.

With this brief review of the sources of information available for studying the history of our national industrial progress, attention is next asked to the subject of the origin and development of American manufactures from the period of the first settlement in Virginia, in 1607-8, to the dissolution of the colonial system in 1776.

PROGRESS FROM 1607 TO 1776.

And in reviewing the pertinent facts of this period the circumstance that in the first instance most forcibly arrests attention is the strong natural tendency exhibited from the very outset by the people who colonized and built up the American States to multiply and diversify their industries—a fact in striking contrast with and in opposition to the opinion so assiduously maintained by a school of American economists that such a result, among an intelligent people, inhabiting a country of varied resources, does not tend to occur naturally, but is rather the direct offspring of legislative direction and interference.

Thus, for example, the second vessel dispatched by the London Company, in 1608, to the settlement at Jamestown, Virginia (founded the previous year), brought numbers of persons skilled in manufactures, of whom says the historian (Stith), "No sooner were they landed, but the President dispatched as many as were able, some to make glass, and others for pitch, tar, and soap-ashes;" and the very first manufactory established within the territory now controlled by the United States was a "glass-house" (furnace) in the woods of Virginia, about a mile from the settlement of Jamestown. And it is further interesting to note that, with the exception of a cargo of "sassafras" gathered in the vicinity of Cape Cod in 1608, the first export from the British North American colonies consisted in great part of what in the most technical sense are termed "manufactures;" or, to use the quaint language of Captain John Smith in his letter which accompanied the invoice, "of trials of pitch, tar, glass, frankincense, and soap-ashes, with what wainscot and clapboard as could be forwarded."

From the very first, under the popular impression probably that the country was particularly adapted to the production of silk, special efforts were made in nearly all the

colonies to direct and divert the attention of the people to this particular industry; and it is recorded that the first Assembly that convened in Virginia under a written constitution, in 1621, especially occupied itself with considering "how best to encourage the silk culture." In 1662 also the Virginia Assembly, with a view of encouraging manufactures, offered prizes for the best specimens of linen and woollen cloth, and a special prize of fifty pounds of tobacco for each pound of wound silk produced in the colony; and it was also enjoined that for every hundred acres of land held in fee, the proprietor should be required to plant and fence twelve mulberry-trees. Silk culture in Georgia also so largely occupied the attention of the first colonists that a public seal was adopted bearing as a device silk-worms engaged in their labors; while bounties for the encouragement of the same industry were repeatedly offered by the colonies of Connecticut, New York, New Jersey, North and South Carolina. It is a most interesting and suggestive circumstance that this specialty of employment, which from the first settlement of the country was particularly selected as worthy of attention, and as such did receive for nearly two hundred years from the various colonial and State authorities an amount of encouragement, through special legislation, greater than was bestowed on any other interest, is the only one of the great industries which has never been able to attain to a healthy condition of existence on the North American continent, and to-day only exists in the United States in virtue of a degree of legislative encouragement far in excess of that demanded and received by any other industrial interest.

But zealously as did the first settlers of Virginia engage at the outset in manufactures, the characteristics of the territory upon which they located, in respect to fertility of soil and mildness of climate, proved antagonistic; and obeying the promptings of self-interest, which are always a far better and surer guide than legislation for determining what occupations individuals as well as communities can best follow, they in common with the population of all the other Southern colonies early became planters rather than artisans. And from that day to this American manufacturing industry has found its greatest development in other and less fertile localities.

Strenuous efforts were indeed made by the authorities to arrest the tendency of the people of Virginia to engage in agriculture rather than in manufactures or commerce, and in 1689 it was even ordered that all the tobacco grown in the colony in excess of a certain quantity should be destroyed. But this and other efforts, like the offering of prizes for the encouragement of the produc-

tion of textile fabrics, proved of no avail. Tobacco grew most luxuriously, and in 1617 readily commanded three shillings per pound, and the Virginians soon found that it was, at least for the time, more advantageous to buy manufactured articles with the proceeds of their crops than to manufacture for themselves.

On the other hand, in New England the circumstances of a sterile soil and a harsh climate were antagonistic to agriculture and in favor of commerce and manufactures, and from a very early day powerfully contributed to give to this section of country a supremacy in respect to the two last-named branches of industry which no subsequent influences have ever seriously impaired or threatened. The branch of manufacturing industry to which the attention of the New England colonists was first, and as it were naturally, directed, by reason of the inexhaustible wealth of their forests, was the manufacture of lumber, for which there was a constant and remunerative demand in England and throughout the West Indies. Ship-building commenced in the Plymouth Colony within three years after the landing, and the business subsequently received a great impulse by the overthrow of the monarchy under Charles I. and the establishment of the Commonwealth, which led the colonists to apprehend that the incentive to emigration, and the consequent sailing of ships from England, being diminished, they would be thereby left dependent on their own resources for interoceanic communications. "The general fear," says Governor Winthrop, in his journal, "of a want of foreign commodities, now our money was gone, and that things were like to go well in England, set us on work to provide shipping of our own;" and the business was prosecuted with such vigor that in 1676, just a century before the Declaration of Independence, 550 vessels are reported to have been built in Boston and the vicinity, of which 230 ranged from 50 to 250 tons burden; and in 1731 the trade of Massachusetts alone employed 600 sail of ships and sloops, having an aggregate of 38,000 tonnage—one-half of which traded to Europe—in addition to over 1000 sail and from 5000 to 6000 men employed at the same time in the fisheries.

The business of constructing ships for home use and for sale in foreign countries was also extensively followed in nearly all the other colonies, and in Maine and New Hampshire especially the manufacture of spars, masts, and ship timber for export early became a leading and profitable industry.

The first saw-mill in New England is believed to have been erected as early as 1634 or 1635 on the Salmon Falls River, New Hampshire, near to the site of the present city of Portsmouth. The first water-mill in

New England is supposed to have been put up at Dorchester, Massachusetts, as early as 1628; and in 1633 another was erected in the Plymouth Colony by one Stephen Dean, which he engaged should be sufficient to "beat" corn for the whole colony. The first Van Rensselaer sent from Holland to Albany as early as 1631 a master mill-wright and two small millstones for a small grist-mill. The first grist-mill in Pennsylvania was erected by Colonel John Printz, Governor of what was then called New Sweden, in 1643. Virginia as early as 1649 had four windmills and five water-mills, besides many "horse-mills," and for a considerable number of years exported large quantities of breadstuffs to her sister colonies and to the West Indies.

The first printing-press in what is now the United States was set up at Cambridge, Massachusetts, in 1638, only eighteen years subsequent to the landing of the Pilgrims in the wilderness. The first thing printed was *The Freeman's Oath*, a broadside; the second, an almanac, in 1639; and in 1640 the first book, "the Psalms newly turned into metre," or *The Bay Psalm-Book*, as it was called—a work which is said to have gone through seventy editions. William Penn landed in his new territory of Pennsylvania in 1682, and four years later a printing-press—the third in the colonies—was at work in Philadelphia. The first press established in the Province of New York was in 1693, none having been allowed there during the rule of the Dutch. The first printing-press in Connecticut was established at New London in 1709; in Rhode Island, at Newport, in 1713-14; in Delaware, at Annapolis, in 1726; in South Carolina, at Charleston, in 1730; in New Hampshire, at Portsmouth, in 1756; in North Carolina, at Newbern, in 1757; in Georgia, at Savannah, in 1762; and in what is now the State of Maine in 1780. The first printing-press in the territory west of the Alleghanies was set up in Kentucky in 1786; the second, at Knoxville, Tennessee, in 1793; and the third, probably, at Cincinnati, then only a trading post, in 1795.

The number of printing-presses in the colonies at the time of the Revolution is believed to have been about forty. The number of separate works printed in the provinces up to this period can not now be ascertained; but the Philadelphia Library contains as many as 459 works printed in that city alone prior to the Revolution.

The first book-binding in this country appears to have been an edition of 1000 copies of the Bible, published at Cambridge in 1663, which was followed by a second edition of 2000 copies in 1685. The work was performed by one John Ratliffe, who came from England expressly for this purpose. His price was about 3s. 4d. per volume, and one Bible was as much as he could bind in one day.

The manufacture of paper of any description was not established in any of the colonies until full fifty years after the introduction of printing, the first paper mill having been erected in the vicinity of Philadelphia by one William Rittenhousen, a native of Germany, about the year 1690. The first paper mill in New England was established in the town of Milton, near Boston, in 1730. In 1732 the following advertisement appeared in the weekly *Rehearsal*, of Boston:

"Richard Fry, Stationer, Bookseller, Paper-maker, and Rag merchant, from the city of London, keeps at Mr. Thomas Fleet's, printer, at the Heart and Crown, in Cornhill, Boston, where said Fry is ready to accommodate all Gentlemen, Merchants, and Tradesmen with sets of Accompt books after the most acute manner for twenty per cent. cheaper than they can have them from London. I return the Public Thanks for following the Directions of my former Advertisement for gathering rags, and hope they will continue the like Method, having received upward of Seven thousand weight already."

The early scarcity of paper in the colonies is illustrated by the following curious advertisement, which appeared in the *Boston Evening Post* in 1748:

"Choice Pennsylvania Tobacco paper is to be sold by the publisher of this paper at the Heart and Crown, where may be also had the Bulls or Indulgencies of the present Pope, Urban VIII., either by the single Bull, Quire, or Ream, at a much cheaper rate than they can be purchased of the French or Spanish priests."

The explanation of this was that several bales of "indulgencies," printed upon very good paper and only on one side, had been captured by an English cruiser from a Spanish vessel, and being offered at a very low price, had been purchased by the Boston printer, who saw an opportunity for profit by printing ballads or other matter for his customers upon the backs of the pontifical documents in question. It is also to be noted that about this time Robert Saltonstall was fined five shillings by the General Court of Massachusetts for presenting a petition on a small and bad piece of paper.

In 1768 Colonel Christopher Leffingwell erected at Norwich the first paper mill in the colony of Connecticut, under the promise of a bounty from the General Assembly. Two years after he was accordingly awarded twopence a quire on 4020 quires of writing-paper, and one penny each on 10,600 quires of printing-paper. Having attained such a degree of success, it is recorded that the government patronage was soon afterward withdrawn.

In Pennsylvania the Dunkers, who settled in Lancaster County, very early gave their attention to the manufacture of paper, and also set up a printing-press. During the Revolution, and just previous to the battle of the Brandywine, messengers were sent to their mill for a supply of paper for cartridges. The mill happening to be out of manufactured paper, the fraternity, who

held their property in common, sent back as a substitute to the Continental army several wagon loads of an edition of Fox's *Book of Martyrs*, and from the paper supplied by the pages of this work the cartridges used in the battle were in part manufactured.

About the year 1770 the number of paper mills in the provinces of Pennsylvania, New Jersey, and Delaware was reported to be forty, this department of manufacturing industry having especially developed in the vicinity of Philadelphia, which was at that time the centre of literary activity for the colonies. It was a business, moreover, in which Dr. Franklin was greatly interested; and he told De Warville, a French traveler who visited America in 1788, that he had himself established as many as eighteen mills.

The business of the manufacture of "paper-hangings" commenced in the colonies about the year 1760, and in 1791 it was one of the branches of domestic industry, according to the report of the Secretary of the Treasury, which were well established.

The household manufacture of textile fabrics—of cotton-wool, linen, and silk—was almost coeval with the settlement of the continent, and the same circumstances which have been before noted as favoring the building of ships also greatly encouraged the development of these other industries. We are accustomed, and with good reason, to regard the tide and volume of immigration which has flowed from the Old World to the New since 1850 as something most remarkable, but the largest comparative immigration which this country has ever experienced occurred during the first half of the seventeenth century, between 1630 and 1640, when nearly every year added a number of individuals nearly or quite equal to the previously existing population. The result was an extraordinary demand for provisions, and the attention of the colonists, especially in New England and in New York, was largely directed to the raising of cattle, and in the former also to the prosecution of the fisheries. Governor Hutchinson, indeed, records that at one time the price of cattle in the colonies rose as high as £25, and even £28, per head. The cessation of immigration in 1640, consequent upon the cessation of persecution in England for religious non-conformity, caused an immediate and excessive decline in the price of cattle, and as suddenly cut off a leading source of provincial revenue. At the same time, with their thus impaired means of purchase, the diminished intercourse with England also caused great uncertainty in respect to the supply of clothing, for which the colonists had been up to this time almost wholly dependent upon the mother country. What next happened, as told with quaint simplicity by the early his-

torian of New England (Hubbard), strikingly illustrates the state of things in which a resort to manufactures becomes a necessity in a new country. After describing the manner in which their necessity first came upon them, he continues :

"Now the country of New England was to seek of a way to provide themselves with clothing, which they could not obtain by selling cattle as before, which were now fallen from that huge price forementioned to five pounds apiece; nor was there at that rate a ready vent for them neither. Thus the flood which brought in much wealth to many persons, the contrary ebb carried all away out of their reach. To help themselves in this their exigent, for the necessary supply of themselves and their families, the General Court made order for the manufacture of woollen and linen cloth, which with God's blessing upon man's endeavor in a little time stopped this gap in part, and soon after another door was opened by special Providence; for when one hand was shut by way of supply from England, another was opened by way of traffic, first to the West Indies and Wine Islands, whereby, among other goods, much cotton-wool was brought into the country, which the inhabitants, learning to spin and breeding of sheep and sewing of hemp and flax, they soon found out a way to supply themselves of cloth."

The first regular or systematic attempt to manufacture cloth, particularly woollen, was made by a company of Yorkshire immigrants who settled at Rowley, Massachusetts, where in 1643 was erected the first fulling-mill in the North American colonies. The manufacture of cordage was entered upon in Boston as early as 1629. In the New Netherlands (New York), although the primary object with the mercantile company which planted and governed that colony was trade with the Indians, yet the characteristic industry of the Dutch prompted to a very extensive household manufacture of linens, woolens, and hosiery; and Denton, the earliest writer in that province, says (1670) of them, "Every one make their own linen and a great part of their woollen cloth for their ordinary wear." Under the auspices of William Penn, the manufacture of (linen and woollen) cloth was one of the first branches of industry undertaken in his new colony; and among the articles mentioned as produced in Pennsylvania as early as 1698 (which daily improved in quality) were druggets, serges, camblets, and a variety of other stuff, giving employment to dyers, fullers, comb-makers, card-makers, weavers, spinners, etc. The general progress made in the manufacture of fabrics during the first century of the existence of the North American colonies is also indicated by a report which Colonel Heathcote, a member of the Council of the Province of New York, made to the English Board of Trade in 1708, in which he says that he had labored to divert the Americans from going on with their woollen and linen manufactures, which are already so far advanced that three-fourths of the linen and woollen used was made among them, "especially the coarse sort; and if some speedy and effectual ways are not

found to put a stop to it, they will carry it on a great deal further, and perhaps in time very much to the prejudice of our manufactures at home."

The smelting of iron ore was one of the industries attempted by the first settlers in Virginia; but both the iron-works and the "glass-house," which had been erected, were early destroyed by the Indians, who, although not versed in any system of political economy, nevertheless ever showed themselves the most persistent enemies of diversified employments. In New England preliminary attempts to establish the manufacture of iron were made in 1630, and in 1645 regular works were established at Lynn. Of these last the old historian (Hubbard) says, contemptuously, "That instead of drawing out bars of iron for the country's use, there was hammered out nothing but contentions and lawsuits;" but, notwithstanding this disparagement, the operations commenced in this locality are believed to have been conducted with a degree of success for a period of more than one hundred years.

One of the first, if not the very first patent granted in this country was by the General Court of Massachusetts, in 1646, to one Joseph Jencks, of Lynn, "for y^e making of Engines for mills to goe with water, for y^e more speedy dispatch of work than formerly, and mills for y^e making of Sithes and other Edged Toolcs," the Court having previously passed a law that there "should be no monopolies but of such new inventions as were profitable to the country, and that for a short time only."

Pig-iron began to be exported from the American colonies to England as early as 1718, when a record is made of a small lot of three and one-half tons received from Virginia and Maryland. By 1728, however, pig-iron had become a regular and important article of colonial export, and some years later the exportation of bar-iron also commenced, and from this time both pig. and bar iron continued to be annually exported from the North American colonies until after the breaking out of the Revolution.

From the official returns of the British Custom-house (which are still extant, and have been published) the exact amount of such exports received in England at different periods from 1728 to 1776 was as follows :

Years.	Pig-Iron.	Bar-Iron.
	Tons.	Tons.
1728-29.....	1127
1732-33.....	2404	11
1745.....	2274	196
1754.....	3244	389
1764.....	2554	1059
1771.....	5808	2222
1775.....	2996	916
1776.....	316	28

Contemporaneously with the manufactures above noticed there were also estab-

lished throughout the provinces manufactures of leather, of bricks, pottery, and glass, of distilled and fermented liquors, of hardware in various forms, of candles, snuff, gunpowder, copperas, and a multitude of other articles, so that at the close of the first century of their existence there was hardly a branch of useful industry common in Europe which was not practiced with more or less of success in the British North American colonies. In fact, so successful had been the attempts of the colonists to manufacture that the jealousy of the mother country began to be awakened at a period considerably anterior to that mentioned, for Sir Josiah Child, although a much more liberal and intelligent politician than many of his countrymen at that day, in a discourse "on trade," published in 1670, describes New England as having come to be the most prejudicial plantation of Great Britain, and gives for this opinion the singular reason that they are a people "whose frugality, industry, and temperance, and the happiness of whose laws and institutions, promise to them a long life and a wonderful increase of people, riches, and power."

TRUE CAUSE OF THE AMERICAN REVOLUTION.

And here we come for the first time upon the true cause of the American Revolution, which is now well understood to have been not so much that the colonists were denied representation in the central government, or that they were unduly restrained in respect to any liberty of their persons, but rather that their rights to property were continually interfered with, that they were denied the privilege of freely buying and selling wherever and whenever they might see fit, and of following the occupations which seemed to them most remunerative. On the other hand, the acts of Great Britain, viewed in the light of the investigations and experiences of another century, are susceptible of a much less harsh interpretation than it has been the custom to put upon them. Thus England, during the whole of the seventeenth and eighteenth centuries, and even later, held, in common with the rest of the civilized world, a most firm belief in the doctrine, which had come down from the Middle Ages, that no one nation or individual could get gain from commerce or trade except at the expense of some other nation or individual, and that therefore the surest way for a nation or individual to prosper and grow rich was to sell as much and buy as little as possible, and to endeavor to obtain gold and silver in exchange for what they did sell in preference to any other products. Stated in the abstract, and in this last third of the nineteenth century, these doctrines seem very strange and most absurd; and yet the United States is the nation of all others claiming to be en-

lightened which to-day by her commercial system fails to recognize or practically denies the great economic axiom that no nation or community can sell to any great extent except in proportion as it is willing to buy; that all trade and commerce must be mutually advantageous, or it would not exist; and that after every fair mercantile transaction both parties, however varied their nationality and residences, are richer than before.

It is also a mistake to suppose that the American colonies were planted with the least reference to the pecuniary or personal benefit of the colonists themselves. The mode was simply this: The King of England, on payment to himself of a certain sum, granted a tract of land of American territory, together with a charter, to a joint-stock company of English merchants and adventurers, who sent out a colony to cultivate the lands and gather their products for the pecuniary benefit of the stockholders. It was clearly an enterprise for making money—as much so as are the railroad and other corporations of the present day—and the colonists were regarded as merely the hired servants of the company. This was the method after which all the colonies were established, and if the colonists possessed any political privileges it was because they wrenched them from the unwilling hands of the corporators. For proof of the correctness of this position reference is made to the pages of all the American historians, and to the still stronger testimony of the great Adam Smith, of Scotland, who, while the American Revolution was progressing, declared that England had founded an empire on the other side of the Atlantic for the sole purpose of raising up a people of customers—a policy which he denounced as fit only for a nation of shopkeepers.

Entertaining such views respecting the nature of trade and commerce and the use of colonies, nothing, therefore, was more natural and legitimate than that England should regard her transatlantic plantations as instrumentalities for the promotion of her own interests and aggrandizement exclusively, and that when the enterprise of the Americans in respect to certain branches of manufacturing industry seemed likely to be prejudicial to similar industries of her own, she should attempt to shackle and restrain their progress. It ought also to be borne in mind that if Great Britain acted unjustly toward the colonies, she was at least consistent in both her home and her colonial policy, and framed the former, equally with the latter, in strict accordance with the then narrow commercial spirit of the age. Thus, if it was forbidden to the colonists to export woolen goods, or transport wool from one "plantation" to another, there was at the

same time on the statute-book of England a law which made it felony for any Englishman to export any sheep from the kingdom, or to purchase or transport any wool within fifteen miles of the sea without permission of the king, or to load or carry any wool within five miles of the sea, except between sunrise and sunset. And again, if the colonists were not permitted to carry any article of produce on the seas except in British ships, the necessity was about the same time announced in Parliament by the Lord Chancellor, Somers, of going to war with the Dutch, and of destroying their commerce, because "it was impairing ours."

On the other hand, in respect to all those colonial industries which were not regarded as antagonistic to British interests, the action of Parliament was generous and considerate. For example, the cultivation of tobacco was forbidden in England by highly penal enactments, for the sake of securing a monopoly of that product to the Southern colonies. Liberal premiums were also offered and awarded for the cultivation and exportation of colonial silk, indigo, hemp, flax, and for the promotion of the fisheries; and in 1750 an act passed Parliament to encourage the exportation of pig and bar iron from his Majesty's plantations in America, whereby all duties on the import of the same into Great Britain were removed, although maintained in respect to the imports from all other countries. Nevertheless, the one most important fact in connection with this topic is that it was the rapid growth of colonial commerce and manufactures, conjointly with the attempt of Great Britain to interfere with and suppress them, which led to a gradual and increasing alienation and final violent separation of the two countries.

The first important act which operated as a restriction on the industry of the colonists was the so-called "Navigation Act" of 1650, which, although primarily intended, to use the words of Sir William Blackstone, "to clip the wings of our opulent and aspiring neighbors," the Dutch, nevertheless struck a heavy blow at one of the foremost industries of the colonies, namely, ship-building. By this act and its extensions in 1661 and 1663 it was provided that no article of colonial produce or British manufacture should be carried in any but British ships, and that the colonists should not be allowed to purchase in any but British markets any manufactured article which England had to sell. Following the enactment of these purely commercial restrictions, it soon also became a policy on the part of Great Britain to discourage all attempts at manufacturing by the colonists in competition with similar British industries; and it was in pursuance of this policy that in 1696 the management of the affairs of the colonies was by royal order committed to a Board of Trade, under

the title of "The Lords Commissioners for Trade and the Plantations." Henceforth the vigilant nation of shop-keepers would not be content with watching and controlling the shipping and trade of American ports, but must lay its hands on all the manufacturing industries of the colonies. The royal governors were required to report yearly to the board on the state of the provinces, and to do all in their power to divert them from setting up and carrying on manufactures. But reports and recommendations were not sufficient to repress the industrial enterprise of the Americans, and three years after, the board having received complaint that the wool and woollen manufactures of the North American plantations began to be exported to foreign markets formerly supplied by England, an act was passed by Parliament which, after declaring in its preamble "that colonial industry would inevitably sink the value of lands in England," prohibited thereafter the movement of any American wool or woollen manufactures not only to foreign countries, but also as between one colony and another. And in 1731, as complaint of the increasing divergence of trade from its prescribed channels by the action of the colonists continued to be made by British merchants and manufacturers, the House of Commons again took up the subject, and ordered, through the Board of Trade, an inquiry "with respect to laws made, manufactures set up, or trade carried on" (in the colonies) "detrimental to the trade, navigation, and manufacture of Great Britain." The report made in pursuance of this order in 1731-32 furnishes some curious particulars respecting the state of manufactures at that time in America, although it was known to be so incomplete that the concealment practiced was made the subject of complaint in England. The Governor of New Hampshire reported that there were no settled manufactures in that province. The Governors of Connecticut and the Carolinas made no returns, and the Governor of Rhode Island confined his report to matters not connected with manufactures. Massachusetts was reported as having manufactures of cloth, a paper mill, also several forges for making bar-iron, some furnaces for cast and hollow ware, one splitting-mill, and a manufacture of nails. The Surveyor-General of his Majesty's Woods wrote that they have in New England six furnaces and nineteen forges for making iron; that many ships were built for the French and Spaniards; and that great quantities of hats were made and exported to Spain, Portugal, and the West Indies. They also make all kinds of iron for shipping, and have several still-houses and sugar-bakeries.

Immediately after the reception of this report, or in 1732, it was enacted by Parliament that "no hats or felts should be ex-

ported from the colonies;" and in 1750 a bill was introduced into Parliament decreeing that every slitting-mill in America should be demolished; and although this bill failed of passing the House of Commons by only twenty-two votes, a subsequent act did pass, that no new mills of that description should be erected.

It is most important and instructive to diverge for a moment at this point from tracing the development of American manufactures, and briefly notice the effect of the long-continued restrictive legislation of Great Britain on political and commercial morality. The multitude of arbitrary laws enacted to force the industry and commerce of the colonies and the British people into artificial and unnatural channels created a multitude of new crimes; and transactions which appeared necessary for the general welfare, and were no way repugnant to the moral sense of good men, were forbidden by law under heavy penalties. The colonists became thenceforth a nation of law-breakers. Nine-tenths of the colonial merchants were smugglers. One-quarter of the whole number of the signers of the Declaration of Independence were bred to commerce, to the command of ships, and the contraband trade. John Hancock was the prince of contraband traders, and, with John Adams as his counsel, was on trial before the Admiralty Court in Boston at the exact hour of the shedding of blood at Lexington, to answer for half a million dollars' penalties alleged to have been by him incurred as a smuggler. And if good old Governor Jonathan Trumbull, of Connecticut (Brother Jonathan), did not walk in the same ways as his brother patriot in Massachusetts, then tradition, if not record, has done him very great injustice. There is also on record a letter of Alexander Hamilton, written in 1771, at the time he was in mercantile business, giving instructions to the master of a vessel in his employ how to avoid the customs regulations on entering ports in the West Indies. But men like Hancock and Trumbull had been made to feel that government was their enemy; that it deprived them of their natural rights; that in enacting laws to restrain them from laboring freely, and freely exchanging the fruits of their labors, it at the same time enacted the principle of slavery, and that therefore every evasion of such laws was a gain to liberty.

Furthermore, the continuance of such a policy as was adopted by Great Britain toward the colonies, and the spirit of resistance which was as naturally evoked in turn on the part of the colonists, could tend to but one end, namely, war and revolution; and in 1775 war and revolution came.

The population of the colonies at about the time (1670) that their progress in man-

ufactures began to excite the jealousy of Great Britain was probably a little less than 200,000.

Mr. Bancroft estimates the total population of the colonies in 1750 to have been 1,260,000; and in 1770, five years previous to the outbreak of the Revolution, at 2,312,000; of whom 1,850,000 were white and 462,000 black.

PROGRESS SINCE THE REVOLUTION.

The immediate effect of the war of the Revolution, by cutting off all except casual and uncertain commercial intercourse with Europe and other countries, was to impart a fresh impulse to such manufactures in the colonies as were then established, and to call into existence some new ones. The immediate effect of the return of peace (in 1783), on the contrary, was most disastrous to nearly all business interests, and more especially to the mechanical and manufacturing industries. But such a result could not well have been otherwise. The country had been subjected to a long and impoverishing war; it was exhausted of men as well as of means; labor was scarce and high, and the burden of debt, both public and private, was most onerous. It has been the custom of many writers in treating of this period to attribute the disastrous condition of affairs which was immediately incident to the close of the Revolution to an unrestrained influx of foreign commodities; but that this agency was not in a high degree potential for mischief is proved by the circumstance that the average imports of British manufactures into the country for several years previous to 1789, notwithstanding a great increase to the population of the States, was considerably less than the average of several years preceding the war; and also that when the first tariff on imports came to be enacted under the Constitution, the rate established on all textile fabrics was only five per cent., and on all manufactures of metal but seven and a half per cent. But the manner in which importations were then made was undoubtedly most mischievous. There was no national government, and the division of the powers of government among thirteen petty sovereignties rendered the adoption of uniform laws impossible. Each State accordingly had its own tariff and regulated its own trade. What was binding in Massachusetts had no validity in Rhode Island, and what was subject to duty in New York might be imported free into Connecticut or New Jersey. Practically, therefore, no revenue could be collected on imports. Great Britain, also, seeing that as a nation we were commercially helpless, not only refused to negotiate a commercial treaty with us, but by an Order in Council excluded our ships from their ports in the West Indies, and, as the government of the States was

then constituted, we had no power through retaliation to compel reciprocity. Yet, according to one who participated in the acts of the Revolution, and was one of the most sagacious observers and writers of the period—Peletiah Webster, of Philadelphia—all the sufferings and evils which the country endured from all other agencies were insignificant in comparison with the misery that resulted from the introduction and use of an irredeemable paper money, and the consequent irregularities of the entire American fiscal system, his exact language being as follows: "We have suffered more from this cause than from any other cause of calamity. It has killed more men, perverted and corrupted the choicest interests of our country more, and done more injustice, than even the arms and artifices of our enemies." And again he says, "If it saved the state, it has violated the equity of our laws, corrupted the justice of our public administration, enervated the trade, industry, and manufactures of our country, and gone far to destroy the morality of our people."

But let the causes have been what they may, there is no doubt that for a brief period subsequent to the close of the war the industry of the country was greatly depressed. The establishment of a stable government, however, by the adoption of the Constitution at once gave to affairs a new aspect. The wretched system of distrust, jealousy, and weakness, which had before paralyzed all enterprise, and sunk the revenues and credit of the Confederation to the lowest point, disappeared, and fresh energy was infused into all departments of business. "American labor," says Dr. Bishop, "at this period began steadily to change its form from a general system of isolated and fireside manual operations—though these continued for some time longer its chief characteristic—to the more organized efforts of regular establishments, with associated capital and corporate privileges, employing more or less of the new machinery which was then coming into use in Europe."

The population of the country increased from an estimate of 2,945,000 in 1780 to 3,924,000 in 1790; and it is curious to note that the percentage of decennial increase of thirty-three per cent. thus established in this decade maintained itself with approximate uniformity for each subsequent decade from 1790 to the breaking out of the rebellion in 1860.

In an address before the "Pennsylvania Society for the Encouragement of Manufactures," August, 1787, by Mr. Tench Coxe (afterward Assistant-Secretary of the Treasury under Hamilton), the great progress in agriculture and manufactures "since the late war" was particularly dwelt upon. In Connecticut, at this time, according to this au-

thority, the household manufactures were such as to furnish "a surplus sold out of the State. New England linen had affected the price and importations of that article from New York to Georgia." In Massachusetts the importation of foreign manufactures was less by one-half than it was twenty years before, although population had greatly increased, and considerable quantities of home-made articles were shipped out of the State. In one regular factory of the latter State there were made as much as 10,000 pairs of cotton and wool cards, 100 tons of nails in another, and 150,000 pairs of stuff and silk shoes in the single town of Lynn. In the course of the address, pattern cards, embracing thirty-six specimens of silk lace and edgings from the town of Ipswich, Massachusetts, were exhibited. In Rhode Island the number of factories was stated to be "great in proportion to its population." The sale of spinning-wheel irons from one shop in Philadelphia in 1790 amounted to 1500 sets, an increase of twenty-nine per cent. over the sales of the previous year. In Lancaster, Pennsylvania, then the largest inland town in the United States, there were in 1786 about 700 families, of whom 234 were manufacturers, in which number were included 14 hatters, 36 shoe-makers, 25 tailors, 25 weavers of cloth, and 4 dyers. Within ten miles of the town were four oil mills, five hemp mills, one fulling-mill. Frederick and Elizabeth, towns in Maryland, and Stanton and Winchester, Virginia, were also important centres of domestic industry, the last-named being famous for its manufacture of hats. There was also a manufactory of glass at Alexandria, Virginia, which, according to the French traveler, De Warville, exported in 1787 glass to the amount of 10,000 pounds, and employed 500 hands. In 1789 Mr. Clymer, of Pennsylvania, stated in Congress that there were fifty-three paper mills within range of the Philadelphia market, and that the annual product of the Pennsylvania mills was 70,000 reams, which was sold as cheap as it could be imported, and that, too, in the absence of any duty. The compiler of the *Bibliotheca Americana*, published in London in 1789, states that the people of North America manufactured their own paper in sufficient quantities for home consumption; and the report of Secretary Hamilton the following year also represents the paper manufacture as one of the branches of American industry which had arrived at the greatest perfection, and was "most adequate to national supply." And yet De Warville a few years previous wrote that on account of the scarcity and dearth of labor and of rags, the Americans could not for many years to come furnish sufficient paper to meet the demand.*

* Bishop's *History of American Manufactures*.

An estimate made by Mr. Coxe in 1790 fixed the annual value of the manufactures of the United States for that year at more than \$20,000,000. It is also curious to note that he took as the basis of his computation the returns of the manufacturing industry of Virginia, which then included Kentucky. As Assistant-Secretary of the Treasury, Mr. Coxe also asserted, about this period, that the manufactures of the United States were certainly greater than double the value of their exports in native commodities, and much greater than the gross value of all their imports, including the value of all the goods exported again.

In January, 1790, President Washington delivered his first annual message to Congress, and it is noted that he was dressed at the time in a full suit of broadcloth, manufactured at the woolen factory of Colonel Jeremiah Wordsworth, at Hartford, Connecticut, "where all parts of the business are performed except spinning." In this message the subject of the promotion of manufactures was commended to the attention of Congress; and acting upon the suggestions of the President, Congress thereupon ordered that the Secretary of the Treasury "prepare and report a proper plan or plans for the encouragement and promotion of manufactories as will tend to render the United States independent of other nations for essential, particularly for military, supplies;" and in accordance with this order Mr. Hamilton in the following year (1791) submitted his famous report, twice printed by order of Congress, on American manufactures.

In this report the Secretary presented a general exhibit, classified under seventeen heads, of the manufacturing industries in the country, which had at that time made such progress as in a great measure to supply the home market, and which were also carried on "as regular trades." Among these the Secretary enumerates manufactures of skins and leather, including under this head leather breeches and glue; flax and hemp, but not cotton; iron, and most implements of iron and steel; bricks and pottery; starch and hair-powder; manufactures of brass and copper, particularly specifying utensils for brewers and distillers, andirons and philosophical apparatus; tinware "for most purposes;" carriages of all kinds; "lamp-black and other painter's colors;" refined sugars, oils, soaps, candles, hats, gunpowder, chocolate, silk shoes, and "women's stuffs;" snuff, chewing tobacco, etc., etc. "Besides these," he continues, "there is a vast scene of household manufacturing, which contributes more largely to the supply of the community than could be imagined without having made it an object of particular inquiry." But as indicating how limited an idea of the actual and future re-

sources of the country was even then possessed by a mind so intelligent and comprehensive as that of Alexander Hamilton, the following memoranda from this report are also exceedingly curious and pertinent. Thus, for example, under the head of coal, he notes "that there are several mines in Virginia now worked, and appearances of their existence are familiar in a number of places." "There is something," also says the Secretary, "in the texture of cotton which adapts it in a peculiar degree to the application of machines," and in a country in which a deficit of hands constitutes the greatest obstacle to success, this circumstance particularly recommends its fabrication. American cotton, he adds, though alleged to be inferior, can be produced in abundance; and "a hope may be reasonably indulged that with due care and attention" its quality will greatly improve.

Under the head of "the means proper to be resorted to" by the government for the promotion of manufactures, the Secretary, after enumerating and discussing the various agencies "which have been employed with success in other countries," gave his recommendation in favor of a system of "*pecuniary bounties*," and offered in support of the same the following reasons:

"1. It is a species of encouragement more positive and direct than any other.

"2. It avoids the inconvenience of a temporary augmentation of price, which is incident to some other modes.

"3. Bounties have not, like high protecting duties, a tendency to produce scarcity.

"4. Bounties are sometimes not only the best but the only proper expedient for uniting the encouragement of a new object of agriculture with that of a new object of manufacture. The true way to conciliate these two interests is to lay a duty on foreign manufactures of the material the growth of which is desired to be encouraged, and apply the produce of that duty, by way of bounty, either upon the production of the material itself, or upon its manufacture at home, or upon both. In this disposition of the theory the manufacturer commences his enterprise under every advantage which is attainable as to quantity and price of the raw material, and the farmer, if the bounty be immediately to him, is enabled by it to enter into a successful competition with the foreign material."

He accordingly recommended the imposition of additional duties on imports, the proceeds of which, after satisfying the national pledges in respect to the public debt, he proposed should constitute a fund for paying the bounties which might be decreed, and for the operations of a board to be established for promoting arts, agriculture, manufactures, and commerce. The bounties thus recommended were not, however, intended by the Secretary to be permanent; for, as he remarks, their "continuance on manufactures long established must always be of questionable policy, because presumption would arise in every such case that there were natural and inherent impediments to success."

He also dwells at considerable length on

a topic too often overlooked, namely, that it "is not merely necessary that the measures of government which have a direct view to manufactures should be calculated to assist and protect them, but also that those which collaterally affect them in the general course of administration should be guarded from any particular tendency to injure them;" and under this head especially asks attention to "the unfriendly aspect of certain species of taxes toward manufactures." Among such he enumerates, *first*, all poll and capitation taxes, which, if levied according to a fixed rule, operate unequally and injuriously on the industrious poor; "*second*, all taxes which proceed according to the amount of capital supposed to be employed in a business, or of profits supposed to be made on it, are unavoidably hurtful to industry: men engaged in any trade or business have commonly weighty reasons to avoid disclosures which would expose with any thing like accuracy the real state of affairs, and allowing to the public officers the most equitable dispositions, yet when they are to exercise a discretion without certain data they can not fail to be often misled by appearances;" and finally, continues the Secretary, in words that deserve to be printed in gold on the walls of every legislative assembly, "arbitrary taxes are as contrary to the genius of liberty as to the maxims of industry."

Although this celebrated report of Alexander Hamilton both at the time it was made and since has been regarded as a model of clear and unanswerable reasoning, and was also unquestionably of great service to the country, yet it is well known that his specific recommendations of bounties in preference to protective or prohibitory duties, and also for the repeal of all duties on imported cotton as a raw material of manufactures, were not complied with; but that, on the contrary, the system of protective duties on imports which then prevailed in Europe was gradually established in its place, and from that day to this has been continued.

The period of the adoption of the Federal Constitution, in 1789, marks also the period of the commencement of the manufacture of cotton in the United States, as a regular and systematic in contradistinction to a domestic and irregular business. Cotton had indeed been grown for many years previous throughout the Southern sections of the country, but its use up to 1789-90 had been almost exclusively domestic, and even for this purpose the quantity produced was inadequate to supply the home demand. In fact, so little suspicion was entertained of the particular adaptability of the soil and climate of the Southern States for the culture of cotton, that when in 1784 an American ship entered Liverpool with eight bags of the fibre as a part of her cargo, the same

was regarded as an unlawful importation, on the assumption that so large a quantity could not have been the produce of the United States. And as late, furthermore, as 1792 the cotton product of the United States was regarded as of so little value commercially that John Jay consented to the incorporation of a provision (afterward rejected by the Senate) in the treaty that he negotiated with Great Britain that "no cotton should be imported from the United States," the design on the part of Great Britain being not to interfere with the cotton culture of the United States, but to secure for her own mercantile marine the exclusive movement of cotton from the West Indies. Mr. Tench Coxe, in common with other members of the "Pennsylvania Society for Encouraging Manufactures," seems, however, to have early foreseen the future importance of cotton to both American agriculture and manufactures, and when the Convention for framing the Constitution assembled in Philadelphia his earnest recommendations to the Southern delegates on the subject induced many of them, on their return home, to make personal efforts to interest their constituents in extending the cultivation of the fibre.

The inventions of Hargreaves, Arkwright, Compton, and Cartwright for carding, spinning, and weaving cotton by machinery were introduced in England between the years 1768 and 1788; and although at first were so much opposed that the inventors were afraid to work openly, and had in some instances their lives threatened and their machinery destroyed, yet Parliament very early appreciated the national importance of the several inventions, and in accordance with the narrow spirit of the age, enacted in 1774, and subsequently, most strict prohibitions of the export of any textile machinery from the kingdom. These statutes, which were vigilantly enforced by the British government, together with a law against enticing artificers to emigrate, for a time proved most serious obstacles in the way of the introduction of the new English textile machinery into the United States, although many most ingenious efforts to evade the law were made by our countrymen. Mr. Tench Coxe, who omitted no opportunity to promote the cotton industry, at one time, for example, succeeded, after no little trouble and expense, in having secretly made in England models of a full set of Arkwright's machinery, but they were unluckily seized and confiscated as they were on the point of shipment. The information sought for was, however, gradually obtained, and in 1786 Hugh Orr, of Bridgewater, Massachusetts, a pioneer in American manufactures, notified the Legislature of Massachusetts that he had in his employ two Scotchmen, brothers, by the name of Barr, who had some

knowledge of the new cotton machinery. Thereupon the Legislature appointed a committee to examine the men and find out what they knew, which committee subsequently reported in favor of a grant of £200 to the Barrs to enable them to complete certain machines, and also as a gratuity for "their public spirit in making them known to the public." Six tickets in a State Land Lottery, which had no blanks, were accordingly voted to the Scotch brothers by the Legislature, and out of the proceeds the first "stock card" and "spinning-jenny" made in the United States were constructed. These machines were deposited by the order of the General Court with Mr. Orr, who was allowed to use them, as some compensation for his exertions in the matter, and was also requested to exhibit them and explain their principles "to any who might wish to be informed of their great use and advantage in carrying on the woolen and cotton manufacture." The subsequent year, 1787, a company to manufacture cotton was organized at Beverly, Massachusetts, with one or more spinning-jennies, imported or made from the State's models, and a carding-machine, imported at a cost of £1100; and about the same time also several other cotton manufactories were projected or started—at Worcester, Massachusetts; Providence, Rhode Island; Paterson, New Jersey, and other places; none of which, however, for want of skill or proper machinery, appear to have been successful.

Meanwhile (1789) there arrived in New York a young Englishman, not twenty-two years of age, whose name, Samuel Slater, was destined to become famous in the manufacturing annals of the United States. He had been apprenticed at an early age to Jedediah Strutt, a partner with Sir Richard Arkwright in the cotton-spinning business, and had afterward served the firm as clerk and general overseer, until he had rendered himself perfectly familiar with the manufacture of cotton as it was then carried on in the model establishments of Great Britain. The reason which has been assigned for his emigration to the United States was a notice in the newspapers of a grant of £100 by the Legislature of Pennsylvania for the introduction of a new machine for carding cotton, and of the establishment of a society for promoting the manufacture of cotton. But be this as it may, the 18th of January, 1790, found him at Providence, Rhode Island, entered into partnership with the firm of Almy and Brown, under an agreement to construct the Arkwright series of machines, and carry on with his partners the manufacture of cotton by the improved methods. In consequence of the restrictions on the emigration of artisans and the exportation of models and machinery from Great Britain, Mr. Slater did not on leaving

home inform his family of his destination, or take with him any patterns, drawings, or memoranda that could betray his occupation, and so lead to his detention. But so thoroughly was he master of his profession that by the 20th of December of the same year, having discarded all the old machinery previously used by Almy and Brown in their attempts to manufacture cotton, he had constructed, chiefly with his own hands, the whole series of machines on the Arkwright plan, and had started three cards, drawing and roving frames, and two frames of seventy-two spindles. The machinery was first set in motion in an old building which had been used as a clothier's establishment; but in 1793 the new firm built a small factory, which may be considered as the first really successful cotton mill in the United States.

The only thing then wanting to insure the rapid development of the cotton manufacture not only in the United States, but throughout Europe, was an abundant supply of the fibre at a cheap rate; and this the invention of the cotton-gin by Eli Whitney in 1793 at once supplied. For some years previous to this the price of cotton in the United States was about forty cents per pound, and it required oftentimes a day's labor to separate a pound of the clean staple from the seed. In 1795 Georgia cotton of good quality was offered in New York at 1s. 6d. (thirty-six cents) per pound; and at that time cotton continued also to be imported. When Slater first began to spin he used Cayenne cotton, but after a few years he began to mix about one-third of Southern cotton, the yarn produced being designated as second quality, and sold accordingly.

In 1799 Mr. Slater built his second cotton mill, on the east side of the Pawtucket River, in the limits of Massachusetts, the first mill ever erected in the State on the Arkwright system; and by act of the Legislature the same, with all its appurtenances, was for a period of seven years exempted from taxation. Until this date the improved methods of manufacture had been confined to Mr. Slater and his associates, but after this men who had been in their employ, and had learned the construction and operation of the machinery, left them, and commenced the erection of mills for themselves or other parties, and before the year 1808 fifteen cotton mills on the Arkwright basis were in successful operation in different sections of the country. The first cotton mill west of Albany was erected in the neighborhood of Utica, Oneida County, New York, in 1807-8. In 1807 the whole number of spindles in the United States was estimated at 4000; in 1808 the estimate was 8000; and in 1809, 31,000. From this time until 1840, apart from the annual estimates of the domestic consumption of cotton for all purposes, the statistics

of the growth of the cotton manufacture in the United States are very deficient and unreliable. In 1815 the three States of Massachusetts, Rhode Island, and Connecticut had 165 factories and 119,510 spindles. In 1831, 795 factories and 1,246,500 spindles were reported for the whole country. In 1840, by the census, 2,285,000 spindles; in 1850 (for New England only), 2,728,000 spindles. After this the data are reliable, and are as follows: 1860, 5,035,798 spindles; 1870, 7,114,000; 1874 (July 1), 9,415,383, of which 8,927,754 were returned for the Northern States, and 487,629 for the Southern. The recent rapid progress of the Southern States in the manufacture of cotton is indicated by the fact that in 1869 this section of the country had 225,063 spindles in operation, and in 1874, 487,629. The progress of the whole country in spinning spindles from 1870 to 1874 was about thirty-three per cent. The aggregate and average *per capita* manufacturing consumption of cotton in the United States since 1827 is shown by the following table:

Years.	Pounds.	Consumption per Capita.
1827.....	49,489,796	4.22
1835.....	79,597,896	5.81
1840.....	118,058,919	6.68
1845.....	161,435,000	8.15
1850.....	263,190,643	11.34
1855.....	306,582,808	11.40
1860.....	450,877,923	14.39
1865.....	145,935,000	5.21
1869.....	447,216,000	11.57
1874.....	567,588,873	18.50

In 1794 the price of Slater's cotton yarn, No. 20, was \$1 21 per pound. In 1808 the price of the same number was \$1 31. Power-

Lowell—had become so popular that they were counterfeited by foreign manufacturers, and in 1827 it is recorded that the demand for American cottons in Brazil was considerably affected by imitations of them made at Manchester, England, and offered there (in Brazil) "at lower prices, although they could be made as cheaply in the United States as the same quality could be produced in Manchester." It is also a noteworthy circumstance that in 1850 in New England the ratio of cotton spindles to population was that of 1008 spindles to each 1000 inhabitants, while in Great Britain for the same year the ratio was 1003 spindles to 1000 inhabitants, so that at this period New England in respect to cotton had comparatively exceeded Great Britain in its manufacturing industry. From 1850 to 1860 and from 1860 to 1870 the number of spindles in New England increased much faster than the population, averaging in 1860 1265 and in 1870 1478 to each 1000 inhabitants.

The most important cotton manufacturing States of the Union, arranged in the order of their consumption of cotton for the year 1874, were as follows: Massachusetts, New Hampshire, Rhode Island, Connecticut, Pennsylvania, Maine, New York, Maryland, Georgia, New Jersey, South Carolina, North Carolina, Alabama, Tennessee, and Virginia. Few or no cotton factories exist in the States of Illinois, Iowa, Michigan, Wisconsin, Kansas, Nebraska, California, or Oregon. The following table exhibits the amount and character of the principal products of the cotton manufactories of the United States for 1874:

STATEMENT OF THE KINDS AND QUANTITIES OF COTTON GOODS MANUFACTURED IN THE UNITED STATES FOR THE YEAR ENDING JULY 1, 1874.

	New England States.	Middle and Western States.	Total Northern States.	Total Southern States.	Total United States.
Threads, yarns, and twines..... lbs.	52,000,000	99,000,000	151,000,000	18,000,000	149,000,000
Sheetings, shirtings, and similar plain goods..... yds.	520,000,000	90,000,000	610,000,000	97,000,000	707,000,000
Twilled and fancy goods, osnaburgs, jeans, etc..... yds.	204,000,000	80,000,000	284,000,000	22,000,000	306,000,000
Print cloths..... yds.	481,000,000	107,000,000	588,000,000	588,000,000
Ginghams..... yds.	30,000,000	8,000,000	38,000,000	38,000,000
Ducks..... yds.	14,000,000	16,000,000	30,000,000	30,000,000
Bags.....	5,000,000	1,000,000	6,000,000	6,000,000

loom weaving was first successfully introduced into Great Britain in 1806, previous to which time all weaving had been performed upon hand-looms. The first power-looms in the United States were put in operation at Waltham, Massachusetts, in 1814, and it was at the mills of the company at this place, also, that the spinning and weaving of cotton were for the first time combined in any large establishment. In this same year the price of cotton yarn was reduced by the operations of the Waltham Company to less than one dollar per pound. In 1823 the "domestics" of the Waltham Company—which at about this time extended its operations and built the first mill at

Besides the above, there is a large production of articles, like hosiery, etc., composed of mixed cotton and wool, for the details of which there are no satisfactory statistics. Among other notable improvements which were invented and brought into use about the time of the adoption of the Federal Constitution were those of Oliver Evans, of Pennsylvania, in respect to the manufacture of flour, the importance of which may perhaps be sufficiently indicated by saying that in all the subsequent progress of invention no radical change has ever been made in the system of "milling" machinery as Mr. Evans devised it, and that it constitutes today the mechanical basis upon which all the

extensive flour mills of the United States and Europe are operated. The more special results of the invention were a saving of one-half the labor of attendance, a better product of manufacture, and an increase of about twenty-eight pounds of flour to each barrel above the method previously in use.

As has been already stated, the value of the product of American manufactures for the year 1790, as estimated by Mr. Tench Coxe, was about \$20,000,000.

The census of 1810 fixed the total value of the manufactured products of the country for that year at \$127,000,000, but Mr. Coxe, to whom the returns were referred by resolution of Congress for revision, was of the opinion that the aggregate, exclusive of all products closely allied to agriculture, such as lumber, sugar, ashes, wine, bricks, indigo, hemp, and the products of the fisheries, was at least \$172,000,000, or including products of the nature specified, \$198,000,000. In 1810, also, Mr. Gallatin, then Secretary of the Treasury, reported to the House of Representatives that the following manufactures were carried on to an extent which might be considered adequate to the requirements of the United States for consumption, as the value of these products annually exported exceeded that of the foreign articles of the same general class annually imported, viz., manufactures of wood, leather and manufactures of leather, soap and tallow-candles, spermaceti oil and candles, flaxseed oil, refined sugar, coarse earthenware, snuff, hair-powder, chocolate, and mustard. The following branches were also reported as so firmly established as to supply in several instances the greater and in all a considerable part of the consumption of the country, viz., iron and manufactures of iron, manufactures of cotton, wool, and flax, hats, paper, printing types, printed books, and playing-cards, spirituous and malt liquors, gunpowder, window glass, jewelry and clocks, several manufactures of hemp and of lead, straw bonnets and hats, and wax-candles.*

Accepting the estimates of Mr. Coxe, it also appears that the annual value of the manufactured products of the 8,500,000 population of the United States in 1810, less than thirty years after the close of the Revolution, was in excess of that of Great Britain, with her accumulated capital and experience, in 1787, when the population of the United Kingdom closely approximated to the same figure.

The immediate effect of the war of 1812, by increasing demand for all necessary products, and at the same time cutting off all foreign imports and competition, was to impart a most unnatural and unhealthy stimulus to American manufacturing industry.

Capital, especially under the form of joint-stock companies, and often without the exercise of the most ordinary prudence or forethought, hastened to inaugurate a host of new industrial enterprises. Mill privileges readily commanded most extravagant figures, wages rose from 30 to 50 per cent., and raw materials and manufactured goods from 50 to 200 per cent. Cottons which had sold before the war at from 17 to 25 cents per yard, found purchasers by the package at 75 cents per yard; and salt, which was, in 1812, 55 cents per bushel, commanded in October, 1814, \$3 per bushel. The number of cotton mills in Rhode Island and in Massachusetts within thirty miles of Providence, at the commencement of the war in 1812, was about seventy; at the close of the war, in 1815, this number had increased to ninety-six.

So long as the war continued there was for nearly all these enterprises an apparent great prosperity, to magnify and inflate which an almost unlimited issue of paper money also powerfully contributed. All the banks in the country, save those in New England, suspended specie payments in 1814; and the Federal government, finding itself short of revenue, early in the course of the war commenced the issue of Treasury paper. But as specie disappeared and redemption was abrogated, not only public and private banking associations, but manufacturing and bridge-building associations, and even individuals, issued paper notes, which rapidly passed into circulation, and were largely taken by the public. In one session, that of 1813-14, the Legislature of Pennsylvania chartered forty-one new banks, with \$17,000,000 of capital; and according to one writer of the time, "the plenty of money was so profuse that the managers of the banks were fearful that they could not find a demand for all they could fabricate, and it was no infrequent occurrence to hear solicitations urged to individuals to become borrowers, under promises of indulgences the most tempting." The result was that the money of the country in a great degree lost its value, and its depreciation, enhancing the prices of every species of property and commodity, appeared like a real rise in value, and induced all manner of speculations and extravagance. The editor of *Niles's Register* characterized "the prodigality and waste as almost beyond belief," and speaks of the furniture of a single private parlor in one of the Eastern cities as costing upward of \$40,000. On the other hand, Mr. Mathew Carey, of Philadelphia, writing in 1816, called this period "the golden age of Philadelphia," and says, "The rapid circulation of property, the immensity of business done, and the profits made on that business produced a degree of prosperity which she had perhaps never

* Bishop's *History of American Manufactures*.

before witnessed." And in another portion of the pamphlet from which the above language is quoted he further declared "that never was the country in a more enviable state."

With the return of peace, and the consequent cessation of demand for commodities on the part of the government, the fall of prices, and the resumption of importations, all this bubble of prosperity, however, collapsed with great rapidity, and the country entered upon a period of prostration and stagnation of all industrial effort which has had no parallel in all its history except possibly during the darkest hours of the Revolution. Expecting large demands and high prices for commodities, English and American merchants imported enormously as soon as practicable after the ports had been opened; but the markets becoming soon overstocked, prices, under forced sales, declined to such an extent as to prove ruinous not only to the importers, but also to a large proportion of the injudicious or high-cost manufacturing establishments which the war had stimulated into existence. To remedy this state of things, Congress in 1816 enacted the first strong protective tariff, although the average rate of duty imposed by it on all imports was only about twenty-five per cent., and on only a few articles was in excess of thirty per cent. It is interesting also to note that this measure was proposed and mainly supported by Southern members of Congress—especially on the ground of encouraging the manufacture of our own cotton—and met with decided opposition from the people and Representatives of the North, whose capital and labor were at that time largely interested in commerce and navigation.

But whatever may have been the ultimate effect of this tariff, its immediate beneficial influence in restoring prosperity to the manufacturing and other interests of the country proved far less than what was anticipated. On the contrary, the stagnation of every kind of trade and industry, instead of diminishing, continued to increase, and did not reach its maximum until four years after the war, or in 1819. Specie payments were resumed in 1817; and as a legitimate consequence no small proportion of the paper promises to pay, which had been so recklessly issued and so profusely circulated as money, without security behind them for their payment, rapidly became worthless in the hands of the holders. The United States Bank, which at that time was the great financial regulator of the exchanges of the country, became also involved, through imprudent or dishonest management—losing through its Baltimore branch alone \$1,671,000—and in attempting to save itself wrought such new mischief that the previous financial and industrial disasters

of the country became almost insignificant in comparison. Rents and values of all real estate and merchandise were enormously depreciated. The population of Philadelphia decreased 10,000 between 1815 and 1820. At Pittsburg flour was one dollar per barrel, boards twenty cents per hundred, and sheep one dollar per head. Farms were mortgaged and sold every where for one-half to one-third of their value. Factories and workshops were every where closed; and in August, 1819, it was estimated by some authorities that as many as 260,000 persons, formerly dependent on manufactures, were absolutely without means of support.

After 1819, although the depression of prices continued through 1820, affairs began to improve. In this latter year the site for the city of Lowell was purchased, and between 1821 and 1827 it is noted that *thirty* new cotton factories were erected in the State of New York alone. But from the epoch of the great financial and industrial revolution following the war of 1812 down to the year 1850 there are no reliable data for exhibiting by decades, or for shorter periods, the aggregate progress and results of American manufacturing industry. Some specific details of interest may, however, be mentioned.

Thus, in 1821 the value of the manufactured products of the United States exported was equal to 28 cents per head of the entire population. In 1825 this value had risen to 51 cents, from which it declined in 1830 to 41 cents. In 1835 it was again 51 cents; in 1840, 58 cents; in 1845, 53 cents; in 1850, 60 cents; and in the period from 1851 to 1861 it attained the highest figures in our industrial history, namely, \$1 40 in 1854 and \$1 53 in 1860. Since the outbreak of the war, however, this representative value of exports of manufactures has not in any one year risen as high as \$1 *per capita* for our entire population.

In 1820 the total value of the books published in the United States was estimated at \$2,500,000, and the relative proportion of British and American books consumed was estimated by S. C. Goodrich (Peter Parley) at *seventy* per cent. of the former to *thirty* of the latter; but before 1850 the proportion of foreign books to American consumed in the country had become very inconsiderable.

The mechanical inventions by which the cost of the manufacture of paper was greatly reduced, through the substitution of machinery producing a continuous sheet, in place of the old hand process by which single sheets were made successively and slowly, had their inception unquestionably in Europe at about the commencement of the present century, but the credit of so simplifying and enlarging the machinery as to make it practical and thoroughly efficient

undoubtedly belongs to American paper-makers, John Ames, of Springfield, having been especially noted for his useful inventions. In 1800, "by the hand process, it took three months to complete the paper, ready for delivery, from the time of receiving the rags into the mill."* At the present day twenty-four hours are amply sufficient. In 1820 the annual value of the product of the paper manufacturing industry of the United States was estimated at \$3,000,000; in 1829, \$7,000,000; in 1844, \$16,000,000, by 600 mills; in 1854, \$27,000,000, by 750 mills; in 1860, \$39,428,000; and in 1870 (exclusive of paper-hangings), \$48,675,000.

The iron industry of the United States divides itself into two periods, one dating from the first settlement of the country to the end of the year 1862; the other extending from 1863 to the end of 1873. The first period was one of gradual but continuous growth; the second was that in which the iron industry was stimulated into an extraordinary growth and activity, first by the war, and then by railroad building on the most extensive scale.

The fact that both pig and bar iron were included among the regular exports of the country for many years prior to the Revolution has been already noticed. After the war the progress of this industry was for a time very rapid, and in 1791 Mr. Hamilton in his report says, "Iron-works have greatly increased in the United States, and are prosecuted with much more advantage than formerly." We find it also recorded at about this time that "a dangerous rivalry to British iron interests was apprehended in the American States, not only in the production of rough iron, from the cheapness of fuel and the quality of the iron, but also in articles of steel cutlery and other finished products, from the dexterity of the Americans in the manufacture of scythes, axes, nails, etc." In 1810 Mr. Gallatin, Secretary of the Treasury, in a report on manufactures, classed that of iron as firmly established, and estimated the quantity of bar-iron produced to be 40,000 tons, against about 9000 imported. According to the census of 1810, there were 153 furnaces in the United States, producing 53,908 tons of iron, and four steel furnaces, producing 917 tons of steel, the importation of steel for the same year being reported at only 550 tons. The commercial and financial revulsions which followed the war of 1812-15 affected disastrously the iron manufacture in common with all other industries; but that it did not entirely interrupt it is shown by the fact that some new establishments of great importance went into operation at the time of the greatest depression; and in 1816 the total import of pig-iron was but 329 tons.

By 1824 the iron production and manufacture were both very active, and the pig-iron product of this year undoubtedly exceeded 100,000 tons. For 1832 it was reported at 200,000 tons. The first furnace for smelting with anthracite coal was built in 1837, but at the close of 1843 there were twenty anthracite furnaces in successful operation. The first important demand for iron in the United States for railroad purposes commenced in 1835, during which year 465 miles of road were constructed, followed by 416 in 1838, 516 in 1840, and 717 in 1841. In regard to the production of pig-iron in the United States during the decade from 1840 to 1850, a period characterized by extreme variations in the tariff policy of the government, there has been no little of controversy; but the most careful investigation yet made into the subject (that of Hon. W. M. Grosvenor) leads to the conclusion that the product of 1840 was about 347,000 tons, and that it increased from that figure to an aggregate of not more than 551,000 tons in 1846, and 570,000 in 1848. Subsequent to this date the progress of the pig-iron industry may be accurately indicated as follows: 1850, 564,755 tons; 1855, 784,178; 1860, 919,770; 1865, 931,582; 1870, 1,865,000; 1873, 2,695,000.

In 1865 the production of cast steel in the United States was 15,262 tons; in 1873, 28,000 tons.

In 1868 the production of pneumatic or Bessemer steel was 8500 tons; in 1873 (estimated), 140,000 tons. The recent progress of that department of the iron industry of the United States engaged in the manufacture of rails for railroads is also indicated by the following statistics of annual product: 1849, 24,314 tons; 1855, 138,674; 1860, 205,038; 1865, 356,292; 1870, 620,000; 1872, 941,000; 1873, 850,000.

In 1840 the consumption of iron in the United States for all purposes was estimated at about 40 pounds *per capita*; in 1846, at about 60 pounds; in 1856, at 64; and in 1867, at (approximately) 100 pounds. The *per capita* consumption of Great Britain and Belgium alike for this latter year was 189 pounds; and of France, 69½ pounds. For the years 1872-73 the *per capita* consumption of iron in the United States has been estimated as high as 150 pounds; and that of Great Britain, at 200 pounds.

It is more difficult to present the details of the growth and development of the woolen manufacture of the United States than those of almost any other great domestic industry; and this, in a great degree, for the reason that no other industry has been subjected to such violent and radical disturbances by reason of financial and commercial revulsions, and by the frequent changes in the fiscal policy of the government in respect to the tariff. Previous to the Revolution this branch of manufacturing was so

* Munsell's *Chronology of Paper and Paper-Making*.

successfully established that its progress was regarded with probably more of jealousy and apprehension by Great Britain than that of any other colonial industry, and most stringent efforts were made by Parliament to check or suppress it. After the war the business generally changed its "home" or "domestic" character, and became more and more of a "factory" enterprise, and developed rapidly, down to the period of the "embargo" of 1808. It is recorded that Arthur Schofield about this time established a mill in Pittsfield, Massachusetts, from which goods were soon sent to New York, sold for British broadcloths, and brought back for sale by a dealer of that same town in which they were manufactured. Other mills were equally successful, and before the "embargo" American woolens were made for \$1 06 per yard, equal in fineness and quality with British goods of double the width, costing \$3 50 per yard.

The immediate effect of the embargo and of the subsequent war was to greatly stimulate the manufacture of woolens; but wool was so high and scarce as to command in 1815 \$4 per pound, while broadcloths were as high as \$18 per yard. The detailed accounts of one factory established at Goshen, Connecticut, in 1813, which have been preserved, show that the proprietors purchased wool at \$1 50 per pound, and sold cloth of a quality which at the present time would not command over \$1 per yard, for \$10; and, further, that the ultimate end of that factory after the war was an entire loss of the original capital, and three times as much more in addition.

coarsest hair to the finest and most glossy silk; and that in order that the manufacture of woolens may be conducted successfully, it is absolutely essential that the manufacturer should be allowed to freely select his raw material from the peculiar products of every climate and soil, and at prices common to all competitors. But such a condition of things, through legislative interference, has not been given to American woolen manufacturers in one single year since 1827; added to which there has been no stability in the duties imposed on imported fabrics of wool, the tariff on the single article of blankets, for example, having been subjected to five radical and sudden changes during the period from 1857 to 1867 inclusive. The extreme and rapid variations in the price of American wool (upon which the American manufacturer has been obliged to mainly rely) since the year 1827 also strikingly illustrate how unstable have been what may be regarded as the fundamental elements of the business. Thus the average price per pound of common "fleece" in New York for the year 1825 was 33 cents; in 1830, 22 cents; in 1835, 33½ cents; in 1839, 38 cents; in 1842, 19 cents; in 1850, 35 cents; in 1853, 41 cents; in 1858, 30 cents; in 1863, 67 cents; and in 1873, 40 to 90 cents.

By the census of 1840 the capital invested in the manufacture of woolens in the United States was returned as in excess of \$15,000,000, employing 21,000 persons, and producing goods to the value of \$20,696,000. Since 1850 the progress and condition of this industry as returned by the census are shown by the following table:

	1850.	1860.	1870.
Number of establishments.....	1,559	1,960	2,891
Hands employed	89,252	41,860	98,108
Capital invested.....	\$28,118,000	\$20,862,000	\$108,928,000
Value of product.....	\$43,207,000	\$61,824,000	\$177,963,000

In the prostration of all business interests that followed the war the woolen industry participated, but yet not more largely than did that of cotton; and it recovered so vigorously that the capital invested in it was reported to Congress to have more than doubled between 1815-16 and 1827. From this time, although the woolen manufacture has continued to increase, and at the present time has attained to a large development in almost every department, its record on the whole has been one of disaster rather than of success; and the annals of Congress from 1827 onward are filled with applications by representatives of the woolen interests for legislative relief, and with most pitiful statements of lack of profit, loss of capital, and abandonment of business. The explanation of this curious result in great part is that no one country produces all the different kinds of wool, which in variety of character may be said to range from the

In 1850 the Federal government for the first time attempted to ascertain through the machinery of the census with any approach to accuracy the exact condition and annual product of all the various industries of the country, not, however, including any establishment the value of whose annual product was not in excess of \$500. The amount of capital at that time invested in manufactures in the whole country was returned at \$553,123,822, and the value of the annual product (including fisheries and the products of the mines) at \$1,019,106,616.

By the census of 1860 the aggregate capital employed in manufacturing for the whole country was returned at \$1,009,855,715, and the gross value of the total annual product at \$1,885,861,676, an increase as compared with the aggregate of 1850 of about eighty-eight per cent. By the census of 1870 the aggregate manufacturing capital returned was \$2,118,208,000, and the gross value of

the total annual product of manufactures \$4,232,325,442. Reducing the census statements of these values of the annual product to equal terms respectively, the increase in the reported values of the products of manufacturing industry for the decade from 1860 to 1870 was *one hundred and eight* per cent. But of this increase *fifty-six* per cent. was computed to represent merely the enhancement of prices in 1870 over those of 1860 by reason of the inflation of the currency and other general causes, leaving *fifty-two* per cent. as the actual increase in the value of production. Of this latter increase it was further estimated that about *twenty-eight* per cent. was due to increase during the decade in the amount of labor employed, and *twenty-four* per cent. to the application of steam or water power, the introduction of machinery, and the perfecting of processes.

But the evidence is unquestionable that the returns of both the census of 1860 and that of 1870 in respect to the aggregate value of the annual product of our manufacturing industries were much less than the actual facts warranted, and that if proper account had been taken of the omissions and deficiencies in the estimates of the periods above given, the true value of the annual manufacturing product for 1860 would have been about \$2,325,000,000 in place of \$1,885,000,000, and for 1870 \$4,839,000,000 in place of \$4,232,000,000.

Careful investigation has also shown that the data upon which the amount of capital invested in manufactures in the United States has from time to time been estimated under the census have been too unreliable and imperfect to authorize any but the most general conclusions; and furthermore that the results of any inquiry by Federal or State officials looking to the obtaining of accurate information respecting invested capital must, from the almost universal unwillingness of persons interested to give information, be ever most unsatisfactory, if not wholly worthless. Thus the estimate under this head, based on the official returns of the census for 1870, was, as before shown, \$2,118,000,000; but this sum, in the opinion of the Superintendent of the Census, Hon. F. A. Walker, did not in fact truly represent more than one-fourth of the capital which actually contributed to make up the gross annual value of the manufactured product returned for the year 1870.

RELATIVE IMPORTANCE OF THE MANUFACTURING INDUSTRIES OF THE UNITED STATES.

The following detailed statements, compiled from the returns of the census of 1870, indicate the relative importance of the great manufacturing industries of the country:

Leather (including the dressing and tanning of skins, the manufacture of boots and shoes, saddlery, harnesses, belting, hose,

pocket-books, trunks, bags, and valises, but excluding all other manufactures).—Hands employed, 202,613; capital invested, \$133,902,000; value of annual product, exclusive of value of material used, \$162,872,000.

Lumber (planed and sawed).—Hands employed, 163,511; capital invested, \$161,406,000; value of annual product, exclusive of value of material used, \$120,201,000.

Flouring and Grist Mill Products.—Hands employed, 58,448; capital invested, \$151,565,000; value of annual product, exclusive of value of material used, \$77,593,000.

Pig and Bar Iron Manufacture (including pigs, blooms, and iron forged and rolled).—Hands employed, 78,347; capital invested, \$119,860,000; value of annual product, exclusive of value of raw material used, \$70,272,000.

Clothing (ready-made).—Hands employed, 118,824; capital invested, \$52,743,000; value of annual product, exclusive of value of material used, \$69,600,000.

Manufactures of Cotton (including batting and wadding, thread, twine, and yarns).—Hands employed, 136,763; capital invested, \$140,906,000; value of annual product, exclusive of value of raw material used, \$64,828,000.

Manufactures of Wool (including woollen and worsted goods, wool carding, and cloth dressing).—Hands employed, 93,108; capital invested, \$108,998,000; value of annual product, exclusive of value of material used, \$66,745,000.

Machinery.—Hands employed, 83,514; capital invested, \$101,181,000; value of annual product, exclusive of value of material used, \$57,597,000.

Carriages and Wagons (including building and repairing of railroad cars, children's wagons, and sleds).—Hands employed, 71,772; capital invested, \$53,941,000; value of annual product, exclusive of value of material used, \$56,565,000.

Agricultural Implements.—Hands employed, 25,279; capital invested, \$34,834,000; value of annual product, exclusive of value of material used, \$30,593,000.

Paper (exclusive of paper-hangings).—Hands employed, 17,910; capital invested, \$39,362,000; value of annual product, exclusive of value of material used, \$18,648,000.

Stores, Heaters, and Hollow Ware.—Hands employed, 13,325; capital invested, \$19,833,000; value of annual product, exclusive of value of material used, \$14,345,000.

Hats and Caps.—Hands employed, 16,173; capital invested, \$6,409,000; value of annual product, exclusive of value of material used, \$12,587,000.

Silk (including sewing and twist).—Hands employed, 6699; capital invested, \$6,242,000; value of annual product, exclusive of value of material used, \$4,415,000.

It thus appears that the preparation and

manufacture of leather ranks *first* in importance of the various manufacturing industries of the United States, and that the industries represented by the planing and sawing of lumber, and by the "milling" of cereals, take precedence over the primary manufactures of iron, as well as over the great textile industries of cotton and of wool.

NUMBER OF PERSONS EMPLOYED.

By the census of 1870, 11,155,240 persons, twenty years of age and upward, were returned according to occupations. Of this number 2,500,189 were engaged in manufactures and mining, being a gain of *twenty-eight* per cent. since 1860, or *five and one-half* per cent. more than the ratio of decennial increase in population. The number employed in agriculture was at the same time returned at 5,151,767, and in trade and transportation at 1,117,928.

SOCIAL CONDITION OF LABORERS.

The data and material for describing the condition of laborers engaged in the manufacturing industries of the United States at different periods are very meagre. During the colonial period and the early days of the republic there was but little accumulated national wealth, but what there was was probably distributed with more of equality than has ever prevailed in any other large community of which we have a correct history for any lengthened period. At the commencement of the present century there were probably a smaller number of individuals in the country, in proportion to the whole population, who possessed an accumulated capital of \$5000 than there are at the present time who possess \$100,000. But if there was but little accumulated wealth in the early days of our national history, there was but little poverty, and consequently but few social distinctions, and the natural resources of the country then as now afforded remarkable facilities to all who were willing and able to work for earning a comfortable livelihood. With the gradual accumulation of wealth, the utilization of natural forces through the agency of machinery, and the great improvements in the means of transportation, the consuming power of the masses has also greatly increased, and many things which were once regarded as luxuries have come to be considered by even the humblest in the light of necessities. But it can not, at the same time, be doubted that the general tendency of events during the last quarter of a century of our national history has been to more unequally distribute the results of industrial effort, to accumulate great fortunes in a few hands—in short, to cause the rich to grow richer and the poor poorer. Such results, however, can not be referred to any

one cause, but they are primarily due to an abandonment of that spirit of economy which so pre-eminently characterized our ancestors; to a marked decrease in the efficiency of labor; to a continual, if not increasing, use of artificial stimulants; to the crowding of population in large industrial and commercial centres; to war; to the interference of legislation with the freedom of trade; and latterly, to the use of an unstable, fluctuating medium of exchange, which all experience shows is one of the greatest curses that can befall the laboring population of any country.

As elements for estimating the social condition of laborers in the manufacturing industries of the United States, the statistics of the wages paid in different occupations are most important; and from the great mass of information on this subject which has recently been collected and published the following general items have been selected. Thus in Pennsylvania, the leading State in the production and fabrication of iron, the average earnings per annum in the different manufacturing establishments of the State for the years 1872-73 (as reported by the State Bureau of Statistics of Labor) were as follows: foremen, \$638 per annum; skilled workmen, \$536; laborers, first-class, \$402; laborers, second-class, \$332; females above sixteen, \$228; youths, apprentices, etc., \$150.

In Massachusetts for about the same period the average wages reported in the cotton-manufacturing industry were, for men, \$403 per annum; women, \$268; children, \$134.

In the silk industry the average earnings per hand in the most prosperous establishments probably approximate \$335 per annum as a maximum.

In the woolen industry the average daily wages of 5500 operatives in the mills of Massachusetts were reported for the year 1871 as follows: men, \$1 62 per day; women, \$1 12; young persons, 94 cents; children, 64 cents.

In any limited review of the progress of a great nation for a period of one hundred years, in respect to any one of its leading departments of industry, much that is interesting and suggestive must of necessity be wholly omitted, and many things treated most superficially. But a general conclusion to which a study of all the facts connected with our national development from the time of the founding the first colonies in the wilderness to the epoch of the Declaration of Independence, and from the establishment of peace and the adoption of the Federal Constitution to the present hour, is that the progress of the country, especially in respect to its manufacturing industry, and through what may be termed its ele-

ment of vitality, is independent of legislation, and even of the impoverishment and waste of a great war. Like one of our mighty rivers, its movement is beyond control. Successive years, like successive affluents, only add to and increase its volume, while legislative enactments and conflicting commercial and fiscal policies, like the construction of piers and the deposits of sunken wrecks, simply deflect the current or constitute temporary obstructions. In fact, if the nation in all respects has not yet been lifted to a full comprehension of its own work, it builds steadily and determinately, and, as it were, by instinct. DAVID A. WELLS.

NORWICH, CONNECTICUT, 1873.

A LION IN THE WAY.

A LITTLE headstrong piece, a pretty little headstrong piece, every old woman in the neighborhood called Bessie Allan; and when she and Georgie Knight, her mate in most of her frolics and adventures, were together, any thing, the same authorities declared, might be expected. Nevertheless, all the neighborhood were Bessie Allan's friends; they all loved the little bright head, the dimpled mischief of the rosy face, the glistening of the brown eyes, with their long, bright, half-curved lashes that knew so well the demure trick of veiling the lustre underneath them at the auspicious moment, and making the face too tempting for any thing but forgiveness and kisses.

She was seventeen, and though all the neighborhood might in some way be called her lover, yet she had never had that single and individual lover who belongs to young girls' dreams; for with all her gay spirit there was a certain shyness—almost like that of the little wild-wood animals, which allures you and then escapes you—and no admirer had ever approached the lovely, frolicsome, piquant thing near enough to become a lover. That is to say, until this present epoch, of which we are about to speak; and then one day the new minister—yes, the new minister, young, heart-whole, handsome, and believed by some of the old women of whom mention has been made, and some of the young ones too, to be nothing less than an angel in disguise, for if such things had happened once, they reasoned, then they might happen again—just as he rose in the pulpit, saw Mistress Bessie come walking into church, and it was all over with him.

Pray don't think ill of the young minister. It was no earthly love of which he was conscious during the brief hour of the pulpit. Only to him, that early summer day, the sky was bluer, the rose was rosier, the sunshine seemed more than ever to be flowing out of heaven itself, like the shimmer of the river of life. He was not exactly

aware that he had even seen Bessie Allan; all that he was entirely conscious of was that suddenly, as if he were in an ecstasy, the whole world had brightened and lifted itself, and he prayed and read and preached after a manner that made the congregation talk, during all the intermission, of Tobit and the angel; and then he went home to dine with Mr. Allan.

As for Bessie, she sat very still between her father and mother in church, and forgot all about her roguish glances hither and yon, all about this body's ribbons and that body's hat, and heard the preaching and the praying with a new light in her eyes and a new comprehension in her mind; joined in the singing of the hymn with her whole soul, and a voice like a bird's; and perfectly agreed for the time being with the old women and the young women that this was no common minister, but more likely to be a spirit in mortal guise than any mere graduate of theology.

Yet Mr. Beckwith was not of such immaterial form as might lead to such opinion. He was a deep-chested, broad-shouldered fellow, with short brown curls clustering in thick rings upon a head of antique outline, with a steely glance in a pair of great blue eyes, and was by no means any more ethereal in appearance than a man of proper proportions and natural emotions should be, except in such moments as those when his excited aspiration lent a singularly pure and holy expression to the face that was usually rather severe than otherwise.

But if this young gentleman had not been self-conscious of Bessie's presence in church, he became very conscious of it in her father's house. Not immediately, to be sure, for the awe in which she had been half spell-bound did not wear off at once. But when she found that the minister liked plenty of gravy, when she had helped him twice to dumplings, when she had discovered that he had a good hearty heathen appetite, then the mischief in her began to get the upper hand, and almost before she knew what she was about, the eyelashes were doing their wonted execution. Mr. Beckwith saw the rosy roguish face before him on the darkness as he walked home that night; it made a picture in the sunrise clouds when he woke in the morning; and after he had known her a fortnight, there was not a day or an hour in which that face did not seem to be lurking somewhere about him—on his sermon paper, between the leaves of his commentary, in the very sunshine that fell across him. Mr. Beckwith was not the man to consider this a mawkish sentimentality, or a thing to be checked by flagellations and mortifications of flesh and spirit. He knew, in fact, that his hour had come. He sat down and reasoned the matter out with himself. A child, indeed, she

was, he confessed, but then an utterly lovely one. Not precisely the material for a minister's wife, according to old-fashioned theories, but then he had abandoned old-fashioned theories in that respect. His wife was to belong to him, not to the parish, and in time she would be every thing the fondest parish could wish. And as for any thing more that could be urged, there was but one answer—he loved her. A month ago he had never seen her; now, life would be a hard struggle to the grave without her. A month ago he had never seen her, yet he was sure he had only been journeying toward her, and he was as determined to make her his own, and as confident that he should do so, as if he had seen it written in the book of fate. When Mr. Beckwith determined on a thing, he was in the habit of accomplishing it.

But still Mr. Beckwith had perhaps had different subjects to deal with hitherto; as well calculate on a will-o'-the-wisp, he presently found, as on Bessie Allan. To-day she was all melting smiles and glances, to-morrow she was remote as a star; to-day she was like a bird on which he was just about to put his hand, to-morrow she was singing and soaring far beyond his reach. After he had met her in some of his walks, and had spent an hour beside her, sometimes strolling, sometimes sitting on a mossy stone, and had been amazed at her acquaintance with the things of nature, at the insight into spiritual things which her young mind in this quiet moment showed, its sympathy with all sweet and innocent influences, its ready acceptance of the great truths to the statement of which his words were apt to tend—after all this, he would be just as likely as not to catch his next glimpse of her down in the meadow, in company with Georgie Knight, making cheeses with her skirts, as if she were ten years old, or racing like a madcap through the straight lines of the orchard, stopping only for whirls and twirls and swift waltz steps as she went along, like one of the old pictures of the sylphides; or else calling the filly to the bars, and catching her by the forelock, and galloping away down the pasture without saddle or bridle, hair blowing in the wind, as wild as Madge Wildfire herself. Mr. Beckwith was not sure that there was not something unregenerate in his heart still, for, if he acknowledged the truth to himself, he loved the little baggage at such times more than ever.

It actually seemed to all the neighborhood, at about that time, as though Bessie Allan were beside herself with exuberance and the mere delight of youth and health and sunshine. The sewing circles and the prayer-meetings were only so many places for her wiles and witcheries—possessed with glee at the one, a coquettish little Puritan at the other under all her glances—always

contriving to go home with some other gallant than the minister. The Bible class was the only place that tamed her much, and there she grew more and more silent; her veil gradually lowered and lowered till it shielded her face; and as long as her unaccountable tears could fall quietly, and only blister the leaves of her Testament unperceived, she staid; and when a hysterical burst became inevitable, without a word of warning she would rush away, as if in danger of her life. Nobody else dreamed what it meant. Mr. Beckwith thought he knew. Poor little Bessie! If ever a young falcon out of the forest objected to the clipping of her wings, she was one, for she felt the band tightening around her. Evidently she was in the mood of those who mean to have their fling out because they know an end is coming.

And yet if you could have seen Bessie's face sometimes as she sat in the twilight, there was such a serene content in its half-hidden smile, you would have said to yourself that here, if any where, was there supreme happiness. But the child did not know herself, for, close upon any such brief experience of content, there would follow such a restive rebellion against all chains that even Mr. Beckwith was startled, if he happened to be in the house on some parochial errand, and saw her dancing down the stairs and through the halls, vouchsafing him neither word nor look, answering neither father nor mother, flinging down her hat if any body called to her to put it on, whistling to her dogs, and making off for a tramp that was to tire out with its fatigue some of the refractory spirit.

Most men would have hesitated a while after one or two such scenes; would have foreseen the plucking of a little termagant from this nettle; would have anticipated trouble in the flesh after the fight was won. Not so Mr. Beckwith. If so good a man could be piqued, he was perhaps piqued into the resolve for conquest; he was determined to teach the tantalizing thing that it was happiness she was flying from, and not torment, as she seemed to believe; he was all the more fixed in his intention to win her—to win her and to tame her. But not one chance for his winning and taming did he get, that is to say, not one chance after the abrupt end of the single opportunity he had contrived to seize and lose.

He had been called that day—almost three months since he first saw Bessie—to visit a dying person across the hills; for many of those who did not exactly belong to Mr. Beckwith's parish used to beg for his ministrations; and in the little time of his residence among them, more than one soul had seemed to wing away the easier on their eternal path for the rapt prayers with which his presence had upbuoyed their flight.

The roads being roundabout, and the bridle-path direct, he had borrowed a saddle-horse—a valuable one, as it chanced—and was returning now in the twilight, lost in thought, and coming slowly, his horse's feet falling so softly on the turfy way that one could hardly hear them, when a sudden scared cry, as he turned a curve of the winding lane, told him who was wandering there before him, with her light garments fluttering in the wind, at sight of which his horse had reared and swerved aside; and he cast himself from the saddle and caught Bessie Allan's hand, begging her not to be alarmed.

"But I have been!" cried Bessie.

"I was thinking," said Mr. Beckwith, "and I had forgotten myself. And when I saw your white dress, it seemed like a continuation of my thought."

"Were you thinking of my white dress, then?" asked Bessie, aptly.

"No, of another; a whiter dress," said Mr. Beckwith, gravely—"of a white dress that I saw a soul put on to-day, winging its heavenly way."

A little overawed, Bessie was silent.

"I have just come from a death-bed, Bessie," said Mr. Beckwith, taking advantage of the mood. "So peaceful and beautiful it was that it makes the things of this life seem too poor and small for thought beside that everlasting one."

"Is Miss Barton dead, then?" she asked, though no one knows how she had learned where the minister had been. "Yes, she was a saint. I wouldn't like to be so good."

"Bessie!"

"I mean it would be so stupid!"

"But at the last?" he queried, patiently.

"I—I don't like to hear about death," said Bessie, with half a pout, half a fling.

"Few of us do when we are young," said the minister. "Yet we are all drifting on the tide that takes us there."

"Don't!" she cried.

"Ah, I have felt it myself," said the minister. "Youth is so full of vitality that it is antipathetic to death. There are only two things that quite reconcile us with the inevitable fact—one, weariness of life, and the other, that exceeding love which makes the hours seem long. I hope the first will never come to you, my—"

"No, indeed," cried Bessie. "How could I be weary of life—how could any one be?"

"If such an hour as this were perpetual," said the minister, taking off his hat, better to enjoy the perfumed breeze upon his brow and in his hair—"this purple air, with the scent of the hay fields floating through it; this tender sky, that trembling star, and the young strong health and heart. Oh no, if such an hour were perpetual!"

"It is!" said Bessie. "It comes day after day, summer after summer. It always will come to me as long as I live. No, I never

shall be willing to die and leave it; never shall be willing to lie in my grave, and know other girls are walking in the lane these summer nights, with the sweet wind blowing over them, and the—the—"

Bessie stopped in confusion. What was it she had been about to say?

Perhaps the young minister was not aware that he still held Bessie's hand; but Bessie was. She essayed to withdraw it, and then the grasp tightened. She blushed red and redder; she felt an arm stealing round her; and then, looking defiantly up, there was the minister's face bending before her. She knew what he was about to say. She didn't want to hear it: not yet, at any rate, did she want to hear it. But she did hear it. That arm held her close, close to a plunging heart; that voice was murmuring in her ear; those lips, they sought her own; and her own—yes, indeed, Mistress Bessie—half eager, half unwilling, were answering them—were answering them! And suddenly, almost as if she did not know what she did, she had lifted her hand, with the willow switch in it with which she had been playing, and had dealt the horse beside them a swift little blow that startled him into a rear and a bound, tore the bridle from Mr. Beckwith's other hand, wheeled Mr. Beckwith shortly about, and sent the horse off at a gallop. There was nothing for Mr. Beckwith to do but to hasten after the horse—so valuable a creature, and not his own—and then there was nothing for the wayward, wicked Bessie to do but to sit down on a stone and cry, and go home at last all dew-bedraggled, and dash past the family room like a wraith, up the stairs to her own nook, bolting the door with a resounding echo that might have dispelled any fear of the supernatural. She sat down in her dark room then alone, dazed, but safe. She loved him—yes, she loved him, she was afraid; but he was a minister, and she didn't want to love a minister. She was half promised to him, but in her thoughts there in the dark room she defied him to exact the promise.

"What in the world is the matter with the girl?" said her mother.

But the father only nodded his wise head, and bade the mother leave her alone. He looked at the absurd little portrait of his short-waisted aunt Dorothy, of whom Bessie was the image and superscription, and remembered the story of her courtship as he had heard her tell it. "It will all come right, mother," he said.

"It's all wrong now," said the mother. "And these tantrums will be the death of me if they don't come to an end soon."

Perhaps Mr. Beckwith thought they would be the death of him. If he did, he could devise no way to overcome them. Half promised as she was by those melting lips of hers, he could not arrive with-

in sufficient distance again of the rebellious little maiden to exact the rest of the promise. That his power was felt, and not only felt now but recognized, was evident enough, or she would never have tried to escape him so. In the mask of hoiden, or in the mask of nonnette, whichever way it was, she was equally inaccessible.

If there was to be a picnic now in the parish, an occasion where all were on a level, this young woman announced her intention of going, before Mr. Beckwith had the chance to invite her, in the company of another suitor, and nobody in that house had ever been much in the habit of gainsaying Bessie Allan. When evening meeting was over, she was not the one to wait for the minister; she caught her father's arm, and said, "Quick! Don't let any body take me!" And after that mark of confidence, the proud and loyal father, happy slave of a spoiled mistress, would not have surrendered her to the minister himself, who was, it was very likely, plodding on behind with her mother and the lantern. When the sewing circle closed its sessions, Bessie said Yes to the first spruce young Corydon that stepped forward. And when three weeks had passed after that twilight in the lane, Mr. Beckwith had not spoken one word with her.

But, for all that, there was a change in Bessie. Nobody ever heard her voice caroling out of the window now; nobody heard her old sweet laugh, like the music of a brook; there was a curious little frown between her eyes when on her maddest escape. Mr. Beckwith, looking at her unperceived, with his longing pain, felt that if he did not conquer soon, it would be the worse for Bessie. He knew well enough now—after the innocent kiss whose remembrance so thrilled him—that she loved him; he knew well enough that it would break her heart should he abandon his attempt; he knew well enough those hidden springs of feeling which reacted so upon the young nature of which she was totally ignorant, and whose first stirring so disturbed her; he knew well enough that he could make her so blissful that she would one day wonder at and despise this time of doubt and fear and this desire for longer liberty from the great thrall of love. But not one chance was he finding to make her learn these things.

It was just at this season, as it happened, toward the close of the bright September days, that flaming handbills were posted up at every corner and on every empty fence proclaiming the approach of Eden's great Scriptural Show and Gymnastic Entertainment, which the villagers were not, however, deluded into supposing any thing other than a circus. Miss Bessie, of course, read the handbills in common with others, and straightway announced to her astounded family that she was to be a patroness of

the great Scriptural Show to the extent of a single ticket.

"Go to the circus!" came the astonished chorus of remonstrance.

"It isn't a circus," said Bessie. "It's a Scriptural show. There are texts from the Bible on every cart."

"They take the livery of God to serve the devil in!" exclaimed her father.

"I don't see any such necessity," she rejoined. "It's an opportunity for studying natural history such as seldom occurs, the bills say."

"Much natural history in those dancing women and riding men!"

"Oh, as for that part, I shouldn't think there could be any thing more interesting than the sight of those people springing through the air from their trapeze," said the well-informed young person, "and showing what fine bodies they can make for themselves. Like pictures of the heathen gods!"

"Nonsense!" said Mrs. Allan; "nonsense! Your head's turned. You! a deacon's daughter!"

"Yes, my child," said her father. "I agree with your mother here. I've never denied you much, Bessie, but I feel that I must deny you this. You can't go to the circus."

"You," said her mother, "that the minister has paid attention to!"

That settled it. Nothing but irons could have kept Bessie from that circus after those fatal words. She confided to Georgie Knight at once her intention of going to the circus; and when the mighty show came into town, she watched her chance and harnessed the filly herself into the little open wagon, and set off with Georgie Knight, unseen and unmissed for a time, to visit the beasts and the gymnasts of the forbidden entertainment.

"What the minister can see in that girl," said old Miss Sparks, looking through the window as the wagon whirled by, "I can't see. She's an engaging rogue, that's true, but I shouldn't want to marry her." But as nobody wanted Miss Sparks to marry her, it didn't so much signify.

Bessie was in great spirits. She was disobeying: that in itself always kindled her merriment. Then she felt sure that Mr. Beckwith would disapprove, and that was another excitement. She had a foreboding that the time was coming presently when her free agency would cease; till it did cease she was defiant. And accordingly, well-pleased with her success thus far, she and Georgie sung and laughed till the road rang with their overflowing gayety as they drove along and put the filly through her paces.

It was only a couple of miles before the road grew dusty and thronged. People were coming and people were going. All sorts of vehicles jostled together. Far off

they could hear the strains of a band rising and falling on the wind till they were in an ecstasy of expectation, as they grew silent and listened. Booths began to line the way, with lemonade and mineral waters and worse; and presently the tents rose on their sight like white clouds, the flag waving its long folds over them. And now they were in the great space before the tents, crowded with teams, with foot-passengers, with men leading piebald horses and Shetland ponies, with boys crying their wares, with the voice of the Boanerges who pressed the claims of the fat woman and the learned pig on the attention; and through it all came the burst of the band again in some tripping dance music, the roaring of the beasts and screaming of monkeys and parrots; and then the great canvases seemed to swell and soar, and a girl, all gauze and flowers, was running up the air on a rope stretched from pole to pole far overhead, dancing from sunbeam to sunbeam, as it seemed to the rapt Bessie. What transport! she thought; and she sat with her head thrown back, regardless of every thing but this flying wonder in the air, till suddenly a shriek rose from the great tent—a shriek that was repeated in the crowded square—the shriek of a thousand voices—one awful cry of fear and agony from all the people, echoed again by all the beasts within: the lion had broken loose!

What a scene it was! what a dreadful scene! Men were yelling as they ran, children were screaming, women were fainting, horses were rearing and snorting, the crowd was surging and plunging this way and that in a frantic effort at escape. Bessie, suddenly called from her rapt reveling with that spirit in the air, gave one look—one look of horror—tried to pull the rein, and, weak as a child, fell back upon the seat. The filly turned her head, and then, with starting and foaming nostril, stood upright one moment, and the next bolted away from the broken traces and left all standing. Georgie Knight, with a screech, flung herself from the wagon, and was swallowed in the flying multitude; but Bessie sat stone-still, her heart beating with great knocks, as unable to move as one paralyzed.

What swift thoughts swept through her mind! This was the end of all her wickedness. This was what she deserved for all the pain she had given father and mother—she, their only child, their hope, who should have been their joy! This was what she deserved, it flashed across her, for making bleed the heart of the man that loved her. Deserved? Ah, no one could quite deserve to be torn to pieces by the teeth of a wild beast. If she had but been true to herself, to him, liked less to see her power, feared less for her liberty, what peace and pleasure might have been hers this instant! And

now— She remembered the Christian girls in the Roman amphitheatre; she was not even a martyr. She had wanted to study natural history; she had a fine chance. She could not stir. In another moment the brute would be done his havoc there, and come leaping through the canvas. Another shriek; a great bursting wave of shrieks. Ah, yes, there he came, tail in the air, tawny mane bristling, eyes blazing—coming in great bounds through the already half-deserted place, coming straight for her! She cowered an instant, then sprang to her feet, and glared full at the advancing monster. It was too much. With a wild cry herself, she turned—but only to hide her face in Mr. Beckwith's breast, as he climbed into the wagon behind her.

Thought is fleet: instantaneous was the rapture mingling with the agony, instantaneous the motion with which she pushed him from her. "Go! go!" she cried. "I can't have my folly kill you too! Oh," as he did not move, "if you love me, go!"

"It is because I love you that I shall stay," murmured Mr. Beckwith, swiftly, in her ear; "that I shall never go until I hear you say as much."

"Oh, you know it!" she cried, and fainted on his shoulder, just as the keepers sprang with their ropes upon the poor old toothless lion, who loved his frolic and enjoyed the scare, and of whom Mr. Beckwith—a muscular Christian, with a pistol in his pocket, having made his harmless acquaintance, moreover, inside the tent—had not felt it necessary to be much afraid.

It was Georgie Knight's seat that Mr. Beckwith occupied that evening as they drove slowly home, after the recapture of the filly and the mending of the broken traces, Mr. Beckwith having made the most of the three hours in which he had had Mistress Bessie on his hands; and Bessie herself, tired and weak, lying restfully, if you will believe it, within the arm that enfolded her.

"Bessie," he was saying, "this is only the second lion in the way. What was that first one which always drove you from me so?"

"I—I was afraid," murmured Bessie.

"Afraid of me?"

"And then—and then you took it so for granted!"

"Oh, indeed," said the minister, folding her closer still; "and what if I took it for granted that you were going to the parsonage with me next month?"

"Oh, I'm not fit!" cried Bessie, with a start.

"If you make one objection," said her lover, "I shall stop at Justice Pettigrew's on our way, and take you home with me to-night!" And there, with that tender arm about her, that face beside her own, all in the soft September twilight and under the

lamp of the evening-star, what could Bessie do but yield!

"I don't know what father and mother will say," she whispered, as at last, having left the wagon, they clung together one moment in the porch, and saw the father and mother hastening toward them down the long entry.

"Father Allan," said the minister, walking boldly in, with his arm round their naughty darling, "this is a will-o'-the-wisp that I have captured, and that I intrust for just three weeks longer to your care. It has come from the circus, and it is bound for the parsonage; and there," said Mr. Beckwith, "it is going to turn into the light of the house, the spirit of the fireside, the sunshine of home!"

MICHAEL ANGELO.

1475—1575.

THE individual force of character of a man who during his life so impressed his personality upon the minds of his fellow-countrymen that they gather reverently to celebrate the four hundredth anniversary of his birth is well worthy of a few moments' study in these times, when the increasing activity of life appears to be repressing all individuality, and reducing all the members of the social body to a monotonous uniformity.

On the 6th of March, 1475, at about two in the morning, Francesca, the wife of Ludovico Buonarrotti Simoni, gave birth to a male child, who was named Michael Agnolo, or, as he is generally known, Michael Angelo. He was the second child of his mother, who at the time of his birth was nineteen years old. His father, Ludovico, was in his thirty-first year. Of his mother's family no records have been preserved. She steps upon the stage of history only for a moment, to appear in the rôle of the mother of Michael Angelo, and withdraws forever into the oblivion of forgetfulness from which she emerged.

The family of Buonarrotti preserved a tradition, which Michael Angelo himself held, as we learn from Condivi, his intimate companion and biographer, that in 1250 Simone Canossa, the founder of the family, had come as a stranger to Florence, where for his public service he was granted the freedom of the city, was made podesta, and having changed his political opinions, and from a Ghibelline become a Guelph, had changed his arms from a dog argent, with a bone in his mouth, in a field gules, to a dog or in a field azure. Besides this the lords of the city allowed him five lilies gules and a crest with two bull's horns, one golden and the other blue. Arms of this character, sculptured by the order of Simone Canossa in the palace of the podesta of Florence, are still to be

seen there. This tradition was perfected, according to the spirit of the time, by ascribing the origin of the family to Beatrice, the sister of the Emperor Henry II., thus giving them a claim to imperial blood. The story is of importance chiefly because it is given by Condivi, who had it unquestionably from Michael Angelo himself; but the modern spirit of historical research has failed to find any record of a Simone Canossa who was the podesta of the city, while the arms of the counts of Canossa, though in the time of Michael Angelo they acknowledged the relationship of the distinguished sculptor, architect, and painter, are very different from those which Condivi describes, having in them no dog and no bone.

But whether the family had imperial beginnings or not, Michael Angelo's immediate ancestors were unquestionably persons of some local importance. His grandfather in 1456 held a place in the signiory of Florence, and his father, having received the same honor, was in 1474 appointed podesta or governor of Chiusi and Caprese, two small fortified cities upon a confluent of the Tiber, called the Singarna. In going from Florence to take possession of his post, Ludovico Buonarrotti was accompanied by his wife Francesca, who was expecting the birth of her child. The situation of the towns is in a mountainous country, the source of the Tiber being in the vicinity, and the journey was made on horseback. In the course of the ride the animal she was mounted upon fell with her, and dragged her for some little distance along the ground in his efforts to rise. Fortunately the accident was in no way productive of injury to her or her child.

In 1476, when the young Michael was a year old, his father's official position having ended, he returned to Florence, and the child was left under the care of the wife of a stone-cutter at Settignano, about three miles from Florence, on an estate belonging to the family. In his after-life Michael Angelo was wont to jestingly ascribe his love of sculpture to the fact that he had with his nurse's milk imbibed a love of his art. The young artist early gave evidence of his natural tendencies, and the house in which his nurse lived, which remained in existence until the last century, is said to have borne the evidences of his childish attempts at painting. In the house of his father in Florence were also similar things to be seen. One of his first efforts toward acquiring the use of his hands was trying to draw. As he grew older this natural passion increased, and despite his father's opposition and that of his uncles, who had the narrow contempt for an artist's ambition which is but natural in every trading society such as that in which they moved, he finally, at the age of fourteen, carried his point, and was articulated as an apprentice to Dominico and David

Grillandajo, who were leading men in the profession at Florence.

That his youthful efforts had not been wholly misdirected appears from the terms of his articles of indenture, by which his masters agree to pay him six golden florins for the first year, eight for the second, and ten for the third. Here commenced the annoyances of his life from the jealousy which his superiority excited in inferior natures. Before his apprenticeship had ended by its own limitations he painted a picture after Martin Schongauer's "Temptation of St. Anthony," which was so excellent that Grillandajo is said to have claimed the merit of it. Whether he did so or not, it was the commencement of their disagreement, which ended in the severing of their connection. Through the good offices of a young friend he was, however, introduced to the gardens of San Marco, where the art treasures of the Medici family were kept, and having attracted the attention of Lorenzo de' Medici by a piece of sculpture he made, was introduced to the palace, had a room assigned him, and was given a monthly allowance of five ducats. Here he met the most cultivated society of the time. The revival of learning had commenced; human society had entered upon one of those periods of growth in which the long-maturing processes seem suddenly to assert themselves with a new activity and assume a new phase, as the plant does when one of its series of leaves is modified, and lo! the blossom appears. It was a wonderful season of intellectual activity in Italy. The art of printing had just been discovered. An Italian had returned from a new world across the Atlantic. Grecian literature was being introduced to the scholars of Southern Europe. The world of reality and the world of speculation had each been found to be vaster than had been supposed. The transition from the methods of thought and the manner of life of antiquity to that of these modern days was commencing.

In the very seat and focus of all this the young artist passed the years of his early manhood, the most impressible period of each of our lives. Politian gave him the marble, and suggested to him the subject of the contest of Hercules with the Centaurs, which he worked into a bass-relief that made his reputation. He would never part with this piece of work, and it remains to-day in the palace of the Buonarotti family in Florence. Lorenzo was on terms of intimate familiarity with the young sculptor, and consulted with him constantly concerning his purchases of objects of art. The members of the Platonic Academy, who exercised such an influence upon the spirit of their times, were his friends, and in some of his poems evidences are given of the hold which the lofty idealism of the Platonic phi-

losophy had upon him. At the same time, however, he mingled with the followers of Savonarola, the forerunner of the Reformation; and being naturally of a melancholy temperament, inclined to solitude, and prone to speculation, the turmoil of politics soon grew distasteful to him, and though his life was passed alternately in study and work, the ordinary ambitions of men had but little interest for him. Yet when the need arose for his services he was always a faithful and devoted citizen, and his time and talents were freely given to the state. As a sculptor, a painter, and an architect, his works have secured him a reputation among the few original creative geniuses the world has seen. It is not of these that there is any need to speak, but of his character as a man; of his individual personality; of that subtle something in the composition of his nature which marks him as original, and keeps alive the interest the whole world feels, in desiring to know all the facts concerning his daily life and conversation.

It is seldom that the world can obtain all that it would desire of this kind of information concerning its great men, and in this instance, though we have much authentic information concerning Michael Angelo, yet more would not be amiss. The letters, the manuscripts, and the other various things which will tell us more than we know, and which have been since his death guarded so jealously by the descendants of his family, are this year, on the four hundredth anniversary of his birth, to be opened to public inspection. An investigation of the material which is already accessible to the student will not be amiss as a preparation for making the best use of such new documents as will be laid before the world on this occasion.

Within a few years the British Museum has become possessed of a number of letters by Michael Angelo, with other documents bearing upon his life. The collection, bound, makes three volumes. The letters are chiefly those which he wrote to members of his family at Florence while he was residing in Rome, engaged upon the Sistine Chapel and other works, or in Bologna, or elsewhere in Italy. The letters are chiefly to his father, and after his death to his brother and nephew. They show us, what was not known before, that the chief use Michael Angelo made of his money was to send it home. His letters are filled with details of domestic affairs and money matters; for the whole family seem to have relied chiefly upon him. Condivi reports that he once said to him, in his old age, "Rich as I am, I have always lived like a poor man."

A letter to his father will show the general character of the correspondence. This was written in 1512 or 1513:

"DEAREST FATHER,—Your last letter shows me how it is with you; before, I only knew it partly. We

must take things as they are, leaving the future to God, and acknowledging where we have erred. The misfortune is chiefly caused by the overweening character and ingratitude of the people [the return of the Medici to power], for I have nowhere seen a more ungrateful and arrogant people than the Florentines. As regards the sixty ducats which you, as you tell me, are to pay, it does not seem to me to be right, and I am very sorry. But here, too, it is best to submit quietly to what God has ordained. I will address a few lines to Giuliano dei Medici, which I will inclose here. Read them, and convey them to him, if you will; perhaps they may help; if not, try to sell what is our own, and we must then settle elsewhere. If you observe that you are treated worse than others, pay on no condition. Rather let what you have be taken from you by force, and write to me. If others, however, do not fare better than we, bear it, and place your hopes on Heaven. Take good care of your health, and see whether you are still able to get your daily bread, and, with God's help, get through, poor but honest. I do not do otherwise; I live shabbily, and care not for outside honors; a thousand cares and works harass me, and thus I have gone on for fifteen years, without having a happy, quiet hour. And I have done all for the sake of supporting you, which you have never acknowledged or believed. God forgive us all! I am ready to go on working as long as I can, and as long as my powers hold out."

These letters are variously signed Michelagnuolo, Scultore; Michelagnuolo di Lodovico Buonarrotti, Scultore; Michelagnuolo di Buonarrotta Simoni; or simply Michelagnuolo. The letters were fastened with a wafer, impressed with a simple seal, represented below. Then a piece of string was passed round the letter, the two ends being secured by being placed under the wafer. The father seems to have

MICHAEL ANGELO'S SEAL.

been a good-natured man, though passionate, and made use of by others as a means for obtaining what they wanted from Michael Angelo. One of his brothers is said to have died of the plague in Michael Angelo's arms. His father died in his ninety-second year. His brother Buonarrotto was the only one who left any children. An extract from a letter to his father, when Michael Angelo was about fifty years old, shows how little sympathy he could look for in life from those of his own family. He says:

"The whole of Florence knows that you are a rich man, and that I have given my life for you, and gain only punishment for it. You, however, gain great praise for it. Tell people what you will, but write to me no more, for it would hinder me at my work if I were now to tell you what you have received from me through twenty-five years. I should like better if I need not say this to you, but I can not change the necessity for doing so. Beware of those of whom you have to beware. We die only once, and we return not back again to make amends for that which we have done amiss. Have you, therefore, lived so long to act thus? God be with you! MICHELANGELO."

Living a life of study and of work, occupied with science and art, conscious of his powers, and naturally introverted, the plane

upon which he lived inevitably made him lonely. He found as little sympathy abroad as he found at home. When he first exposed to the public his statue of "Night," which is so well known as one of the statues decorating the tomb of the Medici, according to the habit of the Florentines, verses were appended to it by persons who wished. One of these, written by Giovannabattista Strozzi, was to this effect:

"Night, whom you see slumbering here so sweetly, was by an angel sculptured in this stone, and though living, sleeps. If you do not believe it, speak, and she will answer you."

To this Michael Angelo replied:

"I am thankful that I sleep, and more that I am stone, The while dishonor holds among us rule.

His lot is happy who can neither see nor feel:
Wake me not, then; pray speak in a low tone."

This was written about 1531. Michael Angelo was nearly sixty. The city of Florence had again fallen under the power of the Medici. Michael Angelo had superintended the engineer-work for the siege, and was naturally despondent at its result. The moral courage it requires to make such a protest only those who have suffered from political tyranny can appreciate.

There is a letter written to Baccio Valori, who had returned to Rome from Florence, where he had been the Pope's representative, and, in fact, the ruler of the city, in which an account is given of Michael Angelo's condition. Most probably the writer was urged to send the letter by Michael Angelo's friends, who, fearing that his grief and disappointment, with his energy of work, might prove disastrous, wanted the Pope to hear of his condition. The letter is given by Grimm, who does not state where he obtained it, and was written by an uncle of the Antonio mentioned in it, who was Antonio Mini, and was in Michael Angelo's service. The letter is as follows:

"A faithful servant, such as I am, should not fail to communicate any thing which I imagine might meet with the especial disapprobation of his Holiness. And this respects Michael Angelo, his Holiness's sculptor, whom I had not seen for months, having remained at home for fear of the plague; but three weeks ago he came twice to my house in the evening for amusement with Bugiardini and Antonio, my nephew and his pupil. After much conversation upon art, I determined to go and see the two female figures, and did so, and, in truth, they are something quite marvelous. Your Excellency, I know, has seen the first, the statue of Night, with the moon overhead and the starry sky, but then the other, the second, surpasses it in beauty. In every respect it is an extremely wonderful production; and at the present moment he is working at one of the two old figures, and, I think, nothing better could be seen.

"But since the above-named Michael Angelo appeared very thin and emaciated, we spoke together about it very particularly, I, Bugiardini, and Mini, for both are constantly with him, and we arrived at last at the conviction that Michael Angelo would soon come to an end if nothing were done to prevent it, because he works too much, eats little and badly, and sleeps still less, and for more than a month has suffered much

from rheumatism, headache, and giddiness; and, to come to an end, there are two evils which torment him, one in the head and one in the heart, and in both help might be given for his recovery, as what follows will show.

"As regards the evil in the head, he must be forbidden by his Holiness to work in the sacristy during the winter, for there is no remedy against the keen air there, and he will work there and kill himself; and he could work in the other small chamber and finish the Madonna this winter, which is such a wonderfully beautiful work, and also the statue of Duke Lorenzo of blessed memory. In the mean while the marble wainscoting could be executed in the sacristy, and the figures already completed could be placed there, and also those partly finished, and these could be retouched on the spot, and in this manner the master might be saved and the works forwarded; and every thing, if it is bricked up, will have a better place than crowded together under the roof. Of this we are certain, that Michael Angelo would be pleased at it, though he can come to no resolution, which I gather from the fact that he is reproached with not concerning himself about it. This is our opinion of what would be good for him, and his Holiness might send word to Figliovanni to speak with Michael Angelo on the matter, and we are convinced it would not be disagreeable to him.

"The evil, however, that lies at his heart is the matter with the Duke of Urbino. This, they affirm, robs him of repose, and he wishes ardently that it could be arranged. If he were to be given ten thousand scudi, he could have no better present. His Holiness could render him no greater favor. This they tell me, and I have heard him say it times innumerable. His Holiness is considerate, and I am certain if Michael Angelo were ruined, he would gladly ransom him with a large sum of money; and especially now, when he works so laboriously, he deserves to be considered. My love and devotion to our master has made me write so diffusely."

The trouble with the Duke of Urbino was a matter that had already been standing twenty years. Michael Angelo had been paid in advance something on account, and had not been able, from the other engagements forced upon him, to supply the work he had contracted for. The matter was compromised, and against his usual custom he had to employ others to assist him. His keen sense of honor was, however, preserved.

With the Duke of Ferrara an incident occurred which showed how sensitive was his artistic spirit, and how his devotion to his work enabled him to retire within himself almost regardless of what was passing about him. When he was appointed commissary-general of the fortifications he paid a visit to Ferrara to study those of that city. When there he promised the duke to paint him a picture, and while the siege of Florence was in active operation, and the duties of his office must have kept him actively engaged, he found time and inspiration to paint the picture he had promised. For his subject he chose Leda and the Swan. After the end of the siege the Duke of Ferrara was notified that the picture was completed, and returned his thanks, saying at the same time that the artist must fix his price for it, since he alone could judge of the value of his labor. The agent of the duke who came for it having spoken of it in a way that offended Michael Angelo, he refused to deliver it, and gave it

to Antonio Mini, whom we have met before. By him it was sold to Francis I. of France, and by him was put in the palace of Fontainebleau, where, at the instigation, it is said, of M. Desnoyers, a councilor of state, it was destroyed. The Royal Academy of London possesses what is thought to be the original cartoon for this picture.

The artistic spirit of independence Michael Angelo possessed fully, and in manifesting it he was no respecter of persons. He treated the Pope with no more regard for his rank than he would show the humblest hanger-on to the papal court. Condivi, who tells the above story, gives several other similar instances. At the same time, he was carefully regardful of merit, wherever he found it. His independence led him to refuse all salary for his superintendence of the building of St. Peter's. Probably he felt that such refusal would be one of the most effective means of enabling him to hold the position against the jealousy of those who envied his superior powers. His letters while he was engaged in this work show the deep interest he felt in it, and the unselfish devotion he bestowed upon it.

As a poet Michael Angelo is less known than he deserves to be. The fate of his poems has been singularly unfortunate. A volume of them was published in 1623, arranged by the grandson of his nephew, known as Michelangelo Giovane. In this edition he seems to have taken great liberties with the text. There is a manuscript collection of them in the Vatican, which consists of two parts, and in which the poems are numbered. Michael Angelo himself, it seems, had prepared and corrected them. In the same collection is a series of loose papers bound up with these manuscripts. Grimm says that "scarcely one of these poems agrees with the edition of 1623;" and again, "any separate papers of Michael Angelo's poems found elsewhere never agree with the edition of 1623." As the editor of this edition claims to have worked for it from papers which, being in the possession of the family, were accessible to him alone, it may be possible that the access given this year to the documents in the possession of the family may enable the world for the first time to really obtain the correct text. Another manuscript collection is in the British Museum. But Grimm says: "Only when the Florentine treasures are brought out will it be worth the trouble to collect Michael Angelo's poems in a critical edition. It is a pity that Condivi has not carried out his intention to have them printed. What has been hitherto written respecting Michael Angelo as a poet, on the ground of the edition of 1623, loses weight from the fact that the writers suppose the text before them to be the authentic one. The succession of the poems, too, is throughout arbitrary, and all

the conjectures based on the accidental arrangement, contained in editions of the present day, fall to nothing as regards this point. The Vatican manuscript may well furnish a foundation for future editions."

Though this statement may be, and no doubt is, correct, yet it will not be amiss to give a few specimens here of these poems, such as we have them, and as well as their terse strength can be rendered in a translation. Wordsworth writes of them in one of his letters:

"I mentioned Michael Angelo's poetry to you some time ago; it is the most difficult to construe I ever met with, but just what you would expect from such a man, showing abundantly how conversant his soul was with great things. There is a mistake in the world concerning the Italian language; the poetry of Dante and Michael Angelo proves that if there be little majesty and strength in Italian verse, the fault is in the authors and not in the tongue. I can translate, and have translated, two books of Ariosto at the rate nearly of one hundred lines a day; but so much meaning has been put by Michael Angelo into so little room, and that meaning sometimes so excellent in itself, that I found the difficulty of translating him insurmountable. I attempted at least fifteen of the sonnets, but could not any where succeed. I have sent you the only one I was able to finish; it is far from being the best or most characteristic, but the others were too much for me."

Harford prints the translations of two of the poems by Wordsworth, but neither of them is excellent. Southey succeeded much better in the following, which in the collected edition is given as

MADRIGAL LIX.

Ill hath he chosen his part who seeks to please
The worthless world—ill hath he chosen his part,
For often must he wear a look of ease

When grief is in his heart;
And often in his hours of happier feeling
With sorrow must his countenance be hung;
And ever his own better thoughts concealing,
Must he in stupid Grandeur's praise be loud,
And to the errors of the ignorant crowd

Assent with lying tongue.
Thus much would I conceal, that none should know
What secret cause I have for silent woe;
And taught by many a melancholy proof
That those whom Fortune favors it pollutes,
I from the blind and faithless world aloof,
Nor fear its envy, nor desire its praise,
But choose my path through solitary ways.

The collection of poems contains sixty-two pieces entitled madrigals, sixty-four sonnets, and a few other poems, one of which is an elegy upon the death of his brother. Translations in English have been made of a portion of them by various persons. In 1840 John Edward Taylor, in a small volume entitled *Michael Angelo considered as a Philosophic Poet*, published versions of thirty-five of them. Other translations of some of them will be found in Harford's and Grimm's lives, and also in some of the English magazines and reviews; but English literature needs a complete, critical edition of them. As indications of their force and spirit the following attempts are possibly of interest, and by calling attention to their merit may

excite some one more capable to undertake the task of presenting such an edition to the American public.

MADRIGAL IV.

[*Come può esser ch'io non sia più mio?*]

How can it be that I am not my own?
Who from myself has taken me,
Who has such power over me,
And more my master than I am, has grown?
Whence is this sore wound in my heart,
The while my body is still sound?
What is this love which has the art
All my desires to ensnare,
Till through the eyes its way is found
Into the soul, and swelling there
O'erflows, when its increase has broken every bound?

SONNET XVII.

[*Fuggite, amanti, Amor, fuggite il fuoco.*]

O lovers! fly from Love, his flame pass by;
His burn is grievous, mortal is his stroke.
Who flies not promptly will in vain invoke
His strength, his reason, or desire to fly.
Fly! and from my example warning take;
From me, who've suffered from his mighty dart—
From me behold how grievous is his smart,
How, pitiless, my woe his pleasures make.
Fly at the first glance, and do not delay!
I, who at all times thought to do my will,
Now, now I feel, and you see how I burn.
Ah! foolish he who, yielding to the play
Of vain desire, will incur the ill
Of Love's sharp dart before to flee he'll turn.

SONNET III.—ON BEAUTY.

[*La forza d' un bel volto al ciel mi sprona.*]

I'm raised by the might of a lovely face;
On earth there's naught to me such joy can give;
Among the blessed I soar, e'en while I live—
A blessing seldom granted to our race.
The work with its Creator all o'erflows—
To Him I reach, by it inspired;
My thoughts, my words, by Him are fired,
When in my soul love for a woman glows.
If from her eyes my own I can not turn,
It is because in them the light I see,
Showing the road that leads me up to God;
If fired by their brilliant flame I burn,
Deep in my heart I feel the ecstasy
Which, through all time, o'er heaven is poured.

MADRIGAL III.—TO VITTORIA COLONNA.

[*Chi è quel che per forza a te mi mena.*]

What is it draws me, bound and chained, to thee,
Even the while that I am light and free?
If without chains thou bindest thus all men,
Binding my heart with cords I can not see,
Who can defend me from thy beauty then?

Who can defend me
From thy bright eyes, whence Love, armed, shoots
at me?

SONNET XXIX.

[*To Messer Gandolfo Porrino, who had asked from him a portrait of Vittoria Colonna.*]

The new, high beauty, whom in heaven I'd hold
Peerless, as here upon this wicked earth—
This earth so blind, rebellious to all worth,
Blind to the splendor she shed on the world—
You saw alone, and I can not portray,
Either in stone, or with my painter's art
That face divine, so only as in part
To satisfy your loving memory.
For as the sun excels each other star,
So her intelligence compared with ours;
And mine, so low, can not ascend so high.
Therefore, to satisfy those minds who are
Admirers of this beauty and its powers
Is but for its Creator, Deity.

SONNET XXVIII.—TO VITTORIA COLONNA.

[*Sovra quel biondo crin di fior contesta.*]

That gilded garland seems so full of bliss,
 As, decked with flowers, it rests upon your hair.
 No wonder that it should so proud appear—
 It is first privileged your head to kiss.
 That bodice, which enfolds you all the day
 Is happy, till the time to be unlaced,
 And then your golden hair makes happy haste
 About your cheeks and round your neck to play.
 And yet the ribbon which so gracefully
 Lies on your bosom must more happy be
 Thus to caress and fondle every charm;
 The while your girdle says, "Here let me lie
 Forever, for I'm sure I can not see
 What need there is here for a lover's arm."

SONNET XXI.—TO VITTORIA COLONNA.

[*Com' esser, donna, puote, e pur se l'veda.*]

How is it, Lady, as experience shows,
 A living likeness from the flinty stone
 Endures when its creator hence has gone
 Down the brief path that every mortal goes?
 The cause to its infirm effect must yield,
 And over nature art the victor is.
 I who have loved fair sculpture so, know this,
 I who have seen time's promises repealed.
 Perhaps a longer life I could bestow
 Upon us both, in colors or in stone,
 Thus fixing both our faces and our love,
 So that the future ages still might know
 How fair you are, and how that you alone
 I love, and how this must my wisdom prove.

The love between Michael Angelo and Vittoria Colonna has been the subject of numerous speculations. It was, however, the flower of his maturer years, and the most natural explanation of it is the simplest. She was the single woman in his long and varied journey through life who sympathized fully with his intellectual and moral longings, and though her heart lay buried in the grave with her dead husband, was proud of being the inspiration of a man like Michael Angelo. "Often," says Condivi, "have I heard Michael Angelo treat of love, and he was wont to speak of it altogether in the spirit of Plato. I can truly say, after having so long and so intimately lived with him, that I never heard proceed from that mouth any but the purest sentiments, and such as tended to repress in youth every irregular and unbridled desire. And that no impure thoughts found place in his mind is evident from this, that he not only admired human beauty, but universally every thing beautiful: a beautiful horse or dog, a beautiful landscape and plant, a beautiful mountain and forest, a beautiful situation, and, in short, every beautiful thing that can be imagined, surveying it with the most animated delight, and extracting pleasure from the beauties of nature, as bees do the honey from flowers." Attempting to measure a nature like his with the scale of conventions which pass current ordinarily, is like attempting to measure the orbit of a comet with a pocket rule.

It appears that Michael Angelo and Vittoria met personally first in 1536, at which

time he was sixty-two and she forty-six. They had previously heard of each other, and respected each other. Of their friendship a most welcome source of information has been discovered within a few years past. Count Raczynsky found in one of the Lisbon libraries a manuscript journal written by a miniature-painter, Francesco d'Ollanda by name, who was sent to Italy by the King of Portugal, and wrote an account of what he saw while there. His manuscript was dated 1549, and speaks of a series of visits he paid to Vittoria Colonna, where he met Michael Angelo, and details at length the conversation which passed. Count Raczynsky translated a portion of the manuscript, and published it in a work of his upon art in Portugal. The manuscript, it appears, has since been lost. The account is reproduced in Grimm's *Life of Michael Angelo*. The conversations took place in the little church of San Silvestro, on Monte Cavallo, where the company remained after the service on Sunday and discoursed art. It is an admirable picture of the society in which Michael Angelo and Vittoria Colonna were the central figures, and is none the less so from its evident authenticity and the naturalness with which the account is given.

Vittoria died in 1547, and Michael Angelo survived her seventeen lonely years. He said to Condivi that he was with her to the last, and that he repented nothing so much as having only kissed her hand, and not her forehead and cheeks also, when he was with her at her last hour. The last years of his life were his most prolific ones, and it is wonderful with what rapidity he sent out plan after plan. He seemed in work alone to find an escape from the consciousness of his loss, until, worn out, he died on the 18th of February, 1564, between three and four in the afternoon, in the ninetieth year of his age.

THE WIDOW CASE.

A DEAR HUNT.

THEY got in at Pekin, and sat down before me in the car—a fat, placid old lady, with a droning voice like the continuous purr of an ancient and sleepy cat, and a lean, tall, grizzled old man, with pursed-up lips and watery eyes. There seemed to be no end of bundles in their arms: there was a big faded carpet-bag of the very oldest fashion, that went under the old lady's feet, for she was short.

"Set right down, wife—set right down, I tell ye, 'nd I'll push it under yer feet; it'll be amazin' handy to keep 'em out o' draughts."

When that was pushed under the end of the seat, there was a great yellow bandbox, quite the worse for wear, to be squeezed into the rack above, causing deep anxiety on the old lady's part.

"For the land's sake! don't ye smash it, John; my best bunnet's in't, and if them bows get bent out o' shape, I do'no' what on airth I can do to't. Lorainy she fixed 'em real nice, 'nd—"

"Oh, pshaw! pshaw! women-folks are allers in a pucker. I ain't a-goin' to break your bunnet: there now. Where's the flag root?"

A long bundle was laid up beside the handbox.

"I guess I'll put up the bag o' wa'nuts; they'll jest slip in easy."

And up went the bag, with a little tin pail over it; and before the couple were free to sit down quietly and hunt for their tickets there had appeared, besides the parcels already detailed, a willow basket with two covers, redolent of apples, a stone jug, and a flat bundle carefully tied up in a red and yellow silk handkerchief.

After much hunting in pockets the tickets were found and delivered, and before we came to the rocky pass of Satan's Kingdom the old couple had settled into quietness and begun to enjoy their journey. But not its picturesqueness. The frowning rocks above us; the sullen whirling river below, black as Styx; the sharp cliff on the other side, along whose face, on a terrace blasted out from the rocks, ran the gleaming lines of another railway; the few trees that looked shudderingly down upon us—all these did not arrest my two neighbors. They were discussing their visit to Pekin in an even flow of talk that I could not but hear; only a part of it, however, I need to repeat, since it held for me a significance I knew not at the time.

"Lorainy Case is a good gal; yes, she's a fust-rate good gal," muttered the old man, as his wife finished telling him how the person in question had "fixed up my Sunday bunnet as good as new."

"It was a mysterious providence that took him away so young," he went on.

"So 'twas—so 'twas," answered his wife. "But he was dreadful headstrong, Thomas was. He might ha' knowed the ice wouldn't ha' bore him after such a thaw. They do say Lorainy begged of him to stay to hum, but 'twas allers yea and amen with him. He stuck to what he'd calc'lated to do tighter 'n wax; so he got drowned, as he might ha' expected, 'nd left her a widder, 'nd she only jest nineteen. It's dreadful hard on her to hev her 'fictions come along so early, as you may say. Still, she does seem to be pretty cherk, arter all, most times. Miss Elbert Case she says 'twas a kind o' mistake Lorainy's a-marryin' Tom, anyway."

"Why, how's that? Folks gener'lly know who they're a-marryin'."

"Well, it was real queer. You see, Tom and Jim was both out to Californy, and Lorainy wasn't but sixteen year old. She'd had a fust-rate edication to Hartford, and she was a beautiful singer; so when she went

to Pekin to teach in the 'cademy, she took to singin' in the choir, and sot beside of Jane Case, and they struck up a kind of a intimacy, so to speak, and Jane she showed her the boys' picturs; and you know Jim was real hansum, but Tom was dreadful hard-favored ef he was smart. Well, I do'no' jest how it come about, but what with the boys a-sendin' messages to 'Jenny's friend,' and Jane a-persuadin' of her to answer back, it come to letter-writin' afore long, 'nd it seems she got the boys' faces sorter mixed like, so't she thought Jim was Tom, and fust she knew Tom offered marriage to her, and she kinder sorter took up with him, and got his pictur copied, that is to say, Jim's. And then Tom he was comin' back to be married, 'nd Jim went and got killed in the mine jest two days afore Tom left, which was kinder luck, as you may say; for when Tom did come home, lo and behold! Lorainy screamed right out, for she thought he was Jim, or a ghost, or what not. Anyway, it all come out, how she'd been a writin' to Tom and a-carryin' Jim's pictur; and you'd better believe there was trouble. But Tom he wouldn't let her off nohow, after two years a-writin' back an' forth; 'nd he'd got some ahead in life as to means, he'd about six thousand dollars, and could buy a farm, and Lorainy—well. I do'no' how she felt: gals will be gals; but they persuaded of her to marry Tom, 'nd, sure enough, 'twan't six months after 't he was drowned. Miss Elbert Case says 'twas a real providence, for they didn't seem to be overly happy. Tom was dreadful rough, an' Lorainy she was pretty sperity, and seemed as though she'd married the wrong man after all, and so—"

"Well, well, mother: mebbe Tom didn't see the providence in't so quick as Lorainy: I should ha' said 'twas more keerlessness than providence that took a man out on rotten ice; but Elbert Case's wife allers was a master-hand for providences. I'm glad Lorainy's provided for, anyway. She's a handsome little cretur, 'nd as good as gold."

"Oh my! she ain't provided for, husband; that's the wust on't. He never made no will, so she hain't got nothin' but her thirds; she'll have to go to teachin' agin onless her aunt, old Miss Fyler, out to Canaan, gives her a home. She's abundant able to do it, but she's kinder near, ye know."

"I declare for't!" exclaimed the old man. "That makes me think! Lorainy knew we was a-goin' to Canaan, 'nd she give me her pictur to take to Miss Fyler, and I do'no' as I should ha' thought on't agin, for I stuck it in this coat pocket."

"Let's see it," said the old lady. So the photograph was taken from the envelope he produced, and very carefully inspected by both parties.

"Favors her mother, don't she?" said the wife. "There ain't no Fyler looks there. She is real hansum, and as pretty a gal as there is any where around."

"That's so," was the ready response; and then the photograph was further discussed, and all the Case family, or I thought so, till after I had been in Pekin myself, and found out that every body in the town was either Case or Humphrey. But I did not listen long; the road grew more and more attractive, and when at last we steamed past Norfolk, and hissed along the hill-side of the beautiful Canaan Valley, I was too absorbed in the series of exquisite pictures to hear the incessant flow of village gossip that went on and on in the vernacular of New England both before and behind me. At last I left my seat, with my bag and shawl still lying there, to stand at the door of the car, which was the last of the train, and watch the lovely curves of meadow fold and unfold at the foot of the dark hills, here and there patches of sunshine lighting up fields of young grain, the fresh verdure of a cluster of maples, pink-heaped apple-trees, or the sudden glitter of the little river that leaped and laughed through all, like a thread of new-molten silver.

"Canaan!" shouted the brakeman, as to the south a still higher hill, crested with evergreens, arrested my sight, and I looked round just in time to see my old pair of neighbors, struggling under their various bundles, disappear by the other door; they might have disappeared then and there from my mind, but that, after watching Canaan Mountain and the bright, tranquil Housatonic disappear in the distance, I returned to my seat, and found a white envelope, unsealed, lying on the floor. As I picked it up a photograph dropped out—it was no doubt "Lorainy's" likeness, which had slipped outside instead of into the old man's pocket. Yes, the slight figure was clothed in black; even the round throat, unrelieved by any whiteness, rose out of a crape ruffle. I knew enough of ladies' dress to perceive that, at least; but the face took all the "widow" similitude even from crape and merino. A photograph is often a caricature: there are faces whose beauty is so entirely in expression that the enforced stillness of sitting for their pictures makes them utter unlikenesses; but this face had a positive beauty of its own in delicate outline, large, pensive eyes, a sweet, full mouth, but a lurking possibility of fun and spirit in the piquant nose and dimpled chin. It was a peculiar face, for all its beauty—unusual, interesting; full of suggestion. No regular, faultless visage, no Madonna, no nymph, no goddess or angel, was recalled by its aspect; over the broad, full forehead the hair lay in loose waves, soft and shining, but color was wanting, of

course. It was a picture that took hold of me vitally, a face that I studied all day, that invaded my dreams, that—I may as well own it—took entire possession of me in twenty-four hours, and resolved me to find out the original as soon as might be. Perhaps I had better introduce myself. My name is Frank Goddard, and I was twenty-nine years old when I found the Widow Case's picture. It would be more according to the fitness of things as depicted in the ordinary novel had I been a poor but honest young man, with uncorrupted morals, preserving clean collars and a clear conscience through the dreadful trials and temptations of a clerk's life in the city; but I was not. I was only a tolerable young lawyer, with plenty of well-to-do relations, among whom were two old maiden aunts who had spoiled me always, and now, having just died, to my real sorrow, carried on a sort of posthumous petting by leaving me fifty thousand well-invested dollars, and a very pretty house and garden in an old New England town. I was not poor before; now I was rich as I need be, and disposed to enjoy my money a little while before returning to the office, which I could well do, having left in my place an old comrade and college chum, who was glad to step into a tolerable business, and do all the work for a year or two, for pay now, and a partnership hereafter. So I left home, intending to travel, and during the first hundred miles of my journey stumbled on the Widow Case's picture and my own fate. Don't suppose I had never been in love before; I had, at least twenty times; I had a fatal facility at that sort of thing. I had been madly in love, refused, accepted, engaged, disengaged. In fact, I have a vague idea of once having two *bona fide* engagements on my hand at once: I don't really know how it happened I was not a victim. I think I must have been a fool.

• However, I knew the symptoms by heart, and here they were setting in again at high tide. There was no help for it. I could not get any further West than Albany. I recovered my trunk there from its durance in the baggage car, refilled my valise, and checked the trunk back to H—, took the cars to Millerton, and then and there bought a ticket for Pekin.

Did any body ever write his experience in Connecticut country taverns? I shall not offer mine to the public, but I think it might be a readable article. I found a room for my valise in Hodger's Hotel, and a feather-bed for my place of rest! But I cared very little. My absorbing object was to find the Widow Case; so I strolled down into the bar-room, a dreary desert of bare floor, enlivened here and there by a spittoon, a creaky arm-chair, a whip leaning against the wall, and a county map. Mr.

Smith, the present landlord of Hodger's Hotel, in a greasy velveteen coat and battered felt hat, was leaning on the high counter with both elbows, talking cows to an old farmer. I did not hesitate to interrupt the deliberate dialogue with my query,

"Are there any families of the name of Case in Pekin?"

This innocent question was received with a roar of laughter by Smith, and an idiotic grin, both broad and long, from the toothless old farmer. I began to feel vexed, naturally enough, and Smith perceived it.

"Scuse me, square; but fact is, there ain't much folks in Pekin besides Cases, 'nd here's one on 'em; this old gen'l'man is Deacon Levi Case."

"How de do! how de do!" chuckled the old man. "Pleased to see ye. Didn't altogether ketch yer name." This time he did.

"Oh, jes so! Why, sounds dreadful natural. Ain't one o' the Norridge Goddards, be ye?"

I disclaimed the honor, but did not enter into the subject of my family; I only raised my voice, and asked him if he knew any widow lady of his name in Pekin.

"Lor, yes! He! he! he! More'n four on 'em. Why, there's Widder Elbert Case" (here my ears tingled, recalling that name in the talk of the old couple in the car), "but she's gone out West; there's Widder Case up to the mill; and another on 'em down to Parsonsville, 't used ter be South Pekin. There ain't no widder up to our folkses; not yet! he! he! he! Do'no' her name, do ye?"

Dear reader, I am not G. Washington. I can tell a lie, at the proper time—and I did it! I could not expose that lovely, delicate being, whose picture I carried in my left breast pocket, to the giggle and chuckle of this grinning old satyr, the coarse laughter of Smith, the bar-room gossip of Pekin. I would rather hunt up every Widow Case in Connecticut (I thought so then!) than do it; so I said, with the ease my law practice gave me, that I did not know her name, my business did not enter into personalities. I would go to all these places. So, getting directions and a horse, I set out alone to hunt up my cynosure. I drove up a shadowy, still, grass-grown road to the mill first, and when I could make the little brown house door resound no louder to my whip and knuckles, I tried the mill itself, but there was nobody there; it was empty of all but heaped grain and piles of flabby bags; the whole place smelled of new pine and fresh meal—all but the shed where the great wheel hung motionless, for that alone was old, and the black fans of the wheel itself bore the tint and slime, and sent into the fresh June air the mouldy scent, of long use, of old water-soaked wood. Then I went back to the house and opened the

door without ceremony: a real old hag rose from her rocking-chair and hobbled up to me with one hand behind her ear. I took the hint, and shouted,

"Does the Widow Case live here?"

"I'm Widder Case," she croaked.

Here was number one! but not my widow, evidently. I made some futile errand about the mill, and left her mumbling and croaking at the door, to follow the next direction, hunting up another widow in Parsonsville, a manufacturing village, that of right was South Pekin, but, like most villages of the kind, had been called after the manufacturer who had built it up. Here I wandered up street and down, investigated at least sixteen whitewashed tenement-houses, each as precisely like the others as the oil jars of the Forty Thieves, and succeeded in finding two more Widow Cases—one a buxom female of fifty, the other a poor creature just dying of consumption. I invented some excuse on the spur of the moment for my appearance to each of them, but I began to understand the situation. If I could have explained it to one of them, doubtless my quest would have been over, but I knew better what was the strife of tongues in a country town like Pekin, and I took an odd pleasure in the trouble of the search; for was not all this zeal and effort for her sake, whose lovely lips seemed to tremble into a smile whenever I gazed on their likeness? Perhaps, had the weather been January instead of June, or the roads been sandy and shadeless instead of the tree-set tracks they were, sometimes running through orchards fair and fragrant with pinkest bloom, sometimes in woods full of summer's delicate odors and the songs of all summer-celebrating birds, while the track was fringed every where with violets blue as the sky above, crowded eyebrights, milky strawberry blooms; and the long budded garlands of the dew-berry tangled in and out among sunny frank-faced dandelions—perhaps but for this my enthusiasm might have failed; but to be a dreaming lover, driving along through country lanes and woods in early June, is to be consciously or unconsciously a blissful man. I know, for I have tried it very often. Sometimes, I must confess, I wondered to myself how many more times I should do it. I had sailed on the bright waves so often, I had no idea at all how it felt to be drowned. Next day I heard of another Widow Case in North Pekin. I was half a day in finding her, and then she asked me to stay to dinner. I did not refuse, for I was very hungry, and the fare at Hodger's Hotel was not enticing. This widow was young—perhaps twenty-five—small, alert, smooth of tongue, and a very Jesuit at questioning. I heard of her afterward in no complimentary fashion, and found she had French

blood in her veins, which accounted for her celerity of mind and body, her airs and graces of sixteen, her suave insincere lips, her restless eyes, and well-acted shrinking modesty. It took all my legal acumen to avoid making a clean breast of it to the little wretch. I asked Smith when I got back where she lived, with a sublime air of ignorance and indifference.

"Oh, Widder Luman Case! Well, see here, square, you ain't overly acquainted in these parts. Ef you hain't got any hefty business up that way, I'd kinder keep this side o' that little crittur. She's curus. I don't want to say nothin' agin her; I hain't no call to say nothin' agin her; but I jest as good not go nigh her as to go nigh her; but I'll tell ye whereabouts her place is ef ye've got ter go there."

Next day it rained. A rainy day in Hodger's Hotel damped my zeal much. I think two would have damped it off, as gardeners say, but luckily it was only a day. Sunshine and cheer returned with morning. But why should I drag out my story? I scoured Pekin in vain. North Pekin, West Pekin, Pekin Street, Pekin Corners: even to the edges of Lovely Street and the outlying hamlets of Avon and Simsbury. I found out nine Widow Cases, of every age, manner, and complexion known to the female sex in America, I believe. Hair of gray, black, blonde, and red; waved, curly, straight as tow; eyes various as a box of artificial orbs; but none—oh, not one!—with the deep brown hair full of golden threads and the dark sweet eyes I had fully made up my mind belonged to "Lorainy." But if I did not find a widow after my heart's desire, I found a friend; for one fine day, driving fast as the son of Nimshi, absorbed in vexation and disappointment, I gave too much of the roadway to a passing team, hit my wheel against a log, and in less time than I can tell it found myself lying in the road with a broken leg. The horse took himself off, and by-and-by I had to pay damages; but that day of reckoning was not at hand, and I thought of no damages but my own when I was picked up and carried into Deacon Peters's house, that fortunately was at hand, and delivered over to the tender mercies of Mrs. Peters and the Parsonville doctor. I thought I appreciated women before, but I found I had only known girls—giggling, glorified, evanescent angels, who would have been as useful in this emergency as a castle of spun sugar or a swan's-down tippet. Deacon Peters's wife was a real woman: sensible, kindly, tender, and generous; full of devices to soothe pain and save trouble. She did her work in the world with a serious ease and condescension that seemed to make it a matter of dignified amusement; and she enlivened it all with a fund of keen humor and quick

apprehension that was delightful to study. I was as restless, as cross, as impatient, as men are apt to be under the circumstances, but she never lost her good nature or abated her care; and, best of all, long before my six weeks of impatience and ache were over, I had found out from her all about my Widow Case, whose name was really Lorana, and who had gone to teach school near Canaan, and board with her aunt, Miss Fyler. It was exasperating to have found her now, when I could not follow her, but it was much gained to know of her being a fixture somewhere. At least I thought so, till, having borne my bedridden state to the end, and then gone back to H—— to settle some business that needed personal overlooking, I found myself, the last week in August, settled as a "city boarder" in Canaan; and having hunted up the little red school-house, some three miles away, where the Widow Case taught, I found it just closed for a vacation! I should have torn my hair only it hurt so. I did a few proper and frantic things—perhaps a little profanity escaped me unawares: in excitement no man is fully responsible. I always felt a great respect for the recording angel who (on good Mr. Sterne's authority) blotted out Uncle Toby's oath with a tear: it showed sense. But what to do now? I had engaged board for a month in a cheap farm-house; I was a little romantic for a man of thirty; I wanted the Widow Case to love me and not my money, so I dressed in my oldest remaining clothes, lived frugally, and made inquiries about the schools in and around the little town, as if I wanted a place to teach. I soon found that Mrs. Case was coming back to Canaan to teach in the academy, and that a classical teacher also was wanted there; so I offered myself to fill the place, and was accepted.

It may be said by literalists and people who live in Litchfield County that there is no academy in Canaan. I have said hereinbefore that I am not G. Washington, and that I can tell a lie if it be necessary. When I say Canaan, I mean Canaan in a Pickwickian sense. I do not wish to bring down on my devoted head the wrath of all the true Canaanites if I should happen to say any thing derogatory about their delightful village; much less do I wish to have any maiden lady of sixty, with a fierce auburn front, piercing gray eyes that had a keen and dreadful-way of looking at one over a pair of silver-bowed spectacles, a sharp voice, and a generally pointed manner, who may live in Canaan proper, descend on me miserable, and say I reviled, or, in the vernacular, "sassd" her, under the name of Miss Fyler; so I repeat the fact that I only call the town where I did engage to teach in the academy, and where the real Miss Fyler, with all the tokens and ear-marks consci-

entiously enumerated here, did live—I only call it Canaan, I say, in a Pickwickian sense; wherefore, may all the tribes—Hivites, Jebusites, Hittites, and all the rest—let me tell my tale to its end in peace and good-will. For very little of either did I get from the aforesaid Miss Fyler! The first day she set eyes on me in church, where I was behaving like a lamb, and singing a very respectable tenor in the next square pew to her own, she glared at me like an unfascinating serpent. She transfixed me. I felt my flesh creep and my hair crinkle. She hated me from the beginning with the fatal prescience some women possess. I think she felt it in her bones that I had come there to see the Widow Case, and being a man-hater of the most vicious and aggravated type, she determined to keep that precious morsel from the clutch of any man, and dry it for her own use. I heard her tell an old crony on the church steps that I was a “city fool”—extremest term of reprobation from her lips—but I did not care. School began the 15th of September, and then I should see the Widow Case! It was enough for me. So I wearied through the flat solitudes of a country village till the blessed day came. I was at the closed doors of the academy even before its principal, the Rev. Philetus Lamb, came with the key. I was first to explore its atmosphere of dust, slate pencils, and old hats, for the glazier’s art did not flourish in Canaan, and many specimens of head-gear as degraded as imperial Cæsar

“Stopped a hole to keep the wind away.”

The day passed in marshaling a crowd of rough boys and giggling girls, but no widow dawned on my disgusted eyes. I ventured to ask the Reverend Philetus if he expected me to teach the sixty odd scholars all myself, and received for answer:

“No, Sir; no, Sir; certainly not, Sir. I expect the women-folks along to-morrer. Miss Case she will teach the English branches—er—grammer ’nd ’rithmetic ’nd singin’; Sewsan Jackson she’ll sewperintend the prim’ry department; and you’ll do classics an’ g’ometry. I—well—I—er—do the generalities—gov’nment, manners, finances—er—c’lect odds and ends, as it were. I don’t do a great sight of teachin’.”

“Lucky for the scholars,” thought I; but I went home without saying so. And the next day, as I was hanging up my hat in the vestibule, I heard the principal clearing his throat violently just behind me.

“A-ahem! he-e-e-m! Mr. Goddard, le’me make ye acquainted with Miss Case. He’s our classical teacher, Miss Case. Pleased to interduce ye!”

Good gracious! there she was. I could only bow and choke and burn up to the roots of my hair; for hers was red—undeniably red; waving and glossy enough, but a

dark rich red; and her eyes, that looked so deep and sad in the picture, were a bright red hazel, the very color of her hair, under penciled brows and curling lashes of dark brown. Pensive eyes, indeed! They had the bright, undaunted look of a lioness, and her full scarlet lips quivered with secret fun as she looked at my gasping self. I don’t blame her now. I almost hated her then. And when I went home at noon I evicted her picture from my breast pocket with fury. I should have thrown it in the fire, but there was none. Red hair! And I had always said and thought that the tortures of the Inquisition should not induce me to like a woman with red hair. And then I remembered I didn’t; and then I recollected I did. Here I had tied myself down to a dirty, troublesome, stupid country school for the sake of a woman with red hair! One thing I could and would do. After a week or two I would find teaching too much for me, and leave. But that was not all. I had spent a whole long summer running after this chimera, this fraud, this mistake. I was enraged. I had to smoke six cigars and take a three-mile walk before I could think of sleep that night. How I hated the thought of the Widow Case! Had I not seen nine of them, all homely? How could I have hoped the tenth would look any better? The Case family were not judges of female beauty, evidently. I exhausted the English language, as far as ejaculations and expletives go, on the still air of the country, till, tired out and shivering, I went home to bed, only to dream of the Widow Case, with a coronal of waving fire above her brow, and two locomotive head-lights for eyes, facing me; whichever way I turned, with intent to burn and slay.

But morning came, and to school I must go. I was late, of course, for I delayed till the last moment; and as I entered, the Reverend Philetus was winding up a long prayer. I sat down just inside the door, and right before me sat the widow, her head bent on a chair-back, and a blaze of sunshine bathing it, and changing the deep redness into living, burning gold. Every stray thread that coiled about the white temples or massive braid glittered like a thread of fire: it was my dream. In the course of the day I saw her many times, and a subtle fascination, akin to terror, fixed my gaze on her always. I found out that her complexion was delicate as any rose-gleaming pearl shell, her eyes radiant, her voice—strangest of strange charms in New England—sweet, delicate, cultivated: it had as many tones as the bird-songs of summer; now it was deep and sad, now gay and mocking; pleading, rallying, incisive, acute, full of sarcasm, full of tenderness. I caught myself wondering what it would be inspired by fervent passion, informed with love. Yes, I am con-

vinced it was her voice that subjugated me; it could not have been her beauty, for she had red hair. I have perhaps betrayed the fact that I was subjugated before this confession. I don't know how it was; I did not mean to be; I meant not to be. It was my helplessness, and not my will, consented. She did not behave in the least like any of my other loves; she treated me at first with a polite indifference. I could sometimes see a flash of fun in her bronze eyes if I was unusually awkward, and I know I was often very awkward when I felt those eyes at hand. When she knew me better, she made perpetual fun of me in a lady-like way. She was sweetly sarcastic toward my opinions; she openly scorned my supine notions—which were really no notions at all—about things in general; she disagreed with me always. I never saw so versatile a creature. To this day I regard her with curiosity and amazement; for I know no more now than I did then at what point she may face about, abandon her position, and utterly rout mine from some new point of attack. I think she would have made a wonderful success as a strategist, had she been in the army. Is it necessary to say that I retained my position in Canaan Academy—that I felt my service, irksome as it was, better than absence from this strange, fascinating creature, before whom I daily lay more and more helpless, who wove her threads more closely about me every hour?

I never could tell if she liked me; I was afraid she despised me; but I adored her. I even came to admire her hair; its redness hid under the shifting golden gloss of light and shadow; her lips were red, but that rich and waving mass was bronze! I was fathoms deep in love, as one may say; and there I drowned happily, till I began to hear mutterings from friends and business in the distance. I tore myself away at the New-Year vacation for a brief visit to H—, where I installed Atwood as my partner, and stopped his remonstrances with this sop. I gave out that I was studying in the country, and carried back with me sundry big law-books, which my landlady had the pleasure of dusting. Somebody had sent the Widow Case in my absence a set of cut jet ornaments. They came from New York, she said. She thought Uncle James sent them, but there was no letter. I brought her a bunch of hot-house flowers, which she said were very pretty. I must say the jet things looked well on her white neck and arms. I thought they would. By this time I had begun to call at Miss Fyler's at least as often as once a week. That worthy lady received me ordinarily with the amenity a cross cat extends to a big dog. I do not know what withheld her from openly flying in my face and forbidding me the house. I think she would have done so but for the

fact that she knew her niece's high spirit, and did not want to be left by her to the loneliness of her bitter old age. But she did not attempt to conceal her hatred of me, and I lived to thank her for it, since I believe nothing else would have made the Widow Case show me any favor. But the blessed little woman had her own share of that perversity which makes her sex at once so tormenting and so delightful. The worse Miss Fyler treated me, the kinder she grew. I was allowed to come home with her from prayer-meetings, when I hung about the door sometimes full twenty minutes for her sake. I took her twice sleighing—a species of devotion which I consider the supremest possible to offer; for how must one be absorbed in a woman when he can drive two hours in a winter night, with the thermometer below zero, nose, eyes, and mouth stiffening in the keen breezes, simply to give that woman pleasure? But I did it. I had rather have done almost any thing else for her. Miss Fyler grew worse and worse. When I went there I could hear her using vehement and unpleasant language about me in the next room while I waited; but I could hear Lora defend me, and that repaid me for her aunt's dislike.

Yet it was spring—coy, shy, inexpressibly sweet New England spring—before I dared ask the Widow Case to marry me; and I don't know to this day how I did it. We were out with a party after arbutus; the day was soft and inspiring; the odor of those tender pink blossoms stole upward from their hidden beds and filled the tranquil air. I had strayed away from the rest, after Lora. How lovely she looked in her black shady hat and dark gray dress with black ribbons and white ruffles! "Mitigated affliction," I am told they call it in the shops. I never did think she was unmitigatedly afflicted by Tom Case's death; but it was proper to wear black, of course, though she looked lovely in every thing. However it was, I did ask her that day, and she almost said yes, and half said no, and at last promised to think about it. I went half mad with joy I dared not show, for fear she would take offense at it and give me my *congé* on the spot; but all day and all night the old French saw ran in my head, "*Château qui parle et femme qui écoute tous deux vont se rendre*," and in a fortnight Lora wore on her left hand a great sapphire set in little diamonds that I led her to suppose was once my great-grandmother's. I don't know that it was; I don't know but it was. Not being G. Washington, as I have already remarked, I can adapt facts in cases of necessity, or even draw on my imagination for them; and if Lora had known I bought that big sapphire at Tiffany's, my poverty would have been shamed and put to flight, and she would have handed it back to me with calm-

ness and contempt. She has said as much as that since. But how Miss Fyler raged! Lorana never should marry a beggarly fellow like that—never! She would leave all her money to Rabzemon Fyler, so she would. That enraged Lora. She told her dear aunt to do as she pleased in that respect; she was glad Uncle Rabzemon would have the money; he and his ten children needed it far more than we did; and as to allowing Aunt Fyler or Aunt Anybody to choose her husband for her, that was simply impossible. Now Miss Fyler hated her brother Rabzemon worse than she did me, but flesh and blood could not bear Lora's impudence, she said—(I thought she was sponge and whalebone before). At any rate, Lora's home was made unpleasant enough for her; but it all drew her nearer to me, and defeated its own end, for she consented to marry me in June.

Now arose many councils as to ways and means. We could not be married at Miss Fyler's, and she had become so openly outrageous that she declared she would lock Lora up if she had the least idea I would try to marry her; but she knew I wouldn't; I was only a fortune-hunting scamp, and now I knew that Squire Coe had made her will, and all her money would go to foreign missions, folks would see how soon I would be missing. It was in vain I tried to convince Lora that all this wild talking would amount to nothing. She had heard so much of it that her ears and nerves tingled with the long dissonance. She was afraid to be married openly in the Canaan church, and at length (as I still enrage her by saying) she all but asked me to elope with her! Of course I was delighted with the idea; that was what the Lord of Burleigh did with his village love, before he brought her to the castle. I began to feel a little uplifted, as the Scotch say, but suddenly Lora made one of her surprising revolutions, and declared she wouldn't marry me at all, it was such a fuss; she had no proper home; she would live an old maid to the end of her days, so she would.

"Just like Aunt Fyler," I acquiesced. Then she had to laugh, but it was almost a week before I could coax and reason her back into her first assent to my plans. So we settled that she should go to Great Barrington in the May vacation, and spend a week there with an intimate friend, and have a little dress-making done; that would throw Aunt Fyler off her guard. Further to do this, I was to stay in Canaan, and meet her on a certain day in Great Barrington, where she was to get on to the train I should come in, and we would proceed to Pittsfield, where an old college friend of mine was settled. He was to marry us, and then we would take a brief tour to H——, where I told her I was to have a position in

a lawyer's office, and a thousand dollars a year; all of which was true, and we all know it is not always necessary to tell the whole truth. I never have believed myself that G. Washington did that, whatever other exploits in the line of veracity he is traditionally credited with.

By this time Uncle James (!) had sent Lora a soft, thick, gray silk from New York, and the prettiest little hat, or bonnet, or something, to wear on her head: that was gray too, with bunches of purple velvet pansies on it. There was no letter, although Lora had written to tell him of her engagement, and then thanked him for the jet trinkets. She found out afterward that Uncle James never got her letter. I don't know how he should, for she gave it to me to mail, and I thought best to forget it. I had a dear old-maid cousin in New York who knew a great deal better than either Lora or I what she needed. So I told her she must be married in that dress and bonnet, they were so pretty; and after much skirmishing she consented, and went off, leaving me in Canaan to get through the intervening week.

At last the day came, and I took the express train for Pittsfield that went through Canaan about 3 P.M. It seemed to be very long before we got to Great Barrington, and when I wanted to get off at the front end of the car the conductor turned me back to the rear door. I stood there eying the platform anxiously; nobody like Lora was there. I might not have known her in colors, and veiled, but I knew I should recognize that hat, even to the little gleaming silver-gray veil that half covered it. No one had entered at the front-door. As I went out from the rear I caught a quick view of some one in black, with a deep green veil, coming in, and then there was a lame woman climbing the steps painfully, and at least six behind her, but not one of them Lora. A cold chill went to my heart. I felt sure she was ill. I jumped from the train as it started, measuring my length on the dirty platform, and picking myself up, went up the street to inquire my way to the house of Lora's friend. She, it seemed, lived a mile from the station, and when I got there, was gone out to tea. I inquired if Mrs. Case was there, to my great delight found she was, sent up my card, and in five minutes found myself face to face with a most forbidding-looking female, in a green calico gown, and black lace cap, trimmed with blue ribbon. She looked at me over her gold spectacles just like Aunt Fyler. My knees shook, and I meekly remarked,

"I wanted to see Mrs. Case."

"That's my name," was the severe reply.

"But I thought—I believe— Isn't there another Mrs. Case staying with Miss Hosford?"

"Oh, the Widder Case! Yes, she went away this afternoon."

I could not make inquiries of her. Another Mrs. Case! how I hated the name! So I inquired out the place where Miss Hosford was tea-drinking, found her after a half-mile walk, introduced myself, and found that Lora had gone by the train I came on. Here was a complication! How could I have missed her? Miss Hosford—a pretty, rosy little creature—seemed to pity me sincerely, and suggested that perhaps her veil concealed her too effectually.

"But I should have known that dress and hat any where," I said. "I studied them well to be sure of it."

"Oh dear!" exclaimed she. "She was in one of her old black dresses, and had on a green veil. She meant to dress in Pittsfield. She said those things were too bridal-looking to travel in. She didn't want to be advertised in the cars!"

That was so like Lora I had to laugh. But what would she do in Pittsfield till I got there?

"Probably get very spunky," suggested Miss Hosford. I thought it but too probable; but all that was left for me now was to take the returning milk train at half past eight: the accommodation shrieked past as we were talking. So I strode back my mile and a half to the station, thence to the tavern for something to eat, and at the due time took that milk train, and was landed in Pittsfield. But there was no Mrs. Case to be found there. No such person at the hotel. Nobody had seen her at the minister's. The station-master had gone to bed by the time I thought of questioning him. I could see him, however, early in the morning, for the down milk train left at half past five. By this time it was well into the night, but I was too tired and anxious to sleep. The musty little bedroom of the tavern did not invite repose: it was a hot May night, and I had a feather-bed. I heard the wheezing wooden clock in the hall strike every hour but four, five, and six. I fell asleep just when I ought not, and the milk train went without me. There was an accommodation train at eight, however, and by questioning the station-master till he was cross, I discovered that a lady in a black dress, with red hair—(oh!)—had bought a ticket for the afternoon accommodation the day before. Of course she had gone back to Great Barrington, so I steamed off for that place at eight, and again hunting up Miss Hosford, found her as anxious as I was myself when once she had heard my story, for she had neither heard of Lora nor seen her. The express train went in an hour. I went back to Canaan therein, as sad and mad as a man might be. To-day should have been the day after my wedding-day, and where was I? My bride

was lost, my appointment to be at H—to-day entirely broken: what would become of the flowers, the friends, the dinner, my dear old cousin from New York, who was to arrange all, and be there to meet us? It was the proverbial slip between the cup and the lip. And worst of all, where was Lora?

I had made up my mind to go back to Canaan and wait, and Miss Hosford promised to telegraph me at once if she heard of her. On the way down I noticed a slight fuss in the cars. People began to talk eagerly. Somebody said the express train up had run over a cow just above Canaan, and was off the track. We were at Sheffield, and must wait there at least four hours, the conductor thought, as the engine and three cars would need to be replaced on the track. I had an old college friend in Sheffield, so I hunted him up, and staid with him overnight, rather than go back to Canaan at midnight, and run my chance of getting into a tavern there. Of course we sat up late talking. Of course, too, exhausted with anxiety, I slept over both morning trains, and only reached Canaan in the late afternoon, and it was Saturday. I flew to the telegraph office, but the operator was not there. Somebody told me that the train yesterday had broken down two telegraph poles in running off the track; and though, fortunately for the train, the poles fell away from the track, unfortunately for me, the wire was broken. Nobody noticed it, for all were busied with the train, and now they had just got about mending it, and the operator had gone to look on.

What a Sunday I passed! Was fate against us? I found myself getting superstitious. I went to church three times, and sat in the next pew to Aunt Fyler, who surveyed me with a glare of triumphant malice. I distinctly heard her say to another old woman on the meeting-house steps:

"I told ye how 'twould be. I do hope Lorainy's learned her lesson! When folks's aunts make a will willin' away their property to forrin missions, 'tain't so dreadful pretty to marry 'em, you'd better b'lieve! H'm! I've seen young fellers before, I guess."

I let her rave. I did not care for her. I went to the tavern after evening meeting, and went to bed. I did not know what else to do, and all night I dreamed Aunt Fyler was trying to marry me herself; but she wanted Lora to be bride-maid, and couldn't find her. But next day—oh, blessed morning!—I had a telegram from Miss Hosford: "Come on first train." Do you think I overslept that time? I confess to being a little troubled on the way as to the frame of mind I should find Lora in, that remarkable little woman had so many changes in her "infinite variety." I thought I was prepared for

any thing; but I never was more astonished in my life than when she threw herself into my arms, sobbing like a tired child, and whispering in my ear,

"Oh, I'm so glad! so glad! so glad! I'm tired and scared to death!"

Heavens and earth! She had never kissed me once before of her own free-will, and here she was acting like a pleased baby. And oh, how pretty she was!

"Lora dear," said I, becoming suddenly conscious of my being the head of this helpless female. "Sit down, darling, and don't cry. I'll take care of you now."

The unaccountable creature gave a wicked little giggle that made me shake in my shoes.

"Miss Hosford," I went on, as that estimable young woman opportunely entered the room, "have you got a clergyman here?"

A smile flickered over her face as she replied,

"Oh yes, we always keep one in the parlor closet."

Lora choked down another naughty little laugh with her handkerchief, but I went on, sternly,

"I mean in the village."

"Yes, we generally do have them in New England, you know."

"Will you be so good as to direct me to one?"

"I would if I could; but our minister was taken ill last night with pleurisy, the Methodist minister went off to Conference on the milk train, and yesterday was Father Walsh's Sunday at Hammertown. I'm afraid he isn't home yet."

"Frank," said Lora, with a great sob, "I don't think we ever shall be married!"

"I do," was my stern rejoinder. "I have hunted you all over Pekin; I have been the derision of nine other Widow Cases; I have broken my leg; I have braved Aunt Fyler's awful countenance; I have chased you up and down in rail cars; I have hunted you from pillar to post a whole year, and at last persuaded you to love me—and now I will marry you, whether or no!"

"Good gracious, Frank!" screamed Lora, while Miss Hosford regarded me with wild amazement, "are you crazy? What do you mean?"

"Just what I say. Go put your bonnet and things on right away: we must take the express train for Pittsfield, and be married this afternoon. I'll tell you the whole story on the train."

She disappeared, and came back very soon looking like a well-dressed angel in the gray silk and hat; but Miss Hosford would cover her up in one of those hideous things called a linen duster. I did not care, though, what she wore, if only we reached Pittsfield and Joe Plunkett's parsonage in safety; and this time we made it out. Once married and on

the way to H——, I told Lora all about my hearing her history in the cars, finding her picture, and not finding her, up to the time of our meeting in Canaan. I did not tell her my trouble at discovering her red hair—you never know how a woman will take that sort of thing. I think I was wise not to.

We reached H—— late at night, and proceeded to my own house. It was all ready for us, servants and stores and fresh flowers, but my good old cousin had been called away that morning to New York. It was just as well; for when I at last actually succeeded in persuading Lora to believe that house and all were mine, and money to live in it comfortably besides, instead of being awed and modest, or even overcome with emotion, she then and there boxed my ears, and declared in strenuous terms that she never would have married me if she had known it.

"But you have," said I; "so don't discuss the matter, my dear. My ears tingle painfully."

Of course she only laughed, and in the most unsympathizing manner asked for some supper.

Still I don't think she regrets it. I am sure I don't. She sits there in the bay-window in the deepest blue gown, falling in soft folds about her, and lit up with delicate lace and the rest of that set of sapphires and diamonds which belonged to my grandmother (reborn Tiffany!). My dear hunt is over. I found the Widow Case. I also found Mrs. Goddard.

"UNDER THE ROSE."

A PLATONIC KISS.

You kissed me, as if roses slipped
Their rose-bud necklaces, and blew
Such breaths as never yet have dipped
The bee in fragrance over shoe,
While rose leaves of their color stripped
Themselves to make a blush for you.

Nor chide with such a cold constraint,
As if you laid the rose in snow;
For this the summer stores her paint,
The dappled twilights overflow
With motley colors, pied and quaint,
For kisses that in flowers do grow.

Nor pout and tease: you did not mean
So sweet a thing. Abide this test:
In open markets grades are seen
Of good and bad, in price expressed;
The buyer's purse must choose between;
But when we give, we give the best.

Yet if that color, sweet as bees,
Of flower flushes teases, see
How we can pluck such thorns as these,
That bleed in blushes, easily;
For kiss me, sweet, just as you please:
I'll take it as it pleases me.

MISS ANGEL.

BY ANNE THACKERAY.

CHAPTER XV.

PUT OUT THE LIGHT.

LADY W. liked to wind up her little passing interests with some triumphant catastrophe which flattered her sense of power, and rid her of any uncomfortable feeling of responsibility. Something had vexed her the night of Mr. Reynolds's entertainment. She was very cross going home, and scarcely spoke to Angel. Was my lady getting tired of her, as she had wearied of so many others?

It was Lady Diana who talked and who praised the supper, the house, the host.

Angel was absorbed in the thought of what had occurred. She could not make up her mind whether or not to repeat it all to her friend.

When she would have said good-night to her patroness at the foot of the stairs as usual, Lady W. responded very coldly. For the first time the gracious lady looked ungracious. She answered the girl's inquiring glance with a cold "Good-night, Kauffman."

Angelica could scarcely believe that the tone was for her. "Are you not well?" she said.

"I am quite well, only sorry to have to speak to you, Kauffman," Lady W. answered; "but I must tell you that your manner to-night was vastly too free for the society into which I have introduced you. I can not countenance free manners in my box at the play, and I have been much annoyed by the levity of to-night. My lord observed upon it, and has begged me to remonstrate."

A faint sound from my lord was heard, but it died away, and he suddenly disappeared by some back stairs.

My lady was fluttering her fan in some agitation. Lady Diana and the footmen and the maids were all roundabout.

Angelica turned pale, stood silent, justly wounded, and then said, with simple dignity, "I will speak to you to-morrow, madam, in private, not now," and she walked away to her own room, trembling, with beating pulse, bewildered, offended.

A fire was burning, and candles had been lighted by Mrs. Betty, unaware as yet of the favorite's disgrace; but the maid immediately began to suspect something amiss when Angelica burst into tears. As I have said before, it was not the first time such scenes had occurred.

Lady W. rustled up, with her beautiful twinkling satin feet, feeling immensely virtuous and superior. She discoursed to Lord W. for an hour on Angelica's enormities, suddenly remembering, as vexed people do,

many others which had never occurred to her till that moment. The girl's manner to Lord Henry Belmore was most flippant and unbecoming; her ways were unendurable. She had tried her best to bring Mr. Reynolds to her feet, but his good sense evidently kept him back.

Poor Lord W. knew of old that it was hopeless to try and stem this torrent; he set his watch a few seconds wrong in his perplexity, gave precise directions to his valet about being called in the morning, and as to the preparation of a pot of glue he should require to complete a little nest of boxes he was engaged upon.

Poor Angel! coldness from those she loved chilled her and pained her as much as their love vivified and warmed; and she loved Lady W., whose kindness had been unending, and whose praises had been very sweet to her. Was it possible that people spoke truly when they said that people changed? Ah, no! she could not believe it, never, never. Angelica was not yet old enough to stretch her interests beyond the radius of her own longings, and of those who loved her; that is the gift of later years, and perhaps the one blessing that supplements their emptiness. No one had ever in her recollection been unkind to her before. She was half amazed, half indignant. Could it be true? Had she been free? Had she forgotten what was becoming to her station? What had she done?

She dismissed Mrs. Betty with the curious eyes, tore off her rose-bud dress impatiently, and flung it on the floor in a heap; then she put on an old dressing-gown she used to wear in Italy. That, at least, was her own; little else. The very fire which warmed her resentment was given to her by the person who had insulted her—the person whom she loved, and whose unkindness cut all the more cruelly because she loved her. Lady W. had been unkind, and they seemed suddenly parted: Mr. Reynolds had been too kind, and they seemed parted too: it was all utterly bewildering. Had she shown herself ungrateful to him? Was she being punished now for the pain she had inflicted on another? Was this a warning not to be neglected by her? Was it too late to undo the past?

Angel was still sitting there, broken and overcome by the different emotions of the day, when some one knocked at the door, and, to her surprise, Lady Diana came in.

"I wanted to talk to you," said she, in her abrupt voice, and putting down the light that she was carrying.

She came up to the fire, and stood leaning

against the tall chimney, silent for a moment; a little round glass overhead reflected the two, in their flowing robes and emotions. Lady Diana also had assumed a loose chintz morning robe; all her hair was falling about her pale face, which was brightened with some unusual look of sympathy and interest.

"I hardly know how you will like what I am going to say, but it is well meant, although you may not think so," she began, in her abrupt voice. "I thought I should find you distressed; I could not help coming to speak on what has happened."

"I am foolish, perhaps," said Angel, beginning to cry again. "I don't wish to trouble any one. I don't ask—" She could not finish the sentence.

Lady Diana began walking up and down the room, then stopped suddenly.

"After what has occurred, the sooner you are able to establish yourself in a home of your own, the better chance there will be for the continuance of your friendship with Judith. But it is not at once that the remembrance of such scenes passes away."

"I should be the most ungrateful of women if any thing ever made me forget my grateful friendship for Lady W.," cried Angelica, looking up with her overflowing eyes, and then, to her surprise, she saw that there were tears in Lady Diana's eyes—real tears.

"Are you sorry for me? How good of you! I was feeling so lonely as you came in; I was longing for mamma, for my father—longing for Antonio, for some one to advise me," cried quick little Angelica, meeting this unexpected sympathy, and then as quickly she drew back frightened again, suddenly remembering Lady Diana's long and many unkindnesses that she had forgotten for a moment.

"I don't wonder you mistrust me," said Lady Diana, who seemed to read her heart. "I have been cold and unkind, but you must forgive all that; and if I mean to try and be kind to you now, be generous enough not to repulse me," said the elder woman. "You must remember that I have loved these people all my life, and that I saw you come suddenly into my place, absorb my rights, my words, my looks, and my home happiness. Was it not natural that I should feel hurt and wounded? My happinesses are few enough. I love these children; and my cousin W. has been a brother to me all my life; and even Judith is dearer to me a thousand times than I am to her. But I am a cold-hearted woman; and I did not come to talk of myself," she said, blushing up. "I came to talk to you, and to say, Will you let me help you to choose a home, where you may be independent and free? and will you let me lend you enough money to pay your rent this year? You shall pay it back as you like and when you will;" and she held out a pocket-book. "This is a hundred pounds.

You can have as much more if you will. I scarcely deserve that you should take it from me."

"How, how am I to thank you? But do you indeed think I ought to leave?" faltered Angelica, reluctant and shrinking from such a desperate measure, although a few moments ago it had been what she wished.

"Believe me, indeed it will be best for all our sakes," said Lady Diana, gravely. "I know this house better than you do. I have made up my mind and paid my price. I am content to be discontented; surely you would never be satisfied with that."

"Content with discontent? no, indeed," said the young painter. "Why should any one accept such a fate? Perhaps you are waiting for something," she added, simply, looking at her visitor, who now for the first time seemed to her capable of interesting and of being herself interested.

"I tell you this is my fate," said Lady Diana, impatiently, "and I expect nothing and ask nothing. Count de Horn would have married me for my money at Venice. Judith was very angry when I refused him. She can not understand—she who values money and position so much—how a woman placed as I am, lonely and insignificant, can be better content with such a fate as mine than she herself is with her own fortunes. She can not forgive a refusal. Good-night, you poor little thing," said Diana, taking Angelica's hand. "I shall like to come and sit to you in your new painting-room, and I will bring my friend Anne Conway to you, and while you stay here remember that Judith has a right to be first in her own society."

"Yes," said Angel, "I will try. I fear you have made me too happy; I have forgotten my own position."

Lady Diana looked hard at Miss Angel as she spoke. "You might remember if you chose that a very good and high position may be yours—one that many of us would not refuse," she said.

Angel blushed up. How lovely she looked, all softened by tears and then brightened by emotion!

"It is too late," she faltered. "That I have not accepted; but the hundred pounds I will take gladly from you, if you will never be unkind to me again."

"Here, child; good-night!" said Lady Diana, kissing her shyly, and running out of the room.

Angelica went to bed somewhat comforted; but all night long strange horrors and dreams haunted her comfortable alcove—dreams and terrors that not all the counterpanes and eider-downs could keep away. She saw Mr. Reynolds in trouble, and some one seemed hiding behind one of the pictures, and then came a scream, and she awoke. She herself had screamed, but there was no

one to hear her. She was thankful when morning light came, and Mrs. Betty with a cup of chocolate. Here was the morning: was every thing as it had been before? But notwithstanding cock-crow and morning light, Lady W.'s coldness continued; if any thing, it seemed to increase and to become a habit.

Angelica's portrait was not yet sent home. She had begged Mr. Reynolds to keep it for her until she moved into her own house. It had been taken out of the studio the night of the supper, and carried into the painting-room, where Marchi used to work upon his master's pictures. The next morning, when Mr. Reynolds walked in, as usual, the picture had been replaced. There it stood, facing him with its half-conscious, half-unconscious witcheries. His heart sank very much when he walked up to it, and for an instant he felt almost inclined with his long-stocked brush to paint the whole canvas over, for it seemed only to smile at him as Angelica herself had done three nights before; but painting out a picture could make no change in his feelings toward her. If feelings could be so easily displaced, the world would be far less furnished than it is at present. Painting pictures of other people would be more to the purpose, thought the workman, with a sigh. Some little details were still to be finished upon this one—the fur on the cloak, the shadow of the throat—and while he added what was wanting, the man became a painter again.

He was able to think calmly, and to make deliberate resolutions. Henceforth he would never again be faithless to his life's true interest. This had been an extraordinary phase, utterly unexpected, and not to be accounted for. What had he been about? He was a "working-man," as old Johnson had called him one day in jest. He was no professed lover or squire of dames. She had been right, as regarded him, though perhaps wrong as to herself, thought the painter, with some natural bias; and for one moment a thought of her, as she had looked standing there by the easel, smiling in her shining silks, nearly overcame his resolve—a fancy of her there, among them all, cherished and tenderly appreciated and faithfully loved.....The brush fell idly as he painted this picture with other things, more fleeting still perhaps than his *olios* and *ceras*. Fate had decided otherwise. He felt certain that she had no feeling for him. Without it, it would be folly for her to marry one so much older, so little suited. Something had gone out the night before, when the house had been lighted so brilliantly. He was surprised to find now how easily this blow had fallen. He was very sad, very much preoccupied, but he felt that, on the whole, circumstances had fallen out better

than he had sometimes expected, less well perhaps than he had hoped.

For some little time past all his future had seemed suddenly illumined by new interests and by a new light. Now nothing of it was left. It was extinguished, that was all. No ray seemed left, absolutely none, and he saw things once more in the old bald daylight.

He was not shaken or distressed, but changed somehow. It seemed to him as if the Angelica he had loved had died the night before, and as if he had now to learn to live again without her. And this old stock phrase is full of meaning to those souls new born again and again into this hackneyed old life through pain and secret pangs.

It is not for any one to say how far Mr. Reynolds was right or wrong in his determination henceforth to rule his life, not to be ruled by the chances of it. Such things are ordered by the forces of each individual nature. People will be true to themselves, whatever part they may determine upon; only the difference is that some try to play a higher part, and fail, perhaps, and are ashamed, and others try for a smaller part, and succeed, and are content.

Mr. Reynolds was still turning over these things in his mind, when Miss Reynolds, the little lady in the dressing-gown and morning wrapper, peeped into the room. She saw her brother standing there, listless, unoccupied. The *pennello volante*, so rapid, so assured in its flash, hung idly by his side. She could see his face reflected in the looking-glass from which he used to paint.

A very strange expression of pity and regret appeared in his looks. Were tears in his placid eyes? No, that was not so; for he started and turned quickly, and seeing her, asked in his usual voice what she wanted.

"I want my pocket-handkerchief, brother," said Miss Reynolds, startled. "I forgot it last night." And then she took courage, and went up to him and took his hand, paint-stock and all, and held it in both hers, and looked at him beneath her big cap. "I should wish you happy, brother," she said. "I saw a certain lady in tears standing in this very spot a few hours ago; at least, if not here, it was there by the great easel, or—no! they have moved it, and put the little one in its place. And oh! brother, you are still a young man, and much admired by many; do not trifle with a sweet girl's happiness, to say nothing of your own. Not that any one can judge for you, but one can't help one's hopes, and happiness is such a blessing, and must add so much to one's life—at least, so I should imagine."

"Thank you, Frances," said Mr. Reynolds, both touched and vexed by her agitation, as he always was. "Thank you, my dear; I hope we shall all be happy."

"She seemed sadly disturbed," said Miss Reynolds; "a little bird—"

"Thank you, my dear," said her brother again, patting her shoulder. "Leave me now. I must go to my work, or I shall be sadly disturbed."

Miss Reynolds opened her mouth to say more, but her courage failed. She was never at ease with her brother, and yet her kind heart yearned toward him, and she longed to say something to comfort him in his evident depression. She was beginning another allusion to an old adage which she thought applicable to the present state of things, but he again signed to her to stop, and Marchi, who had followed her into the room, now announced an early visitor. Miss Reynolds, suddenly conscious of her petticoat and dressing jacket, turned and fled.

CHAPTER XVI.

UND MACHE ALL' MEIN WÜNSCHEN WAHR.

THE sympathies and consolations of light, of harmony, of work, are as effectual as many a form of words. They are *substitutions* of one particular manner of feeling and expression for another. To hungry, naked, and imprisoned souls art ministers with a bountiful hand, shows them a way of escape (even though they carry their charms with them), leads silently, pointing into a still and tranquil world inclosed within our noise-bound life, where true and false exist, but harassing duty and conflicting consciences are not, nor remorse, nor its terrors, nor sorrowful disappointments. A wrong perspective or faulty drawing may be a crime in this peaceful land; renewed effort is the repentance there practiced. Angelica was never more grateful to her pursuit than now, when time was difficult on her hands. The house was not to be ready for three weeks, and during these she must needs remain in Charles Street.

She tried not to think much, but the sense of estrangement was there nevertheless—estrangement from the three people whose good opinion she most valued. If only Antonio would give some sign, if only Mr. Reynolds would come, if only Lady W. would be her own kind self, how suddenly eased her heavy heart would be! She painted steadily, rising betimes to catch the first gleam of the sun dawning through the crowding mists.

Orders came in from one side and another. A message from the Queen, that filled her with excitement, was transmitted by Lord Henry, who had been to Windsor. Lady W.'s coldness did not change; she scarcely congratulated her, she seemed utterly unconcerned, and gave the poor child many a

pang that she was unconscious of ever having really deserved.

Mr. Reynolds came not; Antonio came not; Lady W. was as much absent as though she were gone on a long journey. Would she ever return? Angelica wondered. Besides the natural separations of life, of circumstance, there is also one great difficulty to be surmounted. It is that of moods and mental position. Our secret journeys and flights have to be allowed for as much as those open departures we make with many farewells and luggage and tickets and noisy bustle. There was a powdering closet on the second story of the house in Charles Street, adjoining Lady Diana's room. It was only a small room, divided by a wall with a hole in it and a sliding panel scooped to the neck. On one side stood the barber and his assistant, to the other came the household with the heads that needed powdering; they would boldly pass them through the aperture, by which means their clothes were preserved from the flying clouds. Lord W. was standing in this guillotine, receiving a last touch from the barber, when Angelica passed the open door one morning on her way to the nursery up stairs. She turned, hearing herself called.

"Is that Miss Kauffman? I can not see; pray wait one minute;" and in a minute my lord appeared in full dress, with his star and his smart velvet coat, and snowy wig and gleaming buckles. He was going to court. He had been invited to dine at the royal table. Little Judith and Charlotte and Elizabeth were trotting down stairs to see him before his start; before they came up, Lord W. turned to Angelica, and in a hurried voice said: "I wanted to speak to you. Dear lady, if you think of deciding upon a house, will you make use of my security? would you let me advance you a hundred pounds?" and he hastily pulled some notes out of his embroidered pocket, and tried quickly to pass them into her hand.

Angelica thanked the golden little benefactor with grateful emotion. "Indeed, I would gladly accept your kindness," she said, openly, "but Lady Diana has lent me some money."

She would have said more, but she saw him look uneasy; a door opened, and the figure of Lady W. appeared upon the landing. "What are you plotting?" said she: "I seem to have disturbed you," and she flashed a quick, penetrating look at Angelica.

"My lord is plotting to do me kindness and to give me help. He would help me pay the rent of the house I have engaged," said Angelica. She went up to Lady W. and looked at her with a great sweetness. "Indeed, dear lady, you would have little to fear if none but such as I were to con-

spire against you—I, who owe so much, so very much, to your goodness."

"Do you still remember that?" said Lady W., softened by the very charm which raised her jealousy. She slowly put out her hand to Angel, who held it for a minute gratefully in her own. For one minute the two women looked hard at one another, when Lady W. suddenly melted, and kissed the young painter on the brow. "Take this," she said, "for my sake," and she slipped a ring from her finger on to Angelica's. It was a little cameo set in brilliants, which the girl wore ever after. This tacit reconciliation greatly softened the pain of parting to the younger woman.

As she stepped across the threshold of the little house she had taken, Angel's heart beat tumultuously, and her eyes sparkled. Here at last was a home. After her many wanderings, her long journeyings and uncertainties, here was a home. Here she could bring her father—dear, poor, proud, silly papa! Here she could work in peace, live her life, and be beholden to none.

The woman-servant Lady W. had recommended was standing courtesying at the foot of the stairs. The lamp had been lighted; it was a Roman three-beaked lamp that Angelica had found in some old shop, and bought after much hesitation. A fire had been lit in the studio. The little old house stood warm and welcoming, with an indescribable sense of rest about it, of proprietorship.

No bride coming to her new happy home for the first time could have felt more proudly excited than this little, impulsive, well-meaning, foolish creature, who had by sheer hard work and spirited determination earned a right to this paneled nest. There was a drawing-room in front, with windows into Golden Square: that was the studio. It led into her bedroom, beyond which came a dressing-room. On the second floor was to be her father's bedroom; the dining-room was down below, with windows looking to the square, and wooden cupboards by the fire-place. Angelica, to her surprise, found a beautiful old oak cabinet standing in the studio when she entered it on this eventful evening. She eagerly asked from whom it came. Had Lady W. graciously sent it as a sign of good-will? The woman could tell her nothing. Some men had brought it the day before. They had left a piece of paper with Miss Kauffman's name. She had put it on the shelf.

The piece of paper told its story, although there was no name but Angelica's own upon it. But how well she knew those straight lines, black and even, although here and there the letters seemed to tremble, as writing might do that was seen through water. Antonio had not quite forgotten her, then!

he was not quite gone, dear, kind old Antonio! Angelica went up and kissed the wooden doors that seemed to speak a welcome from her new-found, faithful old friend.

She was dancing about the room half the evening, straightening her few possessions, pulling out canvases, spreading her two or three mats to the best advantage. Then she began to write to her father. He must delay no longer; his house was ready; his child was longing for his presence. She sent money for the journey; she should be miserable until she had seen him sitting there just opposite by the fire. He must not mind dark days and cold biting winds; he should be warmed and comforted in his home whatever the world outside might prove to be.....Then she told him how the orders were coming in faster than she could execute them. And Antonio had sent a beautiful gift that made the whole place splendid. She could not thank him: she knew not where to seek him.

As she wrote, Angelica looked up, hearing a sound. There stood Antonio himself, looking thin indeed, gray, more bent than usual, but kind, smiling, natural: his own gentlest self. His affection was ready to show itself by bright and friendly signs that evening, not by cross-grained reprimands and doubts.

These happy meetings come to all now and then; unexpected, un hoped for.

Angelica cried out with many questions, welcomes, explanations. How had he come? Was he hidden inside the cabinet? she asked, with a laughing, grateful look.

"I am very glad you liked it," said Antonio, smiling. "I thought it would please you when I saw it in the old shop at Windsor."

"Kind Tonio!" said Angelica. "But"—and she hesitated. "How could you? It must have cost—"

Antonio began to look black, and scowled at her for an instant.

"You think so much of the cost of things, Angelica! You measure your gifts by their value. Be re-assured, the cabinet was a bargain, and I have plenty of money just now. I am painting the ceilings of a royal palace at Frogmore, and if you will, I am desired to ask you to undertake one of the rooms."

"I!" cried Angelica. "I have never done any thing of the sort."

"Mrs. Mary Moser is engaged upon a very pretty set of panels," Zucchi continued, "and they would be glad of some of your work as well. You might paint allegories to your heart's content," he said, smiling.

"You are a magician, Antonio!" cried Angelica, gayly, leaning back on her chair and looking at him with the old familiar winning eyes. "Only wait till my father comes, and then I will go any where, do any thing. They told me I am to paint the Queen and

the Princess shortly at Windsor Castle. Is it not like a dream to be at home once more—to have a real house with doors and windows? to be sitting here, you and I, on each side of the fire?"

"It is like a dream to see you once more at ease and in peace," said Antonio, between his teeth, "and to find that your head is not quite turned by your flatterers, since you can look pleased to welcome an old plain-spoken friend in a shabby coat."

It was one of the happiest evenings Angelica ever spent in all her life. The ease and liberty seemed delightful, after the restraint of the house in Charles Street. Antonio's presence was happiness, too; he was in his best and most sympathetic mood; he had returned to her. No thought of what might or what might not be came to disturb her. Mr. Reynolds was in her thoughts—that other friend, so tranquil, reliable—surely she need never feel a doubt about him. Was she right? Is it so? Are calm ripples and placid silence the proofs of deepest waters? Antonio after some time remembered to explain his appearance. He had heard from M. Cipriani that she was coming. He said the news had filled him with happiness. Then he smiled, and added that he had not come up from Windsor inside the cabinet, but on the carrier's cart.

Angelica asked him, with some curiosity, where he had been living all this time. Antonio told her that he had been staying with some good friends at Eton. "My friend is a kind old man, with six daughters," said Zucchi. "He is the drawing-master, and lives in the college. The young ladies are charming. They would be only too glad to receive you, if you should be sent for to work at the Castle; they would make you very welcome."

"Six young ladies?" cried Angelica: "take care, take care, Antonio."

Antonio was silent for a moment. "A painted trellis would be out of place," he said, suddenly, looking up at the ceiling, "in this smoky city; but I will paint you a trellis, if you like."

"Yes," said Angelica, "and paint me a little blue sky, Antonio, and a bird, and some scent of orange flowers." So they went on talking, and the warm happy hours passed. Then a clock began to strike slowly.

"Is that twelve?" said Miss Angel.

"I don't know," said Antonio. Neither of them cared to shorten this peaceful meeting, snatched out of the cold and darkness and noise and racket all roundabout, and belonging to their friendship. But as the clock finished striking, Antonio's heart began to sink, and he felt somehow that the happy evening was over. And the Kauffman too sat looking thoughtfully into the fire, of which while they talked, by some

chance, one half had gone out and turned to blackness, while the other still burned ruddy.

"Look there!" said Angelica: "how oddly the fire burns!" Antonio poked it with his foot.

"You know the superstition," he answered; "they were speaking of it at Dr. Starr's only a day or two ago. It means, so they say, that two people who love each other are about to be parted;" and he looked at Angelica as he spoke. She was playing with her wristlets; a little flush was in her cheeks.

"Antonio," she said, "do you think that people who are parted once can meet again?"

"That depends very much upon fortune's favors, and still more upon their own wishes," said Antonio, dryly. "Chance gives you a sight of people, but you have yourself to make one in the meeting." And then his voice softened. "We have met to-night, Angelica, and have been very happy. Perhaps next time I see you some lord will be here, with his coach and six, and you will not have so much time to give me."

"Time is nothing at all in friendship; you can't measure things by time," said Miss Angel. "There is no lord in question, Antonio. But shall I tell you all? There is some one I often think of."

"Some one who loves you?" Antonio asked, in a dry voice. He was standing up and preparing to go. "Can he keep you, Angelica? Has he got plenty of money? Is he highly esteemed at court? Has he servants in proper liveries?"

"How can you speak in that unkind way?" she cried. "I open my heart to you, and this is how you answer me."

"Excuse me," said Antonio; "I was only talking as all your other friends will talk. For myself I say, if you love any one from your heart, were he as rich as Cræsus, marry him. Ask no one's advice, and make no more difficulties."

"He is not as rich as Cræsus. I did not know I loved him when he spoke to me," said Angel, penitent without much cause. "But when you spoke just now about friends meeting, I could not help thinking of him, and wondering if it might ever come about. I think, Antonio, if he spoke to me again—He is older than I am. I can trust him and look to him."

"Is it that lord I saw in the box at the play?" asked Antonio.

"It is no lord," Angelica repeated, very much agitated. "It is a worker like ourselves. It is Mr. Reynolds, Antonio."

"What! the deaf man?" said the younger painter.

"I thought you would have cared about my interest," said Miss Angel, hurt by his tone and change of manner; "but I see

you are indifferent, that you have not one thought to give to me."

"You see very wrongly," the other answered. "I could even approve of your marriage if you cared for the proposed husband. But that you do not, Angelica. Good-night!" And he was gone.

CHAPTER XVII.

THROUGH WINTER-TIME TO SPRING.

WHILE Antonio was walking home through the black midnight streets, while Mr. Reynolds was sitting in his own studio composing an article for the *Rambler* (the studio was still haunted by some paling ghost of Miss Angel), while the painter had been quietly making up his mind to abandon the siege of the difficult fortress he had incautiously attacked, the fortress itself was secretly preparing to surrender, for it was built upon the sandy foundation of impulse, of youthful, ardent imagination.

With all her faults, as I have said, Angelica was a genuine woman, incapable of deceiving any one, unless, indeed, she herself were deceived, and whatever she might realize now, she had at the time truly felt that gratified vanity was no return for true feeling. Misunderstandings are far more difficult things than people imagine in love or in friendship. Some instinct protects travelers in that strange country where all is instinct, and if they disagree, it is that from some secret reason they do not belong to each other, for quarrels are nothing to those who are united in heart.

If Mr. Reynolds spoke to her again, would she give him a different answer? "Perhaps I might graciously be pleased to allow that I was less indifferent than I had once appeared to be," she thought; and she tossed back her curl and opened wide her eyes, and discovered that it was nearly one o'clock, and time for bed.

Antonio came next morning before Angel was up. He was used to workmen, and to hurrying their reluctant hammers and whitening pails. He took upon himself to dismiss two or three on the spot, feeling sure that Angelica's little store would be soon expended if she gave orders on the same scale as Lady W., who had sent in this army in all kindness and inexperience. Zucchi himself acted as chief artificer and foreman; the men, seeing him take his place so naturally, imagined that he was the owner of the house, and obeyed his orders. When Miss Angel appeared in her wrapping gown and cap, she found that Antonio had accomplished wonders in a hard morning's work, that every thing was in order in the studio. The Princess, followed by the whole court, might come when she would.

"I hope you forgive me for interfering," said Zucchi. "You must remember how quickly money goes in this country, and that one man's day here costs three times as much as with us."

"The days are much shorter and blacker here than with us," said Angelica. "They ought to be cheap enough. How good of you, Tonio, to come to my help! What shall you want for your day's work? See here," she said, running into her room, and coming out again with Lady Diana's pocket-book. "I have saved £80, and Lady Diana has lent £100 for my rent. I am to get £15 for three fans I am painting, to-morrow."

"Do you mean that this is all you have got to reckon on?" cried Zucchi. "I thought those rich had loaded you with their miserable favors. Is this their dole in return for what you have done for them? You will be starving in a month or two if you go on at this rate, my poor child: where is your father, that old mummy? Why does he not come to take care of you?" he said, very much agitated.

Antonio, brought up in the severe order of poverty, had an exaggerated horror of want and of debt, as he had of Angelica's incapacity. Angelica was perfectly justified under the circumstances in doing as she had done; but it is certain that Antonio's cranky anxieties saved her money, labor, and many a consequent worry by his help just at this time.

He used to come for an hour in the morning and for an hour in the evening. Angelica was not always there; but on her return she was sure to find some trace of his presence, and of the industry of the trembling hands. From the very first so many people came to Angelica's studio that his presence was little remarked upon. The Lord Essex of those days was her great friend and patron, so was Lord Henry Belmore, not to be rebuffed, and Lord W. would also hurry in and out occasionally; M. Fuseli came many times; Mr. Boydell and his brother, the artistic alderman, were entirely captivated with the young artist; and so, indeed, were many others too numerous to mention.

All that winter the little house had been alive with voices and footsteps and greetings and exclamations of wonder and admiration from friends, lovers, patrons, and admirers of both sexes. In the engrossment of settling down, of feeling her own success and importance, Angelica thought less of Mr. Reynolds than she did later, when the first excitement of this new way of living had somewhat palled upon her. Who could have imagined that this cold foggy life was to be so full of vibrating emotion and of romance? Rome, with all her wonders, had contained far more commonplace experiences than this black and vapor-haunted city. Lady Diana came often at first, then

more rarely, for she looked on with doubtful approbation at Miss Angel's experiences. Lady W. also came. She seemed to have forgiven Angelica. Angel, standing in the deep windows of her studio, could see her torches flaring up the street as the lady traveled homeward in her chair. As the lights would disappear into the fog, Angel would ask herself if she was indeed the little girl of a year ago who had stood eating grapes and looking over the Rialto. The remembrance of it sometimes came over her so vividly that she seemed to breathe the air, to hear the voices, the sound of the feet trailing upon the bridge. Zucchi's voice did not jar upon these recollections, although he sent them flying.

All that winter Angelica was too busy, too engrossed, to look back often; the present was all in all. She rarely met Mr. Reynolds; but when she did come across him he seemed to avoid her, she thought; and just at this time she was content that it should be so, and glad of the postponement. That all would come right she never questioned; of her power to call any body to her feet she scarcely doubted. "I can look at people," she once told Antonio, half in jest and half in earnest, "and make them turn pale and do any thing I wish; but I don't, Antonio. I could make you much kinder if I tried. But I am used to your scoldings."

Antonio left the room, banging the door.

So time and sitters and days passed by in turn, the house in Golden Square prospered and flourished, and Angelica was delighted with her own triumphs and successes, and the time drew near for old Kauffman's arrival.

The Princess of Brunswick had given so flattering an account of the young painter that the Princess of Wales, the mother of the King, sent a message to say that she was coming to visit Angelica in her studio. "Such an honor was never paid to any other painter," writes Angelica to her transported old father. He read the letter to his sister, the farmer's widow, to the dairy-maid, to the curé after mass, to the goat-herd, to the very goats upon the mountain slope. The whole valley participated in the Kauffman's distant honors and glories. They urged him to lose no time, to start off immediately to the golden scene of his daughter's triumph. "In London, that great city, the applause," says Rossi, "was universal. The public papers contained verses in different languages written in her praise."

It required no little courage and dogged opposition on Antonio's part to continue his system of detraction and plain speaking, as he called it. One can never account for the curious phases of people's minds. To him Angelica was an inadequate genius; but a more complete woman perhaps than any

other he had ever known; more complete in her feminine power than all the six Misses Starr at Windsor put together; than the Princess of Brunswick in her velvet mantles; than Lady W. with all her beauty, her gentle affections, and cultivated vapors.

Sometimes Antonio coming in would find the young painter surrounded by a circle of admirers. Not unfrequently she would be talking nonsense in a high, ecstatic voice. "Yes!" she would say, "I will confess to you all that it has been a something beyond me that has ever driven me onward through life, seeking for the most beautiful and ideal representation of the truth. That is why I try to give some deep allegorical meaning to all that I depict. If I have painted this picture of my friend, Mary Moser, as 'Prudence sacrificing to Duty and enchaining the Wings of Cupid,' it is because I have felt that in the most commonplace form and feature" (here there was a little suppressed titter in the circle, which Angel did not notice—M. Fuseli alone frowned and looked annoyed) "there is often a moral, a suggestion, far beyond the passing moment, and to that we must cling if we would not utterly weary and sicken of the dull disappointments and realities of life." She started up as she spoke, a slim prophetess in a white falling dress, pointing to the picture she had just completed. Some classical recess in the wall just behind made an arch above her head. It was an April evening; the window was open; the dusk was creeping in. A great vase of spring flowers stood on a table by her side.

"I do not comprehend," said Antonio, in his slow English, "why an allegory should be of more value to the world than a truth. I should have imagined until now that a good likeness, carefully painted, is what one wishes for in remembrance of a friend, not a classical allusion to something else which does not concern any body in particular."

Miss Angel blushed up. Some secret conscience warned her that she had been making a display, but why was Antonio to lecture her in public? She said nothing, but she showed by her manner that she was displeased.

Contradiction from Zucchi always roused the secret gypsy in Angelica's character. True friends are sorts of magnifying-glasses. Antonio was a true friend, and saw her perhaps as she really was, with some slight exaggeration.

As for Angelica, for Antonio alone, perhaps, she was but herself—no wonder such as all these people would have declared her to be, no mighty mistress of her art, but a sweet and impulsive-hearted girl whose arch bright looks, half saucy, half appealing, went straight to his heart, whose constant self-denying work and application he knew

how to appreciate. Perhaps she pursued her way too triumphantly; perhaps if her pictures had cost her more, they might have been better worth the sweet lifetime she had given to them, the hours of youth, of gayety, and natural amusement and interest, sacrificed to these smiling ladies vaguely waving their arms or reclining upon impossible banks. He praised her coloring, and Angel's cheeks would burn in answer. Her sentiment was charming, but her drawing was absurd, and he did not scruple to tell her so.

CHAPTER XVIII.

A GAME OF CARDS.

A GREAT many things exist that it is useless to close one's eyes upon, and yet the very wants and disappointments and ineffectual efforts may themselves be a sort of proof of the possibility of the things to which we can not quite reach, the duty we can not quite fulfill. Is life a science? Are we all philosophers with instincts which set us to work upon its awful problems?

Angel was not philosophizing just now. She had not written her little fly-leaves of late, or sat pondering her simple articles of faith. I do not think she was living with her best self all these months. A new phase had come over her; it is one which people decry, but to me it has always seemed a sort of game, no better nor worse than any other—the great game of the London world and its odd interests and superstitions. From being a spectator you are insensibly absorbed in the performance. You begin to understand the points, the tricks, the turns of it—the value of this trump card played against that one. Two for a queen, three for a king, and knaves and diamonds have their value too, and you unconsciously sort your hand and play your card, and find yourself one day deeply excited by this lively living whist-marking, dealing out, bidding. It is but a game, and one day the humblest player may throw down his cards with a weary shrug. I don't know that there is greater harm than in any other pursuit until the day comes when men give their honor and women stake their hearts' truth, their children's happiness, the peace of their homes. Angelica was in danger, staking her poor little heart. She was fascinated, bewildered, by M. De Horn, by his mysterious silence, his handsome expressive looks, his vague significance. She knew nothing of him, but she was very much impressed. It is a pity that moods should come to separate and to divide people.

Miss Angel was not in love with any body, as I have said. She thought more of Mr. Reynolds at that time than of any other person. If Mr. Reynolds had come back, she

would have accepted him. She always turned to her remembrance of him with gratitude and confidence, and somehow her conscience approved and Antonio approved, but Mr. Reynolds himself seemed to avoid her.

His reserve gave her some concern, but she trusted to Miss Reynolds to remove it. Although Mr. Reynolds absented himself, Miss Reynolds was her constant visitor, and from her the young painter used to hear of his doings, of the work he was engaged upon, of the people he lived with.

Lord Charlemont had proposed him for the Dilettante; the beautiful Duchess of Manchester was sitting to him; so was Nelly O'Brien, whose bright eyes still meet our admiring glances; he was as constant as ever to his club; he worked perhaps harder than usual. "And yet something is amiss," said Miss Reynolds, hesitating. "Perhaps you can tell me what it is?" she asked one day, with one of her half-reluctant impulses. They were sitting side by side in Mr. Reynolds's big coach, which had just then stopped at Dr. Burney's door in Poland Street.

More than once the big primrose coach conveyed Angelica to Dr. Burney's musical parties. On this occasion, in an interval of Piozzi's singing, Miss Reynolds returned to the discussion.

"He is not himself," said the elder lady, anxiously. "I have never seen my brother so dull, so depressed in manner."

"I think he has forgotten me altogether," said Miss Angel. "The other evening at the mask, when I would have spoken to him—I had sent away a couple of my friends on purpose to have a quiet talk—he would not come near me; he merely said, 'Are you enjoying the scene, my dear young lady? Do not let me be the means of dispersing your attendant knights,' and passed on. Tell me, what does it mean?" cried Miss Angel, suddenly, and she seized Miss Reynolds's mitten in her quick hand. "Is he displeased with me? is there any thing amiss? It is hard to be estranged from those whose affection one values." Angel's eyes filled with tears as she spoke; her fan slipped to the ground. Some one sprang forward to pick it up—a stately-looking person in mourning garb. It was an old acquaintance, who had lately appeared in London society, Count de Horn, whose acquaintance she had first made at Venice. Angelica took the fan from him with a pretty little *moue*, and let him kiss her hand as he returned it and departed with one more bow. She hastily wiped her tears away behind its sheltering Cupids. She was not sorry that Miss Reynolds should see she was not without adorers still, although Mr. Reynolds chose to absent himself for such long weeks together. She was sur-

prised, when she looked up, to see some expression of disapprobation in Miss Reynolds's face; her eyebrows were working, her little round button mouth was quivering.

"What is it, my dear lady?" said Angelica. "Are you vexed? are you—"

"Oh! it is not I, dear child, whose opinion matters," said Miss Reynolds, looking about, perplexed; "nor does my brother's, for the matter of that; and indeed it was I who said it, and he only replied, 'Poor child! she is not used to our English ways.' But you must have remarked that he is fastidious about ladies' behavior—he puts me in mind of my father in that; and if he objects to the persons who pay you court, dear child," said Miss Reynolds, tenderly, taking Angel's hand in hers, "has he not a good reason—one that you can not resent?"

Miss Angel blushed up. "Dear Miss Reynolds—" she began.

Miss Reynolds colored in her turn, and went on, unheeding. "People say that my brother is not the first to have some reason to complain. You do not mean—you do not realize— Oh, my dear, forgive an old woman who has long, long since passed beyond such things, but who can still remember, and who, if she speaks hardly, only wishes you well from her very heart. You are worthy even of his affection, and his sadness cuts me to the quick."

Angelica did not answer.

CHAPTER XIX.

BE THE FIRE ASHES.

SOME odd phase had come over the girl. A week ago I believe she would have turned away from such words, preoccupied, perhaps, or amused, or offended. Now it seemed as if she had for the first time faced the seriousness of life as it passed; realized the fact that people could suffer from her light indifference; suddenly understood that slight and indeterminate as most events are, they are, after all, our lives, and we have nothing else to live with.

She had played with other people's happiness of late. She had had real happiness and inflicted real pain. She had received a lesson from Mr. Reynolds that she scarcely deserved from him, although it might perhaps have applied more truly to her relations with Zucchi, with poor Fuseli, about whom her conscience did not acquit her. Mr. Dance, too, had reproached her. She would forget it all if she could. Why could she not forget it? Were they all speaking the truth? Was it indeed an unpardonable crime to be pleased and interested and happy in the society of more than one person?

As thoughts run on indeterminately without words or sense, they turn into moods,

into phases of mind. All the next day Angelica came and went about her work with the impression upon her of her conversation with Miss Reynolds. Coming in from a short walk, she found her old maid-servant standing in the passage; she was holding a great bunch of roses in her hand. They had just come from Leicester Fields, with a note from Miss Reynolds.

"My brother sends you these from his garden at Richmond; he hopes to do himself the honor of calling upon you to-day. Shall you be at home at about five o'clock? Your ever most faithful and affectionate servant,
F. R."

All that morning Angel had been somewhat tired. Her painting had not satisfied her. Lady Diana had come, and, finding Count de Horn in the studio, had gone away almost immediately, with marked coldness in her manner.

Angelica began to long for a little of the placid sunshine of old days. The roses and the straggling sunbeam wandering up the old staircase carried her right away.

The count's manner had vexed her, she could hardly tell why. She felt instinctively that Mr. Reynolds would not have approved. It was not familiarity; it was uneasiness, some want of bearing. How different his affected courtliness was from Mr. Reynolds's simple courtesy!

She put the roses carefully in water. They had given her a sense of rest; their fragrance filled the room as she sat down to her painting, and worked on undisturbed by outward things; but that day her hand trembled as Zucchi's did. The canvas seemed to dazzle before her; some strange tumult had taken possession of the young painter. She was engaged upon a pretty and delicate medallion—some Venus, some Cupid, reclining in balmy gardens, very far from Golden Square and from its work-a-day inhabitants. To our excited Angelica the lights seemed flashing from the picture. The Cupid's eyes seemed to meet hers. She felt almost frightened at last, and turned away with an impatient movement, as the tall doors open wide, and with the quiet swinging step and dignity that are peculiar to him, Mr. Reynolds walks into the room.

For a minute Miss Angel, usually so outgoing, was silent and embarrassed. He was calm and friendly; greeted her somewhat shyly. She saw him presently glance at the flowers. "Thank you for sending them," said she. "You know my love for roses. These have come out early."

"Some roses we know bloom in November," said the painter, with a little bow to the November rose now quivering before him.

Angelica looked up somewhat wistfully.

She could not face those anxious, bland glances. Something—what was it?—in his calm superiority seemed to fascinate her will, to compel her willing service. To this impetuous, impressionable, fantastical young person it seemed as if his judgment and tender consideration might be the calm haven for which she longed. Poor little thing! she suddenly so tired of it all—tired of her hard work, tired of the compliments which in her heart she did not accept, longing for some anchor to her laboring craft. She dragged forward a chair, and bestirred herself to make him welcome. “I knew you would come, Mr. Reynolds; something told me you would come to-day, even before I received your flowers.”

“What made you expect me?” said Mr. Reynolds, looking surprised. “I have often thought of coming, wished to come, but it was only when my sister told me that you had honored me by remarking my absence that—”

He stopped, arrested by the strange expression of her face. There was something spiritual, half rapt, half excited, in her looks at that moment. She shook back her great curl; her color rose.

Had he been unhappy all this time? So his words now implied (they had in truth no such meaning). Could she set it all right, make him happy once more—by a single word insure her own lasting peace, his ever-present friendship? She started from her chair.

“Perhaps some instinct spoke to me,” she cried, a little wildly; “perhaps we are less indifferent to each other than you may have imagined. I have not forgotten the honor you once did me. If you also remember—if you also remember,” she repeated, “as your sister has led me to suppose that you do, I might give a different answer now to that which I gave you then.” She looked up, expecting to see a smile upon his face, a reflection of her own excitement. “I have thought much and deeply since last we met,” she said. “It is not too late to try and make amends to you for my mistake.” Angelica’s heart was throbbing fast.

Reynolds looked very pale, and for a moment he in turn could scarcely face Angel’s looks. “My child,” he said, “I will not, must not, take advantage of your confidence. When I spoke to you before, I was in a different mood, carried away by a passing impulse, which I cannot regret, since it has brought me this generous mark of your goodness. But you were right in your decision. You yourself caused me to reflect. I could not hope to make one of your young and ardent nature happy, and I could never be happy feeling that I had sacrificed your life to a friendship which will be yours what-

ever chances. I scarcely know what words to use to tell you, my dear, of my respect and gratitude, to tell you how I am honored by your noble confidence. I hope to prove to you,” he added, “that I am not unworthy of it.”

Angelica scarcely heard what words he was saying. Afterward she remembered them, and they were some consolation to her, but at the time some sudden feeling of overwhelming shame, of indignation, almost of horror, at what had occurred overcame her completely. It seemed to her that she had been mad, bereft of her reason; and now for once Angelica spoke against her nature, against her own conviction. “You are right,” she said, coldly; “I spoke under misapprehension. We have neither of us that regard for each other which would warrant the step I foolishly proposed—a step suggested by another person.”

“But we are friends for life,” said Mr. Reynolds. “Is it not so?”

“I suppose so,” said Miss Angel, with a sigh. She could not answer at that moment, and she was thankful when, by some curious chance, Lady W. was announced, and came in for the second time upon their estrangement.

How Angel got through the next half hour she scarcely knew. She was conscious of Mr. Reynolds’s mute appeal and courteous, grateful, almost deprecating manner, of Lady W.’s renewed interest and affection. It all seemed to her to be meant for some other person, some one who was not present. She was thankful when they left her at last. Zucchi happened to come in. She imploringly whispered to him to take them away, that she wanted to be alone—she must be alone.

As they walked away she sank down upon the low couch in the now darkened room. She covered her face with her hands, with a sort of despair in goodness, in human nature. Was there no single person to trust in all this world?

Had she been actuated by vanity when she turned to this grave and good man? Ah, no! her conscience absolved her. But what had she done?

Miss Reynolds had deceived her unparadoxically and most cruelly. She felt as if she could forgive her in time, but not yet. And as for her friendship, was this her experience of it? She sat there, half worn out, without spirit to move. She felt that there was something in her that the slightest movement or word would awaken. It was part shame, part bitterness of feeling.

Was this what she had inflicted upon others, this miserable torture of heart? Had some demon taken hold of her in her trouble?

LIKE A CHILD.

By LOUISE CHANDLER MOULTON.

PLAYING there in the sun,
Chasing the butterflies,
Catching his golden toy,
Holding it fast till it dies;
Singing to match the birds,
Calling the robins at will,
Glancing here and there,
Never a moment still—
Like a child.

Going to school, at last,
Learning to read and write,
Puzzled over his slate,
Busy from morn till night,
Striving to win a prize,
Careless when it is won,
Finding his joy in the strife,
Not in the thing that's done.

Busy in eager trade,
Buying and selling again,
Chasing a golden prize,
Glad of a transient gain;
Always beginning anew,
Never the long task o'er,
Just as it used to be—
The butterfly before.

Seeking a woman's heart,
Winning it for his own,
Then, too busy for love,
Letting it turn to stone.
Sure of his plighted truth,
What more had a wife to ask?
Is he not doing for her
Each day his daily task?

A child, to pine and complain!
A child, to grow so pale!
For want of some foolish words
Shall a woman's faith fail?
Words! he said them once—
What need of any thing more?
Does one who has entered a room
Go back and wait at the door?

Baby Mary and Kate
Never can climb his knee;
Motherly arms are open—
"Father is busy, you see."
Too busy to stop to hear
A babble of broken talk,
To mend the jumping-jack,
Or make the new doll walk.

So busy that when Death comes
He pleads for a little delay,
If not to finish his work,
At least a word to say—
A word to wife and child,
A sentence to tell the truth,
That he loves them now, at the last,
With the passionate heart of youth.

The kisses of Death are cold,
And they turn his lips to stone;
Out of the warm, bright world
The man goes all alone.
Do angels wait for him there
Over the soundless sea?
He goes, as he came, a helpless wight,
To a new world's mystery—
Like a child.

Editor's Easy Chair.

THE Easy Chair was recently speaking of Mr. Jefferson's Rip Van Winkle, and stating the reasons for not reprehending the actor with casting a glamour over drunkenness, as some of the spectators occasionally feel that he does. He is, after all, they say, a good-for-nothing reprobate, and yet the curtain falls upon our sympathy with him rather than with his wife. One indignant moralist, indeed, declares it to be an outrage upon decency that the wife should be represented at the very end of the play as offering him a glass of the liquor which has made the tragedy of both their lives, as if she and not he had been in the wrong. It is generally a woman's instinct which says this, and it is not easy to gainsay. Indeed, that instinct is not an unsafe guide. What else is it that makes the mother's love so helpful a practical Mentor to her boy?

Fidelius was one day talking with Una in his library about Fielding, and Thackeray's praise of him. "He is the Shakespeare of the English novel," said Fidelius, warmly: "more than any other novelist in our literature he holds the mirror up to nature." "Indeed," replied Una, going to the book shelves: "where are his works?" Fidelius told her, and she took the first volume

of Joseph Andrews. "That story, remember," said Fidelius, "the religious poet Cowper used to read to Mrs. Unwin and the pious circle at Olney." Una heard, and went with the book to her own room. Not long afterward she came into the library with the book in her hand, and replaced it upon the shelf, without saying a word, and went quietly out. Fidelius confesses that it was the severest criticism upon Fielding he had ever known, and that, were he a father, he is not quite sure that he should urge his son to read the Shakespeare of English novelists, and is entirely confident that he should advise his daughter not to read it. The feeling which led Una to return the book, after reading a little in it, is surely that which should surround every child, and it is not different in nature from that which protests against Gretchen's giving the glass to Rip.

Una tells the Easy Chair that she takes exception to what he says of the play, and says that while the question of the kind and degree of responsibility arising from an inherited habit of intemperance may never be satisfactorily answered, yet it is a very serious question whether it is not often held as a soothing salve to the conscience of many an unfaithful mother, who

thus excuses her son's intemperance instead of helping him to withstand it. Is not that long-watching, uncomplaining mother of whom the Easy Chair speaks, who comes stealing to the door far beyond midnight, and who tenderly sustains the drunken son to his chamber, confirming his habit and breaking her own heart? Is there no way, asks Una, of awakening American mothers, who see the terrible increase and wasting woe of intemperance, to the responsibility of so influencing their sons in youth that, by the strong principles then acquired, they may be ready to struggle with the bondage of an inherited habit? And then Una, who is now herself a mother, asks whether women can not be taught to spend as much time and care in making their homes attractive to their boys as in making their girls attractive in society. How mothers labor early and late that their daughters may be all-accomplished and lovely women! How many of them labor with the same careful devotion that their sons may be morally strong? They wish their boys to be their pride. But when they know, as so often they do, that there are fatal tastes lurking in the temperament of those sons which can be conquered only by the most heroic endeavor, do they betimes strive to arm the boy for the struggle, or do they not rather feel that if the evil appears, it is only his misfortune, for which he is to be pitied and consoled?

This is not true of all mothers. There are those who understand duty as well as love, and who are capable of the highest self-sacrifice. "Now I have a right," says Una, "to suppose Gretchen to be a mother of that kind, a wife who has a principle beneath her indignation. She wrings the clothes she is washing, you say, as she denounces Rip, as if it were his neck that she held in her hand. But while you pity him and commiserate his congenital weakness, do you see nothing in Gretchen but a shrew? I will interpret her to you, Mr. Easy Chair. She is a woman of strong, generous nature, who feels the spell of the simple, dreamy, poetic, gentle, fascinating Rip only too well. But she knows and fears its influence over her boys, and for their sake—for a mother's love is stronger than a wife's—for their moral salvation whom this fascinating father drags toward the pit, she denounces her beloved, she sends the faithless, fond, corrupting father into the raging night, and flings herself comfortless upon the bench by her cheerless hearth, having broken her heart to save her children. Now I ask you, Mr. Easy Chair, in exciting our sympathy exclusively for the shiftless, gay, delightful vagabond, false father and husband and man, does not the charming actor whom you applaud throw a glamour over vice, and wrong the cause of the steady, sober, quiet, home-loving man who should be the type of an American father and patriot?"

Certainly the plea is very strong, but, by Una's own showing, the difficulty, so far as the play is concerned, is not that Jefferson does so well, but that the worthy representative of Gretchen does not exactly suggest the character which Una gives to her. If the author or the actor made it plain that such was the intent of the play, we should all sit pitying Rip and admiring and justifying Gretchen. It would, indeed, be a very noble play. Nor can it be denied that Una's suggestion is fair and striking; and a vivid representa-

tion of the Gretchen she describes would be one means of arousing mothers to the duty which she would see them fulfill, of training their boys not to excuse a weakness because it is inherited, but to wrestle with it all the more terribly for that reason, and, with the help of Heaven, to turn the curse into a blessing. But with the play as it is conceived and acted, sympathy goes with Rip, not because he is an idle vagabond, but because with such a nature, with such weakness and so fatal an inheritance or taste, the relation that should do most to help him really does him the most harm.

And it still seems to the Easy Chair possible to view it all not as a moral spectacle, but as a summer dream of idleness and reverie, a fairy drama floating before the eyes that have grown drowsy among the mountains over which a kindly genius has cast a spell of romance. So the young folks see it, we may be sure, and they have no more positive moral feeling in watching it than they have in reading *Cinderella* or *The Fair One with the Golden Locks*. There is a moral in *Cinderella*, and in *Jack and the Bean-Stalk*, and in *Beauty and the Beast*, but it is not the darling public of the nursery that knows what it is.

A WELL-KNOWN author said long ago to the Easy Chair that the one thing which the public liked and would have is personal news, and the more scandalous the better. No books, he said, are so universally popular as personal memoirs, no trials so universally read as those exposing personal details, and no column in the newspaper so sought as the personal column—which was then a novelty. And what book would be so valuable to a publisher or editor as an authentic memoir of Shakespeare, full of personal details? Think of the memoirs of Moore, in eight goodly volumes, filled with apparently unimportant gossip! What a popularity Willis's *Pencilings by the Way* had, especially the letters devoted to the details of London society! And here are the *Greville Memoirs*, one of the most noted of recent books, and one of the most lucrative, for within a very short time of the publication the editor is said to have received ninety thousand dollars as his share of the profits. The author who spoke to the Easy Chair did not philosophize upon the subject, nor seek to explain this universal taste. He was satisfied with the fact, and made the most of it in his career. His theory was that if a man lives by letters, he must cultivate such letters as he can live by—a rule which is capable of fatal perversion, like the truth which Mr. Seward in one of his speeches said that he early learned from Jefferson, that in politics we must do what we can, not what we would. The rule deduced from that remark is sound when followed by a wise and honorable man, but every demagogue can plead it as an excuse for his ill conduct. The desire to hear personal details of great and famous men is as natural as the wish to see their portraits. But a passion for scandal is ignoble.

Mr. Greville was a "well-born" English gentleman of the last generation who had a sinecure office, an easy income, and the *entrée* of the most distinguished and fashionable society. At an early age he began to keep a diary, and as he was diligent and observing, it became very voluminous, and as he lived long, he saw closely

and often intimately a great multitude of interesting persons. He was also a shrewd observer, and had the happy faculty of conveying a vivid impression of the person he described. Judging him from the book, he was not a large-minded or a generous-hearted man, and his statements must be taken always with that impression; but Mr. Hayward, the editor of the *Quarterly*, who has reviewed the work with the intention of correcting many errors, says that although Mr. Greville was called "the Gruncher," from his habitual tone, he seemed naturally a kind-hearted man, with a wide range of sympathies and an unfeigned disinterested eagerness to render useful service—a man of tact, temper, observation, and experience. Mr. Hayward suggests that this was perhaps a mistaken view of his character. But that is not the necessary conclusion, for he may have resolved to write down the precise impressions that he received from the people he met, regardless of the pain that such impressions must convey if published during the lifetime of the persons described or of their friends. Probably whenever he spoke in conversation of the persons mentioned, it was in a very different tone from that in which he writes of them in his journal. But this does not prove him to be insincere. A man is not to be accused of duplicity because he does not call every man foolish whom he may chance to think so, or because his kind heart induces him to speak gently of those whom he does not highly esteem.

In his journal, however, Mr. Greville evidently meant to photograph the exact impression. Of course he is not to be pardoned for recording injurious tales about any one unless he has thoroughly investigated them. The story about Charles Kemble and Ellen Tree is false, and therefore inexcusable; but the later note, although the editor in publishing it may be held to be utterly wanting in generous and delicate feeling for a lady, can not be considered as proof of the author's cynicism or want of a due sense of propriety. To write that Ellen Tree married Charles Kean, lost her good looks, and became a tiresome second-rate actress, is to write something that can only pain Mrs. Kean and her friends in the reading. But Mr. Greville can not be blamed for not thinking her handsome or a first-rate actress. So when he speaks of Washington Irving as appearing to be good-humored, but "rather vulgar," he expresses an opinion which is undoubtedly sincere, but at which those who saw Mr. Irving more and who knew him rather better than Mr. Greville will only smile, and the eyes of no man would have twinkled more humorously at the suggestion than those of Irving himself.

The real value of the book is its sincerity. Mr. Greville undoubtedly supposed that it would be published some day, but at a time when his personal comments would have no sting for any reader, and he had the good sense to know that a diary written in perfect good faith would have very great interest and value not only to those who were to profit by it pecuniarily, but to the public. The chief objection to it is understood to have come from the royal family, and the objection, while due to a natural personal feeling, has a further significance as a protest on behalf of royalty itself. The Queen instinctively recoils from a work which portrays her uncles with such

gross and absurd features, and which does not spare even her mother.

Nothing, indeed, can be more contemptuous than the tone of the diary in describing George the Fourth and his successor, William the Fourth. No epithet is spared in the description and denunciation of George, and the "first gentleman in Europe" fares worse at the hands of his last critic than at those of any of his predecessors. Last month the Easy Chair mentioned what Thackeray said of this precious monarch and Defender of the Faith. He found him to be all bow and grin, and padding and under-waistcoats, and then nothing. And Thackeray's mock inscription in *Punch* for George's proposed statue is a strain as caustic and terrible as Swift:

GEORGIUS ULTIMUS.

He left an example for age and youth to avoid;
He never acted well by man or woman,
And was as false to his mistress as to his wife:
He deserted his friends and his principles;
He was so ignorant that he could scarcely spell,
But he had some skill in cutting out coats,
And an undeniable taste for cookery.
He built the palaces of Brighton and of Buckingham,
And for these qualities and proofs of genius
An admiring aristocracy
Christened him the First Gentleman in Europe.
Friends! respect the king whose statue is here,
And the generous aristocracy who admired him.

All that Greville says of the fourth George confirms the contemptuous and indignant feeling of Thackeray. He seems in all the memoirs to have been one of the meanest and worst of men; and all the moral deformities of the man are likely to be refreshed in the public mind by the republication of certain suppressed memoirs, which, if they prove his marriage with Mrs. Fitzherbert, will do no more than has been already established. But Greville adds to the repulsive portrait of George the absurd one of his brother William, of whom personally little has been made familiar to the public. The sailor-king was supposed not to be a very wise or great man, but there was always a certain kindly feeling toward him because of his consenting "to swamp the peers" if they would not consent to the Reform Bill of 1832. He has been considered a bluff, hearty, good-natured monarch, who filled his office creditably, although not magnificently or even impressively.

But Mr. Greville, who, as Clerk of the Council, was brought into comparative intimacy and familiarity with royalty, makes William a ridiculous figure—ignorant, pompous, testy, and undignified. Some of the stories he tells of him are laughable and incredible, as where he describes him summarily dismissing a party at the palace when the royal bed-time arrived. It is such a scene as might be expected in a Christmas extravaganza. His Majesty Sancho Panza in Barataria or King Valoroso in Paflogonia might so have behaved, but that it is a fact seems ludicrously impossible. William's speeches at dinners are also most absurd; and one of the best touches in the book is the vivid picture, in a few simple words, of one of these prandial performances when old Talleyrand was present, and of his remark as he surveyed the scene and listened, "*C'est bien remarquable.*"

"Something of a blackguard, and something more of a buffoon," is Greville's description of his gracious master; and he mentions a dinner

at the palace at which the Princess Victoria and her mother were present, and at which the king insulted the Duchess of Kent, Victoria's mother, in the grossest manner, insisting that she had kept the princess from his drawing-rooms, calling the duchess "that person," and saying that she would be incompetent to act with propriety as regent, and declaring that he would not endure a course of behavior so disrespectful to him. The princess burst into tears; the duchess said not a word, but ordered her carriage, and announced her immediate departure from the Castle.

This story Greville records a month later, from the account of the king's son, Lord Adolphus Fitzclarence, who was present. Mr. Hayward, to throw an air of doubt over all the stories in the book, tells the same story from the report of "a highly distinguished person, a member of the household, who was present." This witness says that the anger of the king was not because the princess had been kept from the drawing-rooms, but from the opportunity of learning by observation the details of the kingly office to which she was to succeed. The story, so far as the king is concerned, is not essentially different; for in Greville's account he speaks of the court as well as the drawing-room, and in both stories he grossly insults the duchess at his own table. Nor does Mr. Hayward offer us any reason for believing his witness more than Lord Adolphus, although he says that the latter was not the most accurate or discreet of mortals. But he does not assure us that his anonymous witness is.

There can be no wonder that somebody took up the cudgels against Greville's book, for such a work has not a literary and social significance only; it has a political importance which every shrewd Englishman sees. Mr. Bagehot, in his entertaining book upon the English Constitution, speaks of the general impression as to royalty. Hodge, in the beautiful country of England, believes that the king governs. He knows little of the committee of the House of Commons and of the Peers which is called a ministry, except that they are the humble servants of the royal and gracious Majesty that, crowned and sitting upon a throne, with a ball in one hand and a sceptre in the other, rules the realm of England. This is the illusion of monarchy which the author thinks is indispensable to the system, and he is not wrong. In a country of intelligent people authority may be surrounded with forms, but those forms will avoid absurdity.

The practical difficulty with a transparent monarchy like that of England is that it may lose its hold upon the popular imagination. A friend of popular government must believe that the very course of things, progressive civilization, steam, the telegraph, the photograph, all inventions and developments, are its allies. The stars in their courses fight against Sisera. When the Queen's book was published the Easy Chair showed its necessary effect upon the popular conception of royalty. The photograph helps the disillusion. Books like Madame D'Arblay's memoirs and Thackeray's lectures and Greville's diary strike in the same direction. They strip away all the glamour from royalty. They whisk off the enormous peruke, the flowered purple velvet robe, the crown, the sceptre, the mysterious and enhancing

obscurity and vagueness, the reverence and awe and romance, that surround the king, and leave him naked to his enemies. Hodge beholds a distressing revelation. Instead of a gracious sovereign, the fountain of honor, the head of the empire, before whose awful face ambassadors bow and whose train dukes reverently bear, whose very nature partakes of the pompous magnificence with which he is surrounded, Hodge sees a sot, a rake, a mean, selfish, petulant, ignorant man, a powerless puppet in the hands of a parliamentary committee.

As he increases in intelligence it is plain that beef-eaters and lord high chamberlains and gold-sticks-in-waiting will become excessively ludicrous to him, and at length contemptible and intolerable. For the mediæval monarchical state is valuable to the higher and more intelligent class only as they believe it to be real to the lower. When the reality disappears, and the more intelligent know it, another form will become necessary. "The fierce light that beats upon a throne" at last melts it, and such books as Greville's are fervent rays in that light. The poet describes the bird laid low by a shaft winged from its own plumage: Greville was essentially a cavalier, but his book is one of the heaviest blows at royalty.

"GOOD-MORROW to my Valentine." The song is yearly sung, and with ever fresh zest and ardor and sweet tremulous hope. The Graybeard smiles; but yesterday it was he who sat pensive and fearful, and found exquisite delight in venturing to say under the mask of Valentine what in his own person he would scarce have dared. It is one of the white days, or red-letter days—chiefly that, for the letters are of the heart; and yet again snow is but a faint symbol of the white purity of the feeling they express. Certainly it is one of the happy days of the year, days sacred to emotion, official days of feeling. Charles Lamb, in treating of the heart, asks why the headquarters and metropolis of "god Cupid" should be placed in that anatomical seat more than in any other—liver, he suggests, or midriff. "Madam, my liver and fortune are entirely at your disposal;" or, "Amanda, have you a midriff to bestow?" In Lamb's "Table-Talk," reprinted in the delightful *Eliana* gathered by Mr. Babcon, one of the cardinal archbishops of the church of Elia, to whose affectionate zeal and perceptive taste and diligent hand every reader and lover of the unique master is so deeply indebted, and who (a most reverent Old Mortality), scraping the encroaching moss, renews the letters of many an else fading fame—in Lamb's "Table-Talk" he treats of the occult relation between the substance of a feast and its adjuncts, asking why French bean sympathizes with the flesh of deer, why salt fish points to parsnip, or brawn makes a dead set at mustard; why the haunch of mutton seeks the alliance of currant jelly, while the shoulder civilly declines it; why cabbage is reprehensible with roast beef, laudable with bacon; or why oysters in death rise up against the contamination of brown sugar, while they are posthumously amorous of vinegar. He deplores our ignorant and empirical feeding, and aspires to know a general law by which, if nature should bestow a new meat upon us, or be prodigally pleased to restore the phoenix, we

might, upon a given flavor, pronounce what the sauce should be.

But the heart as the symbol of love is surely not a mystery. Did not that gracious fancy light upon the truth that out of the heart are the issues of life? And whence could they issue but from love? How instinctive is the feeling! When Amanda, conversing with Dorimant, and plying her industrious fingers, lifts the heart-shaped emery bag and stabs it with that fine glittering needle, have you not seen Dorimant wince? One of the witch deviltries was making the little figure of a man, which, being cut and wounded, lacerated him whom truly it "disfigured or presented." Is this a transfigured form of that enchantment, so that Amanda, famously bewitching, pierces Dorimant's heart in puncturing her emery? St. Valentine is of the house of Barmecide, a modern caliph of that ilk. For as at the Barmecide feast a man ate and did not eat, and, with all the motion and the smacking zest of toothsome dining, saw nothing, tasted nothing, and fed on air and fancy, so the good bishop on his sacred day suffers Dorimant to unlock his heart and pour forth all its feeling in passionate expression, and yet ordains that it shall not be taken, in the French phrase, *to the serious*, or *at the foot of the letter*. On St. Valentine's Day Romeo may throw his heart at Juliet's feet, but she may not pick it up. He may offer her his life, his hope, his future, his all, but it must be to her only as the offer of a Spanish host, who places his house and all it contains at your disposal. On Valentine's Day lovers talk Spanish. They rehearse the burning truth, in all its fullness and force, which they will one day tell, and beseech the answer on which life and happiness depend. But to-day it is only rehearsal, foretaste, Barmecidian. Ah, what a day! For the wretch is committed to nothing. Lovelace may swear in perfumed poetry to Clarissa that he loves but her, and cherishes no hope but her favor. If it be only a trick, a compliment, a pastime, poor Clarissa can not know it, and her fond heart interprets his by itself. Men are deceivers ever, you say, and no one day in the year, but all days, are devoted to their falsity and folly. But this is the day when the most timid may venture, and it is to-day that under cover of the time the callow Lovelace may begin.

If Graybeard smiles, other Graybeards do not. There is one who might himself be mistaken for St. Valentine; so fresh and gracious and benign are his mien and bearing. It is many, many years ago that he sent his first missive on this day, full of doves and loves and hearts and darts. Never a year since has he failed to send it. Time has slowly stolen the bloom from the young face that flushed rosy red when that first billet came. And the flowing hair that was then an aureole round that young head is an aureole still—but of another color. That first "venture of the heart" returned with more than the gold of Ormus and of Ind. It brought to that enamored youth manliness and hope and devotion and success. The benediction of St. Valentine was followed by the nuptial blessing, a new home, and joys and sorrows. Children were born; children died; fortunes varied; friends vanished; the landscape of life changed. Slowly the lines in those faces grew deeper, the hair on those heads thinner and whiter; but ev-

ery year St. Valentine's postman brought the little note, and the same heart gladdened as in that far-off year. The furrows deepened and the hair grew gray, but those hearts were young forever. Children were married, a new generation came blithely in, but still the immortal lovers remain. Only this year the missive came, not the passionate and proud strain of youth, but sweet and mild with the trust of a love that time can not wither nor custom stale—a love which is the prophecy of its own continuance, the harbinger of heaven. Those hearts beat to the poet's music:

"As the bird trims her to the gale,
I trim myself to the storm of time;
I man the rudder, reef the sail,
Obey the voice at eve obeyed at prime:
Lowly, faithful, banish fear,
Right onward drive unharmed;
The port, well worth the cruise, is near,
And every wave is charmed."

RUSKIN says that in a kindly and well-bred company if any body tries to please them, they try to be pleased; if any body tries to astonish them, they have the courtesy to be astonished; if people become tiresome, they ask somebody else to play or sing, but they do not criticise. Willis, who was much interested in fine society, said he had observed that the best-bred company does not permit sensations and adjectives, or surprises or extravagances of any kind. The aim seems to be, he thought, to keep the conversation at the level of the least active intelligence, and undoubtedly in many circles that pride themselves upon their superiority a cool and refined indifference is regarded as elegance and the highest tone. Ludovicus, who had spent many years in Europe, and was fond of the finest things, returned to his native fields, and was held to be the perfect gentleman. One day as he was standing in the picture-gallery looking at Chrome's last great work, and studying it through his closed hand as a spy-glass, Lionheart, the friend of his youth, whom Ludovicus had not seen for many a year, and who had now come home from Ceylon, came quietly behind him, and, with his heart in his mouth, touched him upon the shoulder. Ludovicus turned and saw his friend, his other self, and he said, his eyes reverting to the picture, "Ah, Lionheart, how do? Do you see what a lovely gray he has put in that shadow?" Lionheart was silent, and thought his friend cold, selfish, and shallow.

It was not so. It was only a manner. It was an extravagant way of avoiding "a scene." Yet that extreme is more agreeable than the other. A manly reticence and restraint are better than the emotional gush of expression, which is so easily simulated, and which is so often made to serve for real feeling. The secret spring of Ludovicus's greeting was that of the conduct which Ruskin describes as peculiar to the best society. It was kindness, sympathy, consideration. He turned and saw his friend, and, because of his warm eagerness of feeling, he said to himself, "Be a man!" and dextrously dissipated the chance of a scene, which was better omitted, by turning attention to the picture. Ruskin goes to the point. The essence of courtesy is good feeling. A good heart is the beginning of a gentleman, and when a scoundrel has what are called gentlemanly manners, it shows only that he has

wit enough to imitate the expression of a disposition which he does not have. A hypocrite and a knave may have irreproachable manners, but irreproachable manners do not make a gentleman. A fine consideration of the feelings of others would never characterize the conduct of a coarse and dull man. But the manners of those who have that consideration are what we call good manners, and they become the universal standard.

Another kind of coarseness and dullness than that of rakes and libertines and all selfish people calls courtesy insincere. There are those who are fond of asking, "Why not call a spade a spade?" and who would have, or who say that they would have, every body say what he thinks of every body else. Pelham, entering the home of Mrs. Fungus, who has invited him to her ball, is to refuse to bow to her, but is to say: "I don't bow to you because I don't respect you. You are a hideous old woman. Your cheeks are plastered with paint; you wear a ridiculous wig; you are stuffed and padded to give yourself a figure; you are a grinning, wriggling old witch, grimacing and lying and backbiting your neighbors." This is what is fondly called dwelling in the palace of truth. It is a kind of truth-telling which would turn human society into a howling wilderness. Truth-telling? How does he know that it is the truth? It is his opinion, his impression. What then? Are

his opinions and impressions synonymous with truth? Is he the Roman Pope, that he should be infallible? How many of our judgments of each other prove to be correct? How many are not modified or susceptible of infinite modification? If you lay down exact truth of statement as the rule of your conversation and manner, very well; but spare us your whims and prejudices and guesses. Give us the pure truth in intercourse, or give us courtesy. Who can give the pure truth? But who can not give courtesy?

"Loke who that is most vertuous alway,
Prive and apart, and most entendeth ay
To do the gentil dedes that he can,
And take him for the grettest gentilman.
Crist wol we claime of him our gentillesse,
Not of our elders for hir old richesse."

A FRIEND, whose memory retains every strain of English verse, reproaches the Easy Chair for forgetting, in quoting the song of Bibbo, month before last, the epigram of Matt. Prior:

"When Bibbo thought fit from the world to retreat,
As full of Champagne as an egg's full of meat,
He waked in the boat, and to Charon he said
He would be rowed back, for he was not yet dead.
'Trim the boat and sit quiet,' stern Charon replied;
'You may have forgot—you were drunk when you died.'"

The song as sung in the clubs is merely an amplification of these lines.

Editor's Literary Record.

THE reader will find in the March number of *Harper's Magazine* an account of Dr. LIVINGSTONE's last African explorations, condensed from *The Last Journals of David Livingstone in Central Africa* (Harper and Brothers); but no epitome can give any adequate idea of the warmth and color which make this volume the most inspiring, as it is one of the most fascinating, of the season. It is vital with the personality of its author—a great and good man, one of the greatest and best of that consecrated host who, the exclusive property of no age and no denomination, have gone forth, gladly sacrificing that which most men hold dear, and imperiling life itself, in order to proclaim to barbaric tribes the good news which has made Christendom what it is.

Dr. Livingstone was not an ordinary missionary, simply because he was not an ordinary man. His ambition was not to redeem a few individuals from barbarism, but a continent; not to add a few scores or hundreds to the church, but Africa to the civilized world. All his interest in scientific and geographical research was subordinate to this one supreme aim, to deliver Africa from the slave-trade, "the open sore of the world," and by this and his published researches bring it within the beneficent influences of commerce, civilization, and Christianity. From the entry in his diary on the morning of starting—"I trust that the Most High may prosper me in this work, granting me influence in the eyes of the heathen, and helping me to make my intercourse beneficial to them"—to the last scene, when he was found dead and cold on his knees by his bed, this spirit of complete, deep, and unfaltering consecration to his God-given work, and this spirit

of quiet trust in God to sustain him in and carry him through it, is manifested on almost every page and in absolutely every incident. This pure unselfishness of his purpose, coupled with a courage which never faltered and a perseverance which never wavered, will draw all readers to him, as it drew to him, in bonds which not even death could sever, his faithful attendants. The "magnetism" in the man is preserved in the book, and gives to it a more than fascination, which lifts it quite above all other works in the same field, such as Sir Samuel Baker's *Ismailia* and Schweinfurth's *Heart of Africa*, and ranks it with the lives of the true heroes of the world and saints of the church. For neither the romances of the one nor the legends of the other record a nobler character, nor one better worthy of a true hero-worship, than the story of David Livingstone's life and death. For what he tells us about Africa we are thankful, of course; but for what he shows in himself we are as much more thankful as the possibilities of manhood are of more importance than the possibilities of an undeveloped continent.

The latest and by no means the least volume on Oriental investigations, whose prosecution has made the names of Layard, Rawlinson, Lenormant, and half a score of others famous, is Mr. GEORGE SMITH's *Assyrian Discoveries* (Scribner, Armstrong, and Co.). His investigations began in the British Museum, where, in 1872, he succeeded in deciphering the tablets containing the Chaldean account of the deluge. That remarkable discovery will probably be fresh in the minds of our readers. A photographic reproduction of a fragment of the tablets, with an account of the contents, was published at the time in *Harper's*

Weekly. This discovery created great interest, not only in literary and antiquarian circles, but also in the larger public. As a consequence, the *Daily Telegraph*, of London, sent Mr. Smith out to Mosul to prosecute further his investigations on the ground; and this expedition was so successful that a second one was undertaken, at the expense of the British Museum. The volume now published embodies the results of these two expeditions. It is illustrated with wood-cuts and photographs. Mr. Smith writes with more graphic power than one would expect from a professional decipherer of the extraordinarily illegible records of the Oriental empires. He presents in a pictorial and interesting manner an account of the ruins explored, the methods of exploration, and the obstacles encountered in the opposition of the Turkish government and the untrustworthiness of the natives whom he was forced to employ. But the most valuable portion of his volume consists in the account of the Assyrian stone records, and his translation of them. Their number is amazing. In the ruins of one palace he found three thousand fragments of tablets, and their position led him to the conclusion that they constituted originally part of a stone library, which occupied the upper story of the palace. Of these tablets the most important yet deciphered are those which from their contents are known as the "deluge tablets," the date of which Mr. Smith places at 2000 B.C. But there are also other inscriptions, some of them of considerable interest and importance, and confirmatory of Old Testament history. A considerable proportion of the book is taken up with translations of these inscriptions, many of which would be nearly if not quite unintelligible to the ordinary reader but for the interpretation with which Mr. Smith generally accompanies them.

Dr. WOOLSEY, one of our most accomplished living authorities upon public law, has edited new editions of Dr. LIEBER's *Civil Liberty and Self-Government* and *Political Ethics*, which have been issued in handsome and convenient form by Lippincott and Co. No more competent hand for the purpose could have been found, and Dr. Woolsey's name gives an added value even to Lieber's works. Of all men of foreign birth who have made America their home, few have been of really greater service to the country or have conferred more lustre upon it than Francis Lieber. He was an American wholly and in the best sense and by conviction; a sound and clear political thinker, a comprehensive scholar, and a man of the tenderest and most generous heart. His contributions to political philosophy are more valuable than any that have been made on this side of the sea; and in both the works which Dr. Woolsey has edited, Lieber's quick sympathies and large learning have made discussions which might seem to be in their nature abstract and dry, full of interest and charm. His view of the state, and of a question which always profoundly interests Americans—the relation of morals and politics—is most interesting and clear. Lieber was a student and a professor, but not a doctrinaire. His mind was singularly practical and sensible, and he draws with a firm hand the luminous line between the object and the methods of political action. Just at this time, when the public mind is alive with interest upon that very subject,

we know of no works that would repay careful and thoughtful study more richly than these of Dr. Lieber's, nor, indeed, any that would be additions of more permanent value to every American library.

Mr. J. W. SCHUCKERS's *Life and Public Services of Chief Justice Chase* (D. Appleton and Co.) is a very different kind of book from the life of the same distinguished statesman by Judge Warden, of which we gave the readers of this Magazine some account in our September number. Mr. Schuckers was for many years Mr. Chase's private secretary. He had therefore peculiar opportunities for knowing not only the public services but the private life and character of the subject of his biography. "No man is hero to his own valet;" nevertheless it is the distinguishing mark of true greatness that those who possess it generally seem greater to their most familiar acquaintances than to the more remote public. This was emphatically true of Mr. Chase, and this biography will therefore add to the reader's respect for the public services of Mr. Chase the warmer regard due to his private life and character. Mr. Schuckers exhibits no inclination to become a mere eulogist, none to shine in light borrowed from the greater luminary, and none of that weakness of obsequiousness which sometimes mars the descriptions of great men by their attendants and subordinates; he does not play the part of a Boswell to a Johnson. Neither does he suffer personal or political prejudices to obtrude themselves in unseemly and uncalled-for criticism. If he is not a eulogist, neither is he a critic: he is a historian. He writes without the least pretense to rhetorical skill, without any endeavor by ingenious grouping or word-painting to impart a fictitious, a romantic, or even an artistic interest to his narrative, and without any of those climaxes and contrasts which sometimes enhance the attractiveness and present effect of history, but generally at the sacrifice of its simple truthfulness. He writes with simplicity of expression, with unostentation, without partiality, save that of a pure, warm, and sincere friendship for his chief, and with a just and honorable, but not extravagant or sentimental, appreciation of that inherent dignity and nobility of character to which Mr. Chase's honorable position neither did nor could add any thing, and from which the criticism of political foes neither did nor could detract. The fifty-second chapter, in which the author presents a well-arranged and succinct summary of the leading characteristics of Mr. Chase's mind and his methods of work, is a noble monument to a noble man, the more fitting and appropriate from its very simplicity. Over the grave of Salmon P. Chase none other than a simple monument would be appropriate. The portrait which serves as a frontispiece is excellent, though one showing him in his later life would have done greater justice to his remarkably fine appearance and bearing.

Singers and Songs of the Liberal Faith, by ALFRED S. PUTNAM (Roberts Brothers, Boston), is a volume of over 500 pages of hymns and sacred poems, taken from American writers of the Liberal Church in America, and accompanied by biographical sketches of the writers. In these sketches Mr. Putnam has embodied something approximating a critical estimate of the poets whose songs he quotes. The biographical infor-

mation, though brief, is compact and sufficiently comprehensive for the author's purpose; the criticisms do not indicate a critical talent in the editor; they are too uniformly commendatory, and are characterized by that multiplication of eulogistic epithets which belongs to the average newspaper criticism. The list of writers embraces all shades of theological thought within the Liberal Church, from Rev. Chandler Robbins to Revs. John Weiss and O. B. Frothingham. The volume includes not only the writings of religious authors, but also poems of a very general character which contain expressions of religious feeling. The reader of this book can not fail to be impressed with the fact that Christian experience is much more catholic than the church has been wont to regard it, and that the variations of religious belief do not produce so great variations in religious emotion as is often imagined. As in our church hymn-books the poems of the Roman Catholic Faber and the Protestant Wesley abide in harmony side by side, so in this volume, the production exclusively of Liberal writers, there will be found the rhythmical expression, the deeply earnest expression, too, of almost every phase of Christian experience to be found in the hymnology of other branches of the Christian church. It is, indeed, true that there is a characteristic lack of that impassioned fervor which belongs to the hymns of the Roman Catholic Church of the Middle Ages, and of that stalwart and muscular piety which belongs to the best specimens of Scottish, Puritan, and German verse. But this lack is a characteristic not of the denomination, but of the age, which is unable to reproduce in any branch of the church a Faber, a Wesley, or a Watts.

The third volume concludes HENRY WARD BEECHER'S *Yale Lectures on Preaching* (J. B. Ford and Co.). It presents Mr. Beecher's theology. It discusses the Bible and the proper use of the Bible, the true conception of God and the true methods of presenting Him, human nature and its development into a Christian manhood. Throughout the volume, however, Mr. Beecher treats of theology not as a science, but as an instrument, that is, he presents not a systematical philosophy of divinity, but only a consideration of those phases of truth which, in his judgment, the Christian ministry can use most efficaciously in their work. This method avoids some perplexing questions, and perhaps harmonizes best with the general purpose of this course of lectures, but the result is not altogether satisfactory. The practical worker will find abundant and useful suggestions in the volume. The theological thinker will regret that Mr. Beecher has not given to the world more fully and frankly the philosophy which underlies his own ministry.

In *Urbané and his Friends* (A. D. F. Randolph and Co.) Mrs. PRENTISS employs a very simple stratagem to render attractive her discussions of certain grave problems in Christian experience. Urbané is a man of threescore years, "every inch a man, and yet with feminine sweetness in his face." A meeting is held in his study every week for personal conversation on practical religious themes, and by means of these meetings the authoress presents her own views in a colloquial and semi-dramatic manner. These are essentially those of a mystic; they appeal to the sentiments and feelings rather

than to the judgment or even the conscience. They are tender and touching—the tragedy of Junia can not easily be read with dry eyes; but their effect will be rather to stimulate religious emotions than to strengthen the soul for the practical work of life.

The most impressive temperance story which we remember to have read is EDWARD EVERETT HALE'S *Our New Crusade* (Roberts Brothers). The idea was suggested by the women's movement last year against intemperance, but the method of Mr. Hale's crusade is more practical and more judicious. The author clearly shows what may be effected by the co-operation and well-directed effort of Christian men and women against the sale of intoxicating liquors. What was done at Bromwich may be done any where.

If we are not greatly mistaken, *Christ and Humanity*, by HENRY M. GOODWIN (Harper and Brothers), will make considerable stir in the theological world, and provoke considerable discussion both of a friendly and a hostile sort from the theological press. Mr. Goodwin will suffer the usual fate of independent and original thinkers. It will be declared that he denies the proper divinity and also that he denies the proper humanity of Jesus Christ, that he is an Arian and also a Eutychian, a Unitarian and also a Swedenborgian. All this, however, he will doubtless survive, as a great many have survived similar attacks before him; and since this is an age which patronizes independent thinking, his volume will be read and even studied all the more because it does not travel the beaten course of the past centuries. Ever since Jesus Christ put to the Pharisees the question, "What think ye of Christ? whose son is he?" the problem has been pondered by the church with very various results. The ordinary orthodox view that his was a double nature, God and man welded together in a character that was neither simply divine nor simply human, but divine-human, that in the one soul there were two wills, and in the one life two lives, however satisfactory it may be to those who are proficient in theological lore, has never practically gained much real acceptance among unprofessional readers of the New Testament. Indeed, most of them have been content to take the simple story of the Gospels, without much thought as to how the God who shines through Jesus became incarnate in him; and those who have thought much and independently can surely not have failed to feel, if not to see, how artificial and foreign to the simplicity of the New Testament teaching is this theory, born of later scholastic theology, of a double personality. Mr. Goodwin, recognizing more than most theologians do that religious truth is a matter of experience, not merely of intellection, undertakes to present to the intellect a simpler theory of Christ's character than this of his dual nature. It does not differ so widely from that of Henry Ward Beecher as he supposes, except in being stated more comprehensively and philosophically. It is, in brief, this: that the anthropomorphic conception of God is the right one; that man—that is, the ideal man—is an image of God; that the human and divine natures are the same in essence; that the difference is in quantity rather than quality; that the human is simply a reproduction in a finite form of the divine; hence, that in the incarnation God does not take upon Himself another

er and incongruous or inconsistent character, but simply empties Himself of the largeness of His being, subjects Himself to the limitations of a body and a bodily condition, and, becoming for the time being man, is truly both man and God, because in the essential features of their nature the two are the same. This, reduced to a paragraph, is the kernel of Mr. Goodwin's Christology. For its elaboration we must refer the reader to the book itself. It is clear in expression, and independent and vigorous in thought; in form it is not altogether happy. The first half consists of sermons preached at various periods during a ministry of twenty years. The natural consequence is a repetition of substantially the same thoughts, and sometimes even the same phrases. On the other hand, this genesis of the volume imparts to it a warmer, more practical, and more spiritual character than belongs to most theological treatises, and adapts it to the interest and the profit of the non-professional reader. The latter half of the volume is more strictly theological, and is devoted to a review, historical and critical, of the doctrine of Christ's person.

In *The Law and the Lady* (Harper and Brothers), Mr. WILKIE COLLINS's last novel, the author, in the opening chapter, hints at a secret which separates Valeria, just married, and her husband. About half the volume is taken up with the wife's successful investigation and final discovery of this secret; the other half in her successful endeavor to solve the mystery of the unjust imputation under which her husband is well-nigh crushed. The interest of the story lies chiefly in tracing out this mystery. The novel is an enigma only less successful than that of *The Moonstone*. Who murdered Mrs. Macallan? is a problem which will tax the novel-reader's powers scarcely less than that other riddle of fiction, Who stole the Moonstone? There is no moral in the story, unless it contains one against the Scotch verdict of "Not proven;" and the characters, though perhaps as strongly drawn, are not as true to nature as those of *Man and Wife*. In the latter novel the plot naturally grows out of the peculiar but not impossible situation in which remarkable but not unnatural characters are involved. In *The Law and the Lady*, on the other hand, the characters are invented in order to create the situation. Only such a trio as the morbidly sensitive Mrs. Macallan, the half-mad Miserrimus Dexter, and the resolutely weak Eustace could either create such a riddle or leave the wife to find the clue to it unaided, and despite her husband's opposition. Miserrimus himself is not a more natural character than Caliban, nor is his personality less marked. We recall in Charles Dickens no freak of fancy more wildly fantastical than the picture of this half imp, half man, in his self-chosen solitary imprisonment, driving back and forth across his room in his wheeled chair, with his "immense imagination at work." This peculiar phase of Wilkie Collins's genius, this purely inventive fancy, is something new; at least we recall in his works nothing of this sort quite equal to it.

A Strange World, by Miss M. E. BRADDON (Harper and Brothers), opens also with a mysterious murder. But the clue to the mystery is given to the reader at once, and the interest in the story turns not upon unraveling it, but upon the effect it produces upon life and character.

Miss Braddon's late novels we have found both healthful and entertaining. Certainly this last story is so. The murder, perhaps, borders on the sensational. It is so improbable as to be almost impossible, and in that the novel pivots on so unreal an incident, and so incongruous a character as Churchill Penwyn, it is undoubtedly defective. It is this dependence on a purely impossible incident and a wholly unnatural character for plot which distinguishes the merely good novel-writer from the best artists. But the rest of the story is not only true to life, the truthfulness of its portraiture is a considerable item in its interest, and the book as a whole may fairly rank with the best of the authoress's numerous works.

The Straits of Malacca, Indo-China, and China, by J. THOMPSON (Harper and Brothers), is one of those volumes of travel which are peculiarly characteristic of the latest phase of literature, and could not, indeed, have been produced except for the latest developments of civilization. Such a work presupposes an accessibility of remote regions which only modern travel has brought about, and a public interest in heathen and half-civilized forms of life which is the product of a broadening culture and a ripening liberality. If we have been "outside barbarians" to the "Celestials," they have been no less so to us, and it would be difficult to say whether the Chinese or the Anglo-Saxon wall has been the most impregnable. Mr. Thompson tells us in his title-page that his book is the product of ten years' travel, adventure, and residence abroad. He is a photographer, and the fact that he was invited to take the likeness of his Siamese Majesty indicates that he is a skillful one. His journal begins at Penang, on the Straits of Malacca, and carries us, by a succession of journeys, to Peking. It embraces an account of Malacca, Singapore, Bangkok, the ancient ruins of Cambodia, Hong-Kong, Shanghai, and Peking, together with a visit to the island of Formosa, and another to the interior of China, up the Yang-tse River. The author writes as one who is overburdened with material. His pages are crowded with the facts and incidents which he has witnessed, but are comparatively free from philosophical comment upon them. He writes without the poetry and humor which characterize most French travelers, but, perhaps for that very reason, his narrative is in appearance more truthful and trustworthy. "It has been my care," he says, "so to hold the mirror up to his [the reader's] gaze, that it may present to him if not always an agreeable, yet at least a faithful, impression of China and its inhabitants." This holding up of a mirror is by no means so easy a task as it appears to be, and the author's prejudices sometimes make a flaw in the glass that affects the picture. Making all due allowance, however, for these, his portraiture of the average Chinaman, as sensual, cunning, implacable, and an unhesitating liar, is not such as to commend very cordially that ethical system of Confucius which forms the theme of so many encomiums by certain of our purely theoretical moralists. Mr. Thompson's observations and descriptions are mainly confined to the life, the monuments, and the people of the lands which he visited; his volume contains comparatively little of scientific information. The illustrations are admirable; they are nearly seventy in number, and are taken from the author's sketches

and photographs. The book is, indeed, in an art point of view, one of the handsomest books of travel of the year.

Dr. JOHN W. DRAPER's *History of the Conflict between Religion and Science* (D. Appleton and Co.) has this much to commend it, that it undertakes to supply a widely felt want in literature, and that its author is a man of extensive erudition, though not always sound scholarship, and of scientific attainments, though not of religious sympathies. But he certainly does not possess that rare impartiality of mind which could alone enable an author to write a successful history of this conflict, and the work which he has written will be satisfactory only to the most extreme partisans in the controversy. It is, indeed, doubtful whether such a history can be written as yet, at least by any one writer—whether for its successful production we must not have the history of religion written from the one standpoint, and that of science from the other. Dr. Draper's language is always moderate and respectful, but he does not indicate that he understands what religion is, what function it assumes to fulfill, or what its most intelligent advocates claim it has accomplished. If he had entitled it "Romanism and Science," his title would have been more just, though less attractive. Indeed, he tells us in his preface with great frankness that he has had little to say respecting those two great Christian confessions, the Protestant and Greek Churches, and this because they have never arrayed themselves against the advancement of knowledge. On the same principle, he should have omitted from his history all mention of science, which has not arrayed itself against the development of man's moral and spiritual nature. There is as little reason for attributing religion exclusively to the Romish Church as there would

be for confining science to the investigations and hypotheses of a purely materialistic and atheistical philosophy. But even as a history of the conflict between Romanism and science it is impossible to accredit this volume with that impartiality which the author claims for it in his preface. We expect the brilliant advocate to close his own eyes and turn the eyes of the jury away from the evidence which is adverse to the verdict for which he pleads, but we have a right to expect that the historian of so important an issue as that indicated by the title of this book will not forget to mention that Copernicus, to whom more perhaps than to any other man the revolution in astronomical science is due, was a Roman Catholic ecclesiastic—canon of Frauenburg—and dedicated his great work to Pope Paul III.; and that to the Benedictines, the most important of the Roman Catholic orders of monks, we owe the preservation of learning, literature, and the fine arts during several centuries of ignorance; the guardianship not only of the Scriptures, but also of the works of such writers as Pliny, Sallust, and Cicero; the creation of Gothic architecture, and the invention of modern music, and the practical application, if not the invention, of scientific agriculture. Dr. Draper sees in religion only an impediment to the intellectual development of man, as some of the fathers, whom he so justly condemns, saw in science only an impediment to man's spiritual development. The true history of the conflict between science and religion can only be written by one who recognizes the truth that each has contributed to the progress of the race, and that the conflict between the two has grown out of the fact that the wisest men are partialists, and by their fears and their prejudices have created a conflict where there was no occasion for one.

Editor's Scientific Record.

SUMMARY OF SCIENTIFIC PROGRESS.

IN *Astronomy* we have the announcement during the month of January of the discovery of asteroids Nos. 139 and 140, the former found in October, by Professor Watson during his sojourn in Peking, and the discovery of which has but just been published; the latter, No. 140, was found at Berlin on the last day of the month. The rediscovery of asteroid No. 104, Clymene, by Dr. Leuther, is also equally worthy of mention, as the increasing number of these small planets renders it exceedingly difficult to keep track of them all; it is to be hoped that American astronomers will take an active part in this labor, which indeed specially devolves upon them, inasmuch as two of their number, Messrs. Watson and Peters, take so prominent a part in the discovery of new members of the asteroid group.

One of the most valuable contributions to the literature of the subject of auroras consists in the new general catalogue of Fritz of Zurich. This author having had the advantage of the use of the great catalogue of Lœwing, and of the smaller works of other authors, has added to these other later documents, some now for the first time rendered accessible, and has employed the same with a praiseworthy critical skill that

renders his catalogue invaluable to the student of these as yet unexplained phenomena. We have already spoken of his investigation into the geographical distribution of the aurora, and anticipate still further contributions from him.

To the study of earthquakes Suess of Vienna has contributed a valuable memoir on the earthquake of Southern Austria. He has in this paper given a careful study of three special earthquakes, and finally a collection of all available data referring to the phenomena in past history. Most highly interesting is his map, showing that the centres of earthquakes are in that country all arranged along certain straight lines or belts of country, which in one remarkable instance coincides with a river valley so perfectly as to afford a basis for very plausible speculations as to the dependence of the shock upon the infiltration of surface water.

In this connection we note that the Prussian government has authorized La Saulls to establish a large number of seismometric stations in the volcanic region near Bonn.

Mineralogical progress since our last has reference chiefly to the announcement of new species of minerals. The first to be mentioned is *miriquidite*, a name recently given by Frenzel to

a new mineral species found with chalcocite, pyromorphite, and other minerals at Schneeberg. It occurs in minute rhombohedral (R and $-\frac{1}{2}R$) crystals, and thus far no analysis has been made, owing to want of sufficient material, but qualitative experiments show it to be a hydrous basic compound of lead and iron with arsenic and phosphoric acids. It has the hardness of fluorite (4), and a dark yellowish to reddish-brown color.

Frenzel has shown that the little tufted or globular forms of silicate of bismuth occurring at Schneeberg and Johannegeorgenstadt are not isometric, but monoclinic, in crystalline form, and consequently he separates them from the old eulytite (isometric), and gives them the new name, *Agricolite*.

Allophite is a new hydrous silicate of alumina and magnesia, much resembling pseudophite, which Websky has found at Langenbielan, in Silesia. It occurs in dense microcrystalline masses, and it might perhaps be questioned whether it deserved a place as a new mineral species.

Ettringite is a new hydrous sulphate of alumina and lime described by Lehmann. In appearance and occurrence it resembles the new *chalcomorphite* of Vom Rath, but has a very different composition (*chalcomorphite* is a hydrous silicate of alumina and lime). *Ettringite* is found in minute needle-like crystals (hexagonal system) filling cavities in masses of limestone inclosed in the lava of Ettringen, not far from the famous Laacher See.

M. Ducloux has recently described in the *Comptes Rendus* a new mineral under the name of *riovolite*. It contains antimony, copper, carbonic acid, with a little silver, and the describer looks upon it as a compound of antimonie acid with carbonate of copper and silver. It is amorphous and compact, and of a yellowish or grayish-green color. It was found disseminated through a white limestone in the province of Lerida, France.

Another new mineral is the *meymacite* of Carnot. It is a hydrated tungstic acid (tungstite), and is supposed to have been made from the decomposition of tungstate of lime, scheelite. In some cases it preserves the form and even the structure of the original scheelite. Its characters are not very well defined, and it may hardly deserve an independent position. It is named from the locality, Meymac, where other minerals containing tungstic acid have been found.

In this connection it may be well to mention a related mineral, described some time since by Domeyko, and called cupro-tungstite. It is a true tungstate of copper, and is interesting in its relation to the cupro-scheelite of Whitney, found in California, and which was a scheelite containing considerable copper. The cupro-tungstite was found near Santiago, Chili.

The progress which is now being made in *Geology*, and the interest which is generally felt in it, are shown by nothing more clearly than by the large number of independent surveys which are now being carried forward in this country.

In addition to the several surveys of the Territories, prosecuted by the general government either through the Interior Department or the War Department, many of the older States are carrying on the same work for themselves. The novelties of the work in the latter case are few,

and the chances for surprising discoveries in the investigation of ground already pretty well known are smaller, and yet the general importance of such thorough work, both for science and for the economical interests of the State itself, can hardly be overestimated.

The geological survey of New Hampshire is now about completed, and the first volume of the final report has just appeared. The work has been carried on for some years under the charge of Professor Hitchcock, and has been and will be the means of bringing out many important facts in regard to the older crystalline rocks of New England—perhaps the most difficult of all problems in American geology. The finding of Helderberg fossils at Littleton, New Hampshire, which we owe to Professor Hitchcock, taken in connection with the locality of the same age long known at Bernardston, Massachusetts, of itself alone throws great light upon the condition of this portion of the country in those remote times. This same subject of the crystalline rocks will be still more elucidated in case the proposition for a new survey of Massachusetts, now before the Legislature, is decided favorably. The thoroughness which is contemplated for this survey will be seen from the fact that it is, as proposed, to continue for fifteen years, and to include not only geology, but also the several departments of biology. Those who have the subject in charge have suggested \$887,000 as about the amount which will be required to accomplish all that is proposed, including the preparation of the results of the work for the press.

In regard to the surveys of other States, that of Pennsylvania, under the charge of Professor Lesley, may be mentioned. It has now completed its first year of field work.

A State with such a wonderful store of mineral wealth may well afford a resurvey of its territory, especially in view of the great progress made in the science since its first survey was completed, in which, by-the-way, Professor Lesley himself took an active part. Missouri has recently published a geological report in 784 pages, containing many valuable facts, particularly in regard to her extensive lead mines. One probable conclusion drawn by Mr. Schmidt from the facts observed is especially important—that the occurrence of lead ore is not exclusively dependent upon the geological formation, but its deposition may have taken place simultaneously in similar rocks of different geological periods. This would make the origin of all the galenite later than the subcarboniferous.

A first report of the geology and agriculture of Texas has been made by Professor Buckley, State geologist, in which a general outline is given of what may be expected from a further prosecution of his labors. Professor Buckley is well known as an active botanist, and he embraces the occasion of his report to reply to some criticisms by Professor Asa Gray in regard to the validity of certain species of plants described by himself many years ago as new in the Proceedings of the Philadelphia Academy of Natural Science.

A meeting of the Board of Directors of the Geological Survey of New Jersey was recently held, in which Professor Cook presented his annual report.

The geologists accompanying the government

expeditions in the West are all in Washington, engaged respectively in making up their reports. Messrs. Gilbert and Howell, who have been connected with the survey of Lieutenant Wheeler, last year accompanied Major Powell. No material change in the corps connected with Dr. Hayden's labors has taken place. A report by Dr. Hayden of his explorations, geological and otherwise, in 1878, is about making its appearance from the government printing-office, and constitutes a very large volume, profusely illustrated with maps and sections, as well as representations of recent and fossil species of animals and plants, the whole making a work of extreme value.

The record of *Geographical Progress* since our last report is, as might be expected, quite meagre, especially in the United States, in view of the difficulties attendant upon such operations during the winter season.

Mr. Dall, to whose labors in Alaska we have referred on many occasions, is now in Washington, engaged in preparing his report, under the direction of the Coast Survey.

Dr. Emil Bessels, chief of the scientific corps of the *Polaris*, has nearly completed a first volume of his report, embracing the physical results of the Hall expedition, and it will probably be laid before Congress in a short time.

The report of the German arctic expedition, in which the *Germania* and the *Hansa* took part, has been completed, forming a series of volumes of much interest.

The scientific corps of the Austrian expedition under Payer and Weyprecht, whose safe return during the past autumn has been chronicled, is also occupied in preparing a report of their labors.

The note of preparation continues to be heard in regard to polar expeditions for the coming season. Of these, that to be undertaken by the English government is the most important, and no pains are being spared to make it a complete success. The vessels that have been selected for the purpose are now being fitted up with every appliance for the safety and comfort of the party; and officered, as they will be, by the most experienced members of the British naval service, accompanied by eminent scientific civilians, and having the experience of all previous expeditions, especially those of the *Polaris* and the *Tegethoff*, for their guidance, we may confidently look forward to a speedy solution of the remaining problems of polar search.

The German government also, it is understood, is fitting out an expedition for the same goal, but will attempt to reach it by a different route. The preparations in Austria toward a similar end have already been referred to.

It is much to be regretted that in this friendly rivalry America as yet shows no intention of taking part. It is, however, by no means too late to carry into effect the suggestion already made from many quarters of an American polar expedition by way of Behring Straits. With several government steamers already on the west coast, either in the service of the Coast Survey, the revenue department, or the navy, and with San Francisco as a suitable point for fitting out one or more of these for this mission, a fair chance still remains for a successful effort.

The opportunity could also be embraced of

exploring the comparatively little known region of Northern Alaska, and of solving the problems which exist in reference to Wrangell's Land. We have previously referred to the fact that the Arctic Ocean north of Behring Straits has for several years been remarkably free from ice, and that an American whaling captain has stated that he skirted along the coast of Wrangell's Land for many miles, and could readily have landed if it had been his business to do so.

Some details have recently been received from the *Challenger*, especially of her voyage from Melbourne to Hong-Kong, during which, as usual, the opportunity was embraced to prosecute the scientific inquiries intrusted to her corps. The most important result of her later movements was the discovery of several isolated basins in the ocean having a great depth in the centre (of between two and three thousand fathoms), with an unbroken rim rising sometimes to within a few hundred fathoms of the surface. This condition was found to produce a peculiar effect upon the deep-sea temperature. In nearly every instance the ocean temperature on the top of the ridges was found to continue, with very little change, to the very bottom, so that instead of a registry of 88° to 36° F., there was found even at a depth of 2000 fathoms or more a temperature sometimes as high as 50°. The explanation of this is of course very simple. The rims of the basins constitute a barrier to the entrance of the antarctic cold water flowing along the main floor of the ocean, and isolate their contents from its influence. Wherever the barrier was broken through, so as to permit the main current to penetrate, indications were found corresponding to those which generally accompany a great depth.

A second report of the operations of the *Challenger*, by Captain Nares, has lately been published by the Admiralty, detailing the observations made during the voyage between South Africa and Melbourne.

Reference has already been made to the starting out of the United States steamer *Tuscarora* for the purpose of making a second series of soundings for an ocean cable, this time between San Francisco and the Sandwich Islands. The *Hawaiian Gazette* of December 2 announces her arrival at Honolulu, and remarks that, in all, sixty-two casts of the sounding-line were made, the first near the Farallones, the water gradually deepening from that point to 2500 fathoms. In latitude 33° 10' and longitude 132° the depth began rapidly to diminish, showing 1417, 435, 413, and finally 385 fathoms in latitude 32° 58'. Numerous observations were made, which showed that there was a submarine peak rising about 2200 fathoms from the ocean bed. Beyond this, for a circuit of five miles around this peak, deep water was found in every direction, and a few miles from the peak 2500 fathoms were reached. From this the depth gradually increased, until in latitude 24°, longitude 132°, the depth was 3115 fathoms. This was only about four hundred miles from Honolulu.

The soundings brought up from the peak showed a mixture of lava and coral, which is supposed to be indicative of a submarine volcano. The temperature at the bottom was found to vary but little from 85° to 86° F.

The results of the survey, according to the

Gazette, are satisfactory, showing, if any thing, a better line between Honolulu and San Francisco than that from San Diego.

Among the more important recent American geographical publications is the report of Captain Jones, of the United States Engineers, of a reconnaissance in 1873 from Cheyenne, through Northern Wyoming, for the purpose of opening a shorter route from the line of the Union Pacific Railroad to Wyoming and Montana. This he discovered in the form of a natural pass in the Wind River Mountains, by which a railroad can readily be extended from Point of Rocks on the railroad, by way of the Yellowstone National Park to Fort Ellis, in Montana, shortening by many hundred miles the line of travel into Montana, and making perfectly easy a journey to the wonderful regions of the Yellowstone geysers and hot springs.

The report by General Comstock of his labors on the Northern lakes during the past year has also made its appearance.

Ethnology.—Mr. Charles C. Abbott figures and describes in *Nature*, January 7, two very striking examples of flame-shaped arrow or spear heads from New Jersey.

On the 22d of December, 1874, Colonel Lane Fox continued his interesting account of his classification of the objects of culture on the basis of evolution. The subject this time was "Early Modes of Navigation." Beginning with the simplest float or dug-out, the author traced the progress of boat-building through the "stitched-plank canoes, bark canoes, outrigger boats, double canoes, up to the more complex craft. The various parts of sailing apparatus were arranged and discussed. Colonel Fox inclines to the view that in its rudest condition the mind of man possesses little of subjective or inventive power, and that he has risen from step to step following the leading-strings of nature.

The last quarterly review of the progress of natural science, theoretical and practical, published by the editors of *Gaea*, Leipsic, 1875, is devoted to prehistoric times entirely.

There is a very interesting article in *Nature* of December 17, 1874, by Mr. E. B. Tylor, on the relation of race to species. The author very ingeniously applies the dotted diagrams of Mr. Francis Galton to illustrate the hypothetical and actual separation of a single race of animals into a species made up of several races, and thence into any number of separate species. One is forcibly reminded, in looking at the clusters of dots, of the process of reproduction by cell multiplication.

The *Geographical Magazine* of January, 1875, gives a very interesting account of the adventures of M. Miklucho Maklay, the indefatigable young Russian traveler, in New Guinea. He was sent out under the patronage of the Grand Duchess Helen. On the 2d of September he was landed on the island with two servants, a man and a boy. The natives fled in dismay, but afterward returned, bringing gifts of hogs, dogs, bananas, cocoa-nuts, sweet-potatoes, and other products, as soon as they became aware of his friendly intentions. The Russians returned the compliment by placing calico, gold paper, empty bottles, buttons, etc., on the shore, but the natives were too courteous to touch them (*Mirab. dict.*!). On the 9th of September the

ship left our traveler to his fate. For more than a year nothing was heard of him. At last, his friends becoming alarmed, a ship was ordered to look him up. He was found almost emaciated by fevers, his boy dead, and altogether about in despair. He has collected a fine lot of anthropological material, which is not yet published. From New Guinea he journeyed to the Moluccas and Philippines, thence to China and Batavia. At the end of 1873 he had made all his preparations to accompany a Dutch expedition to New Guinea, but was disappointed. When Captain Moresby met him in Amboina last June he was preparing to visit the Malay peninsula to study a race called Sunay, and supposed to be Papuans.

M. Gabriel de Mortillet furnishes the following elaborate scheme of the French stone age. The paleolithic age he divides into four epochs—St. Acheul, the oldest (type, almond-shaped flaked axe), Moustier (type, flint arrow-heads and scrapers, bilateral flake), Solutré (type, bay-leaf shaped arrow-head, bilateral chip), Madelaine (type, barbed bone arrows and flint knives). The neolithic age he calls the epoch of Robenhausen (type, polished stone axes, flint arrow-heads chipped serrate). The St. Acheul epoch is found in the lowland drift at St. Acheul, Abbeville, Thenné (Somme), Sotteville le Ronen (Lower Seine), Vandricourt (Pas-de-Calais), San Isidor (Madrid), and on the upland plateaux at Beaumont (Wien), Tilly (Allier), La Gaunterie (Côtes-du-Nord), Valées de la Sause et de la Gulonne (Haute Garonne). The climate was preglacial and moderate. The fauna embraced the hippopotamus, *Elephas antiquus*, and men of the lowest type, *e. g.*, at Neanderthal, Engisheim, Naulette, Denise. The Moustier epoch is found in remains of caves and open places at Moustier (Dordogne), Chez Pourc (Corrèze), La Martinière et l'Ermitage (Vienne), La Mère Grande (Saône-et-Loire), Buoux (Vaucluse), Neuron (Ardèche), Goudenins-les-Moulins (Doubs), Cœuvres (Aisne), Breches de Genay et Mene-treux-le-Pitois (Côte d'Or), in the upper drift at Grenelle, Levallois, Clichy (Seine), Le Pecq (Seine-et-Oise), Montgouillain (Oise). The climate was glacial, cold, and moist. Cave-bears begin to abound, and rhinoceros. Dolicho-cephalic men of low type, *e. g.*, at Engis and L'Olmo. The Solutré epoch is found in remains of open places, shelters, and caves at Solutré (Saône-et-Loire), Laugerie Haute, Badegols, St. Martin d'Exedeuil (Dordogne). The climate was cold and dry. Brachycephalic and meso-cephalic races of men are represented at La Lesse, Cro-Magnon, Laugerie Basse, Baoussé-Roussé, and Solutré. The Madelaine epoch is found in caves and rock shelters at La Madelaine, Les Eyzies, Laugerie Basse (Dordogne), Bruniquel (Tarn-et-Garonne), Massat (Ariège), Montrejeau (Haute Garonne), Aurensan (Hautes Pyrenées), Marceint (Lot), Les Morts, Champs et Puy de Lacan (Corrèze), Le Placard (Charente), Arcy (Toné), Salève (Haute Savoie), Le Sci (Vaud), Baoussé-Roussé (Viatimille), Furfooz (Dinant). The climate was post-glacial; in France reindeer, aurochs, and urus abounded; in Belgium mammoths, hyenas, and lions. The epoch of Robenhausen is found in the Swiss lake dwellings at Robenhausen and Meilen (Zurich), Mooséedorf (Bern), St. Aubin (Neuchatel), Concise (Band), Clair-

vaux (Jura), Wangen (Lake Constance); in dolmens at Morbihan and over the whole of Bretagne, at Argenteuil and La Justice (Seine-et-Oise). Workshops or remains of industrial pursuits are found at Grand Pressigny (Indre-et-Loire), Camp Barbet (Oise), Londinières (Lower Seine), Spienne (Mons), Vibrata (Ascoli); of camps or oppida, at Chassey (Saône-et-Loire), Hastodon (Namur). The climate was very similar to that now existing. Brachycephalic and dolichocephalic races strongly intermixed.

Among recent discoveries in *Zoology* may be mentioned the "new" sea-worms (*Annelida*) discovered by the *Porcupine* expedition at great depths in the Atlantic Ocean, which are being examined and described by Mr. McIntosh.

At the last meeting of the National Academy of Sciences, held at Philadelphia, a paper by Dr. Packard was read regarding a new organ discovered in the king-crab (*Limulus*), and supposed to be renal in its nature, and the homologue of the "green gland" in the lobster, and possibly of the segmental organs of the worms.

Dr. Leconte has published in the *American Naturalist* an additional note regarding the weevils and their classification, read by him at the Philadelphia meeting of the National Academy. He has also published in the *Canadian Entomologist* some judicious remarks on the subject of nomenclature, a matter on which entomologists as well as naturalists generally are much divided.

Another contribution to the subject of mimicry in insects has been afforded by Mrs. Barber, of South Africa, especially as regards the color of the pupa of *Papilio nixus* in connection with the objects on which it was placed, as it appeared to assume a protective resemblance to the leaves or other adjacent organs. The question being raised as to whether some photographic influences had been at work, Mr. Meldola stated that no known substances retained permanently the color reflected on it by adjacent objects, but that there was no difficulty in believing that larvæ might become affected in color by the coloring matter of the food plant, since chlorophyll in an unaltered condition had been found in the tissues of green larvæ. (The remarks were made at a late meeting of the Entomological Society of London.)

In the ninth of a series of valuable papers, communicated by Hermann Müller on the fertilization of flowers by insects, to *Nature*, he shows that butterflies effect the cross-fertilization of Alpine orchids. It seems that from twelve to fifteen per cent. of the orchids of the lowlands are fertilized by Lepidoptera, while from sixty to eighty per cent. of Alpine orchids are fertilized by the same kind of insects. This corroborates, he says, his view that the predominant frequency of butterflies in the Alpine region must have influenced the adaptations of Alpine flowers.

Müller has also shown the wonderful modification brought about in the legs and mouth parts of bees by their efforts in fertilizing flowers.

Lubbock's charming little book on *British Wild Flowers considered in Relation to Insects* has just appeared. He says that while from time immemorial we have known that flowers are of great importance to insects, it is only comparatively late that we have realized how important insects are to flowers. "For it is not too much to say that if, on the one hand, flowers

are in many cases necessary to the existence of insects, insects, on the other hand, are still more indispensable to the very existence of flowers.... There has thus been an interaction of insects upon flowers and of flowers upon insects, resulting in the gradual modification of both."

In another place he adopts the startling and probably correct view that to bees and other insects "we owe the beauty of our gardens, the sweetness of our fields. To them flowers are indebted for their scent and color—nay, for their very existence, in its present form. Not only have the present shape and outlines, the brilliant colors, the sweet scent, and the honey of flowers been gradually developed through the unconscious selection exercised by insects, but the very arrangement of the colors, the circular bands and radiating lines, the form, size, and position of the petals, the relative situations of the stamens and pistil, are all arranged with reference to the visits of insects, and in such a manner as to insure the grand object which these visits are destined to effect."

Lubbock has also continued his observations on the intelligence of insects. He confirms his conclusions presented last year to the Linnæan Society that bees can distinguish colors. He then recounts some experiments on the sense of smell possessed by bees, on the power of recognizing their own companions, and on the different occupations of different bees, mentioning observations which seem to show that the bees act as nurses during the first few weeks of their life, and only subsequently take to collecting honey and pollen. He also records a number of experiments on ants, which certainly seemed to show that whatever may be the case with bees, ants do possess the power of communicating detailed facts to one another.

M. Dareste, in continuing his researches on double or twin monsters, says that after submitting nearly 8000 hens' eggs to the process of artificial incubation, he obtained nearly 4000 monstrosities, but of these only about thirty were double embryos or twin monstrosities. A similar result has been obtained in the case of osseous fishes.

Mr. Mivart has been studying the skeletons of the family of ostriches. He points out that the *Emeu* differs the least from the type of the family, while *Rhea* diverges most on the one side and *Apteryx* on the other, and the axial skeleton of *Dinornis* is intermediate between that of *Cassuarus* and *Apteryx*, with predominating affinities to the existing New Zealand form. A paper on North American mice (*Muridae*) has been published by Dr. Coues.

A not uninteresting zoological fact is the discovery, on the Funk Islands, off the coast of Newfoundland, of bones of the great auk, a species which, although at one time extremely abundant on the northeastern coast of North America, has been extinct for many years. These specimens were found in a guano deposit, but unfortunately are not as well preserved as two skeletons obtained in the same locality a few years ago, one of which passed into the possession of the Museum of Comparative Zoology at Cambridge, and the other into that of the British Museum.

Even more than the usual progress has been made in the subject of *Fish-culture* since our last

reference to it, especially in the better appreciation of the method which is gradually developing itself of hatching the eggs of fish on a very large scale with a very small amount of water. For a number of years past it has been an established principle that it is improper to attempt the transfer of the eggs of fish from one point to another until the embryonic development of the fish has proceeded so far as to permit the eyes to be seen through the egg-shell as two dark specks. After this they can be packed in damp moss (especially eggs of trout and salmon), and kept out of running water, either in a hatching house or in transit, until the full period of development is complete, and the young fish bursts from its envelope. Should this happen while packed in moss or other material, the death of the fish would speedily follow; but if transferred to the water just previously, all the necessary requirements will be met. Indeed, the development would seem to be more certain and entire under the conditions referred to.

To retard the development of eggs, so as to secure their arrival at destination before hatching, it has been customary to keep the mass cool by the application of ice to the top of the box containing them, the melting ice trickling through the interior and maintaining a depression of temperature.

Until recently this method of manipulation has only been made use of for the special purpose of the transportation of eggs, but the idea of employing the principle for general hatching purposes has suggested itself both to Mr. N. W. Clarke, of Northville, Michigan, and to Mr. Seth Green, both of them well known and accomplished pisciculturists. A patent for the device was granted to Mr. Clarke in March, 1874. It is quite probable that in future the method of what may be called "moist development" of eggs will be very extensively employed, since the furnishing of a considerable supply of cold spring water will no longer be required. Indeed, ordinary hydrant water can be used, provided such a quantity of ice be employed as is requisite to keep the eggs at a proper temperature.

The arrangement indicated by Mr. Clarke consists in placing the eggs in layers in trays having either gauze bottoms or those of perforated metal, and arranging these one above the other in a box, perhaps with layers of moss or sponge between, care being taken that there be no undue pressure upon the trays or eggs. Melting ice kept in the top of the boxes, or a small quantity of cold water allowed to trickle from the top, after passing through the moss and over the eggs, drops off below. By varying the temperature the development can be accelerated or retarded, so that, should it be deemed expedient, the hatching of the eggs may be deferred for a month or more beyond the usual time. The practicability of such a retardation has been shown in the experiment of shipping salmon eggs to New Zealand, in which, by arranging the eggs as mentioned, in layers, with moss between, and placing boxes and masses of ice two feet thick alternately in a large ice chest, the whole containing from thirty to forty tons of ice, the eggs were transported successfully, a refrigeration being produced which continued while the ice remained unmelted; and in one instance, after a voyage of six months, the eggs were still

undeveloped and in good condition, hatching soon after being transferred to the hatching troughs in New Zealand.

A further experiment of this kind has just been made, in the shipment of 250,000 salmon eggs, together with a number of those of the trout and char, from Glasgow to New Zealand in the ship *Timara*, which left the Clyde on the 14th of January last. A similar transmission has also been made to the Cape of Good Hope.

Botany.—A valuable paper on the distribution of ferns in North America has just been published by Mr. John H. Redfield in the Bulletin of the Torrey Botanical Club, in which the proportion of species peculiar to one or another part of North America, and those common to certain portions of North America and other parts of the world, are indicated. One important result is the confirmation of Professor Gray's generalization in regard to the close relationship of the plants of Western North America to those of Central and Eastern Asia, this being much more intimate than that which exists between the plants of Eastern North America and Western Europe.

Mrs. Mary Treat has published an account of her investigations upon the bladderwort, a species of the genus *Utricularia*, floating or submerged plants characterized by the attachment of little bladders along the stem, which at one time were believed to be floats to sustain the plant in the water. Mrs. Treat now considers them to be sacs for entrapping various forms of larvae and other animal forms, digesting them, and converting them into food, as is now believed to be done by plants of the genus *Sarracenia*, *Nepenthes*, *Drosera*, etc.

Chicago has followed the lead of older cities in establishing a botanic garden, the Commissioners of Parks having granted sixty acres for the purpose, and placed the enterprise under competent scientific supervision. It is hoped that in time a large collection of living plants will be brought together, especially of those indigenous to North America. The Royal Gardens at Kew, near London, have been taken as a model for this establishment, and, as at Kew, a herbarium and specimens of the products of the vegetable kingdom will also be brought together.

In the field of *Engineering* the events of the past month are quite noteworthy as bearing an important relation to a number of prominent projects of internal improvement.

The Senate Committee on Transportation, which have been for some time considering the merits of the two rival schemes for opening the mouths of the Mississippi, viz., the Fort St. Philip ship-canal project and Captain Eads's plan for the building of jetties, it is understood, have finally decided in favor of the latter. This decision was doubtless influenced by the report of the board of engineers, appointed some time since to examine the subject, which was an almost unanimous indorsement and recommendation of the jetty system, based upon a careful observation of its operations in Europe, where it has been introduced at the mouths of nearly all the great rivers. Captain Eads has proposed to execute and guarantee the work for \$11,000,000.

Opposed to projects of this nature are the several schemes for hastening the completion of the several unfinished transcontinental railways, the advocates of which are likewise desirous of aid

from the Federal government. Thus far, however, no definite action has been taken by Congress.

Schemes for improving the facilities for water navigation appear just now to be in high favor. The so-called Cape Cod ship-canal, a project that has been mooted since the year 1862, is again on the tapis. The proposed canal is designed to cut the peninsula of Barnstable from the main-land of Massachusetts, and to establish a water communication across Cape Cod between Barnstable and Buzzard's bays. The completion of this work, it is claimed, would cut off a long stretch (about a hundred miles) of dangerous navigation on an exposed coast to vessels bound to or from Boston. The length of the proposed channel would be about eight miles.

Another mooted enterprise is the Maryland and Delaware ship-canal, which is designed to connect the waters of the Delaware and Chesapeake bays by utilizing the Sassafras River. The length of the proposed cut is about seventeen miles, and it is claimed that an open route is practicable, without the use of locks, the waters of the two bays being at about the same level.

While upon this subject it is of interest to note the fact that the government appears to be still intent upon the solution of the problem of an interoceanic water-way across the isthmus that joins North and South America. Two surveying parties under government patronage are now *en route* to this field of action. One of them will survey a tract of land on the Isthmus of Darien, and the other a portion of the Isthmus of Panama. When these are completed, six surveys of the isthmus will have been made.

The Suez Canal Company is lengthening the western mole of Port Said, and clearing away the deposit which on that side of the entrance was fast encroaching upon the somewhat narrow channel leading into the port. It is intended to carry the breakwater on that side out into six fathoms of water. The entire work of improvement will not be completed for some years.

The rapid transit problem is just now attracting much attention in New York. The committee lately appointed by the American Society of Civil Engineers to examine and report upon the merits of this question have had no less than seventy plans presented to them, of which they pronounce all but six to be impracticable. Several meetings of citizens have lately been held for the furtherance of this object. One of the most complete of these projects is the so-called marginal railway upon each side of the city, which would facilitate the removal of freights as well as passengers. This plan appears to find many supporters, but it is objected to it that it is costly, and that it can not be realized until the stone docks, now in course of completion, are finished. A committee of the Civil Engineers' Society have submitted to the Mayor of the city a plan and report on this urgent subject, in which they favor the above-named rapid transit routes along the two rivers, either above or under ground, but consider that until it shall be found feasible to construct them the elevated railway along Greenwich Street and Ninth Avenue should be extended to Harlem, and furnished with a double track.

It will not be amiss to note also the recent establishment of another iron ship yard on the Delaware. The new enterprise is styled the

New York and Philadelphia Engineering and Iron Ship-building Works, and is located at Bordentown, twenty-seven miles above Philadelphia.

An important gathering of parties interested in the construction of a New England line to the coal-fields was lately held at Pine Bush, on the New Jersey Midland Railroad. The proposed new road is designed to connect Boston and New England with the coal-fields and the West, by way of Poughkeepsie. The result of the conference is understood to have been favorable to the enterprise, and it is anticipated that the construction of the necessary links between existing roads will be speedily taken in hand.

It is reported that work has already been inaugurated upon a new railway tunnel under the Hudson River, between New York and Jersey City. The vertical shaft has already reached a considerable depth, and is located near the river shore at the foot of Fifteenth Street, Jersey City, from which point the tunnel will extend across under the Hudson, to or near the foot of Canal Street, New York, and thence up Canal Street to a connection with the Broadway Under-ground Railway. The actual length of the tunnel will, according to the statements of the local press, not be less than 6000 feet. The tunneling work will be attempted upon a plan invented by Mr. D. C. Haskin, the distinguishing novelty of which resides in that, instead of using temporary facings of timber or other rigid material, an air pressure (which may be varied, according to the exigencies of the case, up to fifty pounds to the square inch) alone is relied upon to resist the caving in of the wall or the infiltration of water until the masonry wall is completed.

The statement is made that a contract has been effected to build a railroad on the Crew prismoidal one-track system, described some months since in these columns, from the dépôt in Austin, Texas, to some quarries near that city. In a similar connection we glean from foreign sources that a system of steam towage is about to be established on the Bourgogne Canal, in Belgium, over a distance of 150 miles. A single-rail system will be adopted, which possesses many peculiar features. The locomotives will weigh about four tons each, and are expected to draw boats laden with a cargo of 150 tons at the rate of not less than three miles per hour. The system is said to have already been satisfactorily experimented upon for short distances, and the inventor, M. Larmangat, has obtained a concession for its extended introduction for a period of years.

Another interesting trial of the Henderson hydraulic car brake was made a few days since on the Philadelphia and Westchester Railroad, with a special train carrying a large party of engineers and gentlemen prominent in railway matters. The results of the trial tests are said to have been quite satisfactory. The advocates of the hydraulic system for train brakes, it may be noted, claim decided advantages in point of simplicity and economy over the atmospheric systems which are now largely employed.

The railroad journals report the construction of twenty-one and a half miles of railroad for the month of January, 1875. From abroad we have, in connection with railway news, the in-

formation that the Shah of Persia has granted a railway concession to the Russian General Falkenhagen, notwithstanding his existing concession to the Baron Reuter. A protest has been lodged by the last-named gentleman at Teheran, which, it is stated, will be formally supported by the British minister to Persia, under instructions from his government.

The *Engineering and Mining Journal*, which appears to have been at much pains to obtain correct information, gives the following as the production of anthracite coal in 1874:

	Tons.
Total out-put of Wyoming region.....	10,904,764
" " Lehigh "	4,712,280
" " Schuylkill "	6,714,074
" " Sullivan "	86,268
Total production of all the regions..	21,667,886

These figures show but a slight falling off from those of 1873, notwithstanding the great depression which prevailed during the year in the iron and manufacturing trades that usually consume so large a proportion of anthracite.

The following table, given on the authority of Mr. J. J. Valentine, general superintendent of Wells, Fargo, and Co., is a statement of the value of the precious metals produced in the States and Territories west of the Missouri River, including British Columbia, during the year 1874. The figures show an excess of \$2,142,862 over 1873:

States and Territories.	Value produced.
California	\$20,800,581
Nevada	85,452,223
Oregon	609,070
Washington	155,535
Idaho	1,880,804
Montana	3,439,498
Utah	5,911,278
Arizona	26,066
Colorado	4,191,405
Mexico.....	793,878
British Columbia.....	1,636,557
Grand total.....	\$74,401,055

The following current items in *Mechanics and Technology* are noteworthy:

The Messrs. Baird, of Gartsherrie, Scotland, have built a large establishment exclusively for

the manufacture of coal-cutting machinery. This phase of the coal question appears to be making slow but certain progress abroad.

The experimental trial at Sandy Hook of the altered piece of ordnance, to which subject we made reference in our last month's summary, appears to have terminated satisfactorily. A late message from the President to Congress makes the following allusion: "I herewith inclose copies of a report of the Chief of Ordnance and of a board of ordnance officers on the trial of an eight-inch rifled cannon converted from a ten-inch smooth-bore, which shows very conclusively an economical means of utilizing these useless pieces by making them into eight-inch rifles capable of piercing seven inches of iron. The 1294 ten-inch Rodman guns should, in my opinion, be so utilized."

The Edinson electro-motograph was lately explained and exhibited in operation at a meeting of the Society of Telegraphic Engineers in London, where it produced a marked sensation.

M. Gramme, in a communication to the French Academy, claims to have effected substantial improvements in the electric machines that bear his name, by the employment of the new thin plate magnets of M. Jamin. The new electro-galvanic machines have only one central ring instead of two, and two electro-magnets in place of four in the former machines. They weigh only 890 pounds instead of 1650 pounds.

The discovery of a great *bonanza*, or body of ore, of altogether unprecedented richness is just now the theme of all who are interested in *Mining*. The new developments were made on the famous Comstock lode, and have created a perfect furor in the San Francisco stock market.

Among the deaths of men of science, or of those interested in its advancement, since our last report are those of Professor Zetterstedt, of Sweden, an indefatigable entomologist; Mr. Francis Walker, of the British Museum; Mr. Henry Leste, Mr. H. J. Burkhart, and Mr. Johan H. Platt, known in geographical circles; and Mr. Israel S. Diehl and James S. Roome, in the United States.

Editor's Historical Record.

POLITICAL.

OUR Record is closed on the 23d of February. —The business actually accomplished by Congress during the month may be very briefly summarized. The Legislative, Executive, and Judicial Appropriation Bill, appropriating nearly \$19,000,000, was passed by the Senate January 18; also, the same day, the Fortification Bill, appropriating \$750,000, which is the smallest sum devoted to that purpose since the war. The House, February 9, passed the Indian Appropriation Bill, with the Choctaw claim stricken out. The Army Bill, appropriating \$27,000,000, was passed by the House February 19. On the 18th the House passed a bill for the improvement, by the jetty system, of the mouths of the Mississippi River. The Post-office Bill, appropriating \$37,524,361, was reported in the House February 10, an amendment thereto being unanimously adopted repealing the law of 1872 for

additional mail steam-ship service to China and Japan. The Portland, Dallas, and Salt Lake Railroad and Telegraph Bill was rejected by the Senate February 12. The River and Harbor Appropriation Bill was passed by the House February 22.

The new tax bill for the increase of revenues was reported to the House by the Committee of Ways and Means February 10. It proposes to tax all distilled spirits, on which the existing tax shall not be paid at the date of the passage of the bill, \$1 per gallon, whether in distilleries or bonded warehouses or not, and an additional tax of fifteen cents a gallon on all spirits in warehouses, etc., on which the existing tax shall be paid between now and the passage of this act. The tax on imported liquors is to be \$2 50 a gallon. The tax on tobacco is to be increased from twenty to twenty-four cents a pound. The ten per cent. horizontal reduction on manufactured

to be repealed, and the stamp tax on lucifer-matches to be abolished.

No definite action has been taken by Congress in regard to Louisiana, except the tabling by the Senate, February 18, of Mr. Morton's resolution for the admission of Mr. Pinchback to the Senate. The President, February 8, sent a message to Congress relating to Arkansas, taking the ground that Mr. Brooks was lawfully elected Governor in 1872, and that the new constitution adopted in 1874 and the government established thereunder are illegal. The President asked for definite action by Congress "to relieve the Executive from acting upon questions which should be decided by the legislative branch of the government."

The Civil Rights Bill was passed by the House February 5, amended by the omission of that part of the bill which relates to schools.

The proposed reciprocity treaty with Canada was rejected by the Senate February 8.

The House, February 2, by a vote of 171 to 85, adopted the following new rule:

"Whenever a question is pending before the House the Speaker shall not entertain any motion of a dilatory character except one motion to adjourn and one motion to fix the day to which the House shall adjourn; but the previous question on the engrossment and the third reading of any bill or joint resolution shall not be ordered during the first day of its consideration unless two-thirds of the members present shall second the demand: provided, that this rule shall not apply to House resolutions offered in the morning hour of Monday: and provided further, that it shall not apply to any proposition to appropriate the money, the credit, or other property of the United States, except the regular annual appropriation bills."

The Senate, February 8, confirmed the nomination of John L. Routt, of Illinois, for Governor of Colorado.

President Grant has issued a proclamation convening the Senate in extraordinary session on the 5th of March.

The following new Senators have been elected: I. P. Christiancy, from Michigan; General A. E. Burnside, from Rhode Island; ex-President Andrew Johnson, from Tennessee; Angus Cameron, from Wisconsin; S. J. R. M'Millen, from Minnesota.

The Connecticut Democratic State Convention, at Hartford, February 16, renominated the entire State ticket.

The public debt was increased \$1,397,870 during the month of January.

In the French Assembly considerable progress has been made in the debate on the constitutional project submitted by the Committee of Thirty, known as the Ventavon Bill. An amendment giving the President, with the advice and consent of the Senate, power to dissolve the Chamber of Deputies was passed February 2. The next day the clauses making ministers responsible and declaring Versailles the seat of government were passed. The bill for the organization of the Senate came up February 11, and precipitated a crisis. An amendment providing that Senators should be chosen by the same electors as the Deputies in the Lower Chamber, i. e., by universal suffrage, was adopted, 322 to 310. The next day the floor and galleries of the Assembly were crowded. General De Cisse ascended the tribune and declared the dissent of the government from the action of the Assembly on the previous day. A stormy debate followed.

An amendment was adopted providing that each department elect three Senators. This was incorporated with the amendment passed the day before, and the entire amendment was passed, 386 to 253. Finally, a motion to proceed to a third reading of the bill was rejected by a vote of 345 yeas to 357 nays. This was the end of the Senate Bill. The ministers resigned, and it was found impossible to form a new cabinet until definite action should be taken on the Ventavon Bill. The Committee of Thirty, February 22, reported on the new projects for the organization of the Senate. An amendment was adopted providing that the Senate consist of 300 members, of whom the departments and colonies should elect 225 and the Assembly 75.

King Alfonso of Spain is making a vigorous campaign against the Carlists.

The English Liberals on the 3d of February chose the Marquis of Hartington for their leader.—Parliament re-assembled on the 5th. The Queen, in her Speech, recommended the repeal of exceptional statutes in relation to the peace of Ireland, the enactment of laws for the transfer of land, and the reconstruction of the judiciary; also the passage of acts for the improvement of the dwellings of the working classes, for the consolidation of the sanitary laws, to prevent the pollution of rivers, and for the establishment of the office of Public Prosecutor.—Among the members returned to Parliament was John Mitchell, from Tipperary, Ireland. On Mr. Disraeli's motion he was refused admission.

The governments of the various states of the German Empire are investigating the causes of emigration. They will endeavor to remove them by facilitating the acquirement of small estates, and by opposing the action of emigration agents paid by the transatlantic governments.

DISASTERS.

February 15.—Extensive fire at Port-au-Prince, Hayti. Five hundred houses burned.

February 19.—Burning of a match factory in Gottenburg, Sweden. Fifty-one lives lost.

OBITUARY.

January 25.—In Fitchburg, Massachusetts, the Rev. George F. Trask, the well-known anti-tobacco apostle, aged seventy-eight years.

February 4.—In Norwich, Connecticut, William A. Buckingham, ex-Governor of Connecticut, and United States Senator from that State, aged seventy-one years.

February 7.—At Yonkers, New York, Joseph O. Eaton, a well-known portrait painter, aged forty-six years.—In Boston Harbor, Fort Independence, Brigadier-General William Hays, U.S.A.

February 18.—In Washington, D. C., Samuel Hooper, member of Congress from Massachusetts, in his sixty-seventh year.

February 19.—At New Brunswick, New Jersey, Rear-Admiral Charles H. Bell, U.S.N., aged seventy-seven years.

January 12.—Toung-tchi, Emperor of China, aged nineteen years.

January 20.—At Barbison, France, Jean François Millet, a celebrated painter, aged sixty years.

January 24.—In London, England, the Rev. Charles Kingsley, Canon of Westminster, in his fifty-sixth year.

Editor's Drawer.

IT is believed that no man ever lived who had at his tongue's end a greater fund of vivacious anecdotes, or one who could apply them with greater effect, than President Lincoln. Whether these inimitably droll stories, which were redundant with racy humor and sparkling wit, were collected among the idiosyncratic characters with whom he was thrown in contact during his itinerant professional career in the West, or were the spontaneous conceptions of his own eminently prolific imagination, has been a mooted question. Many, however, for the reason that they never heard them before, have accepted the latter hypothesis.

Hundreds of instances might be adduced where appeals to Mr. Lincoln's executive clemency were favorably responded to during the rebellion, and the hearts of many poor widows and orphans were gladdened by the discharge from service of their sons, brothers, or fathers, whose presence at home the President had been induced to believe was absolutely necessary to save their families from extreme destitution and suffering; and these commiserating tendencies of his nature were affirmed by the fact of his reluctance, during the incipient stages of the war, to approve the sentences of courts-martial for the execution of deserters. His frequent visits to the hospitals, and the kind interest he invariably manifested in the comfort of the patients, exercised a most happy and cheering effect upon the drooping spirits of the sick and wounded. Indeed, it is but an act of justice to add that his active practical beneficence was every where felt and acknowledged throughout the army.

He probably never heard of many of the current tales the authorship of which has been attributed to him, but the incidents which follow are not fancy sketches; they are actual occurrences that have been vouched for to the writer by responsible men who witnessed them:

As the President was passing through the wards of a hospital near Washington upon one occasion he observed in one of the beds a young soldier whose pallid countenance and expressionless glassy eyes betokened great physical and mental prostration, and he inquired of the attending surgeon if there was any prospect of his ultimate recovery.

"Not the slightest," replied the doctor. "His vital powers are rapidly ebbing away, and will soon be exhausted."

"I am heartily sorry for the poor boy," said Mr. Lincoln, "and I should like to do something to make his last hours pass as comfortably as possible. Would there be any harm in my speaking to him?" added he. And upon being assured there would not, he sat down by the bedside, and taking the young man's hand, in the kindest possible tone of voice said, "My young friend, I am the President of the United States, and am informed by the doctor that you can not possibly live but a short time. Now if there is any request you would like to make in regard to your family, it will afford me very great satisfaction to comply with it."

The youth turned his dim eyes toward the President, but made no response until the question was repeated, when, with great effort, he

succeeded in giving articulation to his thanks, and expressed an earnest desire to see his aged grandmother, who, he said, was then living in Bangor, Maine.

The President, after assuring him that every effort should be made to gratify his wishes, bade him a kind adieu, and calling the medical officer aside, asked if there was any prospect of the young man's surviving until the old lady could be telegraphed to and come to Washington, and he seemed a good deal perplexed on being told there was no hope of this; but after a moment's reflection, he said the only expedient that occurred to him under the circumstances was the exercise of a little of that harmless strategy which was always allowable in war times; that if he could only find some old woman who would consent to personate the grandmother, the boy was in such a state of lethargy that he would not probably detect the deception, and would die with the consoling belief that he had received the parting benediction of his aged relative.

"That would certainly be a perfectly justifiable device," replied the surgeon; "but where will you find the elderly female to enact the part of the grandmother?"

"Let me see," soliloquized Mr. Lincoln, holding up his left hand while he enumerated with the index finger of the right hand: "there is old Mrs. B——r, old Mrs. S——k, and old Mrs. M——s; they are all most benevolent ladies, but I am apprehensive they could not be prevailed upon to undertake any thing which involved the faintest shadow of deception. No, no," continued he, "there is no hope from that direction; but if I could only induce my venerable friend Gideon Welles to personate the old lady, in suitable costume, the object would be attained, and nobody harmed."

"But," remarked the doctor, "Mr. Welles's long white beard would at once expose the artifice."

"That can all be obviated by his wearing a night-cap, tied down so as to cover up the beard," said the President. Accordingly he sat down at once and addressed a note to the Secretary of the Navy, begging him, as a special favor, to comply with the request at as early a moment as practicable, as the boy's hours were numbered.

Now it so happened when the Secretary received this communication he was busily engaged in official transactions, which, in his opinion, were of so much consequence that they could not be postponed for any thing else, and he replied that he entertained a high appreciation of the honor conferred upon him by the President's selecting him to perform the chief rôle in the sad little drama indicated, but unfortunately he was at that very moment deeply absorbed in the solution of the difficult problem as to whether Noah's ark or the new model gunboat was best adapted to the purposes of modern warfare.

The sympathetic instincts of Mr. Lincoln's nature were so predominating that it was difficult for him to refuse a plausible petition from any one who appealed to his commiseration; and when he found himself obliged to reject a re-

quest, he almost invariably adduced a parallel of such laughable character from some event within his own diversified experience that it seldom failed to put the applicant in good humor, so that very few ever left him with displeasure.

One day during the war a clerk from the Adjutant-General's Office, whose name was *not* Smith (but as this will serve our purposes as well as any other, we will so designate him), called at the White House, and having been admitted to Mr. Lincoln's presence, stated to him that he had for a good while been discharging the duties devolving upon his clerical position, and he flattered himself that the knowledge he had thereby attained qualified him for the performance of the higher functions of an Assistant Adjutant-General, which office he most respectfully but urgently solicited.

The President replied, "I have no doubt, Mr. Smith, that you are all you represent yourself to be, although some people might think other qualifications besides that of being a good clerk are requisite to make an Assistant Adjutant-General. Do you know whether there are any vacancies in the Adjutant-General's Office at this time?" added he.

"There are none," replied he; "but it has occurred to me that I might be appointed, and assigned to the staff of some general officer commanding a corps, division, or brigade."

"Exactly," said Mr. Lincoln; "but has any corps, division, or brigade commander applied for you on his staff?"

"Not that I am aware of," was the answer.

"Well, Sir, do you know of any general officer who wants you upon his staff?" asked the President.

"I can not say that I do at this time, Sir," replied he.

"Then," said Mr. Lincoln, "it seems to me that you might just as well ask me to marry you to a woman who didn't want you as to expect me to send you to a general who didn't want a clerk promoted from the Adjutant-General's Office; and if I were to force any general to take you against his wishes, I reckon he would have as good cause to apply for a divorce as the woman would have who didn't want a husband: so that it looks to me, Smith, as if you had better remain where you are in the Adjutant-General's Office until somebody wants you elsewhere."

ANOTHER war incident illustrative of President Lincoln's colloquial idiosyncrasies:

It will be remembered that while General Grant was investing Petersburg the President paid a visit to City Point for the purpose of witnessing the progress of military operations in that quarter. It will also be remembered that at this eventful juncture the public was with breathless anxiety watching every proceeding which had the least bearing upon the issue of the siege.

Shortly after Mr. Lincoln's arrival at City Point, while he was engaged in conversation with a group of officers around him, a distant musket-shot was heard from the direction of General Parke's corps, which then occupied the right of our lines, about two miles from City Point. Soon after this the report of another shot came, then followed several others in rapid succession, and directly afterward volleys were fired, interspersed with occasional discharges of cannon, all from nearly

the same direction (Parke's position). The President for a few minutes manifested considerable anxiety, remarking that he could not understand why Parke had not, as he promised, informed him if any thing of importance occurred in his vicinity.

The officers could not account for the firing, as they felt quite confident no considerable force of the enemy could have made its appearance near General Parke's corps.

In a short time, however, the firing ceased, and the President, feeling no further apprehension of danger, went to bed.

Early on the following morning my informant, Colonel P——e, accompanied by General N——s, rode over to Parke's head-quarters to ascertain the cause of the firing, when they learned that it was occasioned by a careless recruit, who, about dusk, accidentally discharged his musket near one flank of the line, which was soon responded to by an equally verdant tyro at some other point, and this was immediately followed by other pattering shots along the entire line, so that in a few minutes quite an imaginary battle was inaugurated, and in the darkness which soon obscured every thing, the troops, verily believing the enemy was in front of them, fired volleys of musketry, with now and then a salvo of artillery; but fortunately nobody was hurt, and the disturbance was soon quelled.

Charged with these facts, the officers returned to City Point and reported them to Mr. Lincoln, who had just seated himself at the breakfast-table. Whereupon he turned around with a mischievous twinkle in his eyes, and smilingly observed that this affair reminded him of an occurrence which once took place in Springfield, Illinois.

It happened upon one 8d of July night, after quite a number of people from the surrounding country had assembled in town in anticipation of participating in the celebration of the anniversary of our national independence, and after nearly every body had gone to sleep, with the exception of a few frolicsome young fellows who had been prowling about town until after midnight, and had pretty well exhausted their ingenuity in devising new pranks for fun and mischief, when one of them proposed to bet drinks for the party that he would within five minutes' time make every cock in the whole town crow. The wager was promptly accepted, and the young fellow, who by constant practice had reached perfection in imitating the crowing of a chicken-cock, leaped upon a fence, and slapping his thighs with his open hands, elevated his mouth, and gave forth a vociferous "cock-a-doodle-do-o-o-o," which, in the stillness of the calm night, reverberated like a clarion throughout every nook and corner of the town; but this did not elicit a response, until he made another still more powerful effort, equal in pitch and volume to that of any prond chanticleer that ever greeted the break of day, when a solitary reply issued from a chicken-roost in a remote suburb, which was soon taken up by others in different directions, and within the brief period specified in the wager probably every cock in town had repeated the call. But the strangest part of the whole affair was that the sell was not confined to the chickens, for as soon as the crowing commenced all the boys in the place, who very likely slept with

one eye open upon that special occasion, and verily believing the joyful Fourth of July had dawned, leaped out of bed, jumped into their clothes, and rushed pell-mell to the streets, and within less time than it has taken to relate it, fire-crackers, pistols, and guns were being discharged from every direction. "But," added the facetious narrator, "nobody was hurt any more than when Parke's roosters prematurely crowed last evening."

A LADY'S-MAID visiting with her mistress at the residence of a celebrated surgeon, then deceased, noticed the classic invitation "Salve" upon the hall floor, and in the parlor a picture of Cleopatra applying the asp to her beautiful bosom. Whereupon, with that quick but not always correct woman's intuition about which we hear so much nowadays, she confidently but in all innocence inquired, "Dr. — was a physician, was he not? I felt sure he was when I saw *salve* on the entry floor, and then that poor thing in the parlor, with her broken breast and the leech in her hand. I knew he must have been a doctor."

DRAMATIS PERSONÆ: Bridget, standing on top of a high step-ladder, dusting the chandelier; Dinah, at a side table, wiping a Parian statuette of Ariadne riding on the leopard—the figure being, of course, in the garb of Eden before the fall; and their mistress.

DINAH (*simply, to her mistress*). "Miss Maria, is dis yere de Virgin Mary?"

BRIDGET (*aghast, and nearly losing her balance*). "May the howly powers preserve us! did I ever hear the likes of that! D'ye suppose the Blessed Vargin would go ridin' round the airth on a baste, an' *dressed* like that crnyture?"

A CELEBRATED surgeon used to tell a story, which many who were so happy as to be admitted to his intimacy will at once recognize as his, though we *have* heard it told as original by other lips. A Portuguese, whose English words were as rare as they were imperfect, was brought one day to the hospital afflicted apparently with total paralysis of both legs. It was decided to try the moxa, a little pastil, which is in such cases placed upon the course of the spine, and, being lighted, burns down to and into the flesh. The patient was partly undressed, laid upon the table, and the moxa applied to his back. No suspicion of his shamming was entertained by the doctors, and the man seemed helpless from the waist down. But so unexpectedly efficacious was the remedy that no sooner did the fire reach the flesh than the patient, finding at the same moment both tongue and limbs, declined their further attentions with the cry, "No, thankee; moch obleeg'," sprang to the floor, and seizing his coat, made for the door, and then the street, and was last seen or heard from making quick time round the next corner, and repeating his polite farewell, "No, thankee; moch obleeg'; moch obleeg'; no, thankees!"

THERE has been lately published in London a volume entitled *Songs of Singularity*, by the "London Hermit," which remind one of *Bon Gaultier* and of the *Bab Ballads*, though less scholarly than the one, and less magnificently

ridiculous than the other. We are touched by the joy of the gentleman who

Stood on his head on the lone sea-shore,
And joy was the cause of the act,
For he felt as he never had felt before—
Insanely glad, in fact.

And why? In that vessel that left the bay
His mother-in-law had sailed
To a tropic country far away,
Where tigers and snakes prevailed.

Also we admire the logic of the "Wild Warrior," who bids his followers

Quick! mount the wall! The ladder is red-hot,
The Hope's Forlorn;
But you may just as well be killed as not,
Now that you *have* been born.

Nor are we sorry to hear, in familiar numbers, that

There was an old priest of Peru,
Who dreamed he converted a Jew;
He woke in the night
In a dence of a fright,
And found it was perfectly true.

This being the best that Britain can do, we present the following American effort, describing the mode of administering justice in Cincinnati:

Judge Marchant tilted his arm-chair back,
And rested his hoofs on the pencil rack;
Worse than a gin-mill the court-room smelt,
And oh! how wretched his Honor felt!
For it grieved his nature to be severe,
And he socked on the fines with many a tear.

WHEN the eminent British publicist, Professor Bonamy Price, shed his rays upon this people, he was dined and wined by persons of position in several of our cities. At Washington a particularly bright entertainment was given, at which he requested the ladies and gentlemen at the table to give him on the back of their cards, as a souvenir to take back to England, a single line giving the idea of each about heaven. Rather a copious subject for concise treatment! nevertheless, the request was complied with. One of these was by the witty Secretary of the Navy, who thus expressed his "idee:" *Heaven—A place to be entered without money and without Price.*

How touching is this, from a city friend, who tells us of a poor woman who went to her minister asking him to come and perform the funeral service of her fourth husband, he having officiated for the three who had previously disappeared from the public view.

"Why, Bridget, how is this?" asked the reverend gentleman.

"Ah, it's mighty bad," she replied. "There was never a poor woman worn down with such a lot of dying men as I've been."

It was rather rough.

A PUBLIC functionary in Philadelphia sends us this:

During the month of July, 1874, I was sent to the marble quarries in Lee, Massachusetts, to gain what information I could in regard to their capacity, and to the facilities which their owner had for fulfilling his contract to supply the marble necessary in the erection of the new public buildings in this city. Arriving there, I, with note-book in hand, wandered through

it comes from *sudo*, but we seldom now say sudorific. But, Sir, the iodine, does it act?"

"That is what I want to know; how do you mean it to act—on the throat or—"

"Act? iodine? on the throat? why, the throat, Sir, is very singularly constructed—very singularly; it's beautiful, the mechanism of the throat. If it gets out of order—now yours, Sir, is out of order, and we have been giving you iodine; for Mr. — agrees with me that iodine is an excellent medicine, and what I want to know is, does it begin to produce any effect?"

"Why, that is what I want to know, and therefore I ask what effect is it intended to produce. Is it to act on—"

"What effect? My dear Sir, there are few medicines now in better repute than iodine; we give it in many cases—dropsy, sometimes—not that yours is dropsy; you have nothing dropsical about you; your complaint is an affection of the throat, and we have been giving iodine in your case; you have had it now three days—twice a day. Do you take it regularly twice a day?"

"I take what you send me twice a day, and you tell me it is iodine, but—"

"And does it begin to produce its effect? does it act?"

"Why, that's what I'm asking you. Now is it intended to act as a sedative or—"

"A sedative? what, is your cough more troublesome? We give sedatives sometimes for troublesome coughs, and then in nervous complaints, but then congestion is a thing to be avoided—not that I see any symptoms of congestion in your case; yours is an affection of the throat, and so we give you iodine, and as we are a little particular in proportioning our doses, I want to ascertain whether what you have been taking acts."

And so on. We have all seen him—the man of small calibre but immense bore.

AND this:

Diary: May, 1843.—Dinner of the Sons of the Clergy at Merchant Tailors' Hall. Archbishop Howley, a nervous man, by a curious *lapsus linguae*, gave as a toast, instead of "Prosperity to the Merchant Tailors' Company," "Prosperity to the Merchant Company's Tailor."

THE following is an extract from a letter from Archbishop Whately to Dr. Taylor: "O'Connell has spoiled the dog! The story is of a traveler who, finding himself and his dog in a wild country and destitute of provisions, cut off his dog's tail and boiled it for *his own* supper, giving the 'dog the bone.'"

IN a recent number of Edmund Yates's saucy London paper, *The World*, are these anecdotes of the Rothschild family:

Of the sons of the Frankfort banker, James, who resided in Paris, was the most distinguished. *Bête comme un millionnaire* lost its point as long as he lived, for he was as witty as he was rich. When, in 1848, a deputation of Communists waited upon him and invited him to divide his wealth equally with all mankind, after making some rapid calculations upon a piece of paper, he handed to each member a sou, and then proved to them that this was their exact share. When some one told him that Mirés was to be made a

baron, "Non, non," he said; "dans la haute finance on fait des barons, dans l'industrie des chevaliers." The jovial old cynic roamed over Europe, closeted one moment with a minister and chaffing the next moment with an actress, equal to either occasion.

We remember seeing him one day approach the gambling tables at Homburg. There was a pause, and all waited to see what the great baron would stake. Solemnly and slowly he drew a five-franc piece from his pocket and placed it on the red. When black appeared, and it was swept away, he turned to leave the table. "What!" cried some by-stander, "only five francs?" "Chacun jone selon ses moyens," he replied; and with this reproof to the impecunious herd, who were staking their year's incomes, he went off to his dinner. On his death-bed, when his physicians announced that there was no hope, he is reported to have turned to his secretary and to have said, "Sell Lombards: there will be a fall when I die;" but this story is perhaps only *ben trovato*. Cynic, however, as he was, he gave plentifully to the poor. His wife was the most charitable woman in Paris, and he lavishly furnished her with the means to succor all the distressed who applied to her for assistance, to found schools, and to establish hospitals.

THE art of advertising seems to be as well understood in Spain as in the United States. The following notice in a Spanish paper shows how neatly and tenderly mourning and money-getting may be mingled:

This morning our Saviour summoned away the jeweler Siebald Illmaga from his shop to another and a better world. The undersigned, his widow, will weep upon his tomb, as will also his two daughters, Hilda and Emma, the former of whom is married, and the latter is open to an offer. The funeral will take place to-morrow. His disconsolate widow,

VERONIQUE ILLMAGA.

P.S.—This bereavement will not interrupt our employment, which will be carried on as usual, only our place of business will be removed from No. 3 *Tennis de Teinturiers* to No. 4 Rue de Missionnaire, as our grasping landlord has raised our rent.

THERE are a great many Edwards, large and small, whose personal experience is dittoed by that of little Eddie R—, of Albion, New York, of whom the following is sent to the Drawer:

He had lately attended a circus for the first time, and on the Sunday following was taken by his grandmother to church. Eddie gazed around in some wonderment for a few moments. When the organist began to play, he turned to his grandmother and said, in a whisper,

"Grandma, will there be a circus, so I can see the lion?"

"Why, no, Eddie, this is church."

"Well," replied the little man, "it's circus music any way."

Doubtless. There's a good deal of it in the sanctuary.

HARPER'S NEW MONTHLY MAGAZINE.

No. CCC.—MAY, 1875.—Vol. L.

THE CONCORD FIGHT.

By FREDERIC HUDSON.

"The first shot that is fired in America separates the two countries."—Lord CHATHAM.

Revolutionary war, and may be ranked in history as one of the decisive conflicts of the world.

Half a century after this bold and gallant affair, in 1825, the corner-stone of a monument was laid in the centre of the village to commemorate the incident, and Edward Everett, in the freshness of his eloquence, delivered one of his splendid orations, which thrilled the heart of every patriot. On the expiration of the next decade, in 1836, a plain monument, with an inscription not to be surpassed in brevity and beauty, was erected on the west bank of the Concord River, at the historic spot where the old North Bridge crossed, where was

"Fired the shot heard round the world."

This is the inscription on the simple shaft standing over the spot where the first British blood was shed in the cause of freedom on this continent:

Here,
on the 19th of April, 1775,
was made
the first forcible resistance
to British aggression.
On the opposite bank
stood the American Militia.
Here stood the Invading Army:
and on this spot
the first of the Enemy fell
in the war of that Revolution
which gave
INDEPENDENCE
to these United States.

In gratitude to God
and
in the love of Freedom
this Monument
was erected
A.D. 1836.

THE MINUTE-MAN.

L

ONE hundred years ago, on the 19th of April, a handful of the yeomanry of Massachusetts, hastily gathered together, met a regiment of British regular troops in Concord, fired upon them, put them to flight, and drove them to their intrenchments at Boston. It was the opening event of the

On the inauguration of this modest monument the surviving children and grandchildren of the brave farmers who periled their lives on that memorable morning of '75 gathered around this memorial of the deeds of their ancestors, and united their sweet and grateful voices in singing the following beautiful hymn:

On this green bank, by this soft stream,
 We set today a votive stone;
 That memory may their deed redeem
 When, like our fires, our sons are gone
 Spirit that made those heroes dare
 To die, and leave their children free,
 Bid Time and Nature gently spare
 The shaft we raise to them and thee.
 By the rude bridge that arched the flood,
 Their flag to April's breeze unfurled,
 Here, once the embattled farmers stood,
 And fired the shot heard round the world.
 The foe long since in silence slept;
 Alike the conqueror silent sleeps;
 And Time the ruined bridge has swept
 Down the dark stream which seaward creeps.

On the 19th of April, a century after the event thus immortalized by Ralph Waldo Emerson in this epic song, the descendants of those "embattled farmers" meet again, not only around the "votive stone," but around a representative figure of one of the gallant minute-men who stood by that rude bridge, and fired the shot which opened the Revolutionary war, separated the American colonies from the mother country, and gave a free and independent nation to the world.

II.

Such is an epitome of the Concord fight and its consequences. But what led to the collision in that town? What were the details of that remarkable conflict?

III.

All the world is familiar with the causes which brought on the struggle for inde-

pendence in America. We all know the spirit which animated the people from the seizure of Sir Edmund Andros in Boston, in 1688, to the destruction of the tea in the harbor of that patriotic town in 1774. No one is ignorant of the efforts of Samuel Adams, Joseph Warren, Patrick Henry, Charles Carroll, Alexander Hamilton, Paul Revere, and others, as Sons of Liberty, in clubs, in pamphlets, in newspapers, in pulpits, in the streets, and in coffee-houses, to guide and prepare the people for the impending crisis. All the facts, from the beginning to the end, are fully and graphically detailed in school-books, as well as in more pretentious history. But the immediate cause of the march of the British troops from Boston to Concord, and the particulars of their reception on the route and in that old town, seem to be necessary to enable the reader to comprehend the significance of the movement.

IV.

After a century of annoyances and oppressions heaped upon the colonists by the mother country, the former were finally aroused to the determination to vindicate their rights. One of the steps taken for this purpose was the meeting of a Continental Congress in Philadelphia in September, 1774, where all distinctions between Virginians, Pennsylvanians, New Yorkers, and New Englanders were no more. "I am not a Virginian," exclaimed Patrick Henry, "but an American!" Another step was the assemblage in Concord, in October of the same year, of a Provincial Congress to provide ways and means to resist the tyranny of Parliament, and, with this holy object in view, the purchase of munitions of war was ordered and military organizations encouraged. So, with the spirit of union manifested in the Continental Congress and the practical measures of the Provincial Congress, the colonists prepared for a contest with one of the greatest military and naval powers of the world.

Massachusetts was to receive the first shock of the conflict. Additional troops from England had arrived in Boston, to garrison that town and overawe its inhabitants and those of the surrounding country. There were in that town, early in 1775, ten regiments of the flower of the British army, under the command of Major-General Thomas Gage, and this force was deemed sufficient by Parliament to subdue any rebellious spirit that might show itself in the thirteen colonies. It was believed, indeed, that the moral effect of such a force would be sufficient, and that there would be no further opposition. But the colonists were not to be intimidated. They made their preparations in spite of the threats of the mother country. Military stores were industriously collected, militia companies and minute-men

were formed and hastily organized into regiments, and the inhabitants of the towns encompassing Boston were constantly on the watch for any movement of the British troops. Minute-men were always on the alert, each with gun and powder-horn, at home, with the plow in the field, at church, or at town-meeting.

Of the few places selected by the Provincial Congress as dépôts of military stores, Concord was one. It was a shire town, and its inhabitants were patriotically alive to the vital interests of the country. It was considered necessary to have the cannon, ammunition, provisions, deposited at safe and convenient distances from Boston, to enable the Americans, should an attempt be made to capture these stores, to have timely notice of the movement in order to avert the calamity. The watch over these munitions of war was constant and faithful. Sentinels were stationed at all points on the public roads and at the bridges to warn the country of approaching danger; and the Sons of Liberty in Boston were wide awake

OLD MONUMENT, LEE'S HILL IN THE BACKGROUND.

to all suspicious movements of the British military authorities.

This was the state of affairs on the adjournment of the Provincial Congress on the 15th of April, 1775, and thus Concord became a town of great importance.

V.

No better place for military stores could have been selected. In all the troubles of New England, in all the wars with the Indians, in all the expeditions to distant points, to Nova Scotia, Canada, Cuba, or elsewhere, Concord always cheerfully furnished her quota of men and her share of the sinews of war. In that town the love of freedom was ardent enough to be engraved on the tombstones which are still standing in her old-fashioned burying-grounds. There, in 1773, the first emancipation proclamation was uttered over the remains of an honest African, John Jack, the opening lines of which tell the whole story of the American Revolution:

"God wills us free; man wills us slaves;
I will as God wills: God's will be done."

There, in 1774, the Declaration of Rights was formulated. There, later in the same year, as already stated, the patriots of the province, headed by Samuel Adams and John Hancock, met and deliberated on the dangers of the country. There, too, the cannon, the powder and ball, the provisions, gathered with great difficulty, were secretly stored in the barns, cellars, corn-houses, woods, and fields of the prominent men of the place.

These preparations did not escape the vigilant attention of General Gage in Boston. Spies were frequently sent into the country to ascertain the quantity of stores, to gather facts in regard to the state of public feeling, and to obtain information of the roads and bridges. Two of these spies, Captain Brown and Ensign De Berniere, of the British army, visited Concord on the 20th of March, 1775, for this purpose. The ensign, in his narrative of the expedition, said:

"The town of Concord lies between two hills that command it entirely. There is a river runs through it, with two bridges over it. In summer it is pretty dry. The town is large, and contains a church, jail, and court-house; but the houses are not close together, but in little groups. We were informed that they had fourteen pieces of cannon (ten iron and four brass) and two coehorns. They were mounted, but in so bad a manner that they could not elevate them more than they were, that is, they were fixed to one elevation; their iron cannon they kept in a house in town; their brass they had concealed in some place behind the town in a wood. They also have a store of flour, fish, salt, rice, and a magazine of powder and cartridges. They fired their morning gun, and mounted a guard of ten men at night. We dined at the house of Daniel Bliss, a friend of government. They sent him word they should not let him go out of town alive that morning; however, we told him if he would come with us, we would take care of him, as we were three, and all well armed. He consented,

and told us he would show us another road, called the Lexington road. We set out, and of consequence left the town on the contrary side of the river to what we entered it.... A woman directed us to the house of Mr. Bliss. A little after, she came in crying, and told us they swore if she did not leave the town, they would tar and feather her for directing Tories on their road."

These officers remarked to Bliss that the people would not fight; but he knew better, and pointing to his brother, then passing in sight of the house, he replied, "There goes a man who will fight you in blood up to your knees!"

Meanwhile the patriots of Concord were busy in manufacturing fire-arms, gun-carriages, cartouch-boxes, holsters, belts, saddlery, saltpetre, oatmeal, wooden plates, spoons, and various other articles suitable for camp and field; and meanwhile, too, the militia and minute-men had frequent drills to perfect themselves for the approaching struggle. But the British did not give them much time for this necessary instruction in the art of war.

It was important to the British that all these preparations should come to naught; that these stores should be destroyed; that those two patriots, Hancock and Adams, "whose offenses," in the words of General Gage, "were of too flagitious a nature to admit of any consideration than that of condign punishment," should be captured. It was vital to the interests of the crown that a blow should be struck that would crush the patriot cause effectively and forever.

VI.

What were the means adopted to accomplish this great purpose?

There were, as we have said, ten regiments of British troops stationed in Boston. On Saturday, the 15th of April, 1775, a detachment of these troops, consisting of grenadiers, light infantry, and marines, were taken off duty on pretense of learning a new military exercise, and encamped on Boston Common. About ten o'clock on Tuesday evening, the 18th, they were quietly embarked in boats and barges, and conveyed, under the command of Lieutenant-Colonel Francis Smith, of the Tenth Regiment, and Major John Pitcairn, of the marines, to Lechmere's Point, East Cambridge, where they were landed. After having received a day's rations and thirty-six rounds of ammunition, these troops, numbering eight hundred to one thousand men, began their march, in silence and under cover of night, toward Concord. Officers had previously been sent out over the same road to reconnoitre the route, to intercept any messengers from the friends of freedom in Boston, to prevent the spread of any intelligence of this military enterprise, and, if possible, to surprise and capture Hancock and Adams while *en route* from Concord. The main body of the troops were to proceed to that town and destroy

THE MIDNIGHT RIDE OF PAUL REVERE.

the stores there. The utmost secrecy was observed by the British in all their movements.

But the designs of the enemy could not be concealed from the vigilant Sons of Liberty in Boston. In various ways they became known, and in various ways was the intelligence of the movement of the troops communicated with the interior. On the evening of the 18th of April the following message was sent by express from the Committee of Safety, then sitting in Cambridge, to the "Hon. John Hancock, Esquire:"

"Eight or nine officers of the king's troops were seen just before night passing the road toward Lexington in a musing, contemplative posture, and it was suspected they were out on some evil design."

Longfellow has truthfully described one of the ways by which information of the departure of the troops across the Charles River, late in the evening, was conveyed to the towns and villages in the country:

"Listen, my children, and you shall hear
Of the midnight ride of Paul Revere
On the eighteenth of April, in Seventy-five.
Hardly a man is now alive

It was two by the village clock,
When he came to the bridge in Concord town,
He heard the bleating of the flock,
And the twitter of birds among the trees,
And felt the breath of the morning breeze
Blowing over the meadows brown.

Who remembers that day and year.
He said to his friend, 'If the British march
By land or sea from the town to-night,
Hang a lantern aloft in the belfry arch
Of the North Church tower as a signal-light—
One, if by land, and two, if by sea—
And I on the opposite shore will be,
Ready to ride and spread the alarm
Through every Middlesex village and farm,
For the country-folk to be up and to arm.'"

The embarkation of the troops for Lechmere's Point immediately became known to Warren and his alert associates through several channels. William Baker, of Haverhill, then twenty years old, lived with Mr. Hall, who resided in Cole's Lane, afterward Portland Street, and worked in his distillery. Many of the British soldiers were Hall's customers. On the evening of the 18th of April a woman who quartered with the Forty-third Regiment went to the shop for some articles, and, being somewhat intoxicated, unguardedly mentioned that some of the troops were going to Concord that night on a private expedition. Hall, acquainted with the fact of the stores collected there, saw the urgency of advising General Warren of the proposed movement.

Baker offered to convey the information, although it was a hazardous undertaking to pass the sentries without the countersign. Warren being absent from home, Hall requested Baker to go to Adjutant Devens and notify him, in order to have the country prepared for the emergency. This was accomplished, and after two efforts the adjutant privately left town, safely reached Charlestown, and had Deacon Larkin's fast horse ready for Paul Revere. Baker was repeatedly stopped by the sentinels, but as the officers he wished to see lived on the way he usually went to the distillery, and as he was known to most of the sentries as a workman there, his excuses for being out on Hall's errands were accepted. With this and corroborative information, the signal "two, if by sea," was given; and messengers were dispatched to arouse the yeomanry to arms. Paul Revere left "the opposite shore" between ten and eleven o'clock that night, passed through Medford, awoke the captain of the minute-men there, and on his ride he thundered the news at every house on the way.

About the same hour Ebenezer Dorr started from Boston, and passed over the Neck and through Roxbury. Dorr was a leather-dresser; he was mounted on a jogging old horse, with saddle-bags behind him, and a large flapped hat upon his head to resemble a countryman on a journey, to be suspected at the time, and afterward mentioned in history, as a peddler. Colonel Josiah Waters, captain of the Ancient and Honorable Artillery Company, followed on foot on the sidewalk a short distance from him, until he saw the brave messenger safely beyond all the sentinels. Waters had obtained his information of the expedition from an individual named Jasper, an Englishman, a gunsmith by trade, whose shop was in Hatter's Square. He worked for the British, but sympathized with the patriots. It is related that a sergeant-major quartered in his family had confided to him the plans of the British so far as he knew them. Jasper repeated the facts to Waters, who in turn

"THE REGULARS ARE COMING!"

communicated them to the Committee of Safety.

VII

Paul Revere arrived at the residence of the Rev. Jonas Clark, where Hancock and Adams were visiting, in Lexington, about midnight. Sergeant Monroe and eight men were on guard. Revere was refused admittance, as the family did not wish to be disturbed by any noise. "Noise!" exclaimed he. "You'll have noise enough before long: the regulars are coming!" He requested to see Mr. Hancock. Mr. Clark said he must refuse to admit strangers at that time of night, but Hancock recognized Revere's voice, and called out, "Come in, Revere; we are not afraid of you."

Ebenezer Dorr, in his flapped hat, made his appearance soon after, with the annexed dispatch from General Warren:

"A large body of the king's troops (supposed to be a brigade of about 1200 to 1500) were embarked in boats from Boston, and gone over to land on Lechmere's Point (so called) in Cambridge; and that it was shrewdly suspected that they were ordered to seize and destroy the stores belonging to the colony deposited at Concord."

Hancock immediately gave the alarm, and the village church-bell pealed forth its warning notes; and long before the dawn of the 19th one hundred and thirty or forty inhabitants of that town and neighborhood had collected on the common. Among the excited patriots was Jonathan Harrington, the fifer. About one o'clock his mother roused him from his sleep. "Jonathan, you

must get up; the regulars are coming; something must be done!" Hancock was full of resolution and activity. Adams was calm and placid and happy. Hancock occupied much of his time in cleaning his gun and sword, and putting his accoutrements in order, with the determination to act with the militia. It was with difficulty that he was dissuaded from this purpose. Adams clapped him on the shoulder, and said, "Hancock, this is not our business; we belong to the cabinet." It was nearly the break of day before he was persuaded not to throw himself into the hands of the enemy. It was made manifest that one of the objects of the expedition was the capture of Adams and himself. Indeed, the inquiries on the road of the officers who had preceded the main body of the enemy satisfied him of this fact. They were anxious to find "Clark's tavern," as they called the Rev. Mr. Clark's house, where the two patriots were visiting, with Mrs. Thomas Hancock, an aunt, and Miss Dorothy Quincy, the fiancée of John Hancock.

"Smooth square forehead, with arolled hair,
Lips that lover has never kissed,
Taper fingers and slender waist,
Hanging sleeves of stiff brocade—
So they painted the little maid.

Hold up the canvas full in view:
Look! there's a rent the light shines through,
Dark with a century's fringe of dust—
That was a redcoat's rapier thrust.
Such is the tale the lady old,
Dorothy's daughter's daughter, told."

MAP ILLUSTRATING THE BRITISH ATTACK AT LEXINGTON.

To insure the safety of these rebel statesmen they were conducted to the house of James Reed, in Burlington, a small neighboring town, and it was while on their way thither that Adams, on hearing the volleys of fire-arms of the British, and beholding the rising sun, exclaimed to Hancock, "Oh, what a glorious morning is this!"

VIII.

The militia and citizens who had gathered on the common on the first alarm remained till three and four o'clock. They had sent out scouts to ascertain where the enemy were, but a reconnoitring party of the regulars had captured them. Every one on the road was taken and detained and closely questioned. The British were inquisitive as to bridges, guards, and military stores at Concord. Simon Winship was compelled to march with the troops till within a quarter of a mile of the church, where they halted to load and prime. All authentic news was thus kept from the provincials, and it was considered safe to dismiss the militia for a short time. Some went to their homes near the common, and some to Buckman's Tavern. But at last Thaddeus Bowman, who had escaped the enemy, arrived with tidings of the rapid approach of the redcoats. About half past four o'clock alarm-guns were fired, and drums beat to arms to recall the mili-

tia. Fifty to sixty armed men were on the common, with thirty or forty unarmed spectators, when the British arrived in sight. Immediately on the appearance of the enemy, Captain Parker, the commander of the militia company, ordered his men to disperse and not to fire. It was deemed useless and reckless to make a stand against such overwhelming numbers; but the boldness of the Americans appearing in arms exasperated the British officers, and they rapidly advanced. One of them was heard to say, "Damn them, we will have them!" The enemy shouted and cheered and rushed furiously toward the provincials. Colonel Smith, Major Pitcairn, and another officer rode forward, and when within five or six rods of the militia, one of them cried out, "Ye villains, ye rebels, disperse! damn you, disperse!" Major Pitcairn said, "Lay down your arms, damn you! why don't you lay down your arms?" and immediately discharged a pistol toward the few men before him, as they were retreating. Colonel Smith, then within a few yards of some of the provincials, brandished his sword and gave the order in a loud voice, "Fire! by God, fire!" The order was instantly obeyed, and a brisk fire was continued by the regulars as long as any of the half a hundred provincials were within range. Eight Americans were killed, and ten wounded. This was the result of this cowardly attack, and it was simply a cold-blooded massacre.

Mrs. Hancock and Miss Quincy remained at the residence of Mr. Clark after the departure of Adams and Hancock, and witnessed the brutal attack of the British. One of their bullets whizzed by Mrs. Hancock's head as she was looking out of the door, and became imbedded in a barn near by. "What's that?" she exclaimed, and immediately retired out of range. Miss Quincy was at a chamber window, a spectator to the tragical scene, the particulars of which she related, nearly half a century afterward, to General William H. Sumner.

On the march from Boston the sound of the alarm-bells and alarm-guns that came across the fields on the still air of that night from the different towns within ear-distance of Colonel Smith's route had admonished him of the necessity of prompt action. Those sounds were premonitions that his march was to be over a dangerous and rough road. While *en route* for Concord, therefore, he dispatched an express to Boston to apprise General Gage of the state of affairs, and urged immediate reinforcements.

IX.

While these exciting scenes were being enacted, the two patriot messengers, Revere and Dorr, alert and active, had proceeded on their important errand to arouse the inhabitants of Lincoln and Concord. They

THE LEXINGTON MASSACRE.

left Clark's house between twelve and one o'clock in the morning, and were on their way, when they were overtaken a short distance beyond the town by Dr. Samuel Prescott, of Concord, who had spent the previous evening at the house of his intended father-in-law. He was hastening home with the news of the coming of the British. The three rode on in company, giving the alarm at every house. When near the Lincoln line they were surprised by the reconnoitring party of the enemy previously mentioned. Revere and Dorr were immediately captured. Very fortunately for Concord, Prescott escaped, after he had the reins of his bridle cut, by jumping his horse over a wall and taking a circuitous route through Lincoln. Mounted on a fleet animal, he safely reached Concord.

The British officers closely interrogated Revere and Dorr. In reply Revere said, "Gentlemen, you have missed your aim." "What aim?" asked one of the officers. "I came out," replied Revere, "an hour after your troops left Boston. If I had not known that messengers had been sent to give information to the country, and have had time to carry it fifty miles, I would have ventured one shot from you before I would have suffered you to stop me." This intelligence startled the officers. On hearing distant bells, a scout, whom they had previously captured on the road, exclaimed, "The bells are ringing; the towns are alarmed: you are all dead men." They thereupon held a hurried consultation, and started toward Boston. When within a hundred rods of the meeting-house in Lexington, about two o'clock in the morning, they took Revere's

horse, cut the girths and bridles of the others, parted with their prisoners, and proceeded at full speed toward Boston, and joined the main body of the troops on the road.

On his way through Lincoln the intrepid Prescott gave the alarm there, which enabled the minute-men of that town, under Captain William Smith and Lieutenant Samuel Hoar, and the militia, under Captain Samuel Farrar, "a man of great energy of character and strength of mind," to arrive in Concord and report for duty almost as soon as the men of Concord were on the common.

X.

The British remained about twenty minutes in Lexington. No time was to be thrown away, in Colonel Smith's view of the situation. They re-commenced their march for Concord very soon after sunrise. They proceeded along the six or seven miles of road unmolested, disturbed only by the ominous sound of church-bells and signal-guns that fell upon their ears from the surrounding country as they advanced toward their destination.

III

Concord, meanwhile, had been aroused from her slumbers by the gallant Prescott. The guard on duty at the court-house was Amos Melven. On hearing the exciting news, he discharged his gun and rang out the town bell loud and clear. This was between one and two o'clock in the morning. The Committee of Vigilance, the guard, the minute-men, the militia, the citizens generally, old and young, immediately began to assemble. The first man that made his ap-

pearance was the Rev. William Emerson, armed with his gun. This patriotic promptness of the pastor produced such an impression on the faithful sentinel that in naming his two boys, born after that event, he had one christened Emerson and the other William Melven.

No one was asleep in Concord at three o'clock. All were astir, and wide awake to the approaching danger. The village bell and the alarm-guns aroused Major John Buttrick, who lived half a mile, as the bee flies, across the river. He prepared for the emergency at once, called his son John, a lad of sixteen years and a fifer in Captain Brown's company of minute-men. "John, the bell's a-ringing; jump up, load your pistols, take your fife; we'll start immediately for the village." They were there shortly after two o'clock. It was bright moonlight, which enabled every one to move with celerity, and act with promptness and vigor.

The neighboring towns were to be notified of the coming crisis. Special messengers, Abel Prescott and William Parkman among them, were sent forth on this mission. Samuel Prescott, without stopping to rest, started for Acton, where he notified Colonel Francis Faulkner, who immediately fired three guns, the preconcerted signal for an alarm, and at daylight the men of that town were in motion, with Orderly-Sergeant Seth Brooks at their head, till joined by Davis and Hayward. Major Buttrick requested Reuben Brown to proceed to Lexington, obtain what information he could, and return immediately. Another messenger was sent to Watertown on a similar errand. Brown reached Lexington just before the Americans were fired upon, but returned without the result of that sanguinary outrage. "Did the British fire bullets?" asked Major Buttrick. "I do not know," answered Brown, "but think it probable." Many

THE OLD PINE-TREE FLAG.

believed they fired blank cartridges merely to intimidate the people, as it was the general opinion that the only object of the expedition was the destruction of the colonial stores.

The Committee of Vigilance and the militia officers had been engaged on the preceding day in removing some of the stores to Sudbury and other towns, in accordance with instructions from the Provincial Committee of Safety, in consequence of the alarming rumors that had reached them. On the return of Brown from Lexington, orders were given for the safety of the remainder. This occupied the attention of Colonel James Barrett and a large number of citizens the early part of the morning. Colonel Barrett was a member of the Provincial Congress, Superintendent of the Public Stores, and commander of the militia in Concord. Cannon and ammunition were carried to Stow. Some was covered with hay, straw, and litter of all sorts. Stores were sent to Acton and other towns, and quantities were concealed in private dwellings and in the woods. All were changed about.

The road from Boston to Concord entered the town from the southeast along a ridge which commenced on the right one mile below the village, rose abruptly from thirty to fifty feet above the road, and terminated at the northeasterly part of the common. The top was plain, and commanded a view of the village and vicinity. About midway on this hill, in the rear of Reuben Brown's house, a liberty-pole had been erected, on which the flag of freedom, the old Pine-tree Flag, was first unfurled. Over this road the British were to enter Concord,

and all eyes and thoughts were therefore strained in that direction.

XII.

Minute-men were stationed as guards at the North and South bridges, at a point below Mrs. Jonathan Heywood's, on the Lincoln road, and in the centre of the town. Lieutenant Jonathan Farrar, son of Sergeant Farrar, who was taken prisoner and died at Fort Miller in 1758, was commander of the guard. In case of alarm, it was agreed to meet at Amos Wright's tavern, a building still in existence, and standing close by the immemorial town pump. Near the dawn of day a party of the company of minute-men commanded by Captain David Brown paraded on the common, but were dismissed to meet again at the tap of the drum. Soon after the militia and minute-men of other companies were provided with ammunition at the court-house. They then marched beyond the village, and in sight of the Boston road. There they were joined by a few men of the minute company from Lincoln. One hundred armed men in all had thus assembled in Concord to receive eight hundred to a thousand of the veteran soldiers of England on their approach from Boston! But reinforcements were on the road; the slogan was in the air; the surrounding villages were in arms.

XIII.

It was a few minutes before seven o'clock when the British were discovered marching toward town. The morning was a lovely

one. The previous winter had been an uncommonly mild winter. Spring opened warmly, and the farmers of the country had already commenced their field operations. Fruit trees were in blossom, and the grass and grain had grown sufficiently high to wave with the wind. The sun shone with peculiar splendor, and the morning was a glorious one. One small band of Americans, consisting of Concord, Acton, and Lincoln men, under the command of Captain George Minot, had taken their stand on the hill near the liberty-pole. "No sooner had our men," said William Emerson, "gained it, when they were met by the companies that had been sent out to meet the troops," who reported that the enemy were nearly upon them, and that the Americans must retire. The glittering bayonets of the king's troops were then seen as they marched up to the bend of the road at John Beaton's—a novel, imposing, alarming sight to the squad of militia collected there to meet this invading force. With such overwhelming numbers in sight, the Americans fell back, and took a new position upon an eminence on the same ridge, about eighty rods in the rear, where the men "formed into two battalions." They did not abandon the liberty-pole till the British light-infantry, who came over the hill as flanking parties, had arrived within a few rods' distance. But scarcely had the Americans formed in their new position when they saw "the British troops at the distance of a quarter of a mile, advancing with the greatest celerity."

THE PROVINCIALS ON PUNKATASSET.

What was to be done?

Some advised that they should face the enemy there, and abide the consequences. Of this opinion was William Emerson, the beloved pastor of the town. "Let us stand our ground," said he. "If we die, let us die here!" Some one spoke to Colonel Eleazer Brooks, of Lincoln, and said, "Let us go down and meet them at once. Now is our time." "No!" emphatically replied Brooks. "It will not do for us to begin the war." This view of the situation prevailed.

XIV.

There was yet no organization of any sort with the Americans. There were scarcely men enough to organize; but Major Buttrick saw the necessity of this as the numbers increased, and he went to Lieutenant Joseph Hosmer, then in command of one of the companies, and requested him to act as adjutant. "My company will be left alone if I do," he said. "It must be so, then," replied Buttrick; "you must go." Hosmer became adjutant, and an organization was commenced.

While these movements were being made, Colonel Barrett, who had been incessantly at work in securing the stores, rode up. Individuals were continually arriving with all sorts of reports of the enemy. Some asserted that the British had killed several of the militia at Lexington. Others affirmed the contrary. In the hurly-burly of the time it was impossible to obtain accurate information so necessary for their guidance. In this uncertainty, Colonel Barrett addressed a few firm and impressive words to the men, and charged them not

to fire a shot unless the British first fired upon them. Seeing that the enemy had entered the village a few rods distant, Colonel Barrett ordered the Americans to take a new position, and await increase of numbers. They thereupon proceeded over the North Bridge, and marched, not yet over one hundred and fifty in all, to Punkatasset Hill, about a mile north of the meeting-house. Colonel Barrett accompanied the men as far as the bridge, and thence rode home to give directions respecting the public stores at his house.

While on Punkatasset, smoke was seen rising from the centre of the town, when Major Buttrick said to those around him, "Men, if you will follow me, we will go now and see what they are about." But the smoke subsiding, the Americans remained on the hill, constantly receiving accessions to their number in ones, twos, and threes, each man eager to take his share in the common danger.

Men were stationed on the several roads leading into Concord, to direct the reinforcements to the rendezvous; volunteers hastened forward. Minute-men and militia, the former under Captain Jonathan Wilson, and the latter commanded by Captain John Moore, arrived from Bedford. Numbers came in from Chelmsford, Carlisle, Littleton, Westford, Billerica, Stow, and elsewhere. Those from Billerica came with Captain Solomon Pollard. Some came by the roads, and some across the fields. Thus strengthened, this devoted band marched down from Punkatasset to the high land in front of Major Buttrick's house, where the British on guard at the North Bridge and the vil-

1. Companies of the Regulars marching into Concord. 2. Companies of the Regulars drawn up in order. 3. A Detachment destroying the Provincial Stores. 4. 5. THE BRITISH TROOPS ON CONCORD COMMON.—[FAC-SIMILE OF AN OLD ENGRAVING.]

XV.

Meanwhile the British troops marched into the village. Six companies entered on the ridge of the hill to disperse the minute-men near the liberty-pole. The grenadiers and marines came up the main road and halted on the common. Having taken possession of the Old Burying-ground Hill, the officers made that a post of observation. With their field-glasses they had the whole town in view. They saw that the Americans were increasing in strength. It therefore became urgent with the British to promptly seize the North and South bridges, to prevent, if possible, the entrance of provincials from the neighboring towns.

MAJOR BUTTRICK'S HOUSE.

lage were in sight before them. On their arrival at the cross-road, they were met by the Acton minute-men, Captain Isaac Davis. This company, about forty in number, came by the Strawberry Hill road till they reached the rear of Colonel Barrett's residence. They halted there for a short time to observe the movements of the detachment of the enemy searching the house. Then, partly by a cross-road and partly over the fields north of Barrett's Mills, they marched with a quick step, the fife and drum playing *The White Cockade*, in nearly a straight course to the Widow Brown's Tavern. Thence they took the north road to the high land, where they met Major Buttrick and his men. Captain Davis, a gunsmith by trade, a Harry of the Wynd, was a fine, handsome man, about thirty years of age, brave, patriotic, and beloved.

On leaving Acton, an hour after sunrise, Captain Davis said, "I have a right to go to Concord on the king's highway, and I intend to go if I have to meet all the British troops in Boston." To his wife, as if he had a premonition of his fate, he said, "Hannah, take good care of the children." On his arrival at the scene of action, about nine o'clock, he proceeded at once to Adjutant Hosmer, and, with the fire of battle in his eye, and big drops of perspiration rolling down his manly face from his hurried march, reported his company ready for duty. His men took their position to the right of the other minute-men and to the left of the Concord companies.

Accordingly, while Colonel Smith remained in the centre of the village, he detached six companies of light-infantry, numbering about three hundred men, under the command of Captain Lawrence Parsons, to take possession of the North Bridge, the only entrance to the town in that direction, and proceed thence to the places where military stores were secreted, Ensign De Berniere, the spy, to act as his guide. On their arrival at the bridge, three of the companies, commanded by Captain Lawrie, remained on guard. One of these, under Lieutenant Edward Thornton Gould, guarded the bridge, while the others, of the Fourth and Tenth regiments, fell back to the hill in front of the Old Manse and near the bridge. They were, for a time, scattered about in that vicinity, visiting the houses for food and drink, which were freely given them.

Captain Parsons, with the other three companies, proceeded to Colonel Barrett's, one mile and a half distant, to the northwest, to destroy the stores there. They reached his house about eight o'clock, and just after Colonel Barrett had left on his return to the rendezvous. Captain Parsons said to Mrs. Barrett, "Our orders are to search your house and your brother's from top to bottom." She was requested to provide the soldiers with refreshments. One of the sergeants demanded spirit, but it was refused, and the commanding officer forbade its use, as it would render the men unfit for duty, for, said he, "We shall have bloody work to-day: we have killed men in Lexington."

RESIDENCE OF COLONEL BARRETT.

Mrs. Barrett was offered compensation for the refreshments, but she refused to take any, remarking, "We are commanded to feed our enemies." They threw some money into her lap, which she finally retained, saying, "This is the price of blood." She was assured of good treatment, and that private property would be respected. Some musket-balls, cartridges, and flints had been concealed in casks in the attic, and covered with feathers. They were not discovered. Several cannon had been buried in the field in the rear of the house, and the field freshly plowed. So they were saved. The soldiers took fifty dollars in money from one of the rooms, although the officers had forced money on Mrs. Barrett for food and drink. On seeing Stephen, a son of Colonel Barrett, who had just entered the house, an officer demanded his name. "Barrett," said he. "Then you are a rebel;" and taking hold of him, said, "You must go to Boston with us, and be sent to England for trial." He was, however, released when Mrs. Barrett exclaimed, "He is my son, and not the master of the house." It was the intention to take Colonel Barrett a prisoner, as he was considered one of the prominent rebels of the province. Another son, James Barrett, Jun., was at the house, but being lame and inactive at the time, he was not molested. The soldiers had collected a few gun-carriages in a pile to burn. These were placed dangerously near the barn. Observing this, Mrs. Barrett reminded the officers of their promise not to injure private property. They promptly ordered the articles to be carried into the road, where they were consumed. Shortly after they were startled by the signal-guns at the bridge, and the troops immediately retreated toward the village.

While the enemy were at Colonel Barrett's, and just before their retreat, two companies, one of militia and one of minute-men, from

Sudbury, arrived within sight of the house. These were under the command of Captains Aaron Haynes and John Nixon; Jonathan Rice was a lieutenant in one of the companies. They were accompanied by Lieutenant-Colonel Ezekiel How. Nixon was subsequently a general in the Continental army. On the arrival of these patriots within half a mile of the South Bridge, they were informed by Stephen Barrett, stationed there, that they were to proceed to the North Bridge. To reach that point they had to pass Colonel Barrett's house. Noticing the British there, they halted, and Colonel How exclaimed, "If any blood has been shed, not one of the rascals shall escape;" and, disguising himself, he rode on to ascertain the truth, and talked with the British officers. Stephen Barrett, who came along with the Sudbury men, on entering the house of his father was confronted as we have described. The Sudbury militia and minute-men followed in the rear of the British, and joined in the general pursuit from Concord to Charlestown.

With one of these companies was Deacon Josiah Haynes, eighty years of age. He was urgent to attack the British at the South Bridge, dislodge them, and march into the village by that route. Such was the spirit that every where prevailed among the people at that time. This aged patriot pursued the enemy with ardor as far as Lexington, and was killed there by a musket-ball.

On the way to town the British stopped for a few minutes at Widow Brown's Tavern, and three or four officers went in for some drink. Some was taken out to the soldiers on the road. The officers offered to pay for what they had, but Mrs. Brown declined all compensation. After a brief tarry, almost in sight of the scene of action, they resumed their march to the bridge, wholly ignorant of what had occurred there.

XVI

Immediately after Captain Parsons started on the above expedition, Captain Munday Pole, of the Tenth Regiment, with one hundred men, was ordered to take possession of the South Bridge, and destroy such public provincial property as he could find in that vicinity. Mrs. Joseph Hosmer, in looking out of one of her eastern windows about seven o'clock that morning, saw the approach of the soldiers soon after they left the common, by the glistening of their bayonets in the bright sunlight. On their arrival at the bridge, Captain Pole stationed a guard there, and a detachment on Lee's Hill as a corps of observation, while the remainder of his command visited the houses in that locality for refreshments, and to search for the stores. They were furnished with milk, potatoes, meat, and bread for breakfast. They entered the house of Ephraim Wood to take him prisoner. He was an active patriot, and held the office of town-clerk. Energetically engaged in the important work of the morning in assisting to secure the public stores, he was fortunately not at home. In searching Amos Wood's house the officers were quite liberal, and gave a guinea to each of the women present, to compensate them for the trouble and annoyance inflicted upon them! One room was fastened, and an officer politely asked Mrs. Wood, "Are there not some women locked up there?" With quick wit, she gave an evasive answer, which led the officer to believe such was the case, for he im-

mediately said, "I forbid any one entering this room." Thus a large quantity of military stores concealed therein remained unmolested.

This detachment were also startled by the signal-guns at the North Bridge, and immediately recrossed the river. They removed the planks of the bridge to render it impassable, and hastened back to the centre of the town.

XVII

While these operations were going on at the outskirts of the town, Colonel Smith and Major Pitcairn were not idle in the village. There the grenadiers and marines broke open sixty barrels of flour, disabled two twenty-four-pounders, destroyed their carriages, their wheels and limbers, sixteen wheels for brass three-pounders, two carriages with limbers for two four-pounders, and a few barrels of wooden trenchers and spoons. They threw into the mill-pond and into wells about five hundred pounds of ball. The liberty-pole on the hill was cut down and burned. According to Shattuck they set fire to the venerable court-house and town-hall, the quaintly shaped vane on which bore the date of 1673; but the building and vane were saved, and the latter is still blown about by the winds near the spot where it has been the weather guide for two centuries. But tradition states that the building was fired by an indignant patriot, in retaliation for the destruction of some of the military stores of the province; and the tongs which carried the firebrand

into the building are said to be still in existence in Maine, in the possession of a descendant of the patriotic incendiary. Mrs. Martha Moulton, over eighty years of age, and Betty Hartshorne, who lived near where the Middlesex Hotel stands to-day, became alarmed, hastened to the soldiers, and said, "The top of the house is filled with powder: if you don't put out the fire, you'll all be killed." Several of the grenadiers thereupon extinguished the fire, and they worked with some alacrity.

The day was full of scenes and incidents of audacity and patriotism.

EMERSON MUNDAY'S HOUSE.

Captain Timothy Wheeler had the care of a large quantity of flour belonging to the province, which, with a few sacks of his own, was stored in his barn. This he preserved by a little "innocent evasion." When the troops appeared, he, with affected simplicity, was glad to see them, and offered them bread-and-cheese and cider. After partaking of his hospitality they went to this corn-house, and were about to break in the door, when he requested them to desist. "If you will wait a minute, I will open it for you." On entering the building he said, "Gentlemen, I am a miller. I improve those mills yonder, by which I get my living, and every gill of this flour," putting his hand on a sack really his own, "I raised and manufactured on my own farm, and it is all my own. This is my store-house. I keep my flour here until such time as I can make a

JONES'S TAVERN.

market for it." After a moment's reflection the officer said, "Well, I believe you are a pretty honest old chap. You don't look as if you could do any body much hurt, and we won't meddle with you."

The soldiers then visited Ebenezer Hub-

bard's place, next to Wheeler's. They discovered a quantity of flour in a malt-house near the spot now covered by the Orthodox Church. They beat off the boards of one end of the building, and seized the sixty barrels already mentioned, which they rolled out into the road, and some of them into the mill-pond. Some of the flour was scattered over the road, making it appear as if there had been a slight fall of snow.

Another scene occurred at the tavern of Captain Ephraim Jones. This was situated on the land which the residence of Mr. R. N. Rice now ornaments, near the Public Library. Henry Gardner, the Province Treasurer, had boarded there during the session of the Provincial Congress, and had left in Jones's custody a chest containing some important papers and some money. In an accidental collision Jones had knocked Major Pitcairn down, and was placed under a guard of five men for his carelessness! While thus a prisoner, his house was searched, and the soldiers went to the chamber where Gardner's chest was deposited. Hannah Burns, who lived with the family, met them at the door, and insisted that it was her apartment, and contained her property. After considerable conversation they left her, and the chamber was not touched. Needing refreshments, Captain Jones was released, that he might attend at the bar, but he declared that not a soldier should have a thing without paying for it. But might was right there as elsewhere over the world.

While in the village the British seized and abused several citizens, aged men, who were not armed, some in mere wantonness. Among them was Deacon Thomas Barrett, a brother of Colonel Barrett. In his building there was a gun factory, carried on by his son, Samuel Barrett. The deacon was a man noted for his piety and for the mildness of his manners. Not terrified by the scenes around him, he protested against the violence of the soldiers, and alluded to the unkind treatment of the colonies by the mother country. When they threatened to kill him as a rebel, he calmly said, "You need not take that trouble, for I am old, and will soon die of myself." Touched a little by this remark, they said, "Well, old daddy, you may go in peace."

The historically famous and profane Major Pitcairn, afterward killed at Bunker Hill, called for a glass of brandy at Wright's Tavern, and, while stirring it with his finger, remarked, "I mean to stir the damned Yankee blood as I stir this, before night!" The Yankee blood, it subsequently appeared, was never more stirred than it was during the whole of that immortal day.

XVIII.

The Americans were not inactive while the British were thus engaged in searching

their private dwellings, insulting and threatening their fellow-townsmen, and burning and destroying their public stores. They were increasing in numbers on the hill near the North Bridge. Several hundred had assembled there, and affairs wore a serious and threatening aspect.

There were a regiment of militia and a regiment of minute-men, imperfectly organized, in the vicinity of Concord. There were also two small companies of horse, one in Concord and one in Sudbury, but the members were on duty on that day with the foot companies. The officers of the minute companies had no commissions. They derived their authority solely by the votes of their comrades in arms. They had no combined military organization. In the emergency like that on the 19th of April, aid and comfort were accepted as they came. Of the few hundred men that were engaged in the opening fight of the Revolution, two hundred belonged to Concord. They were volunteers, and no full list of their names has ever appeared. About one hundred names were collected, and we annex the roll of those we have been able to gather here and there in our researches.

NAMES OF CONCORD MEN AT THE FIGHT AT NORTH BRIDGE.

James Barrett.	Benjamin Prescott.
John Buttrick.	Ephraim Potter.
John Buttrick, Jun.	David Brown.
Reuben Brown.	William Parkman.
Josiah Brown.	William Emerson.
Purchase Brown.	Ephraim Wood, Jun.
Benjamin Clark.	James Cogswell.
Abel Davis.	John Cuming.
Thaddeus Davis.	Jonathan Farrar.
John Eastabrook.	George Minot.
Benjamin Hosmer.	Jonathan Harris.
Elijah Hosmer.	Nathan Barrett.
Ebenezer Hardy.	Joseph Hosmer.
Joseph Merriam.	William Mercer.
Charles Miles.	John Robbins.
James Russell.	Jonas Brown.
David Wheeler.	Zachariah Brown.
Thomas Davis, Jun.	Joseph Hayward.
Amos Melven.	Thaddeus Blood.
John White.	Joseph Butler.
Francis Wheeler.	John Barrett.
Andrew Conant.	Ephraim Wood.

Among those early on the field from the neighboring towns was Lieutenant-Colonel John Robinson, of Westford, of the regiment of minute-men commanded by the brave Colonel William Prescott. He was accompanied by the Rev. Joseph Thaxter, Captain Joshua Parker, and private Oliver Hildreth. Mr. Thaxter had been preaching at Westford as a candidate. On the first tidings of danger he hastened to Concord, armed with a brace of pistols, and was in front to receive the first fire of the enemy; and he and William Emerson, the pastor of Concord, were the first chaplains of the Revolution.

Major Abijah Pierce, of Lincoln, who had just been elected colonel of a regiment of minute-men, came with only a walking-cane,

and had to wait to obtain a gun by capture from the enemy. In a few hours he was armed and equipped, and ready for active duty. Officers as well as men were armed with muskets in this initial engagement.

Acting Adjutant Hosmer, with characteristic energy, formed the Americans as they arrived on the hill near the bridge, westward of the residence of the late Stedman Buttrick. This field was about fifty rods from the river. The minute companies were placed on the right, and the militia companies on the left, facing the bridge. They were formed in two lines, and while in position John Buttrick, the young fifer, counted the front line, and stated that there were 250 men. This made the force of Americans at nine o'clock in the morning about 500.

While these preparations were being made, to show the contiguity of the opposing parties, a minute-man of Lincoln, named James Nichols, an Englishman, who was represented as "a droll fellow and a fine singer," said, "If any of you will hold my gun, I will go down and talk to them." Some one took his gun, and he went down alone to the British soldiers at the bridge, and conversed with them for several minutes. On his return he said he was going home. Afterward he enlisted and joined the Americans on Dorchester Heights, whence he deserted to the enemy.

XIX.

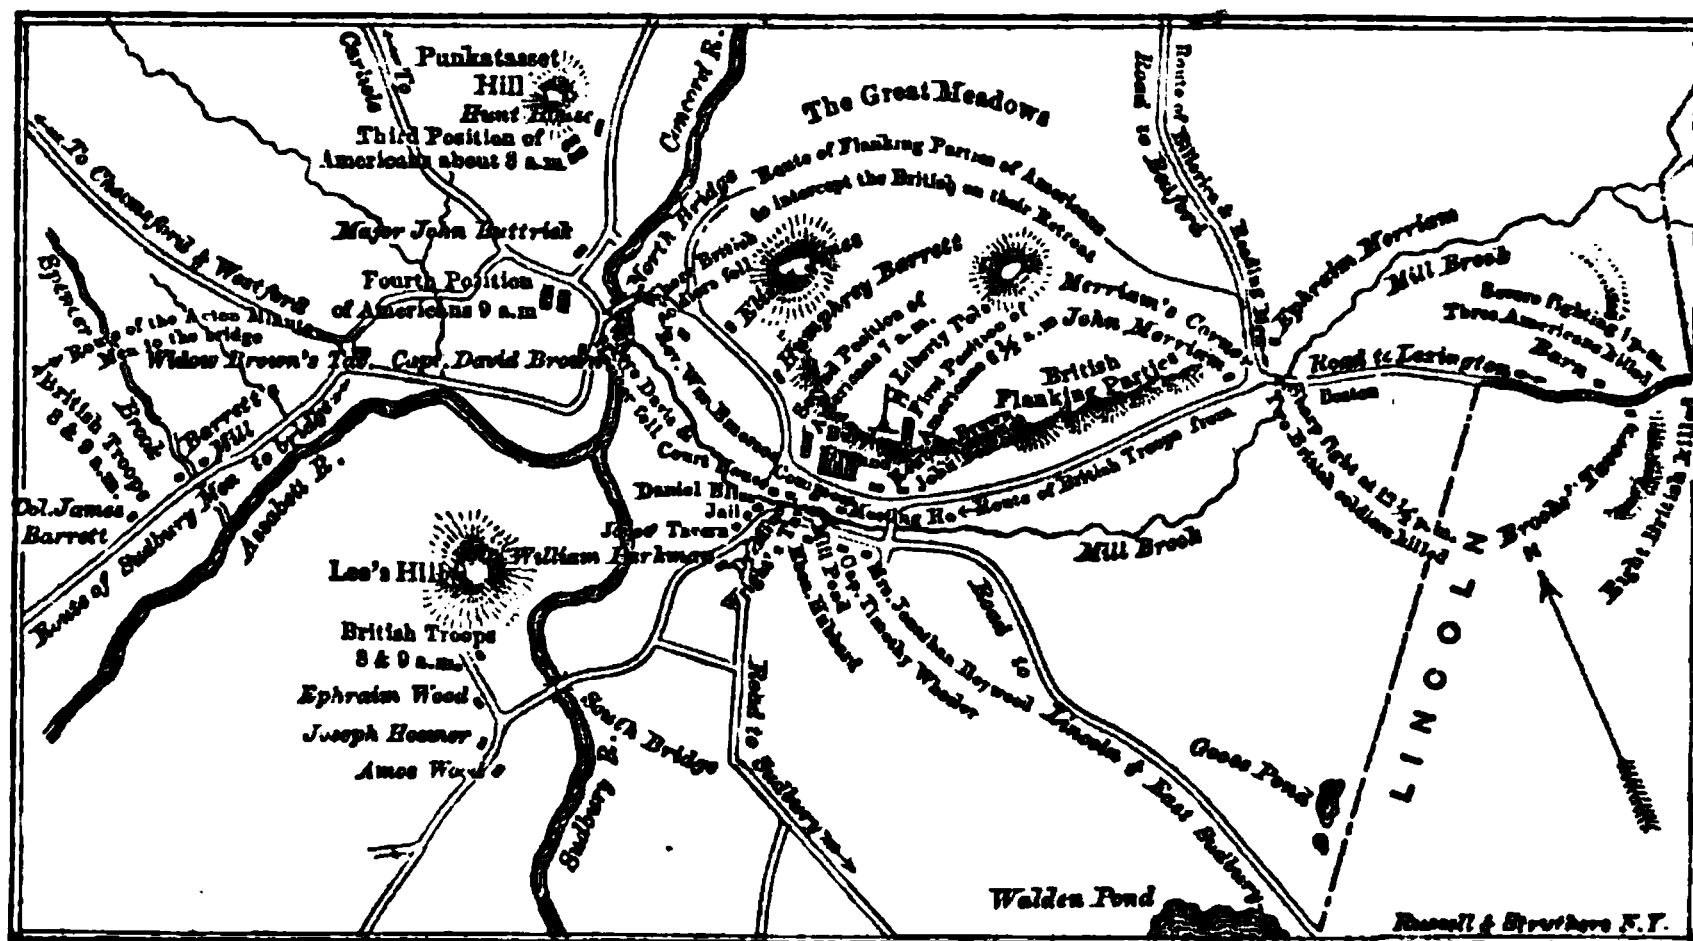

On the highest point of land where the Americans had assembled, the chief officers and citizens of Concord, with a few from the adjoining towns, held a council of war. There was an animated consultation on that historic spot. There Colonels Barrett, Robinson, Pierce, and Brooks, Major Buttrick, Captains Davis, Brown, Miles, Barrett, and Smith, citizens William Parkman, Ephraim Wood, and others, met and consulted on the course they would pursue. These patriots, requiring even more moral than physical courage to meet the regulars, armed with the power of a strong government, did not long hesitate. Indeed, the aggressions of the enemy soon provoked them to a decision. While these deliberations were absorbing their attention, the British were ruthlessly burning gun-carriages, wheels, the liberty-pole, and other spoils in the village, the smoke from which rose in a cloud over the common, and was plainly to be seen by those on the hill. It appeared as if the enemy had already set fire to the town. The sight sent a thrill of indignation through the ranks of the militia and minute-men gathered there. In the midst of the excitement the energetic Hosmer exclaimed, "They have set the village on fire! Will you let them burn it down?" With this danger in view, and urged by the bold and emphatic expressions of Major Buttrick and Captain

Davis, they immediately "resolved to march to the middle of the town to defend their homes, or die in the attempt."

Although the British force at the bridge was not over 150 to 200 men, there were more than 500 in the village, a distance of half a mile, 100 more under Captain Pole, only a mile further, and the three companies under Captain Parsons, expected to return at any moment from Colonel Barrett's. The British could concentrate over 800 men within half an hour after the first gun was fired. The Americans numbered 500, and, in a military point of view, were merely an "armed mob," suddenly called together for self-protection. The British were well-organized, well-disciplined, experienced soldiers—veterans, indeed, accustomed to war in all its rigor, and sustained in whatever they did by a great nation. But in face of all this array, was there a doubt in the ranks of the Americans? In the excitement of the hour Captain Smith, of Lincoln, full of patriotic impulses, volunteered to dislodge the enemy at the bridge with his single company. Smith had led his men to the field on the first alarm, and leaving his horse at Wright's Tavern in the village, took his position on the hill and joined in the council. Captain Davis, of Acton, animated with the same feelings, exclaimed, "I haven't a man that's afraid to go." This was the spirit shown by the provincials, and it was decisive. It was arranged that in the forward movement Captain Davis, as commander of the first company of minute-men, should take the right, which he did in a gallant manner. It was thought best that the minute-men should have the advanced position, because many of them had bayonets, and it was deemed best to be prepared for a charge and close fighting.

XX.

The crisis had come. The council broke up, the officers took their respective positions, as well as circumstances would permit, and Colonel Barrett gave the order to march to "the bridge and pass the same, but not to fire on the king's troops unless they were fired upon." They wheeled from the right, Luther Blanchard and John Buttrick, the young fifers, playing *The White Cockade*, advanced to the scene of action, and placed themselves in an exposed position on the rough, narrow highway. Approaching the road leading from Captain David Brown's house to the bridge, the Acton minute-men, under Davis, passed in front, and marched toward the bridge. In files of two abreast the Concord minute-men, under Brown, pushed forward, and came next in position. These companies were followed by those of Captains Miles and Barrett. The former marched to the battle-field "with the same seriousness and acknowledgment

MAP ILLUSTRATING THE CONCORD FIGHT.

of God which he always felt on going to church." The Acton militia company, under Lieutenant Simon Hunt, followed the Concord minute-men. Those from Lincoln and Bedford fell in under the direction of Colonel Barrett, who continued on horseback in the rear, giving orders to the volunteers as they came in from the other towns. It is impossible to state the precise position of all the Americans as they advanced. The lower road, leading to the bridge, was narrow and subject to inundations, and a wall had been built with large stones, on the upper side, in which posts were placed for a railing, to enable foot passengers to pass over when the river overflowed the road. It can be imagined that this was not a favorable place for the formation of many men in battle array, even if they had been drilled soldiers.

Major Buttrick took command of the Americans in the forward movement. He was accompanied by Lieutenant-Colonel Robinson. Major Buttrick requested Colonel Robinson to act as his superior, as he was his senior in years and in rank, but Colonel Robinson modestly declined, and said he would go as a volunteer aid. "In the left hand they held their fuses trailed," and marched with Captain Davis and his men. Major Buttrick thus led this small band of patriots in double file to the scene of blood.

XXI

The British, somewhat scattered in small groups on the bridge and on the west bank of the river, noticing the advance of the Americans, immediately formed and crossed to the east bank, taking up some of the planks of the bridge as they passed over. The soldiers under Captain Lawrie, who had previously retired to the hill, moved forward and joined their companions on the right

bank of the river. The attempt of the British to dismantle the bridge attracted the attention of Major Buttrick as the Americans were advancing, "two and two, and turning the corner of the cross-road." He remonstrated against the act in a loud and emphatic tone, and ordered his men to march in a quick step. Thereupon the enemy desisted from the destruction. They became alarmed at the menacing movement of the Americans; and it may have occurred to them at the time that whatever obstructions were placed in the way of the Americans would jeopard the safety of Captain Parsons's detachment.

It was, according to Captain David Brown, "between nine and ten of the clock in the forenoon." The British fired two or three guns in quick succession. These were preconcerted signal-guns for the distant detachments of the enemy to return at once. When the Americans arrived within ten or fifteen rods of the bridge, and were rapidly moving forward, one of the regulars, a sharp-shooter, stepped from the ranks and discharged his musket, manifestly aimed at Major Buttrick or Colonel Robinson, the ball from which, passing under the arm of the latter, slightly wounded Luther Blanchard, the fifer of the Acton company, in the side, and Jonas Brown, one of the Concord minute-men. This gun was immediately followed by a volley, which instantly killed Captain Isaac Davis and private Abner Homer, of Acton, a ball passing through the heart of the former, and another through the head of the latter, and slightly wounding Ezekiel Davis, a brother of Captain Davis, a ball passing through his hat and grazing his head. When he saw that his fifer was wounded, Captain Davis impulsively stepped to the wall by the road, and was in the act of sighting his gun, when he was

THE BURN BRIDGE.

hit by the enemy's shot. He sprang two or three feet in the air, fell on the north side of the wall, and expired without uttering a word. Joshua Brooks, of Lincoln, was struck with a ball that cut through his hat and drew blood on his forehead. It appeared as if he had been cut with a knife; and "I concluded," said Private Baker, "that the British were firing jackknives."

Major Buttrick, then in front of Captain Brown's company, instantly jumped from the ground, and partly turning to his men, impetuously exclaimed, "Fire, fellow-soldiers! for God's sake, fire!" discharging his own gun at the same moment. Captain Brown, who never before nor after used a profane word, exclaimed, "God damn them, they are firing balls! Fire, men, fire!" drew up his own musket, deliberately aimed, and fired. One of the dead British soldiers, buried near the old monument, was believed to have been the result of that shot. Major Buttrick's order ran along the line of militia and minute-men, the word "Fire!" "Fire!" came from a hundred lips, and a general discharge instantly followed from the Americans. They fired as they stood, and over each other's heads. The fusillade continued for a few minutes only, when the British broke and fled in great alarm and confusion. Noah Parkhurst, one of the Lincoln men, said to one of his comrades, "Now the war has begun, and no one knows when it will end!"

XXII.

The fire of the Americans was destructive. Two British soldiers were instantly killed. Five officers, Lieutenants Gould, Hall, Sunderland, and Kelly, and a sergeant and six privates, were reported to have been wounded at the same time. It has never been accurately ascertained how many privates suffered in this engagement. More than a dozen had their wounds dressed in the village by Drs. Minot and Cumings, and, of course, there were surgeons with the expeditionary force. Many of the troops were covered with blood as they passed the houses on their retreat to the village, and were seen in this condition from the windows. The sudden flight of such veteran soldiers showed that the fire of the Americans must have been very severe. Lieutenant Hall was taken prisoner on the road, and died the next day. His remains were delivered to General Gage. Lieutenant Gould was also captured, and committed to the kind care of the Rev. Edward Brooks, of Medford. Money was Gould's hope and guide, for he offered \$10,000 for his liberty. On the 28th of May he was exchanged for Josiah Breed, of Lynn, who was wounded in the afternoon of that day. Lieutenant James Potter, of the marines, was also a prisoner, and confined for some time at Reuben Brown's. The black-handled and brass-hilted sword of one of these officers is now in the curious bric-a-brac collection of antiques in the rooms of

SWORD CAPTURED
AT CONCORD,
APRIL 19, 1775.

Charles E. Davis, an enthusiastic archaeologist in Concord. On the hilt the characters X° RG° C° VL N° 10 are engraved.

Two or three of the prisoners were confined in Concord jail. Sergeant Cooper, one of the party who assisted in the search of Colonel Barrett's house, and one of the prisoners, subsequently married a woman who lived with Dr. Cuming. Another, Samuel Lee, who afterward lived in Concord, always asserted that he was the first British soldier captured in that town. The jail was close by Jones's Tavern, and a sketch of the building was drawn by General Sir Archibald Campbell, who was captured off Boston by a French privateer, and confined in it in 1777, till exchanged for Ethan Allen.

The two soldiers killed at the bridge were left on the ground where they fell, and afterward buried by Zachariah Brown and Thomas Davis, Jun., and the spot marked by two rude stones to point out "the place where the first British blood was shed in a contest which resulted in a revolution the mightiest in its consequences in the annals of mankind;" and the stones have remained there to this day. One of the wounded soldiers, John Bateman, died, and was buried at the end of the ridge on the common.

Of the wounded Americans there is only this additional incident to relate. On feeling that he had been hit, Blanchard went, after the action, to the house of Humphrey Barrett, where Mrs. Barrett, on examining the wound with a mother's solicitude, remarked, "A little more, and you'd been killed." "Yes," said Blanchard, "and a little more, and t'wouldn't have touched me at all," and then immediately rejoined his company.

Several of the minute-men were detailed to convey the bodies of Davis and Hoarmer to the house of Major Buttrick, whence they were taken that afternoon to Acton.

On the retreat of the enemy most of the Americans crossed the bridge in pursuit. Many, including the Concord minute-men and the Acton minute-men, the latter under the command of Lieutenant John Hayward after the fall of Davis, went to the eminence in the rear of Eliasa Jones's house, now the residence of John S. Keyes, Esq., and stood behind a wall forty rods or more from where the retreating British were joined by a reinforcement from the village. One of the bullets fired by the enemy during the retreat passed through the shed of Jones's house. The shed and bullet-hole have been carefully preserved by the present owner of the place, and they continue to be an object of patriotic attraction to the many pilgrims who annually visit the scene of the fight.

The result of the affair at the North Bridge, in figures, was as follows:

	Killed.	Wounded.	Total.
Americans.....	2	4	6
British.....	4	13	17

HALT OF TROOPS NEAR ELISEA JONES'S HOUSE.

XXIII.

What was the effect of this repulse on the British?

The fire of the Americans astonished and undeceived them. It was wholly unexpected, for they did not believe the colonists would fight. They did not recover from the shock it gave them, and they continued their retreat to the hill on the north side of the village, on the edge of the common, notwithstanding the reinforcement of grenadiers pushed forward by Colonel Smith to their relief. They reached the main body about the time Captain Pole and his detachment arrived. Shortly after, and in the midst of the utmost confusion and excitement, Captain Parsons reached the bridge from Colonel Barrett's. When his soldiers saw the dead bodies of their comrades on the bank of the river, they were seized with a panic, and "ran with great speed" to the centre of the town. "Their conduct was observed by the Rev. Mr. Emerson and his family, who had witnessed the whole tragical scene from the windows of his house near the battleground." It has been asserted that if the Americans had not become somewhat confused and scattered by the occurrences that had just taken place, this detachment of the enemy would have been captured; but it is as probable that the Americans did not wish to run the risk of having the village burned in retaliation. And what could they have done with so many prisoners?

XXIV.

This short and sharp action changed the position of affairs in Concord. The British had held possession of the town from seven o'clock in the morning. With the first shot the Americans had assumed the offensive.

It is believed that by half past ten o'clock the British had their entire force concentrated in the village. "For half an hour," said William Emerson, "the enemy, by their

marches and counter-marches, discovered great fickleness and inconstancy of mind, sometimes advancing, sometimes retreating to their former posts." It has been supposed that Colonel Smith was in hopes that the reinforcements he had sent for would join him at Concord. But whatever were his expectations, his delay nearly proved fatal to his entire command. It was finally decided to retreat to Boston. It became clear to Colonel Smith that his only safety was in the immediate evacuation of Concord. The British thereupon arranged for the care of the wounded, and hastily collected their material together for the retrograde movement. One of the officers, in his hurry-scurry, left his gold watch at Dr. Minot's, where several of the wounded had been placed. It was found by an old black servant, who, with honest simplicity, called out, "Hollo, Sir, you have left your watch."

The British, in order to carry off some of their disabled officers, confiscated a chaise belonging to Reuben Brown, and another owned by John Beaton. These stolen vehicles were furnished with bedding taken from the neighboring houses. They also appropriated several horses, and among them was the animal that Captain Smith, of Lincoln, had left at Wright's Tavern. One of the chaises was subsequently recaptured by Lieutenant Hayward and returned to its owner, and the following advertisement, which appeared in the *Essex Gazette* of the 10th of August, 1775, tells us about one of the horses, and describes the stolen bedding:

"Lieut. Joseph Hayward, of Concord, gives Notice that on the 19th of April last, in the Fight, he took from the Regulars in Menotomy a Horse and Chaise. The Chaise was owned by Mr. Reuben Brown, of Concord. What remains in his hands is a mouse-colored Horse, near 18 hands high, old, poor, and dull; a good Bed Quilt, Tammy on both sides; a good Camel Riding-hood, brown color; one Pillow; and a piece of Bed-Tick. The owner may have them by telling the marks and paying the Charge of this Advertisement."

Other interesting incidents occurred toward the close of the occupation of Concord. About eleven o'clock several of the British soldiers stationed near Reuben Brown's fired at Abel Prescott as he was riding home from Sudbury. Although wounded in his side, he managed to reach Mrs. Jonathan Heywood's house, where his wound was hastily dressed by Mrs. Heywood and her son Abiel, a lad then, but subsequently a prominent physician in Concord. On the approach of the soldiers, Mrs. Heywood and her son gathered all the family silver and threw it into the well, and then sought a place of greater safety. Prescott ran up stairs and concealed himself in a cask in a dark place behind one of those enormous chimneys which half filled every house in those days. He heard the redcoats uttering bitter threats, as they unsuccessfully searched for him. In their disappointment they smashed the windows of the house. Abel was a brother of Samuel Prescott, who brought the first news of the British early in the morning, and they were a pair of noble brothers.

XIV.

The British left the village at twelve o'clock. They retreated in the same order as they entered, the infantry on the ridge of the hill on their left, and the grenadiers and marines on the road, but with more numerous flanking parties, and thrown out further from the main body. They evidently felt that the return on the home stretch was to be a hazardous one, and Colonel Smith acted with caution. The whole country had been aroused, and it seemed as if "men came down from the clouds."

After the first conflict there was no military order with the Americans. They became almost at one blow an independent people. On the pursuit each man was his own general, chose his own time, his own position, and his own mode of attack. This was a new style of fighting to most of the

British, fearfully telling on their morale, and terribly effective and destructive. On arriving at Merriam's Corner, the end of the ridge, at the junction of the Bedford and Boston roads, the retreating enemy were met by the Americans who had crossed over the Great Fields or Meadows from the North Bridge, and the minute-men who had just arrived from Reading, under the command of Major John Brooks, afterward Governor of Massachusetts. These patriots were on their way to Concord when the ball opened. When the alarm reached Reading, the Rev. Edmund Foster ran directly to Major Brooks, and asked, "Are you going to Concord, and when?" "Immediately," was the reply. With the militia company of Reading, under Captain Bachelder, they started. They left their horses in Bedford, and marched to Merriam's Corner, and arrived there shortly before the British flanking parties came over the hill. There they united with the men fresh from the fight, flushed with excitement and the smoke of battle. General Ebenezer Bridge, of Chelmsford, with a few men from Bedford, was also there; and Colonel William Thompson, with a company of militia from Billerica, added their strength to the others. There was also a company from East Sudbury in time for the second conflict. On came the enemy down the road and over the hill, and a sharp and serious engagement was fought there. It was thus described by Foster:

"Before we came to Merriam's Hill we discovered the enemy's flank guard of about eighty or a hundred men, who, on the retreat from Concord, kept the height of the land, the main body being in the road. The British troops and the Americans at that time were equally distant from Merriam's Corner. About twenty rods short of that place the Americans made a halt. The British marched down the hill with a very slow but steady step, without music, or a word being spoken that could be heard. Silence reigned on both sides. As soon as the British gained the main road, and passed a small bridge near the corner, they faced about suddenly and fired a volley of musketry upon us. They overshot, and no one to my knowledge was in-

jured by the fire. The fire was immediately returned by the Americans, and two British soldiers fell dead at a little distance from each other in the road near the brook. Several of the officers were wounded, including Ensign Lester."

There was another spirited affair on Hardy's Hill, a short distance beyond, where one of the Sudbury companies, Captain Cudworth, came up and vigorously attacked the enemy. Colonel John Ford, of Chelmsford, was also conspicuous in this fight. He had been a ranger in the French wars, and knew how to handle his rifle.

There was also a severe action below the well-known tavern with the quaint swinging sign of those days, with a picture of an Indian on one side and of King George on the other, afterward known as the Brooks Tavern, with the effigy of King George changed to that of General Washington. Foster described this conflict as a very severe one to the British. There was "a wood at a distance which appeared to lie on or near the road where the enemy must pass. Many leaped over the walls and ran for that wood." They "arrived just in time to meet the enemy. There was on the opposite side of the road a young growth of wood filled with Americans. The enemy were now completely between two fires, renewed and briskly kept up. They ordered out a flank guard on the left to dislodge the Americans from their posts behind the trees, but they only became better marks to be shot at." One side of this road was in Concord and the other in Lincoln. The result of this action was that eight of the British were killed, and were buried the next day in the Lincoln burying-ground. One from his dress was supposed to have been an officer. Some were killed in the woods, and some near a barn on the Concord side of the road. Of the Americans three were killed—Captain Jonathan Wilson, of Bedford, Nathaniel Wyman, of Billerica, and David Thompson, of Woburn. Over the grave of the latter, where it is mentioned that he was "slain at the Concord battle," is this epitaph:

"Here, passenger, confined, reduced to dust,
Lies what was once Religion, wise and just;
The cause he engaged did animate him high,
Namely, Religion and dear Liberty.
Steady and warm in Liberties' defense,
True to his Country, loyal to his Prince;
Though in his breast a thirst of glory fired,
Courageous in his Country's cause expired.
Although he's gone, his name embalmed shall be,
And had in everlasting Memory."

The British had reached the limits of Concord, where the Concord Fight, pure and simple, ceased, and where the conflict assumed the proportions of a revolution, which rolled on for the next seven years, with Concord men in nearly every battle, till the struggle ended at Yorktown in Peace and Independence.

The total number of killed, wounded, and

prisoners in the several fights and skirmishes in Concord was as follows:

	Killed.	Wounded.	Prisoners.
Americans.....	5	6	—
British	14	20	8

The number of wounded on the British side is an approximation only. There were probably twice as many as these figures indicate.

XXVI.

Over the remainder of the road the British "were driven before the Americans like sheep," and had to "run the gantlet." It was a race for life with them. The highway was lined with Americans, whose accurate aim generally produced the desired result. They were accustomed, as individuals, to the handling of guns; they were sharpshooters; they had been taught from early youth to hit an Indian, or a wolf, or a wild-cat, or a partridge, at sight; they could hit higher game when necessity and patriotism forced it upon them. They made up in courage and accurate shooting what they lacked in military organization and discipline. Most of them were without cartridges and cartridge-boxes; they had to rely upon muskets and powder-horns. With their military drill, the British could, perhaps, load and fire more rapidly than the Americans, but not with the same execution, as the British soldiers fired from the breast and not from the shoulder. With this experience as marksmen, the Americans intercepted the enemy at every point and at every turn on the highway. Shots were fired from behind every house, barn, wall, fence, tree, and corner. After firing from one position the Americans would fall back, run forward across the fields, and repeat the

manœuvre at a lower point on the road. Their knowledge of the country gave them this immense advantage, while the British were compelled to keep together on the highway, which made the retreat a more disastrous one to them. Any one can imagine how terribly they suffered in all these engagements, ambuscades, and skirmishes on that bright and glorious day for America. Several of the enemy were killed near Viles's Tavern. Colonel Smith was wounded in the leg at Fiske's Hill, and Major Pitcairn hit in the arm and unhorsed there. His charger, a fine animal, ran over the fields, riderless, till captured by an American, and, with the accoutrements, was subsequently sold at auction in Concord. Captain Nathan Barrett bought the holsters and pistols, marked with Pitcairn's name, and gave them to General Israel Putnam.

Among the tragic incidents on that long line of battle was one between James Hayward, of Acton, and a British soldier at the foot of this hill. Hayward, on going to the rear of a house for a draught of water, was seen by a Briton, who had gone into the building for plunder. The Briton went to the door to cut Hayward off as he passed the corner. Hayward's eye caught sight of the regular the moment he opened the door; they leveled their guns and fired at the same instant, the Briton remarking, "You are a dead man." "And so are you," said Hayward. The British soldier was instantly killed. Hayward was mortally wounded, the ball of his antagonist passing through his powder-horn, driving the splinters into his body. He lingered eight hours, and in the midst of his sufferings exclaimed, "I am happy to die in defense of the rights of my country."

On the run down the hill an old fellow was alarmed at the sight, and he soon created a sensation in an unexpected quarter. Shortly after the British left Lexington for Concord a note from John Hancock was received at Mr. Clark's, stating where he and Adams were located, and requesting Mrs. Hancock and Miss Quincy to come to them in their carriage, and bring the fine salmon that had been sent to them for dinner. The ladies went over to Burlington with the fish. They had it nicely cooked, and were on the point of sitting down to enjoy it, when this frightened and excited countryman rushed in, exclaiming, "The British are coming! the British are coming! My wife's in eternity now." Hancock and Adams, supposing that the British were upon them, slipped out of the house and passed over a by-road into a swamp, and thence to the residence of Mrs. Thomas Jones, where they remained concealed till the alarm and danger were over.

On his return to Lexington—indeed, before he had fairly got out of Lincoln—Colonel

the men who had been so barbarously treated by his troops nine or ten hours previously. It was now their opportunity to retaliate, and it was improved. Captain Parker and his men, smarting under the tragical affair of the morning, were there, and gave the enemy a warm reception; but, while the British suffered severely, three more of Parker's company were killed and one wounded in the encounter. But there was now a brief lull in the storm that had raged around the British from the North Bridge to this point; there was a brief respite for the worn-out and demoralized redcoats. The reinforcements which Colonel Smith had so urgently demanded early in the morning had made their appearance.

XXVII.

About nine o'clock in the morning a brigade of eleven hundred men, with two field-pieces and a provision train, marched out of Boston to the relief of their suffering comrades in Concord. They were under the command of Lord Hugh Percy. They reached Lexington about two o'clock in the afternoon, and entered that town to the music of *Yankee Doodle*. Percy placed his cannon on two hills, one on each side of the road, near Munroe's Tavern, and checked for half an hour the eager pursuit of the Americans. This movement, and the presence of such a large reinforcement of regular troops, saved Colonel Smith's regiment from annihilation. It was well known before the arrival of Percy that if Colonel Smith could have found any one in authority to whom he could have handed his sword, he would have surrendered his entire command to have prevented further slaughter. This respite was his rescue. According to Stedman, who accompanied Percy, when Smith's distressed soldiers reached the hollow square formed by the fresh troops for their reception, "they were obliged to lie down upon the ground, their tongues hanging out of their mouths like those of dogs after a chase."

When the two field-pieces opened fire upon the Americans, it staggered many of them, as they were unaccustomed to such warfare. The plunging fire from the bluffs produced a stunning effect on them. Jonathan Harris, one of the Concord minute-men, said that the crashing of the balls through the woods, the falling branches, startled him, and for a moment induced him to think that there was no place like home, and that the sharp sound of the cannonade was fearfully full of panic; but they soon became used to the noise, and were again prepared to follow and harass the British on their stampede down the road after the brief rest given to Smith's exhausted soldiers.

Quite a number of Americans who had pursued the enemy as far as Lexington were compelled to return home for want of am-

munition. They had fired their powder-horns and bullet pouches empty. The case of Hayward, who had the encounter with the Briton, was that of many others—"of a pound of powder which he had taken with him, nearly the whole was fired away, and but two or three of the forty bullets with which he had started remained. This fact shows the extraordinary severity of the pursuit."

Meanwhile the British burned several houses, barns, and shops in Lexington, and many "dwelling-houses were abused, defaced, battered, shattered, and almost ruined." Others were set on fire in Cambridge and along the road-side, and would have been destroyed had not the close pursuit of the Americans prevented such a catastrophe. The unarmed, the aged, and the infirm, who were unable to flee, were bayoneted and murdered in several instances in their habitations. Even "women in child-bed, with their helpless babes in their arms, did not escape the horrid alternative of being either cruelly murdered in their beds, burned in their houses, or turned into the streets to perish with cold, nakedness, and distress."

With the aid of Percy's brigade the enemy were enabled to reach Bunker Hill without being entirely captured or destroyed. There they were covered by the guns of the vessels of war in the harbor. By the time they came in sight of Boston, the force of the Americans had largely increased from all quarters, and some military order began to show itself. One hour more of delay, and both detachments of the British would have fallen into the hands of the Americans. They arrived in Charlestown at seven o'clock in the evening. Smith's regiment had marched thirty-six to forty miles in twenty hours, and endured incredible suffering on their retreat. Percy's brigade were ten hours on the road, and had marched twenty-six miles, and for half that time and half that distance they too were a target for the enraged American sharpshooters. Nearly all the provisions they had they obtained by purchase or plunder, as the provision train sent out with Percy had been captured in Cambridge.

The Americans who joined in the pursuit, beginning at the old North Bridge, and fell in along the road to Charlestown, came from

GRAVE OF COLONEL JOHN BUTTRICK.

Acton, Bedford, Billerica, Brookline, Beverly, Concord, Carlisle, Chelmsford, Cambridge, Charlestown, Danvers, Dedham, Dorchester, Framingham, Lexington, Lincoln, Lynn, Littleton, Medford, Milton, Needham, Newton, Pepperell, Roxbury, Reading, Sudbury, Stow, Salem, Woburn, Watertown, and Westford. "Two companies from Stow, under Captains Hapgood and Whitcomb, marched for Concord at noon, passed the North Bridge, and arrived at Cambridge at sunset." Thirty-one towns! This is the roll of honor represented in the opening fight of the Revolution.

The men of Concord, with Major Buttrick among them, kept in the heat of pursuit until they reached Charlestown Neck, and many of them remained there during the night. None of them were killed, and only a few were wounded. Among the wounded were Captain Charles Miles, who was injured in one hand by a musket-ball, and Captain Nathan Barrett, who received a slight injury.

The total casualties on both sides, be-

tween Concord River and Bunker Hill, were as follows:

	Killed.	Wounded.	Missing.
Americans.....	49	86	5
British.....	73	179	26

The commanders of the Americans at Concord—Colonel Barrett and Major Buttrick, as well as Captain Davis, of Acton—have been remembered, and their names handed down to posterity in the epitaphs over their graves. That over Colonel Barrett states that “he early stepped forward in the contest with Britain, and distinguished himself in the cause of America.”

On the tombstone erected over the spot where Major Buttrick was buried, not far from where the Americans took their first position in Concord, is the following inscription, written by Governor Sullivan:

In memory of
COLONEL JOHN BUTTRICK,
who commanded the militia companies
which made the first attack upon
THE BARRIEN TROOPS
at Concord North Bridge,
on 19th of April, 1775.
Having, with patriotic firmness,
shared in the dangers which led to
American Independence,
he lived to enjoy the blessings of it,
and died May 16, 1791, aged 60 years.
Having laid down the sword
with honor,
he resumed the plough
with industry;
by the latter to maintain
what the former had won.
The virtues of the parent, citizen, and Christian
adorned his life,
and his worth was acknowledged by
the grief and respect of all ranks
at his death.

Other symbols mark the event. Monuments stand in Acton, Lexington, West Cambridge, now Arlington, and Danvers. Two

brass field-pieces, placed in an upright and conspicuous position in Doric Hall, in the State-house in Boston, and two cannon belonging to the artillery company in Concord, bear this inscription:

“The Legislature of Massachusetts consecrate the names of Major John Buttrick and Captain Isaac Davis, whose valor and example incited their fellow-citizens to a successful resistance of a superior number of British troops at Concord Bridge, the 19th of April, 1775, which was the beginning of a contest in arms that ended in American independence.”

This was the result, officially expressed in a few plain words, of this important military expedition; and the Concord Fight became the opening conflict of the contest which gave independence to these United States. One hundred years have rolled by since that event, and Concord celebrated the centennial anniversary on the 19th of April by appropriately unveiling a statue of a Minute-Man at the plow at early morning receiving the news of the approach of the British. It is a spirited figure, in heroic size, of young America a century ago, and is the inspiration of Daniel C. French, the young sculptor of Concord, who, full of genius, has caught the spirit of the incident, and embodied it in this representative image. It is cast in bronze from cannon presented to Concord by Congress by a resolution passed on the ninety-ninth anniversary of the birthday of the American Revolution. The statue is placed where the gallant Davis and Hosmer fell at the old North Bridge. This spot was marked for years by a bush, which Emerson idealized on the fiftieth anniversary of the fight as “the little bush that marks the spot where Captain Davis fell. ‘Tis the burning bush where God spake for his people.” There the Minute-Man will stand.

YES, OR NO?

SAY, shall it be Yes? O tell me, Sun,
 Ere you sink in the west so low—
 You never are troubled by doubts, not one—
 Say, shall it be Yes, or No?

The sun goes down to his resting-place,
 And the stars their faces show:
 O Stars, that glorify all the space,
 Pray, shall it be Yes, or No?

But stars have no sympathy, none at all,
 A-cold in their far-off glow,
 And they only mock at me when I call,
"Shall I answer him Yes, or No?"

Not even a bird on his homeward wing
 Would a comforting note bestow,
 And I listened in vain for his voice to sing
 An echoing Yes or No.

The bird had a mate in the maple's nest,
 Who waited his love-song. Lo!
 There is something astir in my wakened breast
 That is rather like Yes than No.

And as nowhere outside of yourself, my heart,
 Is the word that will help you, so
 You shall look within for the tender art
 To answer him Yes or No!

CARICATURE IN THE PURITAN PERIOD.

THE FATAL GORGON, 1581, REIGN OF ELIZABETH.

THE picture upon this page,* a favorite with the Protestants of England, Holland, and Germany for more than a century, is composed of twenty-two articles and objects, most of which are employed in the Roman Catholic worship. A church-bell forms the hat, which is decorated by crossed daggers and holy-water brushes. A herring serves for a nose. The mouth is an open wine flagon. The eye is a chalice covered by the holy wafer, and the cheek is a paten or plate used in the communion service. The great volume that forms the shoulders is the mass-book. The front of the bell-tiara is adorned by a mitred wolf devouring a lamb, and by a goose holding a rosary in its bill; the back, by a spectacled ass reading a book, and by a boar wearing a scholar's cap. At the bottom of the engraving the pierced feet of Christ are seen resting upon two creatures called by the artist, "the Queen's badges." The whole figure of Christ is supposed to be behind this mass of human inventions; for in the original these explanatory words are given, "Christ Covered."

It was by this device that Master Bat-

man, at the beginning of the Puritan period, sought to present to the eye a summary of what the Reformation had accomplished, and what it had still to fear. Half a century before, Henry VIII. being still the Defender of the Faith, the various articles used in Master Batman's satirical picture were objects of religious veneration throughout Great Britain. They had now become the despised but dreaded rattle-traps of a suppressed idolatry. From the field of strife one of the victors gathered the scattered arms and implements, the gorgeous ensigns and trappings of the defeated, and piled them upon the plain, a trophy and a warning.

There is no revolution that does not sweep away much that is good. The reformation in religion, chiefly wrought by Wycliffe, Huss, Luther, and Calvin, was a movement of absolute necessity to the further progress of our race. The intelligence of Christendom had reached a development which was incompatible with respect for the assumptions of the papacy and with a belief in the fictions which the papacy had invented or adopted. The vase must have broken, or the oak planted in it must have ceased to grow. Nevertheless, those fictions had their beauty and their use. There was a good and pleasing side to that system of fables and ceremonies, which amused, absorbed, and satisfied the people of Europe for a thousand years. If we could concede that the mass of men must remain forever ignorant and very poor, we could also admit that nothing was ever invented by man better calculated to make them thoughtlessly contented with a dismal lot than the Roman Catholic Church as it existed in the fifteenth century, before the faith of the people had been shaken in its pretensions. There was something in it for every faculty of human nature except the intellect. It gave play to every propensity except the propensity of one mind in a thousand to ask radical questions. It relieved every kind of distress except that which came of using the reason. All human interests were provided for in it except the supreme interest of human advancement.

One must have been in a Catholic community, or else lived close to an important Catholic church, in order to form an idea of the great part the Church once played in the lives and thoughts of its members—the endless provision it made for the entertainment of unformed minds in the way of festivals, fasts, processions, curious observances, changes of costume, and special rites. There was always something going on or coming off. There was not a day in the year nor an hour in the day which had not

* From Malcolm's *Caricaturing*. Plate 2, and page 22. See also *Catalogue of the Prints and Drawings in British Museum*. Division 1, vol. II, p. 177.

its ecclesiastical name and character. In our flowery observance of Easter and in our joyous celebration of Christmas we have a faint traditional residue of festivals that once made all Christendom gay and jocund. And it was all so adapted to the limited abilities of our race! In an average thousand men, there is not more than one capable of filling creditably the post of a Protestant minister, but there are a hundred who can be drilled into competent priests.

Consider, for example, a procession, which was formerly the great event of many of the Church festivals, gratifying equally those who witnessed and those who took part in it. In other words, it gratified keenly the whole community. And yet how entirely it was within the resources of human nature! Not a child so young, not a woman so weak, not a man so old, but could assist or enjoy it. The sick could view it from their windows, the robust could carry its burdens, the skillful could contrive its devices, and all had the feeling that they were engaged in enhancing at once the glory of God, the fame of their saint, the credit of their town, and the good of their souls. It was pleasure; it was duty; it was masquerade; it was devotion. Some readers may remember the exaltation of soul with which Albert Dürer, the first of German artists in Luther's age, describes the great procession at Antwerp, in 1520, in honor of what was styled the "Assumption" of the Virgin Mary. One of the pleasing fictions adopted by the old Church was that on the 15th of August, A.D. 45, the Virgin Mary, aged seventy-five years, made a miraculous ascent into heaven. Hence the annual festival, which was celebrated throughout Europe with pomp and splendor. The passage in the diary of Dürer has a particular value, because it affords us a vivid view of the bright side of the ancient Church just before the reformers changed its gorgeous robes into the Puritan's plain black gown, and substituted the long prayer and interminable sermon for the magnificent ceremonial and the splendid procession.

Albert Dürer was in sympathy with Luther, but his heart swelled within him as he beheld, on that Sunday morning in Antwerp, the glorious pageantry that filed past for two hours in honor of the "Mother of God's" translation. All the people of the city assembled about the Church of "Our Lady," each dressed in gayest attire, but each wearing the costume of his rank, and exhibiting the badge of his guild or vocation. Silver trumpets of the old Frankish fashion, German drums and fifes, were playing in every quarter. The trades and guilds of the city—goldsmiths, painters, masons, embroiderers, statuaries, cabinet-makers, carpenters, sailors, fishermen, butchers, curriers, weavers, bakers, tailors, shoe-makers, and laborers—all marched by in order, at some dis-

tance apart, each preceded by its own magnificent cross. These were followed by the merchants, shop-keepers, and their clerks. The "shooters" came next, armed with bows, cross-bows, and fire-locks, some on horseback and some on foot. The city guard followed. Then came the magistrates, nobles, and knights, all dressed in their official costume, and escorted, as our artist records, "by a gallant troop, arrayed in a noble and splendid manner." There were a number of women in the procession, belonging to a religious order, who gained their subsistence by labor. These, all clad in white from head to foot, agreeably relieved the splendors of the occasion. After them marched "a number of gallant persons and the canons of Our Lady's Church, with all the clergy and scholars, followed by a grand display of characters." Here the enthusiasm of the artist kindles, as he recalls the glories of the day:

"Twenty men carried the Virgin and Christ, most richly adorned, to the honor of God. In this part of the procession were a number of delightful things represented in a splendid manner. There were several wagons, in which were representations of ships and fortifications. Then came a troop of characters from the Prophets, in regular order, followed by others from the New Testament, such as the Annunciation, the Wise Men of the East riding great camels and other wonderful animals, and the Flight into Egypt, all very skillfully appointed. Then came a great dragon, and St. Margaret with the image of the Virgin at her girdle, exceedingly beautiful, and last, St. George and his squire. In this troop rode a number of boys and girls very handsomely arrayed in various costumes, representing so many saints. This procession, from beginning to end, was upward of two hours in passing our house, and there were so many things to be seen that I could never describe them all even in a book."

In some such hearty and picturesque manner all the great festivals of the Church were celebrated age after age, the entire people taking part in the show. There was no dissent, because there was no thought. But the reformers preached, the Bible was translated into the modern tongues, the intelligence of Christendom awoke, and all that bright childish pageantry vanished from the more advanced nations. The reformers discovered that there was no reason to believe that the aged Virgin Mary, on the 15th of August, A.D. 45, was borne miraculously to heaven; and in a single generation many important communities, by using their reason even to that trifling extent, grew past enjoying the procession annually held in honor of the old tradition. All the old festivals fell under the ban. It became, at length, a sectarian punctilio not to abstain

SPAYNE AND ROME DEFEATED.—LONDON AND AMSTERDAM, 1691.

from labor on Christmas. The Puritan Sunday was gradually evolved from the same spirit of opposition, and life became intense and serious.

For it is not in a single generation, nor in ten, that the human mind, after having been bound and confined for a thousand years, learns to enjoy and safely use its freedom. Luther the reformer was only a little less credulous than Luther the monk. He assisted to strike the fetters from the reason, but the prisoner only hobbled from one cell into another, larger and cleaner, but still a cell. No one can become familiar with the Puritan period without feeling that the bondage of the mind to the literal interpretation of some parts of the Old Testament was a bondage as real, though not as degrading nor as hopeless, as that under which it had lived to the papal decrees. You do not make your canary a free bird by merely opening the door of its cage. It has to acquire slowly, with anguish and great fear, the strength of wing, lungs, and eye, the knowledge, habits, and instincts, which its ancestors possessed before they were captured in their native islands. It is only in our own day that we are beginning really to enjoy the final result of Luther's heroic life—a tolerant and modest freedom of thought—for it is only in our own day that the consequences of peculiar thinking have any where ceased to be injurious.

If there are any who can not yet forgive the Puritans for their intolerance and narrowness, it must be they who do not know the agony of apprehension in which they passed their lives. It is the Puritan age

that could be properly called the reign of terror. It lasted more than a century, instead of a few months, and it was during that long period of dread and tribulation that they acquired the passionate abhorrence of the papal system which is betrayed in the pictures and writings of the time. There was a fund of terror in their own belief, in that awful Doubt which hung over every soul, whether it was or was not one of the Elect, and in addition to that, it seemed to them that the chief powers of earth, and all the powers of hell, were united to crush the true believers.

Examine the two large caricatures, "Rome's Monster" and "Spayne and Rome Defeated," in the light of a mere catalogue of dates. The Field of the Cloth of Gold, which we may regard as the splendid close of the old state of things, occurred in 1520, three years after Luther nailed up his theses. Henry VIII. defied the Pope in 1533; and twenty years after, Bloody Mary, married to Philip of Spain, was burning bishops at Smithfield. Elizabeth's reign began in 1558, which changed, not ended, the religious strife in England. The massacre of St. Bartholomew occurred in 1572, on that 24th of August which, as Voltaire used to say, all the humane and the tolerant of our race should observe as a day of humiliation and sorrow for evermore. In 1579 began the long struggle between the New and the Old, which is called the Thirty Years' War. The Prince of Orange was assassinated in 1584, in the midst of those great events which Mr. Motley has made familiar to the reading people of both continents. Every intelli-

gent Protestant in Europe felt that the weapon which slew the prince was aimed at his own heart. The long dread of the Queen of Scots's machinations ended only with her death in 1587. Soon after, the shadow of the coming Spanish Armada crept over Great Britain, which was not dispelled till the men of England defeated and scattered it in 1588. In 1605 Guy Fawkes and the Gunpowder Plot struck such terror to the Protestant mind that it has not, in this year, 1875, wholly recovered from it, as all may know who will converse with uninstructed people in the remoter counties of Great Britain. Raleigh was beheaded in 1618. The civil war began in 1642. In 1665 the plague desolated England, and in the next year occurred the great fire of London, good Protestants not doubting that both events were traceable to the fell influence of the Beast. The accession of James II., a Roman Catholic, filled the Puritans with new alarm in 1685, and during the three anxious years of his reign their brethren, the Huguenots, were fleeing into all the Protestant lands from the hellish persecution of the priests who governed Louis XIV.

Upon looking back at this period of agitation and alarm, it startles the mind to observe in the catalogue of dates this one: "Shakspeare died, 1616." It shows us, what the ordinary records do not show, that there are people who retain their sanity and serenity in the maddest times. The rapid succession of the plays—an average of nearly two per annum—proves that there was a *public* for Shakspeare when all the world seemed absorbed in subjects least akin to art and humor. And how little trace we find of all those thrilling events in the plays! He was a London actor when the Armada came; and during the year of the Gunpowder Plot he was probably meditating the grandest of all his themes, *King Lear*!

The picture entitled "Spayne and Rome Defeated"* was one of the most noted and influential broadsheets published during the Puritan period. It may properly be termed a broadsheet, since the copy of the original in the British Museum measures 20½ inches by 13. The Puritans of England saw with dismay the growing cordiality between James I. and the Spanish court, and watched with just apprehension the visit of Prince Charles to Spain and the prospect of a marriage between the heir-apparent and a Spanish princess. At this alarming crisis, 1621, the sheet was composed in England, and sent over to Holland to be engraved and printed, Holland being then, and for a hundred and fifty years after, the printing-

house and type-foundry of Northern Europe. Some of the Pilgrim Fathers of Massachusetts, then residing at Leyden, and still waiting to hear the first news of the *Mayflower* company, who had sailed the year before, may have borne a hand in the work. Pastor Robinson, we know, gained part of his livelihood by co-operating with brethren in England in the preparation of works designed for distribution at home.

Besides being one of the most characteristic specimens of Puritan caricature which have been preserved, it presents to us a *résumé* of history, as Protestants interpreted it, from the time of the Spanish Armada to that of Guy Fawkes—1588 to 1605. It appears to have been designed for circulation in Holland and Germany as well as in England, as the words and verses upon it are in English, Dutch, and Latin. The English lines are these:

"In Eighty-eight, Spayne, arm'd with potent might,
Against our peacefull Land came on to fight;
But windes and waves and fire in one conspire,
To help the English, frustrate Spaynes desire.
To second that the Pope in counsell sitte,
For some rare stratagem they strayne their witts;
November's 5th, by powder they decree
Great Brytanes state ruinate should bee.
But Hee, whose never-slumb'ring Eye did view
The dire intendments of this damned crew,
Did soone prevent what they did thinke most sure.
Thy mercyes, Lord! for evermore endure."

This interesting sheet was devised by Samuel Ward, a Puritan preacher of Ipswich, of great zeal and celebrity, who dedicated it, in the fashion of the day, thus:

"To God. In memorye of his double deliverance from y^e invincible Navie and y^e unmatcheable powder Treason, 1605."

It was a timely reminder. As we occasionally see in our own day a public man committing the absurdity of replying in a serious strain to a caricature, so, in 1621, the Spanish ambassador in London, Count Gondomar, called the attention of the British government to this engraving, complaining that it was calculated to revive the old antipathy of the English people to the Spanish monarchy. The obsequious lords of the Privy Council summoned Samuel Ward to appear before them. After examining him, they remanded him to the custody of their messenger, whose house was a place of confinement for such prisoners; and there he remained. As there was yet no *habeas corpus* act known among men, he could only protest his innocence of any ill designs upon the Spanish monarchy, and humbly petition for release. He petitioned first the Privy Council; and they proving obdurate, he petitioned the king. He was set free at last, and he remained for twenty years a thorn in the side of those who dreaded "Spayne and Rome" less than they hated Puritans and Parliaments.

This persecution of Samuel Ward gave his print such celebrity that several imita-

* From Malcolm, who copied it from the original in the British Museum. See Malcolm's *Caricaturing*. Plate 22.

tions or pirated editions of the work speedily appeared, of which four are preserved in the great collection of the British Museum, each differing from the original in details. Caricatures aimed directly at the Spanish ambassador followed, but they are only remarkable for the explanatory words which accompany them. In one we read that the residence of Count Gondomar in England had "hung before the eyes of many good men like a prodigious comet, threatening worse effects to church and state than this other comet," which had recently menaced both from the vault of heaven. "No eclipse of the sunno," continues the writer, "could more damage the earth, to make it barren and the best things abortive, than did his interposition." We learn also that when the count left England for a visit to his own country, in 1618, "there was an uproar and assault a day or two before his departure from London by the Apprentices, who seemed greedy of such an occasion to vent their own spleens in doing him or any of his a mischief." Another picture exhibits the odious Gondomar giving an account of his conduct in England to the "Spanische Parliament," in the course of which he attributes the British abhorrence of Spain to such men as "Ward of Ipswich," whom he describes as "light and unstayed wife," intent on winning the airy applause of the vulgar, and to raise their desperate fortunes. Nor does he refrain from chuckling over the penalty inflicted upon that enemy of Spayne and Rome: "And I think that Ward of Ipswich escaped not safely for his lewed and profane picture of '88 and their Powder Treason, one whereof, my Lord Archbishop, I sent you in a letter, that you might see the malice of these detestable Heretiques against his Holiness and the Catholic Church." This broadsheet being entitled *Fox Populi*, the writer concludes his explanation by styling the ambassador "Fox Populi, Count Gondomar the Great."

Ward of Ipswich continued to be heard from occasionally during the first years of the reign of Charles I. Ipswich itself acquired a certain celebrity as a Puritan centre, and the name was given during the lifetime of Samuel Ward to a town in Massachusetts, which is still thriving. One of his sermons upon drunkenness was illustrated by a picture, of which a copy is given here,* designed to show the degeneracy of manners that had taken place in England in his day. Mr. Chatto truly remarks that twenty years later the picture would have been more appropriate with the inscriptions transposed.

The marriage of Charles I. with the Princess Henrietta of France, in 1625, was one

FROM TITLE-PAGE TO A SERMON, "WOE TO DRUNKARDS,"
BY SAMUEL WARD, OF IPSWICH.—1627.

of the long series of impolitic acts which the king expiated on the scaffold in 1649. It aggravated every propensity of his nature that was hostile to the liberties of the people. Under James I. the *élite* of the Puritans had fled to Holland, and a little company had sought a more permanent refuge on the coast of New England. During the early years of the reign of Charles the persecution of the Puritans by his savage bishops became so cruel and so vigilant as to induce men of family and fortune, like Winthrop and his friends, accompanied by a fleet of vessels laden with virtuous and thoughtful families, to cross the ocean and settle in Massachusetts. Boston was founded when Charles I. had been cutting off the ears and slitting the noses of Puritans for five years. All that enchanting shore of New England, with its gleaming beaches, and emerald isles, and jutting capes of granite and wild roses, now so dear to summer visitors—an eternal holiday-ground and resting-place for the people of North America—began to be dotted with villages, the names of which tell us what English towns were most renowned for the Puritan spirit two hundred and fifty years ago. The satirical pictures preserved in the British Museum which relate to events in earlier reigns number ninety-nine in all, but those suggested by events in the reign of Charles I. are nearly seven hundred in number. Most of them, however, were not published until after the downfall of the king.

Several of these prints are little more than portraits of the conspicuous persons of the time, with profuse accounts on the same sheet of their sufferings or misdeeds. One such records the heroic endurance of "the Reverend Peter Smart, mr of Ardea, minister of God's word at Durham," who, for preaching against popery, lost above three hundred pounds per annum, and was imprisoned

* From Chatto's *Origins and History of Playing Cards*. London: 1842. Page 181.

eleven years in the King's Bench. The composer adds these lines:

"Peter preach downe vaine rites with
flagrant harts:
Thy Guerdon shall be greater, though
heere thou smart."

Another of these portrait pieces exhibits Dr. Alexander Leighton, who spoke of Queen Henrietta as "the daughter of Hell, a Canaanite, and an idolatress," and spared not Archbishop Laud and his confederates. For these offenses he was, as the draughtsman informs us, "clapt up in Newgate for the space of 15 weekes, where he suffered great miserie and sicknes almost to death, afterward lost one of his Eares on the pillorie, had one of his nostrills slit clean through, was whipt with a whip of 3 Cordes knotted, had 36 lashes therewith, was fined 1000*l*., and kept prisoner in the fleet 12 yeares, where he was most cruelly used a long time, being lodged day and night amongst the most desperately wiked villaines of y^e whole prison." He was also branded on the cheek with the letters S. S.—sower of sedition. Several other prints of the time record the same mark of attention paid by the "martyred" king to his Catholic wife. By-and-by, the crowned and mitred ruffians who did such deeds as these being themselves in durance, Parliament set Dr. Leighton free, and made him a grant of six thousand pounds.

A caricature of the same bloody period is entitled, "Archbishop Land dining on the Ears of Prynne, Bastwick, and Burton." We see Land seated at dinner, having an ear on the point of his knife and three more ears in the plate before him, the three victims of his cruelty standing about, and two armed bishops at the foot of the table. The dialogue below represents Land as rejecting with scorn all the dainties of his table, and declaring that nothing will content him but the ears of Lawyer Prynne and Dr. Bastwick. He cuts them off himself, and orders them to be dressed for his supper.

"*Canterbury.* This I doe to make you examples,
That others may be more careful to please my palate.
Henceforth let my servants know, that what I will, I
will have done,
What ere is under heaven's Sonne."

A burst of caricature heralded the coming triumph of the Puritans in 1640, the year of the impeachment of the Earl of Strafford. Many of the pictures recorded both the sufferings and the joyful deliverance of the Puritan clergymen. Thus we have in one of

"LET NOT THE WORLD DEVISE THOSE WHOM CHRIST HATH JOINED."

them a glowing account of the return of the three gentlemen whose ears furnished a repast for the Archbishop of Canterbury. They had been imprisoned for many years in the Channel Islands, from which they were conveyed to Dartmouth, and thence to London, hailed with acclamations of delight and welcome in every village through which they passed. All the expenses of their long journey were paid for them, and presents of value were thrust upon them as they rode by. Within a few miles of London they were met by such a concourse of vehicles, horsemen, and people that it was with great difficulty they could travel a mile in an hour. But when at length in the evening they reached the city, masses of enthusiastic people blocked the streets, crying, "Welcome home! welcome home!" and strewing flowers and rosemary before them. Thousands of the people carried torches, which rendered the streets lighter than the day. They were three hours in making their way through the crowd from Charing Cross to their lodgings in the city, a distance of a mile.

It was during the exaltation of the years preceding the civil war that such pictures appeared as the one given above, urging a union between the Church of England and the Church of Scotland against the foe of both. This is copied from an original impression in the collection of the New York Historical Society.

The caricaturists pursued Land and Strafford even to the scaffold. The archbishop

was the author of a work entitled, *Canons and Institutions Ecclesiastical*, in which he gave expression to his extreme High-Church opinions. In 1640 the victorious House of Commons canceled the canons adopted from this work, and fined the clergy, who had sat in the Convocation. A caricature quickly appeared, called "Archbishop Laud firing a Cannon," in which the cannon is represented as bursting, and its fragments endangering the clergymen standing near. Laud's committal to the Tower was the occasion of many broadsheets, one of which exhibits him fastened to a staple in a wall, with a long string of taunting stanzas below:

"Reader, I know thou canst not choose but smile
To see, a Bishop tide thus to a ring!

Yea, such a princely prelate, that ere while
Could three at once in *Limbo patrum* fling;
Suspend by hundreds where his worship pleased,
And them that preached too oft by silence eas'd;

"Made Laws and Canons, like a King (at least);
Devil'd new oaths; forc'd men to swear to lies!
Advanc'd his lordly power 'bove all the rest.
And then our Lazie Priests began to rise;
But painfull ministers, which plide their place
With diligence, went downe the wind apace.

"Our honest Round heads too then went to racke;
The holy sisters into corners fled;
Cobblers and Weavers preacht in Tubs for lacke
Of better Pulpits; with a sacke instead
Of Pulpit-cloth, hung round in decent wise,
All which the spirit did for their good devise.

"Barnes, Cellers, Cole-holes, were their meeting-
places,
So sorely were these babes of Christ abus'd,
Where he that most Church-government disgraces
Is most esteem'd, and with most reverence us'd.
It being their sole intent religiously
To rattle against the Bishops' dignity.

"Brother, sales one, what doe you thinke, I pray,
Of these proud Prelates, which so lofty are?
Truly, sales he, meere Antichrists are they.
Thus as they parle, before they be aware,
Perhaps a Pursuivant slips in behind,
And makes 'em run like hares before the wind.

"A yeere agone 'tad been a hanging matter
T'ave writ (nay, spoke) a word 'gainst little Will;
But now the times are chang'd, men scorne to flatter;
So much the worse for Canterbury still,
For if that truth come once to rule the roast,
No mar'le to see him tide up to a post.

"By wicked counsels faine he would have 'set
The Scots and us together by the eares;
A Patriark's place the Levite long'd to get,
To sit bith' Pope in one of Peter's chaires.
And having drunke so deepe of Babels cup,
Was it not time, d'ee think, to chaine him up?"

In these stanzas are roughly given the leading counts of the popular indictment against Archbishop Laud. Other prints present him to us in the Tower with a halter round his neck; and, again, we see him in a bird-cage, with the queen's Catholic confessor, the two being popularly regarded as birds of a feather. In another, a stout carpenter is holding Laud's nose to a grindstone, while the carpenter's boy turns the handle, and the archbishop cries for mercy:

"Such turning will soon deform my face;
Oh! I bleed, I bleed! and am extremely sore."

But the carpenter reminds him that the various ears that he had caused to be cut off were quite as precious to their owners as his nose is to him. A Jesuit enters with a vessel of holy-water with which to wash the extremely sore nose. One broadsheet represents Laud in consultation with his physician, who administers an emetic that causes him to throw off his stomach several heavy articles which had been troubling him for years. First, the "Tobacco Patent" comes up with a terrible wrench. As each article appears, the doctor and his patient converse upon it:

"Doctor. What's this? A book? *Whoever hath bin at church may exercise lawful recreations on Sunday.* What's the meaning of this?

"*Canterbury.* 'Tis the booke for Pastimes on the Sunday, which I caused to be made. But hold! here comes something. What is it?

"Doctor. 'Tis another book. The title is, *Sunday no Sabbath.* Did you cause this to be made also?

"*Canterbury.* No; Doctor Pocklington made it; but I licensed it.

"Doctor. But what's this? A paper 'tis; if I be not mistaken, a Star-Chamber order made against Mr. Prinne, Mr. Burton, and Dr. Bastwicke. Had you any hand in this?

"*Canterbury.* I had. I had. All England knoweth it. But, oh, here comes up something that makes my very back ake! O that it were up once! Now it is up, I thank Heaven!

"Doctor. 'Tis a great bundle of papers, of presentations and suspensions. These were the instruments, my lord, wherewith you created the tongue-tied Doctors, and gave them great Benefices in the Country to preach some twice a year at the least, and in their place to hire some journeyman Curate, who will only read a Sermon in the forenoone, and in the afternoone be drunke, with his parishioners for company."

By the same painful process the archbishop is delivered of his *Book of Canons*, and finally of his mitre; upon which the doctor says, "Nay, if the miter be come, the Divell is not far off. Farewell, my good lord."

There still exist in various collections more than a hundred prints relating directly to Archbishop Laud, several of which give burlesque representations of his execution. There are some that show him asleep, and visited by the ghosts of those whom he had persecuted, each addressing him in turn, as the victims of Richard III. spoke to their destroyer on Bosworth Field. One of the print-makers, however, relented at the spectacle of an old man, seventy-two years of age, brought to the block. He exhibits the archbishop speaking to the crowd from the scaffold:

"Lend me but one poore teare, when thou do'st see
This wretched portraict of just miserie.
I was Great Innovator, Tyran, Foe
To Church and State; all Times shall call me so.
But since I'm Thunder-stricken to the Ground,
Learn how to stand: insult not ore my wound."

This one poor stanza alone among the popular utterances of the time shows that any soul in England was touched by the cruel fanatic's bloody end.

"ENGLAND'S WOLF WITH EAGLE'S CLAWS" (PRINCE RUPERT).—1647.

During the civil war and the government of Cromwell, 1642 to 1660, nine in ten of all the satirical prints that have been preserved are on the Puritan side. A great number of them were aimed at the Welsh, whose brogue seems to have been a standing resource with the mirth-makers of that period, as the Irish is at present. The wild roistering ways of the Cavaliers, their debauchery and license, furnished subjects. The cruelties practiced by Prince Rupert suggested the above illustration, in which the author endeavored to show "the cruel Impieties of Blood-thirsty Royalists and blasphemous Anti-Parliamentarians under the Command of that inhumane Prince Rupert, Digby, and the rest, wherein the barbarous Crueltie of our Civill uncivill Warres is briefly discovered." Beneath the portrait of England's wolf are various narratives of his bloody deeds. One picture exhibits the plundering habits of the mercenaries on the side of the king in Ireland. A soldier is represented armed and equipped with the utensils that appertain to good forage: on his head a three-legged pot, hanging from his side a duck, a spit with a goose on it held in his left hand as a musket, a dripping-pan on his arm as a shield, a hay-fork in his right hand for a rest, with a string of sausages for a match, a long artichoke at his side for a sword, bottles of canary suspended from his belt, slices of toast for shoe-

strings, and two black pots at his garters. This picture may have been called forth by an item in a news-letter of 1641, wherein it was stated that such "great store of pilidges" was daily brought into Drogheda that a cow could be bought there for five shillings and a horse for twelve.

The abortive attempt of Charles II., after the execution of his father, to unite the Scots under his sceptre, and by their aid place himself upon the throne of England, called forth the caricature annexed, in which an old device is put to a new use. A large number of verses explain the picture, though they begin by declaring:

"This Embleme needs no learned Exposition;
The World knows well enough the sad condition
Of regal Power and Prerogative,
Dead and dethron'd in England, now alive
In Scotland, where they seeme to love the Lad,
If hee'l be more obsequious than his Dad,
And act according to Kirk Principles,
More subtile than were Delphic Oracles."

In the verses that follow there is to be found one of the few explicit justifications of the execution of Charles I. that the lighter literature of the Commonwealth affords:

"But Law and Justice at the last being done
On the hated Father, now they love the Son."

The poet also taunts the Scots with having first stirred up the English to "doe Heroick Justice" on the late king, and then adopting the heir on condition of his giving their Church the same fell supremacy which Laud had claimed for the Church of England.

The Ironsides of Cromwell soon accomplished the caricaturist's prediction:

"But this religious mock, we all shall see,
Will soone the downfall of their Babel be."

We find the pencil and the pen of the sat-

CHARLES II. AND THE SCOTCH PRESBYTERIANS.—1651.

Presbyter. Come to the grinstone, Charles; 'tis now too late
To recolect, 'tis presbyterian fate.

King. You Covenant pretenders, must I bee
The subject of your Tradgle Comedie?

Jockey. I, Jockey, turne the stone of all your plots,
For none turnes faster than the turne-coat Scots.

Presbyter. We for our ends did make thee king, be sure,
Not to rule us, we will not that endure.

King. You deep dissemblers, I know what you doe,
And, for revenges sake, I will dissemble too.

irist next employed in exhibiting the young king fleeing in various ludicrous disguises before his enemies.

An interesting caricature published during the civil wars aimed to cast back upon the Malignants the ridicule implied in the nickname of Roundhead as applied to the Puritans. It contained figures of three ecclesiastics, "Sound-Head, Rattle-Head, and Round-Head." Sound-Head, a minister sound in the Puritan faith, hands a Bible to Rattle-Head, a personage meant for Laud, half bishop and half Jesuit. On the other side is the genuine Round-Head, a monk with shorn pate, who presents to Rattle-Head a crucifix, and points to a monastery. Rattle-Head rejects the Bible, and receives the crucifix. Over the figures is written :

"See heer, Malignants Foolerie
Retorted on them properly,
The Sound-Head, Round-Head, Rattle-Head,
Well-placed, where best is merited."

Below are other verses in which, of course, Rattle-Head and Round-Head are belabored in the thorough-going, root-and-branch manner of the time, *Atheist* and *Arminian* being used as synonymous terms :

"See heer, the Rattle-Heads most Rotten Heart,
Acting the Atheists or Arminians part."

In looking over the broadsheets of that stirring period, we are struck by the absence of the mighty Name that must have been uppermost in every mind and oftenest on every tongue—that of the Lord Protector, Oliver Cromwell. A few caricatures were executed in Holland, in which "The General" and "Oliver" and "The Protector" were weakly satirized, but as most of the plates in that age were made to serve various purposes, and were frequently altered and redated, it is not certain that any of them were circulated in England during Cromwell's lifetime. English draughtsmen produced a few pictures in which the Protector was favorably depicted dissolving the Long Parliament, but their efforts were not remarkable either with pen or pencil. The Protector may have relished and Bunyan may have written the verses that accompanied some of them :

"Full twelve years and more these Rooks they have sat
to gull and to cozen all true-hearted People;
Our Gold and our Silver has made them so fat
that they lookt more big and mighty than Paul's Steeple."

The Puritans handled the sword more skillfully than the pen, and the royalists were not disposed to satire during the rule of the Ironside chief. The only great writer of the Puritan age on the Puritan side was Milton, and he was one of the two or three great writers who have shown little sense of humor.

What a change came over the spirit of

English art and literature at the Restoration in 1660! Forty years before, when James I. was king, who loathed a Puritan, there was occasionally published a print in which Puritans were treated in the manner of *Hudibras*. There was one of 1612 in which a crown was half covered by a broad-brimmed hat, with verses reflecting upon "the aspiring, factious Puritan," who presumed to "overlooke his king." There was one in 1636, in the reign of Charles I., aimed at "two infamous upstart propheta," weavers, then in Newgate for heresy, which contains a description of a Puritan at church, which is entirely in the spirit of *Hudibras* :

"His seat in the church is where he may be most seene. In the time of the Sermon he drawes out his tables to take the Notes, but still noting who observes him to take them. At every place of Scripture cited he turnes over the leaves of his Booke, more pleased with the motion of the leaves than the matter of the Text; For he folds downe the leaves though he finds not the place. Hee lifts up the whites of his eyes towards Heaven when hee meditates on the sordid pleasures of the earth; his body being in God's Church, when his mind is in the divel's Chappell."

Again, in 1647, two years before the execution of Charles, an extensive and elaborate sheet appeared, in which the ignorant preachers of the day were held up to opprobrium. Each of these "erronious, hereticall, and Mechannick spirits" was exhibited practicing his trade, and a multitude of verses below described the heresies which such teachers promulgated.

"Oxford and Cambridge make poore Preachers;
Each shop affordeth better Teachers:
Oh blessed Reformation!"

Among the "mechannick spirits" presented in this sheet we remark "Barbone, the Lether-seller," who figures in many later prints as "Barebones." There are also "Bulcher, a Chicken man;" "Henshaw, a Confectioner, alias an Infectioner;" "Duper, a Cowkeeper;" "Lamb, a Sope-boyler," and a dozen more.

Such pictures, however, were few and far between during the twenty years of Puritan ascendancy. But when the rule of the Sound-Head was at an end, and Rattle-Head had once more the dispensing of preferment in Church and state, the press teemed with broadsheets reviling the Puritan heroes. The gorgeous funeral of the Protector—his body borne in state on a velvet bed, clad in royal robes, to Westminster Abbey, where a magnificent tomb rose over his remains—was still fresh in the recollection of the people of London when they saw the same body torn from its resting-place, and hung on Tyburn Hill from nine in the morning until six in the evening, and then cast into a deep pit. Thousands who saw his royal

funeral looked upon his body swinging from the gallows. The caricatures vividly mark the change. Cromwell now appears only as tyrant, antichrist, hypocrite, monster. Charles I. is the holy martyr. His son's flight in disguise, the hiding in the oak-tree, and other circumstances of his escape are no longer ignominious or laughable, but graceful and glorious.

A cherished fiction appears frequently in the caricatures that no man came to a good end who had had any hand in the king's execution, not even the executioner nor the humblest of his assistants. On one sheet we read of a certain drummer, named Tench, who "provided ropes, pulleys, and hooks (in case the king resisted) to compel and force him down to the block."

"This rogue is also haunted with a Devill, and consumes away." There was the confession, too, of the hangman, who, being about to depart this life, declared that he had solemnly vowed not to perform his office upon the king, but had nevertheless dealt the fatal blow, trembling from head to foot. Thirty pounds had been his reward, which was paid him in half-crown pieces within an hour after the execution—the dearest money, as he told his wife, that he had ever received, for it would cost him his life, "which propheticall words were soon made manifest, for it appeared that, ever since, he had been in a most sad condition, and lay raging and swearing, and still pointing at one thing or another which he conceived to appear visible before him."

Richard Cromwell was let off as easily by the caricaturist as he was by the king. He is depicted as "the meek knight," the mild incapable, hardly worth a parting kick. In one very good picture he is a cooper hammering away with a mallet at a cask, from which a number of owls escape, most of which, as they take their flight, cry out, "*King!*" Richard protests that he knows nothing of this trade of cooper, for the more he hammers, the more the barrel breaks up. Elizabeth, the wife of the Protector, figured in a ludicrous manner upon the cover of a cookery book published in the reign of

SHROVE-TIDE IN ARMS AGAINST LENT.—1660.

Charles II., the preface of which contained anecdotes of the kitchen over which she had presided.

Among other indications of change in the public feeling, we notice a few pictures conceived in the pure spirit of gayety, designed to afford pleasure to every one, and pain to no one. Two of these are given here—Shrove-tide and Lent tilting at one another—which were thought amazingly ingenious and comic two hundred years ago. They are quite in the taste of the period that produced them. Shrove-tide, in the calendar of Rome, is the Tuesday before Lent, a day on which many people gave themselves up to revelry and feasting, in anticipation of the forty days' fast. Shrove-tide accordingly is mounted on a fat ox, and his sword is sheathed in a pig and piece of meat, with capons and bottles of wine about his body. His flag, as we learn from the explanatory verses, is "a cooke's foule apron fix'd to a broome," and his helmet "a brasse pot." Lent, on the contrary, flings to the breeze a fishing-net, carries an angling rod for a weapon, and wears upon his head "a boyl-ing kettle." Thus accoutred, these mortal foes approach one another, and Lent lifts up his voice and proclaims his intention:

"I now am come to muddle and cleare
The base abuses of this last past yeare:

LENT TILTING AT SHROVE-TIDE.—1660.

Thou puff-paunch'd monster (Shrovetide), thou
 art he
 That were ordain'd the latter end to be
 Of forty-five weekes' gluttony, now past,
 Which I in seven weekes come to cleanse at last:
 Your feasting I will turn to fasting dyet;
 Your cookes shall have some leasure to be quiet;
 Your masques, pompa, playes, and all your vaine
 expence,
 I'll change to sorrow, and to penitence."

Shrove-tide replies valiantly to these brave
 words:

"What art thou, thou leane-jawde anottamle,
 All spirit (for I no flesh upon thee sple):
 Thou bragging peece of ayre and smoke, that
 prat'st,
 And all good-fellowship and friendship hat'st;
 You'll turn our feasts to fasts! when, can you tell?
 Against your spight, we are provided well.
 Thou sayst thou'll ease the cookes!—the cooke
 could wish
 Three boyl'd or broyl'd with all thy frothy fish;
 For one fish-dinner takes more paines and cost
 Than three of flesh, bak'd, roast, or boyl'd, almost."

This we are compelled to regard as about
 the best fun our ancestors of 1660 were ca-
 pable of achieving with pencil and pen. Nor
 can we claim much for their pictures which
 aim to satirize the vices.

The joy of the English people at the res-
 toration of the monarchy, which seemed at
 first to be as universal as it was enthusi-
 astic, was of short duration. The Stuarts
 were the Bourbons of England, incapable
 of being taught by adversity. Within two
 years Charles II. alarmed Protestant En-
 gland by marrying a Portuguese princess.
 The great plague of 1665, that destroyed in
 London alone sixty-eight thousand persons,
 was followed in the very next year by the

great fire of London, which
 consumed thirteen thousand
 two hundred houses. At a
 moment when the public mind
 was reduced to the most ab-
 ject credulity by such events
 as these, the scoundrel Titus
 Oates appeared, declaring
 that the dread calamities
 which had afflicted England,
 and others then imminent,
 were only parts of an awful
Popish Plot, which aimed at
 the destruction of the king
 and the restoration of the
 Catholic religion. A short
 time after, Sir Edmundsbury
 Godfrey, the magistrate be-
 fore whom Titus Oates made
 his deposition, was found dead
 in a field near London, the vic-
 tim probably of some fanatic
 assassin of the Catholic par-
 ty. The kingdom was thrown
 into an ecstasy of terror, from
 which, as before observed, it
 has not to this day wholly re-
 covered. Terror may lurk in
 the blood of a race ages after

the removal of its cause, as we find our
 sensitive horses shying from low-lying ob-
 jects at the road-side, though a hundred
 generations may have peacefully labored
 and died since their ancestors crouched
 from the spring of a veritable wild beast.
 The broadsheets of that year, 1678, and of
 the troublous years following, even until
 William of Orange was firmly seated on

THE QUEEN OF JAMES II. AND FATHER PETRE.

"It is a foolish sheep that makes the wolf her con-
 fessor."—1685.

the throne of England, in 1690, have, we may almost say, but one topic—the Popish Plot. The spirit of that period lives in those sheets.

It had been a custom in England to celebrate the 17th of November, the day, as one sheet has it, on which the unfortunate Queen Mary died, and “that Glorious Sun, Queen Elizabeth, of happy memory, arose in the English horizon, and thereby dispelled those thick fogs and mists of Romish blindness, and restored to these kingdoms their just Rights both as men and Christians.” The next recurrence of this anniversary after the murder of Godfrey was seized by the Protestants of London to arrange a procession which was itself a striking caricature. A pictorial representation of the procession is manifestly impossible here, but we can copy the list of objects as given on a broadsheet issued a few days after the event. This device of a procession, borrowed from Catholic times, was continually employed to promulgate and emphasize Protestant ideas down to a recent period, and has been used for political objects in our own day. How changed the thoughts of men since Albert Dürer witnessed the grand and gay procession at Antwerp, in honor of the Virgin’s Assumption, one hundred and fifty-nine years before! The 17th of November, 1679, was ushered in, at three o’clock in the morning, by a burst of bell-ringing all over London. The broadsheet thus quaintly describes the procession:

“About Five o’Clock in the Evening, all things being in readiness, the Solemn Procession began, in the following Order: I. Marched six Whiflers to clear the way, in Pioneers Caps and Red Waistcoats (and carrying torches). II. A Bellman Ringing, who with a Loud and Dolesom Voice cried all the way, *Remember Justice Godfrey*. III. A Dead Body representing Sir Edmundbury Godfrey, in the Habit he usually wore, the Cravat wherewith he was murdered about his Neck, with spots of Blood on his Wrists, Shirt, and white Gloves that were on his hands, his Face pale and wan, riding on a White Horse, and one of his Murderers behind him to keep him from falling, representing the manner how he was carried from Somerset-House to Primrose-Hill. IV. A Priest in a Surplice, with a Cope Embroidered with Dead mens Bones, Skeletons, Skuls, &c. giving pardons very freely to those who would murder Protestants, and proclaiming it Meritorious. V. A Priest alone, in Black, with a large Silver Cross. VI. Four Carmelite Friars in White and Black Habits. VII. Four Grey Friars in their proper Habits. VIII. Six Jesuits with Bloody Daggers. IX. A Consort of Wind-Musick, call’d the Waits. X. Four Popish Bishops in Purple and Lawn Sleeves, with Golden Crosses on their Breasts. XI. Four

other Popish Bishops in their Pontificalibus, with Surplices, Rich Embroydered Copes, and Golden Miters on their Heads. XII. Six Cardinals in Scarlet Robes and Red Caps. XIII. The Popes Chief Physitian with Jesuites Powder in one hand, and a — in the other. XIV. Two Priests in Surplices, with two Golden Crosses. Lastly, the Pope in a Lofty Glorious Pageant, representing a Chair of State, covered with Scarlet, the Chair richly embroydered, fringed, and bedeckt with Golden Balls and Crosses; at his feet a Cushion of State, two Boys in Surplices, with white Silk Banners and Red Crosses, and Bloody Daggers for Murdering Heritical Kings and Princes, painted on them, with an Incense-pot before them, sate on each side censuring his Holiness, who was arrayed in a rich Scarlet Gown, Lined through with Ermin, and adorned with Gold and Silver Lace, on his Head a Triple Crown of Gold, and a Glorious Collar of Gold and precious stones, St. Peters Keys, a number of Beads, Agnus Dei’s and other Catholick Trumpery; at his Back stood his Holiness’s Privy Councillor, the Devil, frequently caressing, hugging, and whispering, and oft-times instructing him aloud, to destroy His Majesty, to forge a Protestant Plot, and to fire the City again; to which purpose he held an Infernal Torch in his hand. The whole Procession was attended with 150 Flambeaus and Torches by order; but so many more came in Volunteers as made up some thousands. Never were the Balconies, Windows and Houses more numerously filled, nor the Streets closer throng’d with multitudes of People, all expressing their abhorrence of Popery with continual Shouts and Acclamations.”

With slow and solemn step the procession marched to Temple Bar, then just rebuilt—a vivid reminder of the great fire—and there it halted, while a dialogue in verse was sung in parts by “one who represented the English Cardinal Howard, and one the people of England.” We can imagine the manner in which the crowd would come thundering in with the concluding stanza:

“Now God preserve Great Charles our King,
And eke all honest men;
And Traytors all to justice bring,
Amen! Amen! Amen!”

Fire-works succeeded the song, after which “his Holiness was decently tumbled from all his grandeur into the impartial flames,” while the people gave so prodigious a shout that it was heard “far beyond Somerset House,” half a mile distant. For many years a similar pageant was given in London on the same day.

From the accession of William and Mary we notice a change in the subjects treated by caricaturists. If religion continued for a time to be the principal theme, there was more variety in its treatment. Sects became

satirical prints still preserved in more than one collection. Louis XIV., his pomps and his vanities, his misfortunes and his mistresses, furnished subjects for hundreds of caricatures both in England and Holland. It was on a Dutch caricature of 1695 that the famous retort of the Duc de Luxembourg occurs to an exclamation of the Prince of Orange. The prince impatiently said, after a defeat, "Shall I, then, never be able to beat that hunchback?" Luxembourg replied to the person reporting this, "How does he know that my back is hunched? He has never seen it." Interspersed with political satire, we observe an increasing number upon social and literary subjects. The transactions of learned societies were now important enough to be caricatured, and the public was entertained with burlesque discourses, illustrated,

SACHERVELL.

more distinct; the Quakers arose; the divergence between the doctrines of Luther and Calvin was more marked, and gave rise to much discussion; High-Church and Low-Church renewed their endless contest; the Baptists became an important denomination; deism began to be the whispered, and became soon the vaunted, faith of men of the world; even the voice of the Jew was occasionally heard, timidly asking for a small share of his natural rights. It is interesting to note in the popular broadsheets and satirical pictures how quickly the human mind began to exert its powers when an overshadowing and immediate fear of pope and king in league against liberty had been removed by the flight of James II., and the happy accession of William III.

Political caricature rapidly assumed prominence, though as long as Louis XIV. remained on the throne of France the chief aim of politics was to create safeguards against the possible return of the Catholic Stuarts. The accession of Queen Anne, the career of Bolingbroke and Harley, the splendid exploits of Marlborough, the early conflicts of Whig and Tory, the attempts of the Pretenders, the peaceful accession of George I.—all these are exhibited in broadsheets and

upon "The Invention of Samplers," "The Migration of Cuckoos," "The Eunuch's

Child," "A new Method of teaching learned Men how to write Unintelligibly." There was an essay, also, "proving by arguments philosophical that Millers, though falsely so reputed, yet in reality are not thieves, with an intervening argument that Taylors likewise are not so."

A strange episode in the conflict between Whig and Tory was the career of Sacheverell, a clergyman who preached such extreme doctrines concerning royal and ecclesiastical prerogative that he was formally censured by a Whig Parliament, and thus lifted into a preposterous importance. During his triumphal tour, which Dr. Johnson remembered as one of the events of his earliest childhood, he was escorted by voluntary guards that numbered from one thousand to four thousand mounted men, wearing the Tory badges of white knots edged with gold, and in their hats three leaves of gilt laurel. The picture opposite of the Quaker meeting reflects upon the alliance alleged to exist between the high Tories and the Quakers, both having an interest in the removal of disabilities, and hence making common cause. A curious relic of this brief delirium is a paragraph in the *Grub Street Journal* of 1736, which records the death of Dame Box, a woman so zealous for the Church that when Sacheverell was relieved of censure she clothed herself in white, kept the clothes all her life, and was buried in them. As long as Dr. Sacheverell lived she went to London once a year, and carried a present of a dozen larks to that "high-flying priest."

The flight of the Huguenots from France, in 1685 and 1686, enriched Holland, England, and the American colonies with the *élite* of the French people. Holland being nearest to France, and honored above all lands for nearly a century as the refuge of people persecuted for opinions' sake, received at first the greatest number, especially of the class

who could live by intellectual pursuits. The rarest of all rarities in the way of caricature, "the diamond of the pictorial library," is a series of burlesque portraits, produced in Holland in 1686, of the twenty-four persons most guilty of procuring the revocation of the wise edict of Henry IV., which secured to French Protestants the right to practice their religion. The work was entitled *La Procession Monacale conduite par Louis XIV. pour la Conversion des Protestans de son Royaume*. The king, accordingly, leads the way, his face a Sun in a monk's cowl, in allusion to his adoption of the sun as a device. Madame De Maintenon, his married mistress, hideously caricatured, follows. Père la Chaise, and all the ecclesiastics near the court who were reputed to have urged on the ignorant old king to this superlative folly, had their place in the procession. Several of the faces are executed with a freedom and power not common in any age, but at that period only possible to a French hand. Two or three specimens are given here.

Louis XIV., as the caricature collections alone would suffice to show, was the conspicuous man of that painful period. The caricaturists avenged human nature. No man of the time called forth so many efforts of the satiric pencil, nor was there ever a person better adapted to the satirist's purpose, for he furnished precisely those contrasts which satire can exhibit most effectively. He stood five feet two in his stockings, but his shoe-maker put four inches of leather under his heels, and his wig-maker six inches of other people's hair upon his head, which gave him an imposing altitude of six feet. The beginning of his reign was prosperous enough to give some slight excuse for the most richly developed arrogance seen in the world since Xerxes lashed the Hellespont, but the last third of

CARICATURE OF LOUIS XIV., BY THACKERAY.

his reign was a collapse that could easily be made to seem ludicrous. There were very obvious contrasts in those years between the splendors of his barbaric court and the disgraceful defeats of his armies, between the opinion he cherished of himself and the contempt in which he was held abroad, between the adulations of his courtiers and the execrations of France, between the rigorously enforced mass-attending of the court and the dissoluteness of manners that prevailed.

The caricaturists of London and Amsterdam made the most of these points. Every town that he lost, every victory that Marlborough won, gave them an opportunity which they improved. We have him as a huge yellow Sun, each ray of which bears an inscription referring to some defeat, folly, or shame. We have him as a jay, covered with stolen plumage, which his enemies are plucking from him, each feather inscribed with the name of a lost city or fortress. We have him as the Crier of Versailles, crying the ships lost in the battle of La Hogue, and offering rewards for their recovery. He figures as the Gallic cock flying before that wise victorious fox of England, William III., and as a pompous drummer leading his army, and attended by his ladies and courtiers. He is an old French Apollo driving the sun, in wig and spectacles. He is a tiger on trial before the other beasts for his cruel depredations. He is shorn and fooled by Maintenon; he is bridled by Queen Anne. He is shown drinking a goblet of human blood. We see him in the stocks with his confederate, the Pope, and the devil

standing behind, knocking their heads together. He is a sick man vomiting up towns. He is a sawyer, who, with the help of the King of Spain, saws the globe in two, Maintenon sitting aloft assisting the severance. As long as he lived the caricaturists continued to assail him; and when he died, in 1715, he left behind him a France so demoralized and impoverished that he still kept the satirists busy.

Even in our own time Louis XIV. has suggested one of the best caricatures ever drawn, and it is accompanied by an explanatory essay almost unique among prose satires for bitter wit and blasting truth. The same hand wielded both the pen and the pencil, and it was the wonderful hand of Thackeray. "You see at once," he says, in explanation of the picture, "that majesty is made out of the wig, the high-heeled shoes, and cloak, all *fleurs-de-lis* bespangled..... Thus do barbers and cobblers make the gods that we worship."

UNDER THE STARS.

O NIGHT, look down through cloud and star
Upon our fret and pain!
Bid all the dreams that Day denies
Bloom into faith again!
In tender shades of shadow come
And take Earth's weary children home!

Sweet teacher, wiser than the schools,
Thy speechless lessons bring;
The rebel soul, the aching heart,
The will like broken wing.
Make ready for a stiller night,
And for a dearer Morning Light!

fervently ejaculated, "Godspeed them both!" and went on his dreary way to a country where he knew that life was cheaply held; for on proposing to insure his own at a first-rate office, it had been courteously declined, "the risks in Mexico at the present crisis, and under the present state of affairs, being so manifold." Nevertheless the seductive secretary hoped they should see him back safe and sound, and that he would wish to renew his proposition after having evaded the dangers of war in such a savage and unhealthy region.

It was the trifling episode of his conversation with Martin which induced him so suddenly to accept this engagement, and to maintain for so long an unbroken silence with his friends in Pedlington. He honestly wished Janet to be free to make and retain her own choice, and feared that any thing approaching to an advance on his part, now that he was free, would seem like claiming her on the score of his generosity and of the previous love passage between them.

But when the stormy year of his campaigning was drawing to a close, he wrote to Frank from Mexico, announcing his return by way of Vera Cruz and New York, and casually remarking that he supposed he should have to congratulate Janet and Martin on his arrival. The letter in his hand was a brief answer from Frank, received through his agents in New York, saying how glad they all had been to see his handwriting again, how much more glad they would be to see his face, and expressing astonishment that he had not written before leaving England, or for so many months since. As to the bit of *badinage* about Martin and Janet (Frank said), of course she could not help poor Martin's persistent folly. But they all liked him well enough, and thought he was really enamored of some poetical ideal, and had chosen Janet to impersonate this. Alas! how often is this indeed the case! Frank proceeded to say that ever since Lyte's articles had appeared in the — *Review*, that periodical had entirely supplanted the *Oxford Chronicle*, and the whole family had grown quite learned in the geography and current military and political history of "The Latin Empire." Then in a postscript Frank added: "The sooner you turn up, my dear fellow, the better. A certain person, who has now arrived at years of discretion, is becoming rather more cracked than discreet; and I really don't know what may not happen if the state of suspense is protracted. She says now that she knows you won't come home, but will stay in New York. I wonder whether you will have stumbled across your old enemy George Baily at New York. Probably not. But it seems he has fallen upon his legs in the United States; and though he is a degraded

man now, I must do him the justice to say that he has scraped together and returned the £500 put by for Hubert, of which he had (to the best of our belief) defrauded the governor. He has had the impudence to write to Blanche and ask her to join him out there. We all oppose the idea; but there is no knowing what a woman may not do in such a case. I suppose you do not know that Nelly is to be married to Fuller on the 1st of February, and that they sail for Canada about a week after the wedding."

It is hardly necessary to say that while the paragraph in the body of the letter which repudiated any idea of Martin's success would by itself have been a source of delight to our returning exile, that passage in the *postscript* alarmed and agitated him. Why was not Frank more explicit? What could he mean? One thing was evident now beyond a doubt. Janet had been constant to him, even under the cruel blow of his departure without a word of encouragement spoken or written, after she had heard of his freedom. But now, at length, Frank feared something from the protraction of her suspense. He was not a man to speak prematurely. What was it that he feared? Was she, in anger or despair, about to throw herself away upon some man whom she did not love? Or was her health giving way under the strain?

Well Lyte remembered that two or three years previously Frank had hinted that this passion was "consuming her." It was during the short conversation which arose between them *apropos* of the bottle of perfume. But in the long interval which had elapsed since then he had persistently tried to starve out that regard of hers, not anticipating his own freedom, and since knowing of his own release had pursued his former plan in order to leave *her* free. But now it appeared that she had never wavered, and was suffering past endurance from his seeming inconstancy. Oh, if she could only read his true heart, and see how she was cherished there! Surely, Bedford Lyte insisted to himself, as some millions of lovers have done before, no woman was ever so singly and purely worshiped as she had been in that secret shrine. Nor was he very far wrong. The man had loved the girl with more devotion than many girls have lavished upon them in this degenerate age. He had proved it, too; though after a fashion little likely to have yielded her much comfort hitherto.

Should he find her thin and wasted, with her beauty half gone, her radiance dimmed? Almost he hoped it might be so, that he might prove how far above such mortal chances was his mature love for her. He thought of Osseo, and Owenee the faithful, and declared solemnly to himself that, if his Janet had become "wrinkled, old, and ugly," as did Owenee, he would still be true, as

Osseo was; and doubtless he would have been so. There are some men who can only love once, though as boys they might have slipped, as Lyte had done. Yet had he possessed twelve millions of gold doubloons instead of £1200 (to which sum his little savings amounted), he would have given every fraction of it, without a murmur, to save her beauty—so far in his eyes was it beyond every source of actual or possible delight which he had ever known.

As he fumed and fretted, the sea rose higher, and the wind raged more fiercely in fitful and sudden gusts. Every half hour the mate had been shortening sail during the last watch. It was now four o'clock in the morning, and blowing a strong gale. The ship, no longer steady and upright, at times careened over to leeward, then righting again with a heavy lurch, appeared to suffer a strain through her whole body, as though the knees and joists were parting company, and the ocean about to pour in and engulf them.

As eight bells struck, the mate thundered at the captain's door. That mariner enjoyed profound slumbers under the most agitating circumstances, and had already confided to Mr. Lyte that he could sleep "till the crack of doom," if he only once got "soundly off in a gale of wind."

Being aware of this idiosyncrasy on the part of his commander, Mr. Jones (a small but sturdy mariner) pounded away, regardless alike of knuckles and panels.

"What now?" roared the captain from within.

"Blowin' a gale, Sir," bellowed the officer.

"Have you made her snug?" (from within).

"Ay, ay, Sir."

"How's her head?"

"East-node-east" (in Mr. Jones's stentorian conventional).

"How's the wind?" (from within).

"No-ode" (still more stentorian and conventional).

"Then let it blow!" (from within).

This dialogue, rude, and almost horrible as it may seem, in the face of danger impending over the lives of so many persons who were innocent of the craft and avarice which had actuated the owners, rather inspired the passenger with confidence in the captain. Evidently, even when half drunk and half asleep, he could follow up an idea through its legitimate stages, and form a conclusion which, though rash, was based upon the satisfactory evolution of that idea.

But Mr. Jones was equally worthy of respect, and, moreover, was sober. After a pause, during which the plunging and lurching of the ship indicated great difficulty in steering her on the present course, he again thundered at the captain's door.

"What now-ow-ow?" roared the angry commander.

"Blowin' terrible hard, Sir," bellowed the mate.

"So it was last time you came kickin' up a row here," retorted the captain, who supposed he had been asleep for a whole watch (four hours) since the last disturbance. "How's her head?" he continued, yawning terribly.

"East-node-east," as before.

"How's the wind?"

"No-o-ode!" louder than Boreas itself.

"Then let it blow, and—et cætera," dimly audible.

"We'd better heave her to, Sir," roared Mr. Jones.

At this outrageous breach of discipline, Captain M'Leod, looking like the pictures of sanguinary buccaneers in boys' books, with a fiery visage surrounded with fierce black hair, with glaring eyes and glistening teeth, appeared suddenly at his door in a white guernsey and woolen drawers.

"Pray who commands this ship, Sir?" he inquired, gravely.

"Why, you do, Sir," replied the mate, uncovering.

"And you've made her snug, using your own judgment, Mr. Jones? and you tell me the wind is north, and the ship steering her course? That is so, is it not?"

"That's so, Sir."

"Then let the ship continue on her course; and tell the officer of the watch, if any thing is carried away, to clap it on again."

Before Mr. Jones had securely fastened on his sou'wester again, a snort like the battle-cry of a wild boar, from the recesses of the stern cabin, announced that Captain M'Leod, of the *Adriatic*, was again in the embrace of the drowsy god. Then Lyte heard the discomfited mate growling like a grizzly bear, and blundering up the steps which led from the cuddy to the poop deck, and, when he got there, uniting with the second mate (whose watch it was) in new orders for reducing the amount of sail. Not being able to sleep, Lyte went up also. The night seemed to be pitch-dark, and by the mysterious light of the binnacle lamp the men at the wheel looked like two Brobdingnagians. Presently the mate came aft, and stooped over the binnacle to see the compass. He looked like Magog, and the other two like Og and Gog. The wind yelled and shrieked through the rigging. The cries of the men taking up a third reef in the maintop-sail sounded like the inarticulate howling of lost spirits sent to wander on the trackless deep. Every now and then, as the ship surged up the side of a soaring wave, or plunged into some tremendous ocean hollow, a white gleam of surf skimmed up or down the heaving mass, merely serving to make the darkness visible; and when the passenger struggled and grappled his way to the forward part of the poop, he could distinguish,

partly by sight and partly by sound, and the huge vibrations of the ship, that the crest of every wave, itself an immense body of water, was curling over the weather bulwark, and seething to and fro on the main-deck, always being replenished by another before it could escape at the lee scuppers. After a while, a rift in the clouds allowing a faint glimmer of starlight to appear, Lyte saw the sailors gliding mysteriously, like hobgoblins, down the main rigging, and apparently dropping recklessly into the turbid pool on deck. But really no human being unaided could have got through it, and ropes were strained along from poop to fore-castle, by which the descent and transit either way were made.

Finding after a while that the officer of the watch was clutching hold of something and hanging on beside him, Lyte shouted at him, "Rough-and-tumble kind of work this!" which intellectual remark he had to bellow at the top of his voice about half a dozen times, the officer seeming most anxious to hear it, but unable to do so at first on account of the whizzing and roaring of wind and waves, and the manifold noises of a ship straining in distress.

"We shall ketch it—afore long," was the cheerful reply, which the passenger caught at once, either from the seaman's more judicious selection of time or of his words. After which encouragement, at the imminent risk of his life, Mr. Lyte regained the companion ladder, and blundered back to his little cabin, where he found Tommy still balancing himself on one leg, and with his head still tucked under his wing, as if the ship were upright and motionless in a harbor of refuge.

This sort of thing continued not only without abatement, but rather getting worse and worse, during the morning watch and the whole of the next day, the standing rigging and the bulwarks creaking and grinding in a most detestable regularity of dissonance as the vessel scudded and lurched through a heavy cross-sea. The main-deck was constantly afloat, and though as yet happily the cuddy and state-rooms (in the poop) were high and dry, it is scarcely pleasant to be in mid-Atlantic, in the howling month of February, on board of a ship whose decks and bulwarks form a tank which holds a gurgling, seething pool, ever changing its course, rushing to and fro, hither and thither, with the pitching and rolling of the ship, and dashing with mimic fury of the war without against every obstacle which opposes its movements. Bedford's bones ached worse than they did after rowing either of his two university races, or after running his victorious two-mile race against the champions of Cambridge, London, Dublin, and Durham, in which he gained for himself and his college

undying renown. Why, it was publicly stated, after due reference to *Bell's Life* and *The Field*, that the time in which Lyte accomplished the two miles was fully one-fifth of a second less than in any race on record! The Durham man was beaten by one second and a fifth; the London man by one and two-fifths; the others were nowhere. So terrific had the pace been from start to finish that all the quidnuncs present anticipated a breakdown on the part of Lyte.

Now the hero's running days seemed to have run themselves out. Browbeaten and dejected in aspect, after two or three hopeless and helpless scrambles and tumblings on to the poop and down again, he sat humbly over a novel at the cuddy table, having coaxed the steward for a gravitating lamp, grasping the rack with tenacious digits, entwining his noble legs in the lashings underneath, and barely managing to hold his own, so fickle is human glory!

Captain M'Leod had been restored to a sense of duty at eight o'clock in the morning, when the officer of the ensuing watch again politely suggested heaving to. She was too deep in the *waarter*, he said, being from Somersetshire. She did lurch terrible, and the mastisses wer' in danger, he added.

"Then let her *go off* two points, Mr. Fitzgerald," roared the resolute captain. "Give her the foresail (with a reef in it), and then *let her rip*! Now remember, Mr. Crays—you and your men—her course is due east."

Mr. Crays, in a roar like a savage bear, responded, "Ay, ay, Sir!"

"And you, Mr. Fitz, if she carries any thing away, you clap it on again. And if the wind shifts (which it won't), let me know." And down the mariner stumbled, bestowing upon his sore and studious guest at the cuddy table a sounding smack between the shoulder-blades, inviting him to "keep up his pecker," and, to Bedford's delight (somewhat tempered with apprehension), announcing his determination to "let her rip," i. e., to proceed on her course at all hazards, when more prudent navigators would heave to.

The gale was now blowing steadily from the northwest, and the vessel being steered due east, went more freely with the wind on her quarter. She was running under treble-reefed foretop and maintop sails, a reefed foresail, and a foretop-mast stay-sail. At intervals of two hours, and sometimes less, Captain M'Leod appeared on the poop, with a countenance like "furious Goth" or "fiery Hun," stared savagely at the elements, at the two unfortunates who were steering the stubborn ship, and at the officer of the watch, after which silent protest against nature and art he would disappear. "Stick-ing to your seat like grim death, eh, Mr. Lyte?" he would say, while passing that unhappy individual at the cuddy table. At

last he dragged Lyte into his stern cabin, and fed him on Bologna sausage, Bourbon whiskey, and Angostura bitters. Cooked meals were out of the question. The cook's galley was an island in the middle of a whirlpool, and that sable functionary himself enjoying sweet sleep and balmy oblivion in the regions below. Nevertheless the steward promised Mr. Lyte a cup of tea in the evening, if he could "only get a bit of fire in the cuddy stove." Alas! they knew not what the evening would bring forth.

The afternoon brought forth not more, perhaps, than was dimly foreboded, but certainly more than was distinctly foreseen. At 2 P.M., while his guest was, at the captain's request, "pitching into" a Bologna sausage, and the good ship *Adriatic* was pitching into the waves with an apparent intention of never coming out again, a tremendous *bang* and a *smash* were distinctly audible in the stern cabin, though the wind was carrying sounds forward.

"Hullo!" observed Lyte, pausing with sausage in air.

Bang! Smash! For a few moments the two reports seemed to hush all the previous grinding, grating, creaking, and groaning of casks, barrels, ropes, and timbers which proclaimed the general distress.

"There they go!" rejoined M'Leod, in a sort of oracular response to Lyte's "Hullo!"

Presently a large amphibious boatswain, clad in yellow tarpaulin, and dripping with Atlantic brine, appeared in the doorway.

Grinning hideously, he blurts out, "Fo'es'l carried away, Sir."

"And?" the captain inquired, being fully aware that as yet only the *bang* was accounted for.

"And main-deck swept clean as a whistle. Cook's galley, bulwarks, water casks, barrel, spare spars, and all, clean gone!"

"Pipe all hands to grog, aft, immediately. Tell Mr. Fitzgerald to set the main try-sail, and then set to work and bend a new storm foresail."

"Ay, ay, Sir;" and away went the amphibious one.

Lyte made it a point of honor to ask no further questions. And though M'Leod when drinking freely was not usually communicative, yet being touched by this consideration on the part of his guest, he spoke out. "It must be one of two things," he said: "we must keep on moving pretty fast, and take care *not to get pooped*, or we must heave to. If I heave to, the ship won't ride. She's too deep, as Mr. Green says. I doubt if we could keep her up to the wind."

"What is being pooped?" asked the landsman, innocently.

"If they don't get that try-sail set, and bend another foresail, you'll see before long. On'y then you'll never be able to tell the tale. You see, we're pretty nearly running

before the wind. If one of these big rollers comes along faster than we keep moving, it smashes in our poop, and down we go stern foremost."

At this juncture the howling of the brave fellows was heard in midship. They had swallowed their rum, and were setting the try-sail—a service of danger, now that the main-deck was swept clear of her bulwarks, and was open to the fury of every roller through the summit of which they rushed, and whose foaming crest closed in upon them, as if it were claiming them for its own.

Among brave men in danger a sort of freemasonry exists, as undoubtedly is the case also among cowards. M'Leod had strongly taken to his new ally, and had persuaded him to light his trusty old pipe and smoke it in his own sacred cabin.

At 3.45 P.M. another crash, loud though distant, was heard.

"The foretop-mast, by——!" exclaimed the captain, now springing to his feet and hurrying up on deck. Lyte followed at once. This was a twofold disaster, the foretop-sail and foretop-mast stay-sail both coming down together, depriving the ship of all sail forward, and encumbering her with the wreck. Of course it had been impossible in this stress of weather to bend a new foresail since the former one was carried away, so that now the ship was scudding under only the reefed maintop-sail and the main try-sail, and it was almost as difficult to keep her before the wind as to heave her to.

All hands were immediately summoned, and the wreck cleared away as rapidly as possible under the circumstances. Lyte, seeing a service toward in which he could be of use, scrambled down for his bowie-knife, went along the ropes to the fore rigging, and there worked manfully at cutting away the wreck, though he narrowly escaped being washed overboard more than once, and only owed his life to his own agility and tenacity of grasp.

No sooner was all the topmast rigging cleared away than the forestay-sail was set, and incredible exertions were made by all hands to bend a new foresail. The moon came to the rescue, and though the ship was terribly knocked about and the steering apparatus much strained in the mean while, they had the new foresail set before midnight. Then the captain, at urgent request of the officers (for which Mr. Lyte silently cursed them), hove the ship to, and turned in.

By some obscure mental process it was evident to Lyte that whereas officers and men all liked their captain, all equally distrusted him. The overlading of the vessel, in which M'Leod had no concern, was now acknowledged on all hands; and though

Lyte saw that the man upon whom now chiefly all their lives depended was a drunkard, he also saw that there was a vast reserve of energy about him, drunk or sober, and that he was capable of judicious and energetic action if this could be called into operation at the right moment. Putting together M'Leod's age (about fifty), his robust health, his position, and reputation, it was clear that he could not habitually have indulged too freely while in command of a ship. In all probability the overloading of the vessel had preyed upon his mind in the present instance, and co-operated with other causes of anxiety, to which he had already alluded in conversation with his guest, to cause the present most inopportune outbreak. Consoling himself as well as he could in this way, and with the reflection that the officers were able and willing, Lyte once more "turned in," and while doing so stroked and coaxed his drowsy little bird, which opened one eye and peeped at him curiously; for he was weighed upon with a kind of apprehension that this would be their last greeting. The small bird manifested a power of sleeping, and a dexterity in poising himself on one leg with his head invisible, which were provoking. It seemed to imply that in causing his master to lose a passage on the finest steamer afloat, and to intrust himself on a ship which exhibited the strongest possible tendency to go to the bottom, he had fulfilled his terrestrial destiny, and had no more functions to perform than becoming an insensate ball of fluff, and maintaining his equilibrium by night and day with a sublime disregard to the laws of gravitation.

Again M'Leod emulated his passenger and bird in the profundity of his slumbers and in his practical defiance of certain sound theoretical maxims. To Bedford Lyte, in those anxious sleepless hours, that versatile ship *Adriatic*, large as she was, seemed to achieve every variety of position except the inverted vertical. To say that occasionally he ascertained his heels to be where a man naturally looks for his head would fall ludicrously short of the actual state of the case. After a couple of hours' violent straining and struggling to maintain a horizontal position commensurate with the limits of his berth, he gave that up, as men have given up trying to square the circle. Jamming himself into a corner to leeward in such a posture that nothing short of an absolute somersault on the part of the *Adriatic* could dislodge him, he recommenced the perusal of his novel by the light of a gravitating lamp. Fortunately for him, it was the inimitable *Tale of Two Cities*, by Charles Dickens; and the capers cut by his berth served as a ludicrous illustration of the lively coffin which hopped, skipped, and

jumped along in pursuit of the fugitive and terrified son of Jerry.

Thus the wearisome night-watches wore away far less tediously than they might have done had the modern delineator of humanity never lived and wrought. Already the first glimmer of wintry dawn was peering through the scuttle, and paling the twinkle of his dying lamp as the ship rolled to starboard—when suddenly the *Adriatic* was convulsed from bow to stern-post, from mast-head to keel, by a prodigious shock. Lyte had scarcely time to notice that she swerved and staggered in a manner quite different to all her former evolutions, when the ocean rushed in upon him in a drenching, blinding flood. Whence it came he knew not; but what mattered that? One thing he knew beyond a doubt: his frail door had flown open under the pressure, and it was surging in his little cabin and out again breast-high.

In this horrible predicament he yet formed and carried out one idea. That the ship was foundering he hastily took for granted, and though a powerful swimmer, he knew that a man unaided can not live long in a heavy sea. He therefore slipped off his pilot coat, dropped it in the pool in which he stood, dragged out his cork jacket from under his bolster and put it on, then floundered and scrambled up on to the poop deck, only observing as he went that the water seemed to be leaving the cuddy faster than it came in.

The captain was already on deck, and pounced upon him instantly. The steering apparatus of the vessel had given way, from the tremendous strain upon it; she had suddenly *broached to*, and had fallen into the trough of the sea, where she lay almost on her beam ends, and exposed to the full fury of the waves, which now beat even over the lofty poop. One of these waves had burst open Bedford's cabin scuttle, and had poured an angry stream of water upon him as he sat pent up against the lee bulk-head. Another had burst open the cuddy doors and sent a tremendous volume of water surging up and down the whole length of the saloon. Meanwhile the two gallant fellows at the wheel, and Mr. Green, the second mate, had been washed overboard and were irretrievably lost; and when M'Leod reached the deck he found himself alone on the poop of a foundering ship.

Now suddenly, to his great joy, having a strong and willing man at his elbow, Captain M'Leod snatched a favorable opportunity and seated Lyte on his buttocks with a coil of the tiller chain twisted round his left wrist, and grasped below with both hands about fourteen inches from the block, and implored him for God's sake, and as he valued all their lives, not to let go till he came back.

Then M'Leod vanished; and before we attempt to indicate Bedford Lyte's fate we may as well say that the captain's enterprise was to dare the perils of the main-deck, and trust to the strength and courage of his passenger to keep a little control of the rudder until he could bring the carpenter aft, and two or three more men, to relieve Lyte from his awful position and resume the steering of the disabled vessel.

The difficulty and perplexity of Lyte's situation are wholly past the comprehension of a landsman. There he sat, sternly tugging and straining at that awful chain, for some long, long minutes, which hung

"Like Joshua's moon in Ajalon."

Great masses of water, breaking over the ship's counter, hurled themselves upon him, drenching him to the skin, blinding his eyes, which he was wholly unable to wipe, and gradually freezing the very strength out of his hands and wrists, to which the cold, slippery chain now clung with a deadly coil. His back, or, rather, only the lower part of it, was planted against a projection not high enough to afford him a fair fulcrum; his feet against the still lower and rounded staple which held the block through which the chain would have run had he abandoned it. Had he done so, the vessel would again have been at the mercy of the ruthless elements, and would in all probability have been sunk in less than a minute. Of this he had a vague but positive apprehension.

Every muscle of his powerful frame was strained to the utmost. The invincible will which had triumphed over so many obstacles, moral and physical, was set more firmly than his sinews. Appreciating blindly the value of the tremendous charge intrusted to him, he had resolved, if need be, to allow his hands and wrists to be dragged into the block, and so to check the outgoing of the chain at the price of a horrible and most painful death. A momentary pang on behalf of the poor little bird which had involved him in this fate pierced his heart. Then came with lightning rapidity a perception that this death was the result of having preferred his birds and his stubborn solitude to a frank confession of his early fault, and that happy though perhaps humiliating confidence which he might have enjoyed with Henry Phelps, if he would only have ventured on that confession. How much had that stupid false pride cost him! And the fault, after all, had been so lightly forgiven. These regrets plunged swift, keen arrows, as it were, into his mind and heart. Then followed a smaller though at the moment a still more cruel pang, that he was not now so placed as to bring all his immense strength into active operation. He thought of the Herculean efforts which he

had made at the critical moments in the great struggle between Oxford and Cambridge, and forgot that instead of pulling an oar in a wager boat he was now saving a three-thousand-ton ship from destruction. He almost cried aloud in his agony: "I could have pulled the chain six inches further out—further out—in spite of these cruel jerks, if I only had a—a—purchase. But now— Oh! I am going. Janet! Janet!"

One of those cruel jerks, the furious action of the sea on the loosened rudder, communicated by the tiller to the chain which he was holding, was just dragging his hands into the hateful block, when a sudden relief, which drew the chain a few inches out again, released him.

"Let go! let go!" shouted a stentorian voice above him. "Let go!" It was Mr. Crays, the taciturn third mate, who, gathering from the captain's orders to the carpenter in what position the passenger was left, had snatched up a huge iron hook and hastened along the ropes which connected the fore-castle with the poop, and had caught a link of the chain between Lyte's hands and the block. The iron hook, which was now inserted in the link, was sufficient to secure the chain from being drawn further out; and now the carpenter arrived, with the captain, bringing a lighted lantern and some necessary implements, and when Lyte had cleared his eyes of the salt-water, he was able to assist them in temporarily refitting the tiller and helm.

Alas! the two helmsmen and the sturdy second mate could never be restored to their footing on deck. But the case was too critical with the living to bestow many vain regrets on the dead. The rudder was itself loose. There was not sufficient daylight as yet for them to form an idea how loose. Of the four swivels by which the rudder is connected with the stern-post, one, two, three, or all four might be loosened or injured in some way. But it was absolutely necessary to bring the ship to the wind and heave to again; for the foresail, the forestay-sail, the maintop-sail, and main try-sail had all been blown to ribbons, and it would be dangerous beyond measure to attempt scudding under bare poles. So they lashed up some hammocks in the fore rigging, put the helm up, and brought her head to the wind again, and then set seriously about considering and repairing, if possible, the injury already received.

CHAPTER XXV.

TORIAS DIGS HIS LAST GRAVE.

BEFORE noon on the eventful day which dawned amidst the perils of our last chapter, the crew of the *Adriatic*, now short of three brave hearts and three pairs of willing

hands, had managed by superhuman efforts to bend a new maintop-sail and a new foresail in place of those which had been carried away by the wind when the vessel broached to and swung helplessly round under that furious assault of the elements. Again the good ship, now crippled and tottering like a wounded man, was put before the wind. The sea still swept onward in gigantic foam-crested rollers, which stretched from north to south as far as the eye could reach. But now again the sun shone propitiously, and the wind, though too strong for a disabled ship, was fair. Again they were steering due east, and careering through the mighty billows at racing speed.

"Why does she lean over so horribly to the right?" Bedford innocently asked the captain, with whom he was breakfasting in camp fashion on Bourbon whisky and Bologna sausage, having in prospect a dinner of "Bologna sausage and Bourbon whisky—for a change," as M'Leod facetiously expressed it.

That mariner regarded his guest with some amusement, not unmixed with admiration. After obliging him to repeat the question, he replied, with a sly twinkle of his keen black eye, "Well, you see, Mr. Lyte, she's got a list to starboard."

"Oh!" responded the landsman. "Ah! Indeed!" And as he munched valiantly at the meats of Bologna (commonly at sea called "Polonies") he murmured to himself, "She's got a list to starboard, has she?" and wisely resolved to use his eyes instead of his tongue for further elucidation of this mystery. It seemed to him as if the vessel were bewitched. As long as she was hove to on the port tack there was some reason for her leaning over, though even then the angle of her masts with the plane of the horizon was rather too small; but now that she was scudding freely before a strong fair wind, there was something awful in the persistent way in which she canted over, and at times he really thought she must topple over on to her beam ends, and heartily wished she had pitched her main and mizzen topmasts overboard after the foretop-mast, as she would then have had less weight to overbalance her.

The steering apparatus was also a source of anxiety which would last as long as the voyage. This the captain spoke of with unreserved gloom, all the more freely because Lyte abstained from asking him a question on the subject, and because he had rendered such signal service connected with it in the crisis of their danger. He spoke of it plainly as "a bad job," and one that could not be remedied at sea more than it had been, because the mischief was under water. The breaking of the chain, of course, had been easily repaired, but no one could reach the bolts and swivels many feet under water at

the stern-post of a moving ship. The elements had become propitious and the gale in part abated since that burst of its fury. "And if it hadn't," M'Leod added, "we might as well have abated our efforts; for all the king's horses and all the king's men couldn't have put Humpty Dumpty on the wall again." This was his jocular way of intimating their danger. Nor was he at all careless (as Lyte fancied) about the "list to starboard." But knowing that all his men were tired out, he had sent as many as could be spared below to eat and sleep.

Early in the afternoon the serious work began, the watches having been reorganized to divide the deficiency of the three missing men, and one watch sent back to rest while the other worked.

"Can I help?" asked Lyte.

"I believe you, my boy. Any strong man with a stout heart can do this sort of work, though no honest man likes it."

The temptation to inquire precisely as to the nature of this work was strong upon the passenger, but profiting from experience, he resisted it.

The work soon unfolded its own nature. In the first place, they took off the lid of the main hatch and fastened a broad plank (well soaped) on the precipitous slope which ran sheer off into the sea on the starboard side. Then, one by one, they passed up the cases of clocks and launched them into the deep. The work was simple enough, and would actually have afforded them considerable merriment if the loss of their three messmates, which had so recently occurred, had not oppressed them with a sense of awe and grief.

After two hours' brisk work at the main hatchway, they closed and battened it down again, and went to the fore hatch to relieve the ship equally in that part. While the move was being made, M'Leod withdrew his guest on the excuse of giving him a glass of bottled ale. He also had rum served out to the men, who were behaving splendidly under an unusual strain of labor.

"I don't intend you to work any more this watch, nor to-night, my friend," he then said to Lyte. "Give me a willing horse, and if I work him to death, call me a fool. You have done as much work these last two hours as any two men in the watch."

"I should like to work two hours in every watch, if you don't really object. The exercise would restore my mind and muscle," urged Lyte.

"You won't find shoveling that wheat about good for the lungs," resumed M'Leod.

This was coming very near the point, but Lyte asked no question, and tried to look indifferent.

"The truth is," continued the captain, "we've got to throw the whole cargo between-decks overboard, and then get down to that wheat with our broad wooden shov-

els, and ship half of it over to the port side. If it's wet, we shall have to pitch half of it after the clocks, that is, supposing we float long enough to do it. If it's dry, you'll find it terribly dusty and suffocating work. But I can't afford to refuse your help. We're short-handed, and every hour is valuable. Do you know, Mr. Lyte—it may be soft of me—but I can't help feeling glad that my wife and little girl are praying for our safety every night and morning."

Then after a pause he went on: "I don't like parting with this cargo. It will cost me dear in more ways than one. But what cuts me is the loss of those three men. I once lost a whole boat's crew; but I hardly felt it more than I do this. Mr. Green was as good a man as ever walked the deck of a ship."

Lyte began to find many amiable traits in the character of his rollicking host, of whom it must be recorded that he did not drink to excess again during the remainder of the voyage, and that he acted with singular generosity to the relations of the three men who had been snatched so suddenly from his command.

But to return: it was found possible before night-fall to get at the lower main hatch and remove it. Then, amidst the breathless suspense of the whole ship's company, Mr. Jones and the carpenter went down with a lantern to examine. Would the wheat prove to be dry or wet, that is, had the *Adriatic* sprung a leak or not?

Before many minutes had elapsed—minutes which seemed like hours to all on deck—Mr. Jones passed up the word that the surface of the wheat was dry fore and aft. Crawling along the vacant space on the larboard side, they had felt with their fingers, and encountered no moisture. M'Leod uttered a great sigh of relief. He knew his ship to be tight and strong; but knowing also something of the might of wind and waves, had feared that during the few minutes when she was exposed to their full fury she had received an irreparable injury in her hull. Lyte looked at the burly, roistering fellow, and saw a dimness in his eyes.

"All's well, my lads. Now go to work again," was all he said. But the passenger understood that the lives of so many honest men weighed heavily on this skipper's conscience. For once the men stolidly disobeyed his order, still clustering round with anxious faces. There was but little space below for any one to work; and the wells were long ago choked up with wet grain, so that they could not be sounded nor the pumps used. The question still to be solved was, Would the bulk of wheat prove to be dry underneath?

"Let me go down with a shovel," exclaimed Lyte, confident in his strength, and burning with enthusiasm.

"Or me, Sir!" "Or me!" shouted two seamen, in a breath.

"Mr. Crays will stay here, and hold the line with the lantern," replied the captain. "The rest of you go away and work, like honest lads." Still the sailors closed around stolidly in a circle. "Mr. Lyte, you are too big to move down there. Can't you see I have sent down the two smallest men in the crew?" At which speech the sailors grinned, for it was notorious in the fore-castle that Mr. Jones thought himself rather a large man than otherwise.

Lyte was urgently impelled to retort, "Then how—the unmentionable—is the wheat to be shifted, and this horrible *list to starboard* to be got rid of?" but abstained.

Mr. Jones and the carpenter set to work with their huge wooden shovels, at first immediately under the hatchway, and burrowed down a little way; but presently, afraid of blocking up their own space for moving forward, Mr. Jones cried out, "You must haul away up there, Sir. We've hardly space to turn round as it is."

"My God!" exclaimed the captain, evidently startled; but, recovering himself in a moment, added, "Two of you bring buckets and lines at once, and give Mr. Jones some elbow-room down there."

It was scarcely sooner said than done. Two of the deck buckets, attached by the handles to two strong Manilla cords, were brought and lowered alternately, one being hauled up and emptied overboard while the other was being lowered and filled. But while the two willing hands had gone for the pails, Lyte heard one of the croakers say, "There was room enough and to spare when we put the lower hatch on in port. It's swelled from below, by ——." Whereupon Mr. Crays, stooping over the hatchway with his hanging lantern, turned upon the speaker with such a withering look of contempt that he sneaked away abashed behind the two front ranks of his companions. That any man in the crew should be mean enough to try and depress their spirits prematurely seemed to Mr. Crays a dastardly act, besides being an infringement of discipline and marine courtesy.

"The man spoke thoughtlessly, Mr. Crays. Hoist away there, my lads," cried the captain, cheerily, with another of those touches of tenderness which Lyte had perceived in his character. This little word of compassion worked like magic in the crew. The buckets were hoisted up, hand over hand, passed from one to another, emptied overboard, and lowered again as fast as they could be filled. Not so easy a task, when we remember that the main-deck was wholly exposed, the bulwarks, etc., having been swept away, and the ship leaning fearfully on one side.

Before ten minutes had passed a consid-

erable depth was reached. "Dry as dust down here, Sir," roared Mr. Jones, whose prodigious voice would have led a stranger to look for a Saxon giant instead of a diminutive navigator of Celtic origin.

"Work away a little to starboard!" cried the captain, more cheerfully.

"Half choked, Sir!" shrieked the mate, in a sudden falsetto, proceeding to sneeze and expectorate.

"Come up, then, and look sharp about it," replied the skipper. "And, carpenter, take two men and get your lights up quickly. Now, boatswain and Mr. Lyte! Plenty of room for you big fellows. Go and drive a passage right through to starboard, and send it all up. We must have space down there, and it has evidently shifted somewhat aft."

So the two half-choked men came up, and the two candidates for suffocation went down. At it they went, working into the compact mass on the right; and by the time that lights were in the foremast-head and the rigging on either side, the "bulk wheat" in the hold was pronounced to be dry right through from top to bottom, from port to starboard, and the *Adriatic* free from all suspicion of a leak.

A great cheer for the good ship burst spontaneously from the crew; another for the captain, and another for Mr. Lyte, who was "fit to be a seaman, every inch of him," as the sailors generously admitted.

"And now, my lads, what say you?" asked the skipper. "Bring three more lanterns on the poop nigh to the binnacle, so that the men at the wheel may join us, and we will read the burial service at the gangway over our three lost comrades. Good men and true they were. Then all hands to the capstan to grog, and to-morrow we'll right the good ship *Adriatic*."

A deep murmur of applause broke forth as honestly as the cheers had done. Whether the astute skipper had added a touch of popularity to his pious proposal by the suggestion of grog after prayers is not for this chronicler to question; but certain it is that this truly religious service for the dead was celebrated not only without levity, but with some groans, many tears, and much reverence.

While the men were in the act of dispersing after their grog, a cry of "Sail on the lee bow!" ran along the decks. Strange as it will seem to those who read the sequel, it was the passenger who first gave the notice. When all hands (except Mr. Crays, who remained at the wheel) repaired to the capstan on the quarter-deck, after all had been some minutes at their devotions, Lyte, bethinking himself of the look-out and the pleasures of a secluded pipe, made his way to the fore-castle. No sooner had his sight accustomed itself to the misty light of the

moon, rising in a clear white fog, than he became conscious of a large moving object, apparently not more than five hundred yards distant. His notice was soon taken up by a dozen voices, and ran from prow to poop; and before long he followed his own information, feeling an intense interest in the strange vessel, and being anxious to see what measures the captain would take with regard to her.

Telescopes and flag signals were useless in the doubtful light; but when the stranger saw the *Adriatic*, she fired off five rockets in succession as a signal of distress, but kept on running before the wind, only reducing her sail so as to let the *Adriatic* come alongside. The latter was keeping the wind about four points on her starboard quarter, to counteract in some measure her inclination to that side, so that she was bearing right down upon the stranger, drawing nearer to her every moment, as the moon rose higher above the mist, and revealed them more clearly to each other. They were both forging fast through the water, so M'Leod took in his foresail, that he might come up with the other more easily.

Mr. Jones was on the fore-castle with one trumpet, and special orders to speak first, M'Leod on the poop with another trumpet, and Lyte at his side, Mr. Crays steering, and all the rest of the crew in the lee rigging. "What do you make her out to be, Lyte?" asked the captain.

"A steamer in distress, running before the wind because she can't help herself," replied the passenger, without hesitation.

"You're right, too. You ought to have been a seaman, as the men say."

"I feel a terrible interest in her," said Lyte.

"That's quite another matter. I don't," retorted the captain. "In another two or three minutes you'll be asking me to lower a boat and lose another four men out of my crew, to try and bring some women on board at night, and with this heavy sea running, and only to drown the women after all."

"It's a beautiful night," pleaded the passenger; as indeed it was, with a strong fair breeze, and the moon shining more brightly every minute.

"I tell you a boat would be capsized in this sea before you could get her away from the ship's side," answered M'Leod.

Lyte was resolved not to provoke him by argument at a moment so critical to the fate of many persons. So he merely replied, shortly, "I suppose you know best." But it had not escaped his keen observation both that M'Leod thought the strange ship to be in danger, and that he was harassed with a slight doubt as to the extent of his duty toward those on board.

"She may not be in danger, after all?" he said, as a feeler.

But M'Leod answered, contemptuously: "Large steam-ships don't scud before the wind under canvas only, and let off displays of fire-works for fun whenever a sail overhauls them. I see some ladies on the poop, and look at the people swarming like bees in the rigging and on the fore-castle. I fancy she's an emigrant ship outward bound, with her screw damaged, and perhaps her rudder too, and driven out of her course. How awkwardly they steer! Why, she's standing across our bow as if she wanted us to sink her. Bring her up a point or two, Mr. Crays! Keep your eye on that strange craft, and take us within speaking distance, but give her an easy berth. Use your own judgment when I'm busy."

"Would Muster Lyte lend I a hand?"

Pleased at the distinction, the landsman immediately took his station on the platform beside Mr. Crays, where their two tall, powerful forms stood out in bold relief at the helm of the huge ship, and appeared to the gaze of many an anxious spectator on board the disabled steamboat like the twin deities to the fainting Romans at the battle of Lake Regillus. It happened also that both the men wore rough dark pilot coats and pantaloons, and were in all external respects singularly alike, except that the amateur sailor wore an old blue flannel cap, and the professional one a black cap with a gilt band round it.

"We shall forge ahead too fast for her. Boatswain, down with the main try-sail!" cried the skipper.

The unfortunate steam-ship, seeing them shortening sail, now imitated this measure, but lowered a much larger sail in proportion to her size than the *Adriatic's* main try-sail, in consequence of which the latter was going through the water much faster than the former when she overhauled her.

As though to compensate for the brevity of this personal maritime interview, Mr. Crays (assisted by Lyte) steered the *Adriatic* with such skill that you might almost have thrown a ship's biscuit from one deck on to the other.

"Ship a-hoy-oy-oy!" roared little Mr. Jones from the fore-castle, as soon as he came abreast of the steamer's poop. You would have thought from the noise he made that the unfortunate vessel was disappearing on the horizon.

In reply to this Boanerges, Lyte distinctly heard the silvery laughter of young women on the strange poop. How it thrilled through him, and reminded him of the gently flowing Peddle, and the nymphs whose laughter had made music on its rippling surface! He turned his head a little from the people in misfortune, whom he was powerless to assist, but listened acutely.

The strange captain was on a narrow gallery which ran from the poop to the top of

a roundhouse on the main-deck, and so on to the fore-castle. As the *Adriatic* passed him he moved along this gallery, taking no notice of Boanerges, but speaking rapidly and distinctly, though with a German accent, to Captain M'Leod; thus he kept up the colloquy at last from the very bow of his vessel, having commenced it nearly on the poop.

"This is the *Hanseatica*, bound from Bremen to New York, touching at Southampton. We are nine days out. We have sprung a leak; have twelve feet of water in the vessel. It is gaining every hour. The screw is broken. And the rudder is so loose the ship will only go straight before the wind."

All this he got through distinctly, and with every word audible, by the time that the poop of the *Adriatic* had reached his roundhouse. Then he paused with a polite gesture, hoping that in such an extremity the Englishman would offer to take him and his company on board.

"Curse the Dutch idiot!" muttered M'Leod between his teeth. Then spoke loud and harshly: "We are dismayed, as you see, and have thrown half a valuable cargo overboard, and now have to shift our lower-deck cargo. All our water is washed overboard, except a little in the iron tank; and our bulwarks and cook's galley, as you see. Moreover, three of the best men in my crew were washed off the poop and drowned."

"Mein Gott! I am sorry," cried the courteous German, who must indeed have been sorry at this useless tirade, while the *Adriatic* was rushing past, and he was already at his last footing on the prow of his sinking ship.

"Will you not at the least take our ladies on to your ship?" he screamed.

"Send 'em," roared M'Leod.

"I can not. Mein Gott! I can not. Both my quarter-boats is washed away."

"Jolly-boat," shouted M'Leod, pointing with his brass trumpet to a huge boat which was suspended upside down over the fore hatch.

"It is broke in many bits. *It is rotten!*" screamed the German, as he stood alone on his black prow, wringing his hands, and looking a very impersonation of helpless agony.

The *Adriatic* was now fast forging ahead.

A yell of anguish and dismay, shrill enough to split the welkin, and piercing the ear like poisoned arrows, arose from the decks of the doomed steam-ship.

"By the God that made me, Mr. M'Leod, I for one can't stand this," Lyte said, calmly, relinquishing the wheel to Mr. Crays, and flinging off his coat.

"What do you propose to do, Sir?" M'Leod asked, sternly.

"What can I do?" asked Lyte, half fren-

zied. "I can go and die with them, if I can't help them to keep their pumps at work till they fall in with a ship commanded by a man with a human heart. Anyhow, I am going to swim off to them at once. I should blush to step on English ground if I left those foreigners to die like kittens."

"That vessel will sink to-morrow between ten o'clock and noon," M'Leod coolly replied.

"Then I'll sink with them, and may our blood be on your head and on the head of your wife and child, you unmanly man! Good-by, Mr. Crays. Here goes!"

And having by this time kicked off his boots, away he flew like an arrow into the boiling surge, cleaving the sea before his head with pointed fingers; and rising again some yards away, he turned and swam with the sea, merely uttering a shout now and then when soaring at the top of a wave—an old cry which he remembered being used by the German sailors at Hamburg and Bremen. Of course he had no intention of swimming any distance, knowing well that the crew of the *Hanseatica* had seen his plunge, and would bring the vessel near him and fling him ropes, perhaps with a life-buoy attached.

The astonishment of M'Leod was literally boundless. Up to the very moment when his guest flew off the taffrail he believed that Lyte was merely acting a part to coerce him into lowering a boat that night against his own judgment. Being an obstinate Briton, he chose not to be coerced, but would have endeavored to restrain Lyte from such a rash act had he really credited his intention. First he would have told him (what was simple truth) that he had not the least intention to desert the forlorn *Hanseatica*, but that, arguing from her captain's statement that she would float till noon to-morrow, he had resolved to take her passengers and crew off to-morrow shortly after daybreak, unless in the mean time a vessel bound westward should come upon the scene, and so do some of them a still greater service by taking them to America. This was the more prudent plan also in behalf of his own crew, as the sea was abating every hour, and the labor would probably be unattended with danger to-morrow; also in behalf of the owners of the steam-ship, as it would be more easy for them to secure the insurance moneys from the underwriters if it could be proved that she was actually about to founder when deserted. Then, if his headstrong guest had refused to listen to reason, M'Leod was not sure but what he might have yielded, and let the obstinate fellow take the life-boat and the boatswain and four volunteers, and go and fetch the ladies. But no men or low trollopes of women would he have on board till he had

made arrangements for stowing them away where the clocks had been.

Now, however, he did not hesitate for an instant. In less time than it has cost me to explain his negative conduct, the skipper had proved his activity and the sincere regard which he had acquired for Bedford Lyte. Even in this last altercation Lyte had enhanced this regard, not using a single coarse or mean expression, and nobly abstaining from claiming service on the score of the tremendous service which he had rendered to the ship and all on board of her.

In less than five minutes the life-boat, with the four best men as oarsmen, and Mr. Crays as cockswain, and the boatswain in the bows, was cleaving the moon-lit waves. The *Adriatic* had shortened sail, and was dodging to and fro warily with men on the look-out all over her rigging. The *Hanseatica* had tried to pick up the swimmer, and failed, owing to her defective rudder; but as he was beginning to wish for his cork jacket while swimming in her wake, and hoping she would throw him a life-buoy, oars came splashing up; a coil of line was chucked before his face; he laid hold, drew it short, and was pulled under the gunwale of the *Adriatic's* life-boat. Two stalwart arms were protruded, he made a spring upward with all his might, and they caught him under the armpits and hauled him in.

"How be you, Muster Lyte?" asked Mr. Crays.

"Jolly, thank you, Crays. I began to feel tired, though, when you came up. It's awkward swimming in a sea with these clothes on."

"You are to drink this now, Sir." (*This was whisky and bitters.*) So he drank it without making any wry faces, and then *did* begin to feel jolly.

"Now thank you all, my merry, merry men," he cried. "But easy, lads, easy! Where are you rowing to? I'm going on board the *What's-her-name*. You don't think I took that header for nothing."

"We be to putt you on board of she, and leave you there for the night, or to fetch off the saloon ladies to the *Adriatic*, or to take you back as we be, whichever you do choose, Muster Lyte," said Crays, categorically.

"I vote for fetching off the ladies," said Lyte; "but, in that case, how about the rest of this ship's company, passengers and all?"

"Why, *Muster Lyte*!" exclaimed Crays, reproachfully, "you didn't go for to think that our skipper, whom we've sailed with this thirteen voyages or more, was going to leave all them poor creeturs to perish! *He* know'd about how long the lobsided old thing would float. He wanted to hold off and on till daylight, and then fetch 'em off comfortable when this sea had gone down a bit more. It's well enough now when you be at sea,

but it's orkard alongside o' ships, partickler at night."

After this oration Lyte paused, and then said: "I see I have done our good captain wrong in thinking he was going to desert these foreigners. But I'll give £5 apiece to every man in this boat's crew for saving me from drowning (which you've done, lads, and no mistake), and £5 apiece to each if you'll come now and fetch off the ladies from the *Hanseatica*."

"Hooroar! hooroar!" they shouted; and again the life-boat danced over the waves, and soon drew alongside the lee of the steamship, which contrived to luff up a few points in order to *make* a lee-side for the protection of the gallant little boat. Only Mr. Crays and Mr. Lyte went on board, the latter of whom the captain, Overbeck, received at the gangway, and clasping the dripping hero in his arms, squeezed the water out of his scanty garments, and poured words of gratitude and devotion into his ears. He had seen the dispute on the retiring poop of the great ship, had seen the gallant plunge, and heard the swimmer's German shouts from the summit of the waves. He had endeavored with his own hands to cast lines to the swimmer as the *Hanseatica* passed him in its wayward course, and was in the act of lashing together some spars to be cast astern for his support, when the life-boat appeared rowing straight to the scene of his struggles. This good man insisted upon taking Lyte into the roundhouse, and clothing him in dry garments from his own chest, before he would conduct him to the saloon. Meanwhile he sent to the ladies, requesting them to hasten their preparations for departure, and promising himself to bring any valuables which they might have to leave in his own box to the *Adriatic* on the following morning. "For me," he said to Lyte, "if I am permitted to bring a few articles for those charming young creatures, my own chronometers and sextants, and half a dozen shirts, I am more than satisfied. You are my benefactor, and your captain is not so hard of heart as I thought him to be. Oh, it is too terrible to think that he might have sailed away had you not plunged into the mighty ocean!"

On board the poor crippled, helpless steamship an absolute panic had prevailed for a few minutes among passengers and crew when the *Adriatic* forged ahead without any apparent intention of rescuing them from their fate. All their four sea-worthy boats had been carried away or dashed to pieces by the fury of the sea. Even upon the poor old inverted jolly-boat a topmast had fallen and staved it in. The other topmasts were overboard, the rudder was half torn from the stern-post, the engines were wholly incapacitated for work, and worse than all, the ship had sprung a fearful leak, and the

steam-pump being unavailable, it was found impossible to prevent the water from gaining upon them every hour, though one gang relieved another without cessation at the hand-pumps. Even without further accident (and to what chances and risks were they not exposed?) it was scarcely possible to keep the ship afloat another twenty-four hours.

The crew consisted of thirty-two hands, all told. There were some seventy-five steerage passengers on board, men, women, and children—Germans and Danes. In the saloon were two German gentlemen, merchants, and an Englishman escorting his wife and her two sisters. Only the latter group and the superior officers of the vessel were allowed on the poop deck. They (the cabin passengers) sat there while the *Adriatic* was careering past them. She was for about a minute not more than fifty yards distant. Only one short, thickset, fierce man, with a brass trumpet in his hand, stood at the taffrail of her poop. He wore a maroon worsted jacket, like the bar-keeper in a London gin-palace. This was Captain M'Leod. Behind him stood two broad-shouldered, splendid men, looking like twins, and taller even than they were from the little elevation of the platform on which they stood to turn the wheel. The only peculiarity about either of these two was a faded blue flannel cap which one wore; but his back was turned upon the steamship.

The two Germans sat pale and mute, but gazing with agony at the *Adriatic*. The Englishman, a fine, tall, bearded soldier, rose and waved his undress military cap. "Help! help! you Englishmen; for the love of God! You won't leave women to sink in this cursed ocean. Help!" But the wind swept his words away, and the two captains, bawling at each other through their speaking-trumpets, overbore the sound of his voice. Seeing that he had spoken in vain, and hurt as much at the hardness of the hearts that could resist such an appeal as at the fate impending over his charge, he looked down at his beautiful young wife with a face upon which despair was slowly creeping. A smile was only fading out of her bright young face. She and her younger sister were not old enough to appreciate danger. They had just been laughing at Mr. Jones's stentorian greeting. The elder sister, who was going "out" to meet her husband, seemed more sad and indifferent to good or evil than frightened.

No sooner had the *Adriatic* passed them fairly than the expression of the Englishman's face underwent another change, which his wife quickly discerned. "Why, George dear, what has happened now? Are we all going up to heaven in a balloon? Tell me quickly. Nothing can surprise me any more."

"Nelly, my love! Janet! Don't you see him?" he said, pointing ecstatically to the stern of the *Adriatic*. They turned instantly, and gazed with wide-open blue eyes and envious black curling lashes.

"Don't you see him, my darlings? It's Lyte! It's my dear old Bedford, the truest man and best friend in the world. Don't you know his cap? the old university blue, in which he won every race he rowed. Look at him. He has left the wheel. He's pitching into that brute of a skipper in the taster's jacket and the penny trumpet. He's taking his coat off. See! can't you see, girls? He's going to thrash him. Won't he give it him? That's all."

The two German gentlemen, who were not familiarly acquainted with English vernacular, could not quite follow Captain Fuller's free and easy diction; but being highly interested in his sudden hilarity, and charmed with any prospect of a change, to which they thought this source of interest might conduce, came and craned over the taffrail, staring also with wide blue eyes at the dumb-show on the poop of the retreating ship.

Janet's heart leaped and bounded within her so furiously, or rather so gleefully, that she had much ado not to leap overboard herself. "Hold me tight, Nelly," she exclaimed. "Blanche dear, you hold me tight on this side. Don't let me jump over into the horrid sea. I can't quite see him, my eyes are so full of tears. I am crying for joy. It is my 'Sir,' you know, Nelly, my own 'Sir.' Is it really him? Is that his old broad back turned to us, with no coat on and a blue shirt? I remember his broad back in church. They won't let him jump into this nasty rough sea to come to me, will they? But he taught Berty to swim. He can swim. He can do every thing. You know he can, Nelly. And why don't you say so? Every thing!" Thus the innocent prattled in her joyous bewilderment, while Bedford Lyte was waging his hot and hasty war of words with M'Leod.

Presently Fuller started, seeing his friend apparently mounting the rail for that headlong and fearful plunge into the mighty sea. "Look at him. Was there ever such a trump? He is going to swim off to us."

"A trump! Was is das?" remarked the Hamburger. "Perhaps das is Herr Van Tromp!"

"Hullo! There he goes! Hurrah! God bless him! Was there ever such a good pluck'd one? Eh, mein herr? what do you think of that? That's the way an Englishman bathes—likes deep water and plenty of sea-room."

But Janet was frightened now, and well she might be; for, remember, this was transacted by moonlight, and if an envious cloud or mist had obscured that luminary, both ships would inevitably have lost sight of

the solitary swimmer. Even in her full effulgence none but the most daring and powerful swimmer could venture on such a plunge into such a sea. Yet, as some men have dived from the yard-arm of a full-rigged ship, the feat was far from singular.

The ships as yet were not very far apart; and at first it seemed easy enough to steer the *Hanseatica* two points out of her course to pass close to the swimmer, drop him a noosed rope to slip under his arms, and so lift him on to the deck. In order to make sure of his new friend, Captain Overbeck took in yet another large sail, which reduced the pace of her progress by one-third. Alas! shortly after this was done, and they had arrived almost abreast of poor Bedford, they found that the vessel had lost all steerage-way from the slowness of her movement, and were unable to force her near enough to assist their benefactor. But while their futile efforts were being made, a joyous sight greeted Fuller's eyes.

"I told you so, girls!" he exclaimed, though he had omitted to tell them any thing of the kind. "Look, there comes the life-boat. A beauty she is, too, and well manned. I thought the bold buccaneer would be afraid to let Lyte drown. His college would have come down upon the skipper, and had him hanged. You can't drown a man of that stamp like a poor devil of a Dutch emigrant. See how splendidly they steer—right toward him!"

"Why do they twist about so, then?" asked poor little Janet, who was picking up a little courage now that she saw a fine handsome boat rowed by four men, steered by a giant, and with an amphibious monster in the bows sent out on purpose to pick the gentleman up after his moonlight bath. She thought no longer of their own peril, but of his, and expected to see the boat going straight as an arrow, or a skiff on the placid river Peddle.

Fuller explained to her that it was necessary to meet each roller as it approached with the pointed bow of the boat. All she cared about just now was "Sir's" safety; and lo! now it was secured. She could see him distinctly drinking something out of a flask, then, after the oars had all been still a while, a loud hurrah! and then the boat came dancing over the waves swiftly toward the *Hanseatica*. She hid her face in her hands and listened. There once more were the well-remembered sounds, the swing, the pulse, the splash of unseen oars, coming to her from the unseen world, bringing life and joy to her heart, bringing her lover, who was come, having risked his own life to save hers, to make her one with him, and keep her safely forever. Yes, he did love her still. She could not, would not, doubt it.

Now while Bedford was being dressed by Captain Overbeck, Fuller ascertained from

Mr. Crays that he had no anticipation of finding any friends on board this ill-starred ship, and that he expected to find none but Germans in the Bremen steamer. So they agreed to hide and let him see Janet first alone. Fuller knocked at the captain's door, and whispered a communication which induced that officer to withdraw at the door of the saloon. Finding himself alone there, and the state-room doors around all closed, Lyte called out, "Ladies! please not to be longer than you can help."

Then a door at his elbow was opened, and Janet was standing alone in the doorway. She wore only a plain black velvet frock. But her eyes were dancing with the light of love. Her lips were just parted, like the carmine petals of a fuchsia disclosing a milk-white calyx underneath. There still hovered about her a fragrance of dewy rose-leaves, and her glorious hair was massed in all its profusion on her comely head.

"Am I dreaming?" he asked.

There were two lamps hanging up over the table in the middle of the saloon. One of these threw a subdued light upon her, and she assuredly was a real woman—really his own Janet, only grown far more beautiful than his imagination had pictured her in its wildest dream.

"Are you really Janet?" he asked.

There was something so reverential in his admiration for her beauty that it consoled her for the disappointment of finding that he had not come solely or specially to rescue her.

"Did not you know I was here, Sir?" she asked, timidly.

It was the first time she had ever called him "Sir."

"I had much less hope of seeing you than of being in paradise to-day, dear. Indeed, this is a foretaste of paradise, seeing you again after so many years. I never used to speak to you like that in the old days; and now that I would do so, perhaps you will not let me."

"You took away my dear old Gamp, you know," she replied, archly. "And it is not *me* you have come to save to-night." So saying, she peeped up slyly at his puzzled face.

"I can not honestly say it was, dear," he urged, with provoking conscientiousness. "Yet I felt strangely drawn toward this vessel, and I fancied I heard you laugh when little Boanerges hailed it. I could not look toward the deck when I thought I could not help the people on it; but in two minutes I had determined to help them, or die in the attempt."

He saw nothing of her now but her golden hair glistening in the light of the dim lamp. It almost touched his breast as she stooped and murmured, lowly, "Do you love—me—Sir?"

"Look at me, darling," he said, clasping both his arms round her little waist.

"I'm afraid," she whispered. "Oh no, I'm not. There!" and lifting her face, she looked modestly and sweetly into his "dear sad eyes," as she used to call them.

"Do I love you?" he repeated. "Well, dear, I have loved you so truly and so intensely for five or six years that I may honestly say this most blessed moment is the climax of every moment of time for all those years. But may I hope that you will forgive me all my harshness, and that you will love me a little?"

"I want to be your little wife," she whispered.

Then he at last, after so many years of waiting, of self-denial, self-control, and resignation, yielded to that impulse which is common to all men so situated. Nor did she affect a false modesty, but allowed him to feel that she considered herself in a manner his already. She knew the man so well at length, his honor, loyalty, and integrity, that she already experienced the repose of love. She could lean upon him in all things, or, if need be, could lie in his arms like an infant. He was strong enough physically, intellectually, and morally for her to repose in him with a perfect trust.

"What in the world were you going to New York for?" he asked her, as they returned to the *Adriatic*.

"To find my Sir, and give him back his fortune," she saucily said.

"Or?" he urged.

"Or his little girl."

* * * * *

Thus the formal courtship of Janet Browne and Bedford Lyte was, after all, of brief duration, and under disadvantageous circumstances, yet was it perhaps as pregnant with joy as many elaborate and luxurious wooings. The remainder of the voyage to the British Channel was a series of incessant hardships and apprehensions, for the rudder of the *Adriatic* became less and less trustworthy every day. They were crowded with guests, for whom they could neither provide water enough to drink nor decently cooked food to eat. The beds, fortunately, had been brought from the Bremen vessel and placed between-decks. Moreover, these people were for the most part angry, discontented, and more dirty even than a scarcity of fresh-water rendered necessary. Three strong men died for want of water, and even the ladies could only have a short half pint each per diem.

Instead of proceeding to Canada by way of New York, Captain and Mrs. Fuller returned to their sister's wedding, which took place at the rectangular "dry-dock" church in the ensuing March. Having thus had more time to think of his future plans, and a deep repugnance to subjecting his wife a

second time to the terrors of the ocean, Fuller sold out of the regiment in Canada into which he had exchanged, and took his wife to live at his own place in Oxfordshire, where Bedford and his wife often visit them. Janet struggled hard to have her nuptials celebrated at the dear old church near the abbey, where he and she had long ago worshiped together, and even then innocently loved each other. But on this point Mr. Browne was adamant. Where he worshiped, there should his children be baptized, confirmed, receive communion, and (if girls) be wedded. So they yielded, on condition that the Rev. Cyprian Key should marry them, which he did. Lyte suggested that an ecclesiastic of the Browne family should "assist," by way of making peace, but the only available one had tried to lecture Mr. Browne on his anticipatory death-bed, and he could "bear the sight of" that divine less than before. So this amiable proposition was frustrated. The old proverb that "it's an ill wind which blows nobody good" was curiously exemplified, as we have seen, in the case of the *Hanseatica's* loss, and the gain which accrued to Nelly and Janet. It also proved a benefit to poor Mrs. George Baily, who received letters in England informing her that her husband had died in New York rather before the date on which she had expected to arrive.

The poor little English tomtit fulfilled its last mission in obliging its master to cross the Atlantic in a ship which was destined to rescue his bride from a watery grave. It only survived until the night before the wedding, when, at midnight, while roosting on the rail at the foot of Lyte's bed, it suddenly, and contrary to custom, lowered its second leg, grasped the rail with both feet, and finding its hold to slacken even so, fluttered to Bedford's pillow, and died in the hand that projected from under his drowsy head. On his bridal morn Bedford wrapped the remains of his faithful and most serviceable friend in a parchment scroll, wherein were written certain words of the great Master as to the Divine care for such humble creatures, and carried the parcel to Tobias Graves, with orders to bury it decently in a coffin of zinc, soldered, and cased with oak, in consecrated ground.

Mr. Browne still thrives at Pedlington in a green old age. His gentle wife still watches over him and all her scattered brood with unfailing tenderness. Frank, who as yet has been too fastidious to marry, devotes much of his superfluous energy to tormenting sister Joan, who is developing the fruit of an acidulated temper on the apex of her Roman nose. Albert has withdrawn to the cheerful village of Tiddenden, where he reads melancholy effusions, and endeavors to relieve the firm of his annuity by perilous evolutions on (and off) a bicycle.

We may conclude this simple chronicle by remarking that about a year after the marriage of Mr. and Mrs. Bedford Lyte, the former's only relative died, and, to recompense him for previous injuries, left him an ample property, saddled with the condition that he should invest 12,000 or 13,000 in land. He therefore purchased a pretty cottage and model farm on the Thames, near his friend Captain Fuller; and Blanche, until her second marriage, with Maynard Martin, Esq., of Plumstead Manor, in Kent (her junior, some say), used to divide her time chiefly between Mrs. Fuller, of Watermead, and Mrs. Bedford Lyte, of Abbey Cottage.

THE END.

RELIGION AND DOCTRINE.

By JOHN HAY.

He stood before the Sanhedrim;
The scowling rabbis gazed at him.
He recked not of their praise or blame;
There was no fear, there was no shame,
For one upon whose dazzled eyes
The whole world poured its vast surprise.
The open heaven was far too near,
His first day's light too sweet and clear,
To let him waste his new-gained ken
On the hate-clouded face of men.

But still they questioned, Who art thou?
What hast thou been? what art thou now?
Thou art not he who yesterday
Sat here and begged beside the way;
For he was blind.

—And I am he;
For I was blind, but now I see.

He told the story o'er and o'er;
It was his full heart's only lore:
A prophet on the Sabbath-day
Had touched his sightless eyes with clay,
And made him see who had been blind.
Their words passed by him like the wind
Which raves and howls, but can not shock
The hundred-fathom-rooted rock.

Their threats and fury all went wide;
They could not touch his Hebrew pride.
Their sneers at Jesus and his band,
Nameless and homeless in the land,
Their boasts of Moses and his Lord,
All could not change him by one word.

*I know not what this man may be,
Sinner or saint; but as for me,
One thing I know, that I am he
Who once was blind, and now I see.*

They were all doctors of renown,
The great men of a famous town,
With deep brows, wrinkled, broad, and wise,
Beneath their wide phylacteries;
The wisdom of the East was theirs,
And honor crowned their silver hairs.
The man they jeered and laughed to scorn
Was unlearned, poor, and humbly born;
But he knew better far than they
What came to him that Sabbath-day;
And what the Christ had done for him
He knew, and not the Sanhedrim.

THE STONE AGE IN EUROPE.

By CHARLES RAU.

SECTION OF A PART OF THE CAVE OF GAILLENREUTH, BAVARIA.

II.—THE CAVES.

THE exploration of caves in England, France, Belgium, Germany, and other parts of Europe has been even more fruitful in important results illustrative of the former condition of man than the examination of the river gravels treated in the preceding article. Caves, it is well known, mostly occur in limestone rocks of various geological formations, and differ very much in extent and shape. Thus, the so-called grottoes are short cavities with wide external apertures, owing in many cases their origin to soft materials, such as marl, that have been carried off from beneath the harder rocks which now form their roofs, while the real caverns are frequently of surprising dimensions, extending for miles under the ground, and containing large chambers or halls, connected by galleries often so low that visitors must creep on hands and feet in order to pass through. Sometimes these chambers are not situated in the same plane, but have to be reached by ladders from above or from below. The entrances to the caves, though in most cases nearly horizontal, or more or less inclined, are sometimes quite perpendicular, forming natural shafts. Some caves, like the celebrated Mammoth Cave in Kentucky, contain small lakes or navigable waters, harboring curious fishes, in which, owing to the eternal darkness that surrounds them, the organ of sight has remained undeveloped.

Limestone rocks are remarkable for being traversed by many fissures and cracks, presenting natural conduits through which the atmospheric water is carried into the interior of the mountains. This water possesses the quality of dissolving to some extent the lime with which it comes in contact. In reaching the caves, it trickles from the roofs and the sides, and, having evaporated, deposits its contents in the shape of thin layers of carbonate of lime wherever circumstances favor that process. The incrustations adhering to the roof, which gradually have acquired the form of icicles, are called *stalactites*, while those on the floor appear like conical or columnar elevations, designated as *stalagmites*. Often these pendent and rising formations have met, presenting pillars or buttresses, or have assumed other strange shapes, in which the tourist, who views them by the flickering light of a torch, imagines to recognize curtains, cascades, organs, statues, altars, and other odd figurations which his fancy may suggest. How many thousands of years were required for building up these sometimes colossal accumulations of calcareous matter can not be determined, considering that the increment may not progress in an invariable ratio even in the same cave; but in order to show how slowly the deposit sometimes increases we will mention that in the celebrated cavern of Adelsberg, in Illyria, names and dates traced in the thirteenth and fourteenth cen-

turies can be deciphered even at present, the incrustation formed since that time not having acquired a thickness sufficient to hide those inscriptions.

In caves where these calcareous formations have been progressing—for in some they are wanting—the floor is covered with a stalagmitic crust of variable thickness. Below it there occurs in many cases a more or less stratified layer of yellow or reddish earth, in some instances of considerable thickness, which frequently rests upon a basis of pebbles, differing in material from the rocks of the neighborhood, and evidently brought from distant places. The earth or mud just mentioned is often of little consistency, and almost loose, but sometimes strongly impregnated with lime, in which case it forms a cement of considerable hardness. This substance has been designated as *bone earth*, because the bones of extinct and living animals are abundantly found in it, and likewise, though more rarely, those of man, together with rude articles of his workmanship. Land and fresh-water shells of existing species are sometimes mingled with these remains. In general the bones lie indiscriminately scattered throughout the earth, in a manner altogether different from their relative position while belonging to the living organism, insomuch that the jaws are separated from the skulls, and that the different parts of a skeleton have rarely, if ever, been found in their proper places. Many of the bones retain their original sharpness of outline, which seems to indicate that they were still covered with the fleshy parts when introduced into the cavern; others, on the contrary, are worn and rounded by friction, thus exhibiting the unmistakable marks of their having been drifted by water. There is also a great difference in the chemical condition of the bones, some of which appear quite fresh, having retained their animal matter, while most of them are more or less void of it, and sometimes so far decayed that they crumble into dust upon being handled. Some bones, finally, have been gnawed and cracked by wild beasts.

The osseous remains of European bone caves are chiefly those of bears and hyenas, intermingled with the bones of wolves, foxes, gluttons, horses, oxen, stags, mammoths, and other extinct or still living mammals. From the great preponderance of the bones of carnivores, it has been suggested that the caves served formerly to those animals of prey as dens, into which they introduced their victims, torn or entire, to feed their young; and there is ample evidence that this was the case to some extent. Hyenas evidently have inhabited certain caves and reared their young in them. Bears likewise retire to caves, chiefly during hibernation, but, according to Vogt, are not in the habit of introducing bones. Yet such occupations

of the caves by bears and hyenas, even through many generations, can not account for the astonishing number of bones found in some of them. In the cave of Gailenreuth, in Bavaria, were discovered within ninety years the remains of at least eight hundred cave-bears; and from the amount of bone earth in another Bavarian cave Dr. Buckland has calculated that five thousand five hundred animals of the same species were there entombed. Large collections of bones, moreover, are found in caves with entrances so high that no living animals could have had access to them. The rolled stones, finally, which, as we have mentioned, often underlie the bone earth or are mingled with it, certainly were not brought to their places by wild beasts. It must be assumed, therefore, that the bone caves owe their deposits in a great measure to the agency of water. The surface of Europe, as we have shown, was subject to great changes at those remote periods when the now lost animals were still in existence, and we have alluded to the causes by which floods, more or less extensive, were produced. When the then higher levels of the water-courses and their increased swiftness are taken into consideration, it would seem to require no great stretch of fancy for imagining in what manner pebbles, mud, shells, and bones, fresh as well as decayed, were introduced into the caves, even into such as are now found high above the bottoms of valleys. In some caves containing no pebbles the mud may have been gradually deposited by the melting of snow. Caves, doubtless, were the first dwelling-places of primitive man. They afforded him protection against the inclemency of the weather, against the attacks of wild beasts and of enemies of his own race. Occasionally he also deposited there his dead. Hence the human remains found in bone caves may be, in a number of cases at least, relics left by the former occupants. Some, however, believe that human bones and tools were mostly washed into the caves, like the animal remains and other materials there deposited.

A satisfactory solution of the question how bone caves were filled is by no means easy, and geologists therefore are not quite agreed on that point. Several causes, such as a successive occupation by animals and man, or *vice versa*, together with the action of water, may occasionally have co-operated in the formation of the deposit in the same cave. This view, we must expressly state, applies only to bone caves proper; other caves undoubtedly served as the regular habitations of man, who has left there abundantly the tokens of his occupancy, as we shall have occasion to show in the sequel.

After this condensed general description of bone caves, we will now proceed to lay

before the reader a few of the most important facts resulting from the cave researches which have been carried on with uncommon zeal, especially within late years, in various countries of Europe.

In 1828 M. Tournal discovered in the cavern of Bize, Department of the Aude (Southern France), human bones and teeth, together with fragments of rude pottery, in a layer of mud and breccia containing land shells of living species and the bones of mammals, such as the aurochs and the reindeer, the latter of which is not known to have lived in historical times in France, and whose remains usually occur in that country associated with those of the mammoth. Bones of an antelope, a stag, and a goat were also met in this cave. The human remains were found to be in the same chemical condition as those of the accompanying quadrupeds. M. Tournal concluded that these remains had not been suddenly washed in by a flood, but had been gradually introduced at successive periods. At the same time M. De Christol gave an account of his discoveries in the cavern of Pondres, near Nismes, in the neighboring Department of the Gard, where he had discovered some human bones with those of an extinct hyena and a rhinoceros in a deposit of mud and gravel which filled the cave up to the roof. He also found there fragments of two kinds of pottery, the rudest lying near the bottom of the cave, below the level of the extinct mammalia. The conclusions arrived at by Messrs. Tournal and De Christol, that man had co-existed with those animals, was disputed by contemporary savants, and Sir Charles Lyell himself, after having examined a number of caves in Germany, "came to the opinion that the human bones mixed with those of extinct animals, in osseous breccias and cavern mud, were probably not coeval. But of late years," says this eminent geologist, "we have obtained convincing proofs that the mammoth and many other extinct mammalian species very common in caves occur also in undisturbed alluvium (or drift), imbedded in such a manner with works of art as to leave no room for doubt that man and the mammoth co-existed."

Among cave explorers the late Dr. Schmerling, of Liège, occupies a prominent rank. After having devoted many years to a careful examination of the caves in the valley of the Meuse and its tributaries, he published in 1833 the results of his investigations, but unfortunately died before his merits were duly appreciated by the scientific world. Many of the caves—he examined more than forty—never had been visited by explorers, and he found their floors incrustated with an unbroken stalagmitic covering, under which the bones of extinct and living animals and those of man oc-

curred in the bone earth. The human bones lay scattered about like those of the animals, and corresponded in appearance and chemical condition perfectly to the latter, which were sometimes broken and rounded, and never exhibited traces of having been gnawed. Dr. Schmerling therefore came to the conclusion that these caves had neither served as burying-places nor had been the dens of wild beasts, but that streams communicating with the surface of the country had introduced their contents. The animal remains found by him were those of the cave-bear, cave-hyena, mammoth, rhinoceros, horse, reindeer, red deer, roe, wild-cat, wild boar, fox, wolf, weasel, beaver, hare, rabbit, hedge-hog, mole, dormouse, field-mouse, water-rat, shrew, and some others. Together with these were dispersed through the cave mud land shells of living species, and in rare instances bones of freshwater fish, snakes, and birds.

The most important remainder of man discovered by Schmerling is the skull of the Engis cavern (now totally quarried away), which was found imbedded five feet deep in a breccia, associated with the remains of the rhinoceros, reindeer, and horse. This skull, now preserved in the museum of Liège, has attracted much attention on the part of anatomists, and has, like that found in 1857 by Dr. Fuhlrott in a cave of the Neanderthal, near Düsseldorf, elicited much comment concerning the physical and mental condition of prehistoric man. We shall have occasion to speak of these two skulls at the close of this article.

Dr. Schmerling found many rude flint flakes or knives, evidently made by man, dispersed through the mud of the caves, and in one cave, that of Chokier (now obliterated), he obtained a polished needle-shaped bone implement perforated at the lower extremity, which occurred in a matrix containing the remains of a rhinoceros.

The Belgian savant clearly pointed out that man once lived contemporaneously with several extinct species of quadrupeds; but his views, being contradictory to the then prevalent opinions of geologists, did not meet with approval at the time of their publication, and his reputation as a clear-sighted investigator dates from a period when neither distrust nor applause could any longer affect him. The energy displayed by Dr. Schmerling is worthy of particular mention. He had to be let down, says Lyell, day after day, by a rope tied to a tree, so as to slide to the foot of the first opening of the Engis cave, where the best-preserved human remains were found; and after having thus gained access to the first subterranean gallery, he was compelled to creep on all fours through a contracted passage leading to larger chambers, there to superintend by torch-light, week after week

FLINT IMPLEMENTS FROM KENT'S CAVERN (HALF SIZE).

and year after year, the workmen who were breaking through the stalagmitic crust, as hard as marble, in order to remove piece by piece the underlying bone breccia, nearly as hard. Thus he remained for hours, with his feet in the mud and with water dripping from the roof on his head, in order to mark the position and guard against the loss of each single bone of a skeleton. And at length, after having found leisure, strength, and courage for all these operations, he looked forward, as the fruits of his labor, to the publication of unwelcome intelligence, opposed to the prepossessions of the scientific as well as the unscientific public. Such has been the fate of too many discoverers.

About the same time, when Dr. Schmerling was carrying on his explorations of Belgian caves, the Rev. J. MacEnery, of the Catholic clergy, found in Kent's cavern, near Torquay, Devonshire, in the red loam below the stalagmitic covering, not only bones of the mammoth, woolly rhinoceros, and other extinct quadrupeds, but also a number of flint tools, some of which resembled the oval-shaped kind common at Abbeville. Mr. Godwin-Austen published in 1840 an account in which he stated that he had exhumed in Kent's cavern, from the undisturbed loam below the stalagmite, works of man, such as arrow-heads and knives of flint, with remains of the elephant, rhinoceros, ox, deer, horse, bear, and a feline animal of large size; and that all these must have been introduced before the stalagmitic flooring had been formed. In 1864 a systematic exploration of the cave was begun, and is still successfully progressing, under the superintendence of Messrs. Pengelly and Vivian.

There occurs above the thick and almost continuous stalagmitic floor of Kent's cavern a black mould, in which numerous rel-

ics, belonging to different times, have been found, such as stone implements of the later period, bronze articles, bone instruments, pottery, in part distinctly Roman in character, marine shells, numerous mammalian bones of existing species, and some human bones, on which it has been thought there are traces indicative of cannibalism. The red cave earth below the stalagmite contains abundantly bones of extinct animals and implements fashioned by the hand of man; and in a part of the cave there extends, immediately underlying the stalagmite, a thin layer of black soil inclosing charcoal, numerous flint implements, and bones and teeth of animals. According to Mr. Evans, the principal forms of the tools are these: tongue-shaped flint implements, and others of flat ovoid form, with an edge all round; flakes of flint of various sizes and wrought into different shapes, including the so-called scrapers;* the cores from which flakes have been struck; and stones which have been used as hammers or pounders. Besides these a few pins, harpoons, and needles of bone have been discovered.

With the exception of the hippopotamus and the musk-ox, the fauna of Kent's cavern comprises all extinct species already enumerated as occurring in drift gravels, together with a number of quadrupeds still existing in Europe, like the reindeer, stag, wolf, fox, glutton, and various rodents; yet the dog, roe, sheep, goat, common ox, pig, and rabbit are wanting. Mr. Evans concludes, from the number and character of the tools, which bear in many cases the distinct traces of their use, from the presence of charcoal and charred bones below the stalagmite, and from various other circumstances, that the cave was, during the accu-

* This class of implements will be described in another article.

BONE IMPLEMENTS FROM KENT'S CAVERN (NATURAL SIZE).

1. Fragment of harpoon-head. 2. Pin. 3. Fragment of needle.

mulation of the bone earth, at all events from time to time, the habitation of man.

The Brixham cave, also situated near Torquay, was accidentally discovered in 1858, and a committee of prominent geologists procured the means for a thorough exploration, which was conducted by Mr. Pengelly. The cave chiefly consists of a succession of galleries of no great width, which were either entirely or partly filled with gravel, bones, and mud. At the top there occurred a layer of stalagnite from one to fifteen inches thick; next below was loam or bone earth, of a red color, from one foot to fifteen feet in thickness; and at the bottom lay gravel containing many rounded pebbles. This stratum being probed in some places was found to exceed the thickness of twenty feet. The layer of bone earth inclosed numerous mammalian remains, constituting a fauna almost identical with that of Kent's cavern. No human remains were found, but a number of worked flints of antique forms occurred in the lower part of the bone earth, and some of them even in the underlying gravel. In the loam was discovered, in close proximity to a flint implement, the left hind-leg of a bear, every bone being in its natural place, which proves that the parts of the limb were still connected when it was brought to the cave. According to Mr. Pengelly, the deposit in the cave is probably owing to the transporting agency of water, in which case a valley seventy-five feet in depth, which now runs in front of the cave, could not then have existed, but must have been subsequently excavated.

Space does not permit us to describe other English caves—for instance, the Wokey hyena den, near Wells, which, it seems, was tenanted at different times by hyenas and men, and has yielded some oval-shaped flint implements of the Abbeville type; nor can we attempt to enlarge on the bone caves of the European continent, considering that other classes of caves will yet be brought to the reader's notice. Cave researches, we may state in this place, are progressing with constantly increased energy in Europe, giving rise to a literature of monographs and

larger works that has already reached an almost bewildering extent. The results, however, present only local differences, while, on the whole, the conclusions arrived at are the same, namely, that in times anteceding any historical record or tradition tribes of savage men lived in certain districts of Europe contemporaneously with various species of animals which have either be-

come entirely extinct or have migrated to other parts of Europe, or even to other continents.

The various animal remains and those of man discovered in the bone earth of a cave may not always belong to the same epoch, especially in cases where water has been the means of their transportation. A flood, it may be argued, will sweep from the surface any thing not too heavy to be carried away by it; in places it will tear up the ground, and disentomb bones of animals that died long ago, or will remove, perhaps, remains of man, together with implements made by him, or with the bones of animals that perished either long before or long after the time of his existence. Thus it may have happened that remains of various periods became commingled in the mud of the same cave. In such cases the state of preservation of the bones themselves affords the best guidance in judging of their relative antiquity. The human bones found by Dr. Schmerling in the Belgian caves resembled in color, weight, and chemical condition perfectly those of the extinct and still living mammalia associated with them, and hence the explorer concluded, and no one now doubts, that these human and animal remains belong to the same period. Various other circumstances must be taken into consideration. The bones of extinct animals found in caves are often split lengthwise, evidently not by animal agency, but by that of man, who thus opened them in order to extract the marrow, a method still practiced by modern savages. At other times these bones bear striæ or cuts that could not have been produced by the teeth of wild animals, but must be ascribed to flint knives employed in detaching the flesh. The flint tools themselves, which occur commingled with the bones in caves as well as in river gravels, are quite peculiar in shape and workmanship, differing in many respects from those of the later or neolithic phase of the Stone Age; and the animal remains sometimes found with these more finished instruments invariably belong to a fauna identical with that of historical times. We shall

have occasion to bring forth yet stronger evidences.

The prehistoric tribes of Europe, as we have observed, sometimes buried or deposited their dead in caves. Such a primitive place of sepulture was a small grotto in a limestone hill near Aurignac, in the Department of the Haute Garonne, Southern France. It is situated about forty feet above the valley, through

SECTION OF THE GROTTO OF AURIGNAC.

which a rivulet flows, and in front of it there extends a small terrace somewhat sloping toward the valley. The entrance to this grotto was formerly hidden by a talus of small stones and earth, which the rain probably had washed down the slope of the hill. Sportsmen, however, knew that there was at this place a hole into which the rabbits escaped when pursued by dogs. One day in 1862 a laborer, employed to repair the neighboring road, introduced his arm into the rabbit-hole and drew out from it a large human bone. Suspecting that the hole communicated with a cave, he set to work digging a trench through the talus, and after a few hours' labor he found himself opposite a large slab of rock, placed vertically, which closed the opening of the grotto. Having removed the slab, he looked into a small vaulted recess filled with human bones, among which were several entire skulls. This unusual occurrence created some excitement in the community, and the Mayor of Aurignac, Dr. Amiel, therefore ordered all the bones to be re-interred in the parish cemetery; but, being a physician, he first ascertained, by counting the corresponding bones, that they constituted the skeletons of about seventeen individuals of both sexes and all ages, and, further, that the adults must have been persons of small stature. Unfortunately these human remains are lost to science, for in 1860, when M. Edward Lartet, a distinguished paleontologist, visited Aurignac with a view to investigate the particulars of the discovery, the village sexton was unable to indicate the place where he had interred the bones. M. Lartet, not discouraged by this failure, determined to search the remaining deposits outside and inside the vault, and hired for this purpose workmen, whom he superintended during their digging operations. When these were finished, his observations resulted in the conclusion that the grotto had served as a place of sepulture, while on the small ter-

race in front of it funeral banquets had been held by the relatives and friends of the departed. His views were based on the following facts:

Outside of the grotto there extended over an area of six or seven square yards a layer of ashes and charcoal from six to eight inches thick, which thinned off toward the vault, not actually reaching it. This layer rested on the natural rock formation, and indicated the fire-place where the repasts were prepared and eaten. It contained broken, burned, and gnawed bones of extinct and recent quadrupeds, also rude hearth-stones, reddened by heat, and numerous works of art, but no osseous remains of man. Above this stratum lay a deposit of rubbish with similar contents and a few scattered cinders. M. Lartet identified the bones of no less than nineteen species of carnivorous and herbivorous animals, those of the latter being most numerous. There were remains of the cave-bear, brown bear (?), badger, polecat, cave-lion, wild-cat, cave-hyena, wolf, fox, mammoth (two molars and a heel-bone), woolly rhinoceros (a young animal), horse, ass (?), wild boar, gigantic Irish deer, stag, roebuck, reindeer, and aurochs. The fox, horse, reindeer, and aurochs were represented by many individuals, and seem to have chiefly served as the food of those savage feasters. The bones containing marrow had been split open by man for its extraction, many of them being also burned. The spongy parts were wanting, having been gnawed off by wild beasts, doubtless by prowling hyenas, which fed on the remnants of the meals. The bones of a young rhinoceros had been broken and gnawed in this manner. On many bones could be perceived the cuts produced by the flint implements used in removing the flesh. These remains were almost exclusively obtained from the deposits extending before the entrance of the grotto. The bones found *inside* of it, in a layer of loose earth or rubbish, generally

exhibited no traces of having been gnawed or scraped, the only exception being a *calcaneum* or heel-bone of the mammoth, of which animal no remains excepting this bone and two molars were found. The rubbish in the grotto yielded nearly all the bones of a cave-bear's leg, close together and uninjured, also the artificially shaped and perforated tooth of an animal of the same kind, teeth of the cave-lion, and some tusks of the wild boar. Hence it was inferred that those ancient hunters were in the habit of entombing trophies of the chase and food with their dead, in accordance with a custom that was and still is common among many tribes of savages.

The articles fashioned by man which were obtained from the deposits in the vault and outside of it, consisted of numerous flint flakes or knives, sling-stones, chips, a flint core or nucleus from which flakes had been split, and one of those flat round stones with cavities on both sides supposed to have been used in making flint tools. Among other instruments, further, may be mentioned arrow-heads without barbs, made of reindeer's horn, and a well-shaped and sharply pointed bodkin cut from the horn of the roe-deer. Lastly, there were found with the skeletons in the vault eighteen small perforated disks, made of a kind of cockle-shell or *Cardium*, which doubtless had originally been strung together for the purpose of ornament.*

What we have just stated is a *résumé* of the account given by M. Lartet after his first exploration of the Aurignac grotto. He subsequently revisited that locality and continued his researches, in the course of which he obtained results not altogether in keeping, as it appears to us, with his former experiences. The number of skeletons found in the cave, the stone slab by which it was protected, and various other circumstances plainly indicate its use as a burial-place; and there can be no doubt that the terrace in front of the cave was often resorted to by savage hunters, who feasted there on the spoils of the chase. Yet the burials may be of much later date than the feasts. "It is very much to be regretted," said Sir John Lubbock ten years ago, "that M. Lartet was not present when the place was first examined; for it must be confessed that if he had seen the deposits before they were disturbed, we should have been able to feel more confidence that the human skeletons belonged to the same period as the other remains." In 1870 M. Cartailhac, of Toulouse, paid a visit to Aurignac, "in order to see the celebrated grotto, and to collect such objects as might have been left there." In examining the cave he noticed a difference in the color of its walls, from

which he judged that the lower deposits must have been of a yellow color, and covered by a layer of much lighter tint; and while minutely searching the crevices of the cave, he found in the darker ground a tooth of the rhinoceros, one of the reindeer, and fractured bones of the cave-bear. The level of the higher deposit, on the other hand, yielded some small bones of living wild animals and of man, and also a pierced disk of *Cardium* and a fragment of pottery. The lower deposit of the cave, it would thus appear, corresponded with that outside of it, while the layer inclosing the human skeletons was formed at a subsequent time. However that may be, the chief result of M. Lartet's discoveries remains intact: he has furnished another proof that man was the contemporary of extinct animals, which served him for food, and that consequently the age of mankind reaches back to a very remote period.

Among the thus far discovered human remains referable to the far-distant epoch under notice, the Neanderthal skull, already mentioned, and that of the Engis cavern have chiefly excited the interest of the learned, and have caused much speculation concerning the physical and intellectual qualities of the primeval inhabitants of Europe. The first-named skull, or rather skull fragment—for it consists only of the upper portion of the cranium—belonged to a skeleton which was found in 1857 in a small grotto in the Neanderthal, or Neander Valley, not far from Düsseldorf, Rhenish Prussia. Quarrying operations led to the clearing of the grotto, situated about sixty feet above the bed of the small river Düssel, which flows through the valley. It contained a horizontal layer of hard loam intermixed with rolled gravel, a drift deposit identical with that occurring in all caves of the Düssel Valley, and in which the bones of extinct quadrupeds are sometimes found imbedded. In this gravelly loam of the Neanderthal grotto the workmen found, two feet below the surface, a human skeleton, which they threw out in an unceremonious way, and which would have been lost to science but for the interference of Professor Fuhlrott, of Elberfeld, who rescued from total destruction the upper part of the skull, the thigh and arm bones, a collar-bone, a part of the pelvis, a shoulder-blade, and several fragments of the ribs. These remains are undoubtedly of the highest antiquity, possessing the same qualities which characterize the bones of the mammoth, cave-bear, etc., occurring in the neighboring districts, and inclosed by the same kind of loam that contained the skeleton. Professors Fuhlrott, Vogt, and other anthropologists therefore conclude that the Neanderthal man lived together with the mammoth and other extinct animals of the drift period. The body

* Quite similar flat shell beads were formerly made by the aborigines of North America.

THE NEANDERTHAL SKULL (SIDE VIEW).

probably had been washed into the grotto during high water. The skull was first described anatomically by Professor Schaaflhausen, of Bonn. He pointed out its enormous ridges above the orbits of the eyes, behind which the frontal bone is considerably depressed, its elongated, elliptical shape, narrow and low forehead, and unusual thickness. The other bones of the skeleton were found to correspond in length to those of a European of middle stature, but they were much stouter, and exhibited a greater development of the muscular ridges. On the whole, Professor Schaaflhausen comes to the conclusion that the individual to whom the Neanderthal skull belonged must have been distinguished by slight development of brain and uncommon strength of bodily frame. According to Professor Huxley, the skull in question is the most ape-like of the human crania yet discovered, and Professor Vogt expresses himself to the same effect by stating that it has more of the simian or monkey type than any other known race skull. Yet Huxley is far from regarding the Neanderthal bones as the remains of a being intermediate between man and apes. At most, he says, they demonstrate the existence of a man whose skull may be said to revert somewhat to the pithecoïd or ape type. Both Huxley and Vogt detect in the Neanderthal skull an approximation to the cranial formation of the Australian.

The Engis skull, likewise fragmentary, but more complete than the one just described, was found, as we have stated, five feet deep imbedded in a breccia, in juxtaposition with remains of the rhinoceros, reindeer, and horse. This skull, it will be noticed by a comparison of the accompanying drawings, indicates a far higher type than that of the Neanderthal. According to Huxley, "there is no mark of degradation about any part of its structure. It is, in fact, a fair average human skull, which might have belonged to a philosopher, or might have contained the thoughtless brain of a savage."

In our first paper we alluded to human bones found by Messrs. Bertrand and Re-

THE ENGIS SKULL (SIDE VIEW).

boux in the suburbs of Paris, in the same drift beds in which flint implements of the oldest or paleolithic types had been discovered. The remains, among them a skull, occurred seventeen feet below the surface. The skull, which exhibits marked traces of inferiority, being narrow and slanting from the front to the back, is supposed to be that of a woman.

Among the latest discoveries of remains of prehistoric man are those made by M. Rivière, who found in 1872, in one of the caves of Mentona, near Nice, France, the almost entire skeleton of a man above middle size, imbedded twenty feet below the surface of the deposit. The attitude of the skeleton, says M. Rivière, was that of repose, as if the man had been surprised by death during sleep. The bones and the surrounding earth were of a reddish color, produced by oxide of iron. Many pierced shells and teeth of the stag covered the skull, doubtless forming originally a chaplet or some other head ornament. A bone implement lay across the forehead, and two spearheads of flint were placed below the occiput. Remains of the urus, cave-bear, cave-lion, cave-hyena, woolly rhinoceros, wolf, stag, chamois, and others, together with many marine and land shells, were found in the deposits above the skeleton; also chipped flint implements in great number, but neither ground tools nor pottery. The skeleton, now in the collection of the Jardin des Plantes in Paris, shows no marked approximation to the simian type, excepting, perhaps, the tibia, or shin-bone, which are more flattened than in the European of the present time. Professor Vogt draws attention to the extreme scarceness of remains of extinct animals in this cave, conjecturing their presence might be owing to a secondary deposit.

In 1873 M. Rivière discovered in another cave of the neighborhood a second human skeleton, less complete than the one exhumed by him in the preceding year, but likewise stained by oxide of iron, and decked with shell ornaments. A few unpolished flint implements lay near this skeleton.

Later in 1873 and in the following year he further succeeded in finding in caves near

Mentone three additional skeletons, two of them belonging to children, the other to an adult individual. The head of the latter was surrounded with pierced sea-shells and teeth of the stag, originally constituting an ornamental head-dress. There were also found the remains of a necklace and of bracelets of shells and teeth. Curiously enough, this skeleton, too, was stained with oxide of iron, like those previously discovered by M. Rivière, who thinks that the covering of the corpse with micaceous specular iron formed one of the funeral customs of the people who deposited their dead in these caves. With this skeleton, which belonged to a vigorous individual of good stature, and resembled in its details that first discovered by M. Rivière, were found a tooth of a cave-bear, bones of ruminants, pachyderms, and rodents (not specialized in the report before us), and a number of shells of edible marine mollusks; also implements of bone and stone, the latter merely chipped, and mostly consisting of sandstone, limestone, and other materials, but rarely of flint. No implements or ornaments accompanied the skeletons of the children.

Sir Charles Lyell is of opinion "that the time of inhumation of the remains of ele-

phant, rhinoceros, and cave-bear in subaerial breccias at different altitudes in the cliffs of the neighborhood will have to be critically ascertained before their geological bearing on the age of the human skeletons can be finally settled."

Generally speaking, the fauna of the caves thus far treated in these pages is analogous to that of the river drift, and the same peculiarities characterize the drift implements and those occurring, commingled with osseous remains, in the mud of caves. The bone and tool bearing strata of the drift and the older cave deposits, therefore, may be assumed to belong to one period, provided that this term is taken in its broadest and most expanded sense.

In our next article we shall lead the reader once more into caves, but into such as served as the regular habitations of human beings who were, to all appearance, somewhat more advanced and lived at a later period than the earliest European tribes, of whom we know now at least that they existed. The merit of having established a fact of such importance belongs to that indefatigable class of investigators whose aim it is to bring light into the darkest recesses of hoary antiquity.

PERFORATED TOOTH OF A LION. FROM THE LOWEST DEPOSIT OF A GROTTO NEAR BORD, ON THE RIVER OLORON, SOUTHERN FRANCE (NATURAL SIZE).

PSYCHE.

I.

When trembling Psyche softly crept
Where her unknown, mysterious Love
Concealed in shrouding darkness slept,
And held her lamp the couch above,
Eager to prove what hidden spell
Of beauty held her charmed heart,
To teach her eyes its power as well;
New sweetness to her life impart,
And point with fresh delight the keenness of Love's
dart,

Her dazzled eyes, one moment's space,
Beneath the trembling golden light,
Saw all the beauty of that face,
So fair it made a day of night—
That glorious shape like sun-lit snow
Beheld, with sudden glad surprise,
Then—startled by the lamp-light's glow,
Flashed into hers those angry eyes,
And Love had fled for aye back to his native skies.

II.

Ah, dearest! trying hard to pierce,
With wistful, questioning blue eyes,
The secret of the universe,
That deepest of all mysteries,
The nature of another's soul,
And what it hath akin to thine,
A vision of the unknown whole
From what thou knowest to divine,
And by thy love's sweet light to read this heart of
mine:

Forbear, dear love, to ask to see
All that my inmost spirit holds,
For still a veiling mystery
The godlike form of Love infolds;
And while our pulses beat as one,
And all my being bends to thine
As turns the flower to the sun,
Still leave my heart one hidden shrine,
Where, sacred and unseen, reposes Love divine.

AMERICAN HUMOR.

By THE HON. S. S. COX.

PART II.

FUNNY PARAGRAPHS ETC.

IN the previous article on this theme I considered our humor in its general phases, and especially in its exaggerations.

I now come to consider the distinctive and peculiar qualities of our humor.

We have not a little humor, especially among the more cultivated portion of our people, common to all men—a translatable humor, quite as enjoyable in French as in English. But we have veins of our own as rich and varied as our mines. I propose to prospect for a few of these veins. In all of them the salient quality—exaggeration—appears.

But first, there is a little silvery vein which runs through our newspapers, and which Prentice, of Louisville, first worked successfully. It consists in adroitly garbling a brief extract from an opponent's article, and diverting the meaning into a dash at some frailty of the opponent. The manner in which this is done is humorous, though the matter generally has the pungency of sarcasm and wit. Near akin to this species of humor is that which has recently become a part of our newspaper paragraphs. It consists in giving a comic account of a catastrophe, and then by a sudden and serious turn, leaving a suggestive hiatus, making a conclusion which connects the premises. A woman undertakes to foment a fire by taking observations with a kerosene lamp near it. The comment is: "Wet day, or there would have been a larger funeral."

Mr. Jones was observed by his wife through the window to kiss the cook in the kitchen. Comment: "Mr. Jones did not go out of the house for several days, and yet there was no snow-storm."

A young man in Pennsylvania attempted to stir up several rabbits out of a hole with the butt end of his gun the other day. Twenty-three shots have been picked out of his shoulder, and the doctor is still

probing. The young man thinks the rabbits must have escaped.

A woman put her tongue to a flat-iron to see if it was hot. That household is remarkably quiet these days.

A dear good fellow at the South telegraphs to his affianced in Maine. "To —: Your life is a rich bouquet of happiness, yourself the sweetest flower. If Northern winds whisper Southern wishes, how happy you must be! Good-night. Happy dreams, sweet love. Frank." Four doctors are in attendance upon the telegraph operator.

"If George had not blown into the muzzle of his gun," sighed a rural widow, at the funeral of her late husband, "he might have got plenty of squirrels, it was such a good day for them."

"He handled his gun carelessly, and put on his angel plumage," is a late obituary notice.

At Middletown, New York, a youth showed his father's pistol to little Dicky Snell. "Eight years of age," was the inscription they put on his little casket.

A good little boy tried to lift himself up by a mule's tail. The doctor thinks the scar on his forehead is permanent.

A man in Memphis undertook to get a mule off the steamboat by twisting his tail. The man landed. Another mistook the head-lights of an engine for a fire-bug. He subsequently joined the temperance society.

A young man fixed himself up for hunting; he would call on a young lady, and let her see how nice he looked; he stood near the fire, with a pound of powder in his coat pocket. He was seen going through the roof, with a pensive smile.

A young man in Louisville thought a circular brass saw was standing still; he felt it. Several fingers are preserved in the beat of spirits.

A young lady, aged only seventeen, raised a large family. She used a keg of powder in the cellar.

A well-dressed person saw a beautiful damsel at a window in New York city. It was New-Year's, and he rang the bell. He may thank the beautiful snow at the foot of the steps that only his hat was mashed!

An anvil was dropped upon a colored clergyman from a third-story window. He complained of an injury to his—hat.

There is another kind of humor, which Artemus Ward, the showman—shrewd and simple, exaggerative and satirical—originated. It never fails to be copied by the press and read by the million. His visit to the President elect was an overdrawn picture of the gang of ravenous office seekers pressing on the "honest old dispenser." He, like Nasby, Billings, and company, hid under bad orthography and worse grammar the neatest nonsense and the broadest satire. While he had not so keen and critical a sense of the dialect or patois as Russell Lowell shows in the character of Hosea Bigelow—while he had not the pointed wit of Holmes or Saxe, whose verses are a fit frame for their exquisite artistic humor, yet Artemus, next to Mark Twain and Bret Harte, hit the very midriff of American humor. I have no time to recall illustrations. They occur to all. His interview with the Prince of Wales in Canada, his amusing attempt to buy the Tower of London, which so shocked the pompous old warder, are samples. How the world was startled to know that it continued to "revolve around on her axle-tree onst in twenty-four hours, subjick to the Constitution of the United States!" "If you ask me," said he, "how pious the muchly married Brig-

ARTEMUS WARD AND HIS BETSY JANE.

ham Young is, I treat it as a conundrum, and give it up." But who can forget how he won his Betsy Jane? The situation of the lovers was embarrassing, to say the least.

"We sat thar on the fence, a-swingin our feet two and fro, bluebin as red as the Baldwinville skool-house when it was first painted, and lookin very simple, I make no doubt. My left arm was ockepied in bailan-sin myself on the fence, while my rite was woundid luvlin round her waste."

The reasons why the two sympathized are amusingly simple:

"There was many affection ties which made me hanker arter Betsy Jane. Her father's farm joined our'n; their cows and our'n squencht their thirst at the same spring; our old mares both had stars in their forerides; the measles broke out in both famerlies at nearly the same period; our parents (Betsy's and mine) slept reglarly every Sunday in the same meetin-house; and the nabers used to observe, 'How thick the Wards and Peasleys air!' It was a surblime site, in the spring of the year, to see our several mothers (Betsy's and mine) with their gowns plaid up so thay couldn't see 'em, affectionately Billing sope together & aboonin the nabers."

A portion of this humor seems to emanate from a pure love of the superlatively grotesque. We hardly know how to analyze such ultimately funny nonsense as that, for instance, of the "Fat Contributor's" account of the "one twin"—a human parenthesis with one bracket gone—always pawing round, even in sleep, for his missing brother.

The humor of Mark Twain rises to a higher style. I refer to the elegance and drollery of his *Innocents Abroad*. Never has there been a more tear-compelling, juicier piece of serio-comic weeping and wailing than

Twain's mourning over the supposed grave of his ancestor Adam. I omit his story of the Seven Sleepers, his discussion of the oyster's love of enterprise and of the beautiful, whose shells he found on the heights above Smyrna. In an article like this, intended not to make a laugh, but only to show why we laugh, it is out of place to quote redundantly. I can only refer to his recent speech before the Accident Insurance Company, in which he expressed his satisfaction at observing cripples—they advertised the company—and then the further satisfaction which injured humanity, after insurance, took in the loss of legs and arms! But I can not refrain from one familiar quotation. I refer to his lament in memory of his blood-relation:

"The tomb of Adam! how touching it was, here in a land of strangers, far away from home and friends! True he was a blood-relation; though a distant one, still a relation! The unerring instinct of nature thrilled its recognition.

The fountain of my filial affection was stirred to its profoundest depths, and I gave way to tumultuous emotion. I leaned upon a pillar and burst into tears. I deem it no shame to have wept over the grave of my poor dead relative. Let him who would sneer at my emotion close this volume. Noble old man—he did not live to see his child; and I—I—I, alas! did not live to see him. Weighed down by sorrow and disappointment, he died before I was born—six thousand brief summers before I was born. But let us try to bear it with fortitude. Let us trust he is better off where he is. Let us take comfort in the thought that his loss is our eternal gain."

This is the humorous sublime! It is the lachrymose comic magnificent!

This is only equaled by the *Heathen Chinee* of Bret Harte. This poet-humorist of the Sierras, producing the patois of the miner and the hunter of the Pacific slope, and drawing an economical lesson out of the game of euchre by the aid of Ah Sin, the pensive and child-like Celestial, has in it all the facetiousness of Dickens and of his Sairy Gamp in *Truthful James*, all the mischievous deviltry which Bill Nye could furnish, and all the roistering rowdyism of a scene in *Harry Lorrequer*. Besides, it has in it a moral which an Oriental story-teller would envy. It brings together the Orient and Occident of cunning fun. Withal, it has the element of exaggeration, without which no American humor seems to be possible.

Second. For another source of our daily fun we are indebted to Shillaber. His Mrs. Partington, however, is but an American edition of Sheridan's Mrs. Malaprop. We love the old lady the more when we hear her say, like a good housewife, that she gets up every morning at the shrill carrion of the

chandelier! But her mischievous nephew, Ike, is purely indigenous. His mischief is the very essence of Young America, without its father. Ike is yet to grow into the full stature. He stands as the juvenile embodiment of a peculiar vein known among us as practical jokes—what the boys term “sells,” and from which springs their expression, “Well, he’s sold.” This is almost a monomania with some. Even such players as Sothorn have not disdained to play its pranks. It is the result of that proverbial shrewdness which seeks to slyly lead a green one on, in the most natural way in the world, until the catastrophe is ready, when the pitfall is opened, and the victim drops or rushes in with a curiosity only equalled by the surplus fund of experience which he receives. Barnum’s book has many examples of these “sells.” Yankee tricks, which in the eye of ethics are but another term for swindling, are illustrations. The raciness of the joke hides the rascality of the job; and we applaud the successful humorist, first because we can not but admire his shrewd calculations on the simplicity of human nature, and next because we are glad to see our fellows learning the ways of the world in such an amusing way. In trading, he is the very incarnation of the keenest shrewdness. He will be sure to do business under the most ad-

THE HEATHEN OWNER.

verse circumstances, and secure a profit also. This propensity is portrayed in the story of Sam Jones; that worthy, we are told, called at the store of a Mr. Brown, with an egg in his hand, and wanted to “dicker” it for a darning-needle. This done, he asks Mr. Brown if he isn’t “going to treat.” “What, on that trade?” “Certainly; a trade is a trade, big or little.” “Well, what will you have?” “A glass of wine,” said Jones. The wine was poured out, and Jones remarked that he preferred his wine with an egg in it. The store-keeper handed to him the identical egg which he had just changed for the darning-needle. On breaking it, Jones discovered that the egg had two yolks. Says he, “Look here; you must give me another darning-needle!”

The Dutchman was a victim to a practical joke who lost five dollars to the Yankee on a bet that the Yankee could eat the

Dutchman. Jonathan began the work of mastication at the extremities, and was soon saluted by the roar and kick of the Dutchman. “Oh, mein Gott! Dunder und Blitz! stop dat bitin’. Take your five dollar. It hurts!”

Sometimes these jokes pay, sometimes not. The Yankee skipper whose vessel was mistaken by an Englishman for a Russian, and who didn’t run up his bunting until the Englishman was about to broadside him, and who gave as a reason “that he wanted to see how spry Bull would clear for action,” came near paying dearly for his joke.

The best humor is always more or less exaggerative. Falstaff's monsterring of his courage, and Captain Bobadil's plan, with nineteen men besides himself, of annihilating an army of forty thousand, are illustrations of English exaggeration.

It was both a humorous, useful, and a witty exaggeration, that of the English comedian Mathews, who recently presented his compliments to the human race, begging leave to state that, as much as he loved them, he found it impossible to provide for the necessities of London alone. No better answer could be returned to the indiscriminate begging in big cities.

No bit of humor has been so loudly received before the foot-lights as that in Boucicault's last play of *Shaughraun*, where the fiddler relates how he avoided the pledge not to drink more than a thimbleful. There was no other thimble in the house except a tailor's thimble, and it never got full! This was thoroughly Celtic, but, I doubt not, as well relished in New York as in Dublin.

But if there be one quality of American humor by which more than another it can be characterized, it is the universal tendency to exaggeration. Why there should be fun in such efforts is not the inquiry. Whether it be owing to the doctrine of natural depravity, which likes a lie, or whether to vanity, which would blow the bellows for its own dilation, or to an honest intention to amuse without the intention to deceive, I care not. This tendency to spread one's self to intensity is an American trait, and the great source of our fun. We go our whole length on every occasion, and as much more as we can stretch. Our language is never meek; it is superlative.

When the cholera was devastating New Orleans daily, ay, hourly, a waiter ran into the bar-room of the St. Charles Hotel, and gave this order in the rapid style of such characters: "Two brandy cocktails for No. 24, a gin flip for No. 26, and a coffin for No. 29. Two first in a hurry; t'other can wait."

In one of the railroad disasters on the Baltimore road, a survivor, in answering the query as to what was passing in his mind as the car was rolling over, gave a characteristic answer when he replied, "Oh, y-y-es, I perfectly remember saying, 'Lord, have mercy on us; and don't be too long about it, for there's not a minute to spare!'" In the very article of death the ruling passion of "put it through, on the fast line," but echoes the enterprise of our people. Scott and Vanderbilt must ride more than a mile a minute, or there's something wrong. Yes, and they ride themselves, to show it can be done safely. It would seem as if all veneration for the solemnities of life had departed from us. We act as if there were no future world—we certainly act as if we believed there was no Satan and no retribu-

tion. Our little boys, behind their cigars, and down on the "old man," the "venerable author of their being," as he is sometimes called, for some parental injunction; the proprietor of the newly organized city of Pumpkinville—away out West—dilating on the unrivaled advantages by water, by rail, and by plank-road of his magnificent site; the Fourth of July or Centennial orator telling the masses of Blatherville about the voice of one freeman being equal to a thousand Austrian bayonets, and sweeping the periphery of creation together into immense symbols of our everlasting glory; the poet just fledged, and trying his feeble pinions on the thunderous symphonies of that almighty heft of water at Niagara; the young attorney addressing his first jury, and never in the course of his extensive practice having met such outrageous injustice as that attempted on his client; or our biggest statesmen behind their Senatorial desks, and down on all mankind for their outrage on and presumption toward this great nation—all find expression in the sacrilegious, audacious, and reckless verse sung by our boys:

"If you want to live well,
Go to a crack hotel,
And call for de best accordin'.
When de bill begins to swell,
Tell 'em all to go to— Well,
We leave for de oder side o' Jordin'."

Hear one of our urchins sing that in *fortissima* style, with a *crescendo*, and you will understand the rollicking independency which obtains among us. The utter disregard of sacred things is not common alone to our boys. In the Reign of Terror in France, while the men were cutting off human heads and carrying them around Paris on pikes, the boys were imitating them by guillotining cats and carrying around their heads on sticks; so in America the prevailing irreverence among our men finds its counterpart among our gamins.

Our youths outdo the children of all other nations in their lack of reverence for the aged and for their parents. I am almost ready to believe the story of a particularly smart child who left home at the age of fifteen months because he heard that his parents intended to call him Obadiah! This irreverence has got into our recent poetry. Colonel John Hay understands this. He shows it in the story of the *Prairie Belle* and her heroic engineer. I do not refer to the dialect of the Western boatman, nor the grotesque picture of the steamer—

"the oldest craft of the line,
With a nigger squat on the safety-valve,
And her furnace crammed, rosin and pine"—

nor to Jim Bludsoe's exclamation above the roar of the flames,

"I'll hold her nozzle agin the bank
Till the last galoot's ashore,"

but I refer to the audacity, suitable to the

WOULDN'T BE NAMED OSADIAN.

time and the country, with which he ushered his hero into heaven, with all the "cussedness" which made him stick to his post until his ghost went up in the smoke of the burning boat. This audacity is specially noticeable in the pretty and touching story which Colonel Hay has versified in his *Little Breeches*. The father finds his little son, after long searching in the prairie snows, sitting upright in the sheep-fold chewing tobacco.

"How did he git thar? Angela."

And then he breaks out into the exclamation:

"I think that saving a little child,
And bringing him to his own,
Is a derned sight better business
Than loading around the throne!"

This fills the American idea of unrest. It means business. Such ideas attract not merely because they are humorously dialectical, not because they glorify the paternal instinct, but because of their utter irreverence. Yet this is not more irreverent than Lowell's verse about an unholy Democrat and the Mexican war:

"You hev to get up sirty
Ef you want to take in God."

Its counterpart is seen in the juvenile performance of a lad who, kneeling by his pious mother, with folded hands and his head full of the music of the day, repeated the well-known child's prayer:

"Now I lay me down to sleep,
I pray the Lord my soul to keep;
If I should die before I wake—
Pop goes the weazel!"

For sacrilegious audacity we give the following: An American company in the Mexican war was drawn up in line in one

of the churches of the City of Mexico. Suddenly the cry of "Temblor! temblor!" was heard, and while the Mexicans were rushing wildly out of their houses, and in greatest consternation dropping on their knees, beseeching the protection of the Holy Virgin, this American company at every horizontal quake would be dashed against the church walls. What are they thinking of? With ready exaggeration they liken their situation to one of the surf-boats they had used at Vera Cruz. At every surge the cry goes round, "Shove her off, boys!" "Steady, men; keep your places." "Now she rises!" "Shove her off!"

Again does our assertion hold good in the case of the youth who was told the story of the two-and-forty children who were torn by the bears for mocking the prophet. Instead of heeding the moral, he went right out and saluted the first baldheaded individual with, "Go up, baldhead! Now bring on your bears!"

In Cincinnati, when the Prince of Wales went to the Opera-house, a boy put his head into the carriage window, and astonished his hearers by singing out, "How are you, Wales? How's your ma?"

Not long since a good man addressed one of our Sabbath-schools at Zanesville, Ohio. He told them of the better world in tones so pathetic, and with tears so sincere, that he seemed to touch chords of finest feeling in their gentle young bosoms, and concluded his discourse by requesting them to sing "Jordan." Instead of "Jordan's stormy banks," he was astounded to hear, in one unbroken chorus, that

"Jordan am a hard road to travel."

The comic wonder elicited by this irrev-

bank, where the world hath no temptation and the tomb no terror, where immortality with the dear ones who have gone before becomes a presence and a transport! Jordan! whose flow makes music with the dying song of praise, whose light silvers the darkness of the Valley of the Shadow, and fills the fading vision with the glory of answered prayer, and the soul with the reality of that country beyond, where the Good Shepherd forever infolds his own in the sweet pastures by the still waters. Jordan! ay, and what other consecrated association is not broken up by the plowshare of riant, defiant, independent Young America!

Said I not truly, that our humor stops at no sacrifice for its fun?

Our religious music in fashionable churches is assuming this fast, not to say sacrilegious, tone. Doesticks goes into a church, where the organist receives a big salary to draw a large house with his music. The organist struck up *Old Hundred*. At first it went as it ought to; but soon the organist's left hand got unruly among the bass notes; then the right cut up a few monkey shines on the treble; *left* threw in a large assortment

CHURCH MUSIC.

erent audacity has not yet subsided in the vicinity where it occurred.

One would suppose that in a Christian country, that stream, consecrated by such holy memories, would not be polluted by the ribaldry of our youth. Jordan! whose banks are hallowed by the foot-print of prophet and saint; whose waters rose up that Israel might bear over that beauteous type of our covenant with Heaven; whose wave mirrored the clear heaven, and the peaceful dove descending upon the baptized form of the Redeemer, emblematic of the Father's pleasure! Jordan! the sanctity of whose name, though the twelve stones erected by grateful Israel have long since mouldered, and though the spot where the body of our Lord was laved by its waters has no monument for its identity—though the Bedouin roams in its valley, and its calcined soil no longer smiles with cultivation—is still dear to the Christian of every clime, as with wistful eye he gazes upon that fair and happy land where his possessions lie, and with the power of grace struggles through its swelling flood to that other

of quavers; *right* led off with a grand flourish and a few dozen variations; *left* struggled manfully to keep up, but soon gave out, dead beat, and after that went back to first principles, and hammered away religiously at *Old Hundred*, in spite of the antics of its fellow; *right* struck up a march, marched into a quickstep, quickened into a gallop; *left* still kept at *Old Hundred*; *right* put in all sorts of extras to entice the left from its sense of propriety; *left* still unmoved; *right* put in a few bars of a popular waltz; *left* wavers a little; *right* strikes up a favorite polka; *left* evidently yielding; *right* dances into a jig; *left* now fairly deserts and goes over to the enemy, and both commence an animated hornpipe, leaving poor *Old Hundred* to take care of itself. Then a crash, a squeak, a rumble, and an expiring groan; and the overture is finished, and service begins.

Here is the fashionable echo to the boy's song of *Jordan*, told humorously by an almost forgotten writer—in fact, the forerunner of the large class who rely on exaggeration's artful aid for their fun. I do not

discuss here the moral quality of our humor. We are so constituted that while we reprehend the lack of veneration and the exaggerative tendency of our humor, we can not help but laugh at its fun.

A few years ago the letters of Doesticks, from which I have quoted, ran through the press, a gross exaggeration. So wild were they that they could not last long, but their ephemeral success shows the keen delight of our people in this limitless superlative humor.

His description of the American tragedian's voice ought to be recalled :

"Imitating by turns the horn of the City Hall Gabriel, the shriek of the locomotive, the soft and gentle tones of a forty horse-power steam saw-mill, the loving accents of the scissors-grinder's wheel, the amorous tones of the charcoal man, the rumble of the omnibus, the cry of the driver appertaining thereto—rising from the entrancing notes of the infuriated house-dog to the terrific cry of the oyster vendor—causing the 'supes' to tremble in their boots, making the fiddlers look around for some place of safety, and moving the assembled multitude to echo back the infernal roar."

This is an etching in broad limning of an exaggeration, and was enjoyed because the subject was commensurate with the description. Shakspeare himself had contemporary players who suited this description. Nor are such characters limited to the stage. They are to be found in the pulpit, and even in so sedate a body as Congress.

Our habits and fashions as well as our talk are all on the extensive scale, and a faithful description of them would provoke laughter. But that is not enough. The description must be overdrawn. To illustrate. It is some time since ladies had taken to hoops. They had completely usurped the sidewalks in the cities. A cynical old bachelor meets two fair ones promenading, and thus enters upon his description :

"At forty paces distant they seemed like miniature pyramids of silk; at twenty paces we smelled Cologne-water and other essences; at ten paces a little lump like a bonnet was discernible at the top of the skirt pyramid; at three paces distant we heard the imbedded voice of a female in the dress; at two paces we discovered four ringlets of slim appearance, resembling cat tails dipped in molasses, two eyes of weak and absurd expression, lips like unto thin sandwiches, and cheeks rouged with *mien-fun* (Chinese coloring). Positively this was all that could create in us the impression or imagination that the above things (dry-goods, etc.) formed a woman."

This exaggeration has its cause. Our national success has kindled it. Within the century what have we not done? Moved the Indians west of the Mississippi, and by treaty, etc., given them missionaries and whisky, money and schools, and our Interior Department is trying to civilize all that the War Department can not murder; we have made our land the principal cotton and the great grain growing country of the world; we have increased our numbers twelvefold, our annual income twentyfold, and our conceit, pride, and humor—manifold!

True, we made no figure at the great World's Exhibition in 1851, nor at Vienna in 1873, for our greatness was too large for transportation. I remember well the poor display we made in 1851. We had India rubber of every conceivable form, and daguerreotypes without number, the one emblematic of the conscience, and the other of the vanity of our people. *Punch* laughed at our eagle floating over the vast expanse of nothing, but it did not affect our complacency. Our isolation from Europe, our independency, added to our surprising progress, have impressed us with the idea that we are the model people, and this impression will make us so as surely as thought precedes action. This self-esteem is no doubt carried to a laughable length, and we ought not to be unduly sensitive when "chaffed" about it, for without it we should never have declared or won or enjoyed our independence.

Before the Declaration of Independence we went our length in begging, as loyal subjects of a beloved crown, for our English rights. History says that our humble petitions were presented on knees to the royal head, who scorned us. But we were no sooner scorned than we "went our length" the other way. The Declaration of Independence is a splendid exaggeration in itself. "When in the course of human events," it begins. It could not say "American" events. "The laws of nature and of nature's God" is its transcendent invocation. "All men are created free and equal," though a million of ebony evidences were then existing to the contrary. "All government derives its powers from the consent of the governed," when, as Garrison used to demonstrate, if that were true, no government could exist for a moment.

With such a chart and with such a grand initial momentum, need we wonder at the magnitude of our ideas, the magniloquence of our orators, and the exaggerations of our humor? Our large lakes, our long rivers, our mountain ranges, our mammoth conifers, our vast mineral treasures, our wide prairies, our great crops, our growing cities, our enlarging territory, our unrivaled telegraphs, our extensive railroads and their equally extensive disasters, our mechanical skill and its infinite production, our unexampled civil unpleasantness and its results, would call for an aggrandized view of our political and social position, and, as a consequence, for a broad, big, Brobdingnagian humor.

Think of what we have had these past years—the horse distemper, the Boston fire, and the "tidal wave" election, all dispensations of what Mrs. Malaprop would call an unscrupulous Providence!

There is such a unity in the human mind that it can not be high-strung on one sub-

ject without being similarly keyed up on another. There is a sympathy running through the American mind of such intensity and excitement in relation to our physical growth and political prominence that our humor must become intensified. Our rivers in their spring floods typify our humor with their rush, their whirl, and their overflow of all bounds.

A half century ago the *Edinburgh Review* examined our census, and found enough of honest triumph for America in her actual position, and hoped that we might spare that dazzling galaxy of epithets by which we undertook to persuade ourselves that we were the greatest, most refined, most moral, and most enlightened people on the earth. It hoped we would cease sending our statesmen up every morning to Pisgah's heights to enjoy a prospective subjugation of the whole globe. We were even then advised to drop our superlatives. As well advise an American to refuse his photograph to be hung at a county fair! We are great, but intensely conscious of it. No wonder that Dickens returned home to laugh at the infinity of "remarkable men" every where introduced to him. At every village he was pointed out General A, or Colonel B, or Esquire C, with the information volunteered, "One of the most remarkable men in the country, Sir."

This extravagance pervades our dialect and our opinions. Our dialect has not only swollen to a laughable bulk, but the wildest perversions of good words have resulted from it. One of our scholars published in 1848 a dictionary of Americanisms; it contains over 400 pages. We naturalize outlandish words with more speed than we naturalize aliens. What with the Dutch of New York, the Scandinavians of the Northwest, the Welsh of New York and Ohio, the French of Louisiana, the Germans of Pennsylvania, the Minorcans of Florida, the Spanish of the Mexican war, the Mennonites of Russian proscription, the Indian terms ingrafted on our stock, the provincialisms of New England and of the West, and the broad-vowelled Africanese of the South, we present not a few heterogeneous elements to begin with, which our writers and speakers are not loath to aggrandize. No sooner is the horse distemper prevalent than it is named "epizootic," and then reduced to and employed as a verb by the negro minstrelsy of our cities. It was only the other day, after the election, that a New York editor saluted me as a "Tidal Waver!" Our war gave us at least three words which are thoroughly at home in our midst, "skedaddle," "gobble," and "bummer."

The metaphorical and other odd expressions belonging to the West and South—a list of which Mr. Benjamin gives in his lecture on Americanisms, and which Mr. Bart-

lett has collected in his dictionary—originate in some funny anecdote, which makes its way up through many mouths until it obtains the imprimatur of the *Congressional Record* and the currency of the metropolitan press. If the history of our lexicography were written, it would be a comic one; for where no anecdote could be found as the root of our new and odd phrases, their origin would be traced to the necessities of uneducated but original geniuses, who make words for their ideas precisely as they make a new ox-yoke or a threshing-machine, which words soon become popular from the oddity of the thing, and in time find places beside the dignified Latin and homely Saxon of our tongue.

John Bull growls at what he calls new-fangled terms from America; and he calls on his children to tolerate no longer that which, commenced in humorous aberration, has continued till it has become a nuisance. In the United States, he says, if a half dozen newspaper editors, postmasters, and dissenting ministers, two or three revolvers, a bowie-knife, a tooth-pick, and a plug of tobacco, get together, the meeting is called a monster mass-meeting. If Joel Wainright blows out General Ruffle's brains on the New Orleans levee, it is not a murder, but a "difficulty." Our civil war even is called the "late unpleasantness." If any thing is big, it is forthwith called mammoth; so that one might suppose Anak and all his sons were nephews of Uncle Sam. Some English author waits patiently to hear of our plesiosaurus pumpkins, or ichthyosaurus hedgehogs, leviathan lap-dogs, behemoth butterflies, and great sea-serpent Congressional speeches! He gives seventeen synonyms for the word "money," thirty-two for the word "drunk," and thinks it time to stop this importation of slang.

We ought to welcome this genesis of new words, since our exaggeration has emasculated and disrobed so many of our old English words of their meaning. The word *powerful* is powerless to convey any significance; *magnificent* is tawdry; *mighty* is weak. All through the South the expression "mighty nice" or "mighty weak" is as common as that vulgarity in England, "awfully jolly." There is no end to our superlative language. *Desperate*, *all-killing*, *all-fired*, etc., are gentle terms; *first-rate* is generally acknowledged to be fifth-rate; a *roarer* is as gentle as a cooing dove; *tip-top* is from fair to middling; *splendiferous* is only tolerable; *old hoss*, when analyzed, is found to be the tenderest appellation of a biped juvenile without hoofs; and an *institution* is any thing the institutor pleases—an eating-saloon, a free-love club, a shoe-peg factory, a steam fire-engine, a water-cure, a six-barreled pistol, a barber's shop, or a sausage-stuffing machine. Some years ago a New Orleans paper call-

ed the negro an institution. I heard a sanguine young father denominate his baby an institution. The generalizing mind of America sees in the baby the germ of future republics, and he dare express it. Not long since a New York paper offered a reward for a new set of terms to express what used to be expressed by many of these familiar words.

As illustrative not only of this tendency to coin new phrases, but fresh and exaggerative metaphors, I might quote from Lowell several of our oddest expressions. The backwoodsman prefers his tea "barfoot," meaning without cream and sugar; a rocky piece of land is heavily mortgaged; hell is a place where they don't cover up their fires o' nights; a hill is so steep that, in the language of the stage-driver, lightning couldn't go down it without being shod; the negro is so black that charcoal would make a white mark on him; the weather was so cold that a fellow who had been taking mercury found his boots full of it.

Our unlettered people have the same strain: "mean enough to steal acorns from a blind hog;" "cold as the north side of a grave-stone in winter;" "quicker than greased lightning;" "handy as a pocket in a shirt;" "he's a whole team and a dog and tar-bucket under the wagon." Sometimes this tendency is subdued in the quaintest way. An American was asked if he had crossed the Alps. He said he guessed he did come over some "risin' greound!"

Another advised a man with big feet, who wanted a boot-jack, to go back to the forks in the road and pull his boots off!

Our editors, with their accounts of meetings, their rallies to the indomitable who yet are conquered every other year, and their grandiloquent fustian, but minister to the people who sit to them for a likeness. The ware is suited to the demand. As is the court, so is the bar; as is the public, so will be their organs. None know better than the editor himself the ridiculousness of his rhetorical gasconade. Your editor, cigar in hand, cool as the arctics, sits down in his sanctum and writes a rally for the election. He calls on his political friends: "Once more to the breach!" He hears "the shouts of victory and the lamentations of the vanquished." He puffs his cigar. "Victory must perch on our banners. Down with corruption! Freemen, keep your council-fires burning brightly!" He takes another puff, italicizes the manuscript, and writes on. "Push on the columns! Rout them! Overwhelm them! Let the welkin ring with the soul-stirring tidings that the country is saved!" He knocks off the ashes, and the "devil" cries for "copy." The breathless patriot besprinkles it with notes of admiration, and placidly smiles as he passes it over.

The American acts upon the principle

which physiologists have remarked, that there is something besides the nutritive quality requisite in food, that a certain degree of distention of the stomach is required to enable it to act with its full powers, and that it is for this reason hay and straw must be given to horses as well as corn and oats, in order to supply the necessary bulk.

The opinions of our people are always aggrandized, not only by intense language, but by superadding to them other ideas, until they tower up beyond all verisimilitude. The sober hue, the faithful outline, the correct perspective and mellow shading which give relief by contrast, are discarded for the glare and distortion which suit our humor.

Pick up a Southern paper. The editor wishes to say that the Mississippi is very low. How does he say it? "The cat-fish are rigging up stern-wheelers!"

Another wishes to give an idea of the altitude of his Shanghai: "He is so high that he has to go down on his knees to crow."

A strange genius, describing a lake in Minnesota: "It is so clear that by looking into it you can see them making tea in China."

An Illinois enthusiast wishes to give you his idea of heaven: "It is an endless prairie of flowers, fenced in with pretty girls."

A Mississippian brags to a Yankee about a big tree he chopped at for ten days, took a walk around it on Sunday, and found a man who had been chopping on the other side for two weeks! This was before the mammoth conifers of the Pacific were discovered. We know now that the only mistake in this description is in the location.

A horse traveled so fast that his rider fancied he was passing through a grave-yard, from the rapid succession of mile-stones.

Many years ago I was one of a party in Washington city, when South and North vied with each other in convivial life. Another of the party was General Dawson, member from Western Pennsylvania, whose homestead was Albert Gallatin's old home. He was an admirable story-teller. I recall somewhat sadly, now that he is gone, how well he illustrated the laziness of a class of Virginians. The story was a part of his Congressional canvassing. On one occasion he got across the Pennsylvania line into a little village of Virginia. He was in the midst of a group around the tavern. While treating and talking, a procession approached, which looked like a funeral. He asked, who was to be buried?

"Job Dowling," said they.

"Poor Job!" sighed the general. He was a good-natured, good-for-nothing, lazy fellow, living on the few fish he caught and the squirrels he killed, but mostly on the donations of his neighbors. "So poor Job is dead, is he?"

"No, he ain't dead, zactly," said they.

let it be strongly expressed. Give the American his theme, allow him creation for the range of his figures, and if he does not, in the language of one of his tribe, "stand one foot on the Georgi-um Sidus—a star which rolls in unfathomable space—and the other upon the terrestrial sphere, and bring down the forked lightnings to enlighten your benighted understanding," it will be because you do not stop to hear him out.

A country editor describes a rival

"GO ON WITH THE FUNERAL!"

"Not dead—not d— Yet you are going to bury him?"

"Fact is, general, he has got too infernal all-fired lazy to live. We can't afford him any more. He's got so lazy that the grass began to grow over his shoes—so everlasting lazy that he put out one of his eyes to save the trouble of winking when out a gunnin'."

"But," says the general, "this must not be. It will disgrace my neighborhood. Try him a while longer, can't you?"

"Can't; too late—coffin cost \$1 25. Must go on now."

About this time the procession came up and halted, when the general proposed, if they would let Job out, he would send over a bag of corn. On this announcement the lids of the coffin opened, and Job languidly sat up: the cents dropped from his eyes as he asked,

"Is the corn shelled, general?"

"No, not shelled."

"Then," said Job, as he lazily lay down, "go on with the funeral!"

Perhaps nothing can better illustrate the colossal audacity of our thought and humor than the career of our most illustrious showman.

It matters little what the idea is, only

town in this copiousness of imagery. He said that "it takes several of their pigs to pull a blade of grass, and they are so poor that the foremost seizes the spear in his mouth, the balance having taken each other by the tail, when they give a pull, a strong pull, and a pull all together, and if it breaks, the whole tumble to the ground for want of sufficient strength to support themselves. It takes three or four of them to make a shadow."

Need I refer you to the sermon of the Baptist preacher in Mississippi? Is it not in every one's memory? It will not out. Its humor was so contagious that it seemed to sweep over the American heart as if the sainted brother himself stood before us as

he "played on a harp of a thousand strings—spirits of just men made perfect!"

What but a sense of humor in both speaker and auditors could possibly have carried off such a speech as that alleged to have been made by the great Webster?

"Men of Rochester, I am glad to see you, and I am glad to see your noble city. Gentlemen, I saw your falls, which I am told are one hundred and fifty feet high. That is a very interesting fact. Gentlemen, Rome had her Cæsar, her Scipio, her Brutus, but Rome in her proudest days had never a water-fall one hundred and fifty feet high! Gentlemen, Greece had her Pericles, her Demosthenes, and her Socrates, but Greece in her palmiest days never had a water-fall one hundred and fifty feet high! Men of Rochester, go on. No people ever lost their liberties who had a water-fall one hundred and fifty feet high!"

In fine, not to reproduce illustrations all too familiar, there is an extract, which I quote, which sums up the case in the "most unparalleled" style. It was intended as a humorous reply to some gasconade of a rival journal by an imaginative editor:

"This is a glorious country! It has longer rivers and more of them, and they are muddier and deeper, and run faster, and rise higher, and make more noise, and fall lower, and do more damage, than any body else's rivers. It has more lakes, and they are bigger and deeper, and clearer and wetter, than those of any other country. Our rail-cars are bigger, and run faster, and pitch off the track oftener, and kill more people, than all other rail-cars in this and every other country. Our steamboats carry bigger loads, are longer and broader, burst their boilers oftener, and send up their passengers higher, and the captains swear harder than steamboat captains in any other country. Our men are bigger and longer and thicker, can fight harder and faster, drink more mean whisky, chew more bad tobacco, and spit more and spit further than in any other country. Our ladies are richer, prettier, dress finer, spend more money, break more hearts, wear bigger hoops, shorter dresses, and kick up the devil generally to a greater extent than all other ladies in all other countries. Our children squall louder, grow faster, get too expansive for their pantaloons, and become twenty years old sooner by some months, than any other children of any other country on the earth."

Connection between the ideas is not essential, nor the quantity of meaning conveyed. A drop of idea will diffuse itself through a sea of verbosity; and the more cloudy the idea, the greater the intensity. Take that very dim idea of our manifest destiny, what involutions of verbiage hath it not been lost in? With what complacency the American sees the nations march before him, empires tremble, and crowns fall at his invincible feet! In the imagery of Young America, he takes a seat on the topmost ridge of the Alleghanies, one foot on the Nevadas and the other on Chimborazo, smokes a long nine with the man in the moon, hears the Antilles roar responsive to the Rocky Mountains, invokes the spirit of General Jackson, hears the tramp of the coming generations, and don't care a Continental—cuss! That was a characteristic exaggeration which a Western drover attempted at the Crystal Palace to a company who were looking at the statue

of the infant Ptolemy Lagus, fed and shielded by an eagle: "It's a cussed Yankee lie! Ptolemy Lagus! Don't I know? I tell ye it's the American eagle feeding young Sam with gravel stones to give him grit!"

The days of our spread-eagle oratory, I fear, are nearly over, at least in our legislative bodies. Before the war we had rhetorical flags and emblematic birds in profusion. The last effort in Congress which I recall was that of a Louisiana member during the first years of the war, who made a pathetic apostrophe to the escutcheon of his State above him, on the painted glass. How touching his appeal to the female pelican and the little pelicans feeding from her breast may be imagined, when I say it was received with titters, which enlarged into laughs, and the laughs into guffaws. The like has not been attempted since. Congress, at least, is growing fond of facts; and, when humorously applied, is not afraid to roar. But the day of Crockett and Mullins has about departed. I recall, however, a recent speech by a member of the Missouri Legislature which combines this spreading elocution with considerable unique and grandiose jocoseness. His theme is the 8th of January. Some one objected to posting up a hundred bills announcing that the glorious day had arrived. The objection was on the score of economy. Here is his retort:

"The gentleman is suddenly seized with the 'retrenchment gripes,' and squirms around like a long red worm on a pin-hook. [Laughter.] Gentlemen keep continually talking about economy. I myself do not believe in tying the public purse with cobweb strings, but when retrenchment comes in contact with patriotism, it assumes the form of 'smallness.' Such economy is like that of Old Skinflint, who had a pair of boots made for his little boy without soles, that they might last the longer. [Laughter.] I reverence 'the day we celebrate.' It is fraught with reminiscences the most stirring; it brings to mind one of the grandest events ever recorded in letters of living fire upon the walls of fame by the strong right arm of the god of war! On such occasions we should rise above party lines and political distinctions. I never fought under the banner of Old Hickory, but, 'by the Eternal,' I wish I had. [Laughter and applause.] If the old war-horse was here now, he would not know his own children from the side of Joseph's coat of many colors—Whigs, Know-Nothings, Democrats, hard, soft-boiled, scrambled, and fried—Lincolmites, Douglassites, and blatherskites! I belong to no party; I am free, unbridled, unsaddled, in the political pasture. Like a big bob-tailed bull in fly-time, I charge around in the high grass and fight my own flies. [Great laughter.] Gentlemen, let us show our liberality on patriotic occasions. Why, some men have no more patriotism than you could stuff in the eye of a knitting-needle. Let us not squeeze five cents till the eagle on it squeals like a locomotive or an old maid. Let us print the bills and inform the country that we are as full of patriotism as Illinois swamps are of tadpoles. [Laughter.]"

Of course it will not be denied that these instances are rare, but they are as characteristic of our people as Mulberry Sellers and his "millions." We have orators who are witty, who do not need this extrava-

gant wing for their flights. We have political orators who are quite sharp enough to make the speech Sheridan did to the shoe-makers of Stamford when asking their votes; and yet I doubt if they are not too sharp to risk such a fatal result of wit as he experienced. He was denounced by the irate shoe-makers for saying: "May the trade of Stamford be trampled under foot of all the world!"

I once stood beside an American in the Crystal Palace in London in 1851 when the great organ in the western transept struck up *Yankee Doodle*. He said that he felt as if two Bunker Hills were rising in his bosom! He could not express himself otherwise, though the remark was palpably false.

There is something humorous in a lie, especially if it be a whapping one. It displays spirit and invention, and the size of it challenges our admiration, as it were a Colossus. Impudence is at the bottom of it, and self-complacency helps it along. Americans lack neither of these requisites. The coolest man in the world is the imperturbable whittling Yankee. In this he copies and goes beyond the Norseman, who had the same misty and grand way of saying things. The jokes of the Sagas were broad and immense. One of the old Scandinavian poets says that his hero had so big a beard that the birds made nests in it; and he makes the North Wind say that the distance was so great that when he attempted to blow an aspen to it, he couldn't blow a puff for days afterward. Our idea of the American eagle must be one with the Giant of Edda, who sits at the end of the world in eagle shape, and when he flaps his wings, all the winds come that blow on man. In the same spirit the American bounds his country on the east by the Atlantic Ocean, on the north by the aurora borealis, on the west by the setting sun, and on the south by the Day of Judgment.

These exaggerations are not therefore peculiar to America; they are composite; they are not merely made up of Norse poetry, but there is in them a strong flavor of Celtic imagery, and we know that the Celt is of the Orient, all radiant with the superlative. The search into the origin of our language and of our people would do much to solve the problem of the origin of our humor, as of our institutions.

In conclusion, no one can doubt who surveys the surface or pierces the heart of American society that we have a humor peculiar, grotesque, composite, shrewd, and exaggerative. Not to become didactic, but for the practical application of this analysis of our humor, let me make a few suggestions:

First. Our humor lacks refinement. I venture to say that three-fourths of our humor

will not bear rehearsal in the presence of women. Gentlemen, so called, even in the company of ladies, group together in a corner to chuckle over some "good one" which Smith or Jones has just heard, and thinks too good to be lost; or ladies, perhaps, will have their companions dragged off by the button-holing process to the hall, and soon after their ears are greeted by vociferous laughter. Indecency and Fun are old cronies. Horace, Ariosto, Montaigne, Sterne, Beaumont and Fletcher, and even Hogarth, prove it. We have in our list of patents a contrivance for cleaning smut out of wheat. If we would have superfine brands, we should employ it in our humor.

Secondly. Our humor needs moderation. This it may have without losing its peculiarities. To accomplish this we must study moderation in our business and our pleasures. We wear out too soon. More moderation in our business, our thoughts, and our amusements would instill more veneration into our youth, give more emphasis to age, and inspire more awe of the sacred relations we sustain to our land, our race, and our God. The *otium* known in Roman days, when Cicero and Sallust could retire from the forum and the baths of the imperial city to their sequestered villas at Baia, the repose which the gentler amenities of interchange give to the mind, find no counterpart in our midst. Our summer resorts are themselves strung on extremes. We leave our homes to travel for relief, and are glad to hurry back to the partial tranquillity they give.

With all our greatness, we should be great in a better sense. Action is sublime, but godlike is—repose! Our enjoyments in this life ought to antedate the future life. The clouds of unrest and fear, if they can not be dispelled in this our sphere, can be fringed with luminous beauty. Why should we care so much for the fleeting things which so warp our spirits and worry our life? If we think of it, our star is but a sand grain in the vast spaces, and our little life but a watch tick in the eternal years of God. Let us while we may, if not for our own, yet for the solace of others, gather the roses of hilarity, but not with such rude clutching as to destroy the plant or dissipate the fragrance.

There are those in our midst so tinctured with Puritanic austerity as to prefer frowns to dimples, who see nothing but levity in mirth, who find no manhood in the cheerful heart. There are others who dive deeper into the philosophy of life, and, like the old philosopher, are ever ready to weep at the sorrows and even the joys of others. There are meditative men, who find thoughts too deep for tears in the flowers of the field. Far be it from me to detract from the respect which such grave intellects ever receive

from the loftier intelligences of their time. To an Omniscient mind, holding in its grasp the infinite relations which every object, act, and thought sustain, perhaps our sincerest laughter is fraught with tears. But God has limited our vision. We see but in part; hence we see fragments, oddities, and incongruities; and Man alone of all the animals is made a laughing creature, to enjoy them when they come within the range of his vision.

Others, from similar generalizations, find motives for laughter in every thing, as if, in the eye of pure reason, short-sighted men were continually playing fantastic tricks, at which, as the Germans boldly aver, God laughs almighty.

But he who always laughs is reckoned not less foolish than he is reckoned mad who always weeps. Nature in her hill and dale, her night and day, her cloud and sunshine, teaches that wise alternation which is the golden mean between these extremes of mood. Let the earnest endeavor alternate with the cheerful heart. Let heroic performance follow the jubilant soul.

Thirdly. While we moderate, let us enlarge the domain of our humor. Need and greed are our presiding spirits. If we can not exorcise them, let us at least turn from them more frequently. The brawn and muscle of America toil for us day after day, with how little cheer. These are the builders of our greatness. Why can not they have, as Thebes had, Orphic music as they build? They deserve aureoles of joy around their sweating brows. Intellect and work have been too long divorced. The division of labor has been carried from economy into the social conditions of life, so that we hear of a class of thinkers and a class of operatives. Let the workman think and enjoy; let the thinker work and enjoy. Our liter-

ature seems to look to the fashionable city avenues for its success, and holds the mirror up to its denizens as if they were the essence of American manhood.

Our humor needs to be democratized. Our genteel laughter needs crossing with that of hearty toil. The one is becoming a "barren simper, a sniff and titter and snicker from the throat outward, producing some whiffling, husky cachinnation, as if laughing through wool"—a slow, formal unpuckering of its mouth under cambric, and half gurgling its enjoyment. Compare it with the laugh of labor, as Carlyle would describe it, "bursting forth like the neighing of all Tattersall's, tears streaming down the cheeks, foot clutched in air, long, long continuing, uncontrollable—a laugh not of the face and diaphragm only, but of the whole man, from head to heel."

There is no national platform like good humor. If the rich would make the poor forget their repugnancy, if the high would smooth the harsh prejudices of those below, let them cultivate good humor. The joke is a great union element. If velvet paw can only shake horny hand over a joke, velvet paw and horny hand are a community at once of equal franchises.

If our humor were thoroughly crossed and largely diffused, the treasuries, stratagems, and spoils of politics would lose their terror; certainly sectional asperities and public discussions would lose their wrinkled front. From the forum, the street, the office, our humor would be transplanted to the gardens of home. Thus purified around the hearth-stone and at the daily meal, it would unshadow our brow, and, along with those rarer blooms of domestic love, spread forth from its rich treasury of hue and aroma its graces to make the world less mournful.

THE JUDGE'S DAUGHTER.

BY THE AUTHOR OF "A SACK OF GOLD."

I.

JUNE the tenth—and to-morrow will be Dorothy Cotterell's eighteenth birthday. Advanced age! The gate of ivory and pearl takes as yet only the most delicate tints from childhood's imagination, and beyond the enchanted portal, womanhood for Dorothy.

She is standing in the open doorway of the Cotterell mansion, and she gives a little elastic jump of irrepressible delight at the prospect of soon being so old. She is tall and slender, fair as her English sisters, but with the transparent purity of complexion due to a severe climate. She wears a canary-colored slip, with the waist two inches deep, as prescribed by rigid fashion, her slippers are daintily laced, and her blonde hair is gathered up on top of her head with an enormous shell comb.

Summer has come, royal if transitory, bathing the glad earth with sunshine which exhales the fragrance of balsam, the breath of flowers, and the mingled odors of the forest's veiled censers. Below, the river Penobscot rolls swiftly down to sea, and the schooner *Betsy* rides at anchor off Lake's Wharf.

Jacob Lake comes hastily up the tiled path, after loitering irresolutely at the gate. Dorothy must confide in somebody this summer morning, and she smiles bewitchingly on fascinated Jacob. Why not? Jacob may not presume to her good graces, but she can smile down on him, for she is the Judge's daughter, and known to all the land. Across this gulf Jacob Lake, humble, plain, and mean, devours her with his hopeless gaze; he sees not the canary slip, the dainty shoe, the monstrous comb, but the pliant, graceful form, the rounded white arms, limpid blue eyes, audacious and tender, the tendrils of silky curls framing the oval face, and the tempting mouth with delicately curved red lips. Yes, and he adores the foot within the slipper with the most slavish homage of man. The light in Jacob's pale eyes grows fierce, even cruel, but he droops the fat lids submissively.

"You will be glad to hear I've made my fortune on that cargo of steel from England, Miss Dorothy."

She bends her head like a lily swayed by the breeze.

"Yes, I am glad. You must not think too much of money, though, Master Jacob."

"I only think of it for what it will bring," he protests, eagerly.

But Dorothy does not care to hear what money will purchase for Jacob. Her lip curls slightly; she is tired of playing with her mouse.

"Here is a damask rose for you," she says, quickly, taking care that her slender fin-

gers do not come in contact with his coarse palm.

"To-morrow is my birthday, and my father will not tell me what my gift is to be. Oh, I forget!"

She darts away *sans cérémonie*, and disturbs an old woman among the jam pots of her pantry. This old woman is chiefly noticeable for a black silk poke-bonnet, which she dons when she rises at dawn, and doffs only when she retires. Hence there is mystery to the youthful mind in the bonnet of Serena, Judge Cotterell's housekeeper and Dorothy's nurse.

"Guess her head runs up to a p'int!" chorus wondering childish voices; and every baby born for the past forty years at Indian Point has stared at the grim head-gear, ornamented with a stiff bow on top, like a door-knocker. Rumor is divided, Serena being reticent on the subject, between the theory that she fears draughts and that she never intends to be taken by surprise and scalped by Indians. However, here she is among her jam pots, golden gooseberry, luscious plum, and aromatic quince, stored by this queen bee for the sterile winter, absorbed in calculating the ravages made by Judge Cotterell's guests on her last autumn's harvest. Dorothy does not mind the bonnet. She knows that within the rim there is a frilled cap inclosing a face like a dried walnut, all nose, and two twinkling kindly eyes leading straight down to the best heart in the world.

"Serena dear, remember your promise. You have always said I should know about my mother when I was eighteen, and see her room."

"No, I didn't; and if I did, it was only to kinder keep ye quiet. I sha'n't show ye or tell ye nothin'. La, child, what's the good? Let the dead rest."

Of course Serena has risen and taken a key from the carved chest with brass handles. She always protests while yielding.

Dorothy's face grows tender and wistful as she crosses the threshold of a chamber kept locked all her life. The Cotterell homestead is the finest house on the river, and the builder is justly proud of his polished stairway, wainscoting, embrasured windows, and high chimney-pieces carved with patient skill. Nay, more, our most gracious sovereign, George III., gazes across the parlor at Queen Caroline on the opposite wall; there is massive plate on the buffet in the dining-room, where a corpulent punch-bowl seems always to exhale the steam of Jacob Lake's rum from the West Indies, and the cellar is known to be well stocked with Burgundy and port. Dorothy has been mistress of it all, free to trip down unexpected steps, and trace bewildering passages leading to room within room, like the boxes of a Chinese toy; but she holds her breath as

she crosses the unknown for the first time. There is a pervading scent of lavender, and in the very gloom some faint pulsation of a vanished presence. Dorothy gazes in awed silence at the high four-post bed, shrouded in chintz hangings, the cedar chest like a coffer, and the bureau quaintly inlaid in brass, surmounted by curious ornaments—bubbles of tinted Venetian glass, feather-work, and shells. A Louis Quatorze gold watch swings from a hook, with the hand pointing to twelve o'clock, and a pair of satin shoes with high heels stand beside the bed. There is nothing as pathetic as a shoe of the dead. A sob rises in Dorothy's throat; all her heart goes out to the shadowy mother.

"Don't let him find ye here," whispers old Serena. "She told me to give ye all when ye could understand. Here's the chest and her diary. I will watch for the Judge."

The nurse goes out and closes the door softly. The Judge must not know; Serena is thoroughly aware of his idiosyncrasies by this time. He is a genial host, a scholar, having belonged to the king's Council, a devoted father, but stern in his rule. The Judge serves God by rising at four o'clock of the bleak winter morning, reading his Bible aloud until such time as shivering, drowsy Dorothy is standing at her place at the breakfast-table on the stroke of six.

"People will rise to eat, when they will not to serve the Lord," he says, solemnly.

After the meal Dorothy falls asleep on her knees while her father prays, and ten chances to one Serena pinches her into a state of wakefulness at the right moment to arise. Suspicion is never allayed in the Judge's mind on this question of morning's duties; he makes a careful tour of his kingdom, peering into kitchen and barn; then, having set the machinery well in motion, he retires to his study, reclines in his leather arm-chair, spreads a silk pocket-handkerchief over his face, and takes a refreshing nap to atone for his exertions.

Well does Serena remember the day when two babies lay in her arms, the boy Samuel, the girl Dorothy, and a strange light of revelation came into the dying mother's eyes as she said to her husband,

"I know all at last. As sure as there is a God above, you will be punished through my children."

The old housekeeper has seen too many leaves fall from the tree to be much awed by death, but a tear rolls down her cheek at the thought of Samuel. How they watched over that boy, the Judge and the minister! she thinks, gazing out on the river.

"He nigh upset original sin in their doctrines: there was no sin in him. He was just a saint from his cradle. Deary me! the Lord takes away our idols. I s'pose

there never was a father who schemed and planned such a future as the Judge did for his only son. It was all to be a man in the future of his country. The minister must pray day and night that Samuel should escape all the snares of the devil; and all the while holy angels were leading him straight to heaven."

Serena takes a pinch of snuff from a silver snuff-box, rubs her long nose violently, as if to dispel grief, and suddenly begins to chuckle irrelevantly.

"Plenty of the old Adam in our Dorothy, though! My! if he didn't try to break her will at two years—taught her a verse of Scrip'ter, and she wouldn't say it!"

The vision of little Dorothy seated on a stool in the study, obstinate and silent, while the Judge exhorted her, threatened, even cajoled, so that she yield to his authority and lisp the desired words, fills Serena with glee even now.

"Poor mite! What does a man know about babies? I took her at night, and she cried herself to sleep on my neck. He never tried to break her will again, mind ye."

An hour passes, and Dorothy still kneels before the chest of which she is heiress. Satin petticoats, brocaded gowns, yellow lace, and wondrous scarfs are heaped about her, but she rests her cheek on a little red book. Sunshine pours through the window which Serena has opened. Dorothy's hair is fluffy gold, and there is a sheen of splendor on the rich fabrics of a past generation. The faded characters of the diary have furnished her a clew to her mother's own youth. Dorothy's fancy supplies the fresh coloring even as the sunshine enters the dead chamber with revivifying touch. Left dependent on the charity of a haughty aunt in Norwich, and drawn as by a magnet toward the aunt's handsome son, Cousin John Moncrieff. Dorothy sees it all with a thrill of sympathy. Poor and beautiful, sent away to New England in order that John may be induced to wed a country heiress. How will beauty transplanted fare in the household of a kinsman—a colonial secretary—attract the admiration of sedate, mature Judge Cotterell? England has faded to a cloud across seas; John is lost; hope is dead. Here the chain breaks.

To Dorothy the very pages are eloquent with a love never fully expressed—the flower messages of Cousin John, the pathos of his song, the meaning in his eyes; yet she may never know that Judge Cotterell, on the eve of his marriage, dispatched a missive in answer to one of John's, begging for tidings, hungering for the pale bride so soon to be the older man's very own. Tempted and fallen in this cruel emergency, the latter could not give her up, and on her death-bed she denounced him for his duplicity.

At noon the Judge returns home, and

Dorothy, flushed, bewildered, even guilty, meets him, yet the chamber door is discreetly locked again. A tall, thin man, with aquiline features and silvered hair, scrupulously elegant as to dress. His small-clothes, silk stockings, and silver shoe-buckles become his station; but a brown coat with long skirts can not conceal his stooping gait, and the ruffles at his wrist fall over hands wrinkled by age.

"To-morrow is your birthday," he begins, flecking a grain of snuff from his linen. (Just as if Dorothy did not know!) "I intend to take you to Boston."

Dorothy is speechless from delight and excess of surprise.

"Serena has been preparing your wardrobe."

At midnight Dorothy slips into her mother's chamber, and hastily selects a dress, a box of trinkets, and a large Moorish fan to carry with her. While she is thus employed, Serena enters the young girl's room with a bundle in her arm. She unfolds several garments wrought with all the skill of needle-work, then places them in a damask cloth.

"One can never tell what may happen!" she sighs, mournfully, laying the bundle in Dorothy's chest.

The *Betsy* sails at noon, and the event brings all Indian Point to the wharf, where there is bustle of preparation, and Captain Pettigrew is the hero of boyish hearts. Just as Judge Cotterell is about to embark with his daughter, the minister approaches. The Rev. Nehemiah Gibson is a small, pale man, with a piercing eye and a calm dignity of bearing. "Blessed are the pure in heart, for they shall see God." The whole country-side is full of the marvelous efficacy of the Rev. Nehemiah Gibson's prayers, which amount to prophecy. Does he not bring the rain from heaven and the fish into the nets by his invocations? Did he not keep alive his wife, the shrewish woman who mocked at piety, by his supplications, until, spent by her infidelity, he committed her to her Maker, and that very day she sickened and died?

He takes Dorothy's hand with scarcely suppressed emotion. Such education as the Judge's daughter can boast has come from this theological source. She can read her Testament in Latin and Greek.

"The Lord be with you, my child. But if you yield to the temptations of a great city, the worldly pomps and vanities, you will surely receive your punishment."

Dorothy bows her graceful head in reverent acquiescence, but she does not heed the words that chill many a by-stander. The mirage of the future spreads before her eyes, colored with the rainbow prism, and there is a melody welling up from her heart unheard by other ears.

Blow, summer breeze, and inflate the sail which bears us out into the beautiful unknown world!

"It's a long voyage, and full of peril," sighs old Serena, ambition and fear tugging at her heart-strings.

Jacob Lake is pale, and gnaws his lip in jealous dread. The minister stands, a small black figure with folded hands, gazing steadily after the receding vessel, in his wonderful eyes the look of one who sees far beyond.

And so the schooner *Betsy* glides gently down the stream.

II

Province House is illuminated with innumerable clusters of wax-lights, which shed a lustre on the carved pilasters, blazoned escutcheons, and the polished floor of the ball-room. The court-yard is thronged, and coaches pause before the gate for fair ladies to alight, while the soldiery guarding the portal check the familiarities of the crowd, who may only gaze on that Aladdin's palace, the Governor's residence, from afar. Boston is the most prosperous town of the colonies, and to-night his Excellency entertains Admiral John Moncrieff, just arrived out with the fleet.

The guest of the evening has landed from the flag-ship, has courteously exchanged greetings with the company, and stands at the upper end of the ball-room. He is an elderly man, with silvered hair and an imposing presence, in the rich naval uniform, on his breast many orders and medals. Perhaps the most graceful youth in the company is his son, Captain Clarence Moncrieff, now doing garrison duty here.

Memory haunts the father, giving a sombre tinge to his first impressions of this New World. Here fled his cousin years ago to escape him, pale Dorothy, who must ever be held a priceless treasure, because never attained. The chilled silence he scarcely dares to break by a single inquiry. Did his mother know what fate might have befallen Dorothy? Will he see her to-night, a staid matron?

The son is startled by the nervous clutch of his father's hand on his arm, and no less by the change in his features. John Moncrieff has turned pale, furrows line his brow, his eyes are fixed on the doorway, and from his lips escapes the exclamation—almost a cry, in its pained surprise—"Dorothy!"

A girl stands in the door, slowly wafting a large Moorish fan as her glance rests calmly on John Moncrieff. Her dress resembles a tulip, being a superb brocade with stripes like the blended hues of the rainbow; frills of lace veil the round arms, a slender pointed waist reveals the symmetry of the form, and the yellow hair is piled high over a cushion. She is accompanied by a lady attired in the pale blue and pink of the Pom-

padour reign, her black eyes and blooming cheek forming a charming contrast with her powdered tresses and coquettish costume. A look is exchanged between the ladies of the provincial court, which says, more eloquently than words,

"One of Mrs. Shackleford's whims. How that woman plots to attract all eyes!"

To John Moncrieff the present has vanished. Already he has stepped on the golden bridge which spans time, and on the other bank is the love of his youth, in the tulip-shaded gown, wafting his gift, the perfumed Moorish fan.

"Father, you must open the ball with our hostess," warns the Captain.

Thus is the present thrust sharply upon him. Oh, the years! the long years! She can not be Dorothy, but a phantom mocking him as he steps ashore, for he is old, and his son stands beside him. He turns again to the girl, who appears frightened, as if moved by some indefinable sympathy; then, with an effort, he recovers himself.

"Go to that young lady and apologize for my conduct. I was startled by a resemblance."

Admiral Moncrieff opens the ball with the Governor's lady. Clarence Moncrieff threads his way through the crowd to Dorothy's side; Mrs. Shackleford smooths away any obstacle in his path; and he is left to make his speech to Dorothy in his own fashion. Dorothy is dazzled with light and sound; each lady is a goddess of beauty to her inexperienced eyes, each officer a hero of romance. Is she really the Judge's daughter, and does Indian Point still exist? She looks at Clarence Moncrieff through her long eyelashes, and forgets the conduct of the great officer in the apologies of his son.

The favorite of his regiment and the pet of all womankind is bending over Dorothy, and the face into which she looks is as softly rounded as her own, youth having imprinted a dimple in the chin, smiling about the mobile lips, and laughing perpetually in the frank, boyish eyes. She has just consented to dance the minuet, and laid her hand timidly on the scarlet sleeve of her partner's coat, when the voice of Judge Cotterell says:

"You have not my permission to dance."

Dorothy turns pale, and glances around helplessly for her chaperon. That lady shows no false colors; she claims the stern Puritan's escort, and presents him to the Governor. Judge Cotterell is far too well bred to drag away guilty Dorothy, and thereby make a scene. He remains for an hour conversing affably with the dignitaries; but Dorothy's light feet have become lead as she meekly waits by his side.

For the first time in their lives Judge Cotterell and John Moncrieff meet. Even now there is a grave between them, and they

do not speak, if aware of each other's identity. As they leave the gay scene, Dorothy again encounters the long, wistful glance of the Admiral. Impulse would lead her to kneel before this stranger and kiss his hand, and opposed to this reverence is a rebellion in her heart against her own father. Mrs. Shackleford yawns slightly in the coach—pleasure is a cup of which she sips nightly. The chalice has never before been held to Dorothy's eager lips. The Judge utters no word of reproof.

Still in a dream, the girl stands in her chamber, with the dawn stealing in the window. At that moment Clarence Moncrieff is going home to barracks, singing a buoyant song, and will propose as a toast at mess, "The sweetest of little Puritans." Dorothy has sinned: what will be the retribution?

Judge Cotterell had gone to Concord to visit an old friend of the bench, when Mrs. Shackleford claimed shy Dorothy with, "I shall take you to the ball, *mon enfant*. Never mind papa; I alone am to blame."

"I must wear my mother's dress," says Dorothy, eagerly.

Mrs. Shackleford assents, and directs her maid to make for her also a costume of old date, and the whim shall pass as her own. There is much merriment over the absurdity of the fashions of a past day as they assume their toilets, and then Pleasure touches Dorothy with her magic wand.

The cold dawn comes in the window, but her cheeks still glow. A damask cloth has fallen on the chair with a slip of paper attached to the inner side, as careless Dorothy tossed it down after choosing the wrought garments it contained. Old Serena prepared for all emergencies. Her child had started on a long and dangerous voyage. Who may tell in the providence of God if she shall ever return? The girl reads:

"Dorothy Cotterell's grave-clothes."

Yes, she has worn the garments of death.

III

On a September morning Captain Clarence Moncrieff vaults into the saddle and rides forth from the fort. He is mounted on a black horse of powerful build, with restless, uncertain eyes, and small, vicious ears. The sole amusement of the young officer, banished to this wilderness, is to scour the country on the back of a horse whose value is enhanced by the reputation of having already killed two grooms. The boy-knight can not resist teasing Bucephalus with the spur and curbing bit as the animal bounds forward.

The old story of garrison life has been enacted down here on the coast; one regiment has marched out, glad to welcome release from monotony; the other has entered with many a shrug of disdain, prepared

to do battle, or be conquered by *ennui*. Our Captain was loath to quit the gayeties of Boston for a post where a fishing hamlet extends along the shore, and the gulls wing their flight over the wide expanse of bay.

The forest paths are crisp with the fallen leaves; here and there a vine twines like a scarlet flame about the gray trunk of a tree; the air is keen with last night's frost, and sets the blood dancing in the horse-man's veins. Thought is busy; he is volatile, ardent, impetuous, as becomes his years. His fancy is curiously haunted by a pair of limpid blue eyes, and a smiling, rosy mouth. Moreover, a flavor of mystery piques his interest. Why should his father grow pale at sight of this beauty so quaintly attired, and then forbid all mention of her, all search for her home and station? Where is she now? What is she doing? Does she ever think of him, of what he said that night, and might have said, had not the stern father appeared just then? He has traversed many miles while absorbed in meditation, and finally reins up Bucephalus where two roads branch, and a pure spring bubbling from the moss tempts the thirsty steed.

Beyond is Indian Point, and near at hand a house bordering on the forest, with gambrel roof and dormer-windows visible through the trees. His ride is without purpose; he prepares to return down the stream.

At the moment when Bucephalus springs forth from the fort, Dorothy Cotterell, occupant of this veritable house with the dormer-windows, is moved by certain bitter words of Jacob Lake's to linger before the mirror in the best parlor.

"You are very much changed since your visit to Boston," he exclaims, hotly, and Dorothy prefers to accept the words literally.

Life at Indian Point is not as happy as it once was. The girl has tasted her apple of wisdom, and is not the same. Or has another petal simply unfolded, blushing with the still veiled loveliness of the perfect flower? Jacob Lake is miserable; his money does not buy him peace, and, gourmand that he is, his fond mother's most delicious buttered short-cake is set aside untasted. A fatality that he dares not resist draws him onward to a brink he fears to contemplate; there is a primitive, savage, animal layer of humanity beneath Jacob's smooth submission. The Judge is morose, the minister vigilant and sorrowful; old Serena alone is cheerful.

Resting her elbow on the frame, Dorothy gazes dreamily into the depths of the mirror, a small Venetian glass incased in carved wood. The parlor is clearly reflected before her, the paneled wall, wide chimney-place

ornamented with Dutch tiles, and furniture with slender legs; but Dorothy beholds again the ball-room, the stranger who turned pale at sight of her; and lapsing deeper into reverie, loses herself in visions of the hero who has since furnished romance to her thoughts. Ah, the handsome face and graceful form! When shall she admire the like again? The house is quiet; the Judge is out; Serena has been summoned away by illness; and her handmaiden has slipped down to the village for a gossip. Every door is wide open, inviting the warm noon-day across the threshold. Suddenly the mirror reflects a bronze face: an Indian is peering over Dorothy's shoulder. The transition is startling; Dorothy springs to her feet, and confronts an old woman wrapped in a blanket, carrying a bundle of herbs, the merest pretense for begging. "Me tired," she says: "tea very good. Me tell you fortune in cup tea. The priest no let me, though."

Dorothy smiles re-assuringly; the old woman crosses herself.

"You shall have your cup of tea, and tell my fortune," says Dorothy. "Wait; here is a half crown to quiet your conscience."

The neighboring tribes are peaceful, but, to the grief of the Rev. Nehemiah Gibson's soul, the Roman Catholics have ravished these sheep from his fold. Dorothy is surprised to find the handmaiden missing and the house deserted, but gets the tea herself. Lives there a girl who does not know that the Indians are wonderful fortune-tellers? While she is thus employed, the woman listens, stealthily approaches a window, and utters a peculiar note, like the cry of a bird. Then she sips her beverage gravely, and begins to croon to herself, swaying her body. Dorothy watches her half fearfully. The magical moment arrives when the cup is reversed on the saucer and turned thrice. Dorothy leans forward with parted lips to watch proceedings. A strong hand grasps her shoulder, and a voice hisses in her ear,

"Fire-water!"

Terrified Dorothy is in the power of an Indian. The blood-shot eyes glare at her threateningly, and the horrible face is close to her own. Her voice deserts her; the very beating of her heart is stilled. She gazes stupidly at this fearful antagonist, all the while conscious that if she falter she is lost. She even turns mechanically to the old woman, who impassively looks on.

"He no hurt. Give him fire-water," is her crafty suggestion.

"What do you want?" comes from pale lips at last.

His response is to drag her toward the wide yawning cellar. She utters a shuddering cry at his touch, and he places a hand over her mouth. The old woman has already closed the kitchen door, barring es-

cape. Despair nerves Dorothy to wrench away the fingers which close her mouth, and she simulates the courage requisite to ask,

"Would you like brandy?"

The Indian grunts acquiescence, and releases his hold. The captive darts into the cellar.

In the mean while the black horse, Bucephalus, instrument of fate, after slaking his thirst at the cool spring, has just raised a slender head, when a girl rushes forward and flings her arms about his neck, panting,

"The Indians! save me!"

Wicked Bucephalus stands like a rock until his master loosens the clinging arms. The fair head droops on his shoulder, and he studies the upturned face of the beauty of the ball.

Piercing shrieks ring out on the air. The Indians have vanished like shadows; but the little handmaiden, returning from her gossip in guilty haste, sees Dorothy push aside the cellar grating and flee, pursued by an enraged red man. She gives the alarm with the full power of healthy lungs.

All too brief the moment of delicious proximity when the young knight holds fainting Dorothy in his arms. Gentleman though he is, the temptation is irresistible to whisper caressing words in her insensible ear, to rest his cheek against the soft white one on his breast, to restore warmth and color to the blanched lips with his own. Is there not a faint responsive thrill?

Jacob Lake is witness of this scene, and the savage depths within him stir with as yet inarticulate wrath. All the neighborhood is aroused. There is an electric bond of sympathy linking together our frontier towns. Dorothy is saved, and her protector, Captain Moncrieff, rides back to the fort with that kiss lingering on his lips.

IV.

The meeting-house of Indian Point is small and weather-worn, for it stands on the loftiest hill, and points its slender spire to heaven in the sight of all the country round. Winter has come, although there is as yet no snow, and the settlement has made all necessary preparations to defy the north wind. Every house is banked with cedar branches, the meal chest is full, the smoke-house stored, the cellar fragrant with spicy apples, the garret with aromatic herbs.

"Remember the Sabbath day to keep it holy," seems to belong to all nature on this November noon. Even the river's life is calmed beneath a thin crust of ice, and the forest path is an avenue of splendor, where every branch and twig wear a diamond of icicle.

Captain Moncrieff's motive in taking a Sunday ride is as transparent as crystal. Ostensibly he comes to worship in the Indian Point meeting-house, in reality to catch

a glimpse of Dorothy. Bucephalus steps daintily along, as if taking a roguish pleasure in his mission. The interior of the meeting-house is severely plain. An aisle separates two rows of high stiff pews; the pulpit is attained by a steep flight of steps; and from the gallery proceeds the twanging of Jacob Lake's base-viol leading the high-pitched choir. The walls are white, and there are little windows up under the roof, suggestive of the times when we carried our muskets to service and watched through these loop-holes. Now we live in peaceful days under the rule of our gracious sovereign. Indian Point tenaciously holds the belief that no one ever caught cold in serving the Lord. Hence the absence of fire, except in the foot-stoves of the good wives, which the children use as sleds to coast down hill after service. The minister has already given out his text, when a stranger enters. A rustle of curiosity pervades the meeting; Jacob Lake snaps one of the strings of his instrument; Judge Cotterell offers the new-comer a seat in his pew with grave courtesy, where Dorothy and old Serena are already placed.

Nothing can exceed the propriety of Captain Moncrieff's demeanor; he has worshiped in minster and cathedral, rich with the ornamentation of generations, and here he sits in a small whitewashed tabernacle, with the difference: Dorothy sits beside him, stealing glances at him through long silky lashes, of which he is subtly aware. The Rev. Nehemiah Gibson pursues his way through the mazes of theological discourse; there is magnetic power in the mellow voice, and when his glance rests casually on Captain Moncrieff, a shaft of light seems to pierce the young man's soul.

Meeting over, Indian Point lingers to exchange greetings. Dorothy looks appealingly at her father, and colors high. Thus prompted, the Judge invites the young officer home to dinner—an invitation accepted with such gay alacrity that Serena ignores her dearest crony, Dame Tompkins, and hastens down the hill to inspect the larder. Oh, the golden moments slipping into golden hours, while the Judge entertains his guest with an opinion on the state of the colonies at the present time. Dorothy, most demure of maidens, is simply a spectator, and Captain Moncrieff tosses back to the Judge the ball of conversation with the artful suggestions of a good listener. Such diversions are, indeed, made as to urge the young lady to play on the spinet—an accomplishment of which her father is justly proud—but this may not be on the Sabbath, unless Dorothy confine her sweet voice to the limit of psalm tunes. The Judge as guardian dragon never quits his post. At last Serena brings her poke-bonnet to bear on the situation. Something ails the favorite hound; Serena

fears that he is rabid. The Judge hastens out only to discover that the hound is frantic because his teeth are glued together with a lump of molasses candy. How can a sensible dog have been induced to swallow candy? Serena is innocently surprised.

The two young people stand in the deep embrasured window which overlooks the ice-incrusted river.

"Do you remember the ball?" he softly inquires.

"Oh yes." Dorothy's gaze is obstinately fixed on the floor, and the bloom in her cheek deepens and pales beneath his scrutiny. He ventures to take one of her slender hands; the fingers cling instinctively to his own, instead of shrinking as from Jacob Lake's palm.

"May I come again?"

Dorothy raises her eyes slowly to his, and he is answered.

"Love me, sweet."

In the hall a far different scene is being enacted. The Judge has suddenly grown pale, and puts his hand to his brow as if smitten with a sickening fear.

"Moncrieff! that is the name. Why have I not thought before? Can it be—"

"His son?" supplies Serena. "Of course it is. You can't help yourself; it's nater."

While the gentlemen exchange farewells, and the genial warmth of the younger is irresistible, Dorothy runs down the steps to whisper in the ear of the black steed,

"Bear him safely for my sake."

Wicked Bucephalus curves his neck and tosses his head coquettishly, as if proud of his charge.

Down in the Lake house the head of the son and heir rests on the kitchen table, with his arms stretched abroad in the abandon of misery.

"Mother, that officer is at the Judge's with his fine speeches. Curse him!"

V.

It is late in the month of February, and intensely cold. If outward circumstances could chill the ardor of lovers, the bitter wind, the sullen black waves of the fretted bay, and the succeeding twilight, awful in its white stillness, might deter Captain Moncrieff from leaving the sheltering fort. But Dorothy waits for him, the heart of the mate flutters in anticipation in the nest, and he spurs Bucephalus out into the night. Fairies have been at work on his pathway, spirits of snow and frost have heaped the hollows with drifts, powdering the branches with glittering draperies which form arches above his head, and the moon, small orb of a steel-blue heaven, imparts to the snow crust a silvery radiance. The black horse and rider move noiselessly through the realm of dreams, the earth lying shrouded in profound sleep. Our young knight is ra-

diantly happy; the raillery of the mess can not deter him from taking the forest path; and that very day he has written to his father, who is at New York, claiming consent to his marriage with Dorothy Cotterell, of Indian Point. Well may our knight be radiant; he has held the charmed key which unlocks gates of brass; all obstacles have melted away; even Judge Cotterell has given a reluctant consent, nature being too strong for him, as Serena predicted. This very night all preliminaries must be arranged; the wooing shall be brief; our young knight is imperious; and Dorothy already bends, lilywise, in sweet submission to his will in most things. The smooth flank of Bucephalus feels the insulting sting of the spur; horse and rider fly through the silvery stillness of night, phantoms of a dream. Other phantoms are also abroad, it would seem. A shadow has haunted our preoccupied soldier these three miles, now darting ahead, now lingering behind warily. It has no shape, this lurking thing which should belong only to darkness, and evidently feels itself so out of place in the crystalline splendor of the luminous forest that it skims behind trees, and finally vanishes among the rocks ahead. Every thing shall be adjusted to-night, the old Judge charmed into acquiescence, and he will hold lovely, winsome Dorothy to his breast at last.

His fingers are stiffened by the piercing cold. He changes the bridle from one cramped hand to the other. As he does so a shapeless thing starts out from the projecting boulder, and whoops in the horse's ear. Bucephalus rears on his hind-feet, clears the shape in one bound, and plunges along the path, mad with fear, dragging his unseated rider by the stirrup. O silvery night and luminous forest! can no power check the steed's winged feet, and raise the beautiful fallen head?

Jacob Lake enters his house an hour later, his teeth chattering and his arm broken—it may be by the blow of a horse's hoof. His mother confronts him with a terrible suspicion in her eyes.

"Where have you been?"

"In the woods. It's all over with me, and I don't care who knows," is the sullen response.

Mrs. Lake is a capable woman. She binds the injured arm. She saddles a horse with her own hands, and having equipped her son for a journey, says,

"Ride down to the shore and catch the first coaster for Newfoundland. I will send for you when it is safe to return. Here is your father's wallet. Go!"

The Cotterell mansion beams with light and warmth. The kitchen is one ruddy glow from the open fire, where the logs blaze and the crane supports an iron pot that emits savory odors. Serena is in her glory here.

A huge tin kitchen bask on the hearth, containing a giant turkey on the spit, well basted with sausages. From the Dutch oven, with its crown of fiery coals, emerge biscuit and johnny-cake. There is still flame enough to reveal the low rafters overhead, the blue paint of the doors, the knots in the pine floor, and to illumine Dorothy, in a gown of crimson Salisbury flannel.

"Surely he is late, Serena!" she says, anxiously.

The old woman is silent. Last night she saw a winding-sheet in the candle. The clock ticks slowly. Dorothy flutters from the fire-place to the little window. Her ear catches the trampling of hoofs. She must

be first at the door. At last! Light streams forth from the open portal, staining the snow deep red, and there stands the black horse, quivering in every limb, spent, unnerved, drooping, and dragging a senseless form.

In the best parlor, decked still with garlands of evergreen, the fire crumbles to ashes and darkness, as Dorothy, speechless and tearless, lays her head on an irresponsible breast, while her father stands with bowed head.

The night is very still, a snow-clad earth meeting the horizon line of cloudless heaven, and in the pure moonlight gleam the white tombstones of Judge Cotterell's once pale bride and only son.

THE REPUBLICAN MOVEMENT IN EUROPE.*

By EMILIO CASTELAR.

[Sebenteenth Paper.]

III.—THE GERMANIC PEOPLES.—(Continued.)

RELIGIOUS IDEAS.—XIII.

FROM the monastery of Blaubeuren, where Strauss passed through his second grade of instruction, he went to the University of Tübingen, where he was to conclude his course. The city is small, but beautiful and cultivated. The Neckar caresses its feet, and an old feudal castle crowned its brow. One of its lords, in extreme prodigality, gave it some liberties in return for having paid his royal debts. Time has divided it into the new and old city, and has impressed that character of youth and age which lends to cities such beauty. The mountains which surround it and the forests which cover them give a delightful amenity and purity to its atmosphere. When Strauss arrived at this university two tendencies were dominant. First, the spirit of conciliation which verged upon rationalism, and then a supernatural system which was not far from orthodoxy. By a felicitous concurrence of circumstances, the masters of the seminary were transferred to the university. The ancient orthodoxy was proscribed, and the new theology of Schleiermacher admitted. That profound worship of reason, that prudent neglect of miracles, the happy concordance between science and faith, the arms borrowed from dialectics, the pantheist spirit scattered through its dogmas—all the ideas of the master soon appeared to him as a wide and universal peace signed between revelation and reason. But he soon found that it was only a transitory truce. At this juncture, in this critical state of mind, there fell into his hands Hegel's book on phenomenology, his masterpiece, his treasure, the *résumé* of his doctrine, full of new ideas, of original points of view, of relations never

before noticed between the idea and being, between the laws of logic and those of the universe, between the philosophy where all thoughts have birth and history where thought becomes real, between the heart and religion, religion and science, phases of the spirit, points in the incalculable line of the idea, a philosophical series, a luminous ladder by which being may ascend from the bottomless abyss of its primal essence, close to nonentity, up to the plenitude of life, the consciousness of itself in the absolute.

And as the philosophical idea grew stronger, the theological grew weaker. It seemed to him that Protestantism was rapidly on the way to the denial of its fundamental and primary principle, that is, that the free and intimate conviction of the individual ought to accept beliefs without at any time yielding to outside suggestion, a principle which was giving way to an idolatrous adoration of the dead letter. Only one aristocracy of thought has preserved the reason sufficiently serene, the conscience sufficiently enlightened, the will sufficiently free, to not be petrified in tradition and to follow the open path of its inner calling, by those interior suggestions which Socrates called the voice of God in life. The national literature has preserved the German spirit from retrogression and decay, which might have gone even as far as the Catholic reaction. Fortunately a superior man brought about the Evangelical Union, depriving the dogmas and principles which separate the two communions of all their obligatory character and force, by which he gave a greater space to free thought than existed in the old orthodoxy. The load of dogmas and miracles and traditions which had caused the ship of the church to careen was thrown overboard, and she was given thus more

* Continued from the March number, page 425.

freely to the winds of the age. Christ Himself was not the second person of the Trinity, Son of God, leaving His divine mansion to take upon Himself our poor human nature, and after His terrestrial existence, broken by the Cross and the sleep of death in the grave, reunited by the resurrection, and ended by His ascension to heaven, after His earthly life mingled anew with the eternal; but He was a man, naturally perfect, though subject to the narrow conditions of individual and national life, needing to be aggrandized by the accretion of ideas, by the current of time, by the light of the human conscience in its progressive transfigurations.

But to this effusion of the spirit there had succeeded a narrow orthodoxy, the child of reaction. The torn banners of tradition had been dusted and thrown again to the breeze. The literary tribunals fell under the inspection of the ferule of the pietist aristocracy. The preparatory studies of philosophy and philology were abolished to avoid pagan temptations. The student of theology must not ask what ideas are true, but what ideas are edifying. The mania of sacerdotal supremacy became popular. The priests proposed to direct the will of the king rather than to enlighten the conscience of the people. Fanatical intolerance became the characteristic of selfish and ambitious natures. They were all poisoned by the dead body in their brain—their own murdered conscience. It is necessary to take counsel of one's self, to study reason, and not to fall, as in former ages, into the error that what is really within us exists outside of us and in distant heavens, and that the idea of our own making is a supernatural inspiration. Led by these sentiments, which were for him rules of conduct, Strauss proposed to study the truth independently of all tradition, to say what he believed to be true without regard for any sort of prejudice; and in this spirit he began his great work of the *Life of Jesus*.

We are not to believe, however, that he was always the rationalist which his writings reveal. Educated in religious tradition by his pious mother, grown up in the halls of the seminary, his first years are those of tranquil belief. But the century contained many temptations, and the serpent of doubt glided into the paradise of innocence. It was the day of mesmerism, when electricity shone like a new spirit diffused over the planet; when every sort of legend was accepted in regard to this universal agent; when people believed in the transparency of bodies, in the angelic transfiguration of creatures, the material view and the tangible experience of souls, the voyage to the moon, to Uranus, where Goethe, transmigrated there, received the newcomers; the close communion between all worlds; the effusive embrace of all beings

until they arrive at the fullness of life, eternity identified with God. It is therefore not surprising that from religious traditions and Christian piety Strauss passed first to the doctrine in which nature took on a magic aspect, to the doctrine of Jacob Boehm, and thence to another doctrine in which nature took on an idealist character—the doctrine of Schelling. It was a peculiarity of such spirits at that time to fix themselves to no idea; to knock at the door of every school in their search for truth; to crawl to the foot of every altar in search of consolation; to pass from system to system like butterflies from flower to flower, to drink their essence, to rise from nature to God, and to fall from the bosom of God into the void; to question the gods of all religions to see if they could give strength to the fainting will and conscience: a state like that of the Grecian school, a spirit of compromise like theirs, where antiquity united the Pythagorean numbers and the Homeric gods, the ideas of Plato to the experiments of Aristotle, the Verb of Plotinus to the universal spirit of the Stoics, believing that they were thus uniting their forces for the continuation of life, but in reality tracing their testament, the epilogue of their faith, for the impending hour of death.

The doctrine of Boehm had great temptation for men like Strauss; that relation of the spiritual with the physical world, of the morality of human actions with the development of cosmic life; that resurrection of the Pythagorean numbers, and of their combinations with ideas and things; the virtue of the Seven which extends from the spiritual works of God to the days of creation, to the primal qualities of being, to the branches of the apocalyptic candlestick. Because in nature every thing is the expressive symbol of some superior idea, every thing is thus animated in universal matter, as in universal movement, by the Divine breath and Divine speech which first created the Son, then the Holy Spirit. And as there are three persons in the Trinity, there are three worlds in the universe; two commanded by Michael and Ariel, where the good angels live, pure, beautiful, transparent, in scenes of light, seeing every day fresh miracles in the creation of suns and the flowering of beings in perpetual spring, listening to the uncommunicable music of Divine actions, a holiness which the third world can never possess, governed, as it is, by Lucifer, and inhabited by us, where the ambition of passing fixed limits and rising to higher spheres and more celestial life has given birth to evil, which disturbs and corrupts and ruins every thing; evil mingled, however, with good, because while among the good angels every thing is holy, and among the evil angels every thing is perverse and diabolical, among men every

thing is good and evil at once, like the light which vivifies and burns, like love which creates and wastes; from which sad combination we shall not escape, except on the day of the second coming of Christ, bringing redemption to Lucifer and to men, redemption of matter and of spirit, all transformed, blessed, and saved in the immensity of the primitive heavens, in the presence of the Eternal Father.

Two causes led the doctor to extraordinary and supernatural beliefs: first, his assiduous reading of the writings of Schelling, the magian of nature; and second, his intercourse with Kerner, the magnetizer, the poet, who pretended to cure the sick and drive out devils from the bodies of the possessed, and who cultivated a singular prophetic and somnambulist in Prevost, reduced by her infirmities to a sort of soul without body, or body without flesh and blood, composed entirely of nerves, which placed her in direct communication with the pure spirits exhaled like odors from the earth and other planets through the medium of death, and wandering in the infinite to return among us occasionally through the conjurations of magic and the effluvium of magnetism.

But all these fancies were mere pastimes of youth. The books of Hegel determined his vocation as a theological critic. The teachings of philology decided him to apply to the Bible the scalpel of his calm reason, tempered in his profound knowledge. A journey to Berlin fixed his tendency toward philosophy and religious criticism. From that time heresy entered into his mind and took complete possession of his understanding. He became suffragan vicar in a village of Suabia. There he passed some time trying to learn if there could be any compatibility between the religious ministry and the profession of his rationalist pantheism. In reality he was not born for a philosopher, and had not taken from his master, Hegel, any thing more than the dialectic method. But his learning was rich in itself and brilliant in its manifestations, and he soon came to be professor in that same university where he had been scholar. Clear in his study of the most difficult problems, precise and accurate in his expositions, brilliant in style, always perspicuous and serene, Strauss was above every thing else a consummate man of letters.

I believe that there can be no more critical and painful situation in the world for a man of clear intelligence and honest mind than that of exercising a ministry so elevated as the priesthood: of ardent faith in his motives and pure virtue in his measures, of abnegation and sacrifice in his ends, wholly devoted to giving faithful believers ideas of God and His providence, sustaining them in the combats of life and of passion, infusing

into their souls the hope of immortality—and suddenly finding that the foundation of this ministry, the belief in the religion of which he is the preacher and apostle, is slowly dying, drying away in the inmost recesses of his being. Under these circumstances the priest appears, therefore, to the eyes of the world, if he forsakes his ministry, a criminal apostate, and to his own eyes, if he remains in it, a mountebank and impostor.

Several Catholic poets have powerfully described the conflict of certain priests who, after being united to the Church, and having entered into their profession and made their eternal vows, binding them to chastity and renunciation of the pleasures of love and the joys of the family, meet in the world with a woman, perhaps destined by Providence to complete and beautify their life, and thus pass through all the circles of hell—hopeless love, unreasoning jealousy, a dropsical thirst of feeling without satisfaction, of infinite desires without alleviation on earth; torn by ardent passions, insufferable remorse; victims of the strife between the voice of the heart and that of the temple; excited by the very scenes to which they give consecration, the celebration of marriage between beings happier than themselves, the baptism of children born of sacred loves, the enchantments of the family in which the priests appear to bless the felicity which never can be theirs, until, in this tremendous conflict, they either fail and fall, forsaken of God, or die martyrs to their religion and their duty.

But there is another torment, greater still, of those who are born and brought up in pious families, with their eyes on the sacred books and their thoughts on the revealed faith; who grow up in the shelter of the seminary, where the faith inspired at home passes to be a conception broadened in the intelligence; who attain their maturity in learned universities, where these sentiments and conceptions become universal ideas, felt and believed by the whole being, sentiment as well as reason, and who eagerly embrace the priesthood in virtue of these convictions; and while they exercise it, doubt enters into the paradise of the soul, corrodes the mind, illuminates with its flashes the depths of the understanding, presents the sacred books as a history more or less human, hardly capable of resisting criticism, the dogmas, the material of their preaching, like symbols of dead ideas, the holy temple like a sepulchre of extinguished ages, all religion like a light which is passing to shadow; and in this situation fate compels them to the alternative either of deceiving the world in opposition to their consciences, or of destroying themselves forever in the face of the world if they are faithful to their duties and listen to the interior voice of the soul, which counsels them to pre-

fer to any thing in heaven or earth fidelity to what they think and believe to be true.

Strauss found himself in this situation, and also his school-mate, Dr. Marklin, of whom Strauss has written an interesting biography. His sufferings were even more intense than those of Strauss. The more he fought with himself, the less could he accustom himself to preach what he believed false. The idea that the divine had only been united with the human in one historic character, in Christ, and had been revealed solely to one distinct people, the Israelites, and in one historical moment, at the advent of Christianity—this idea tormented him indescribably. The immortality of the soul and its individuality, the basis not only of Christianity but of the whole spiritual doctrine which it takes from Socrates and Plato, was invincibly repugnant to him, and appeared to him a natural consequence of a low conception of life and the haughty selfishness of man. In vain he read and reread the celebrated discourse of Schleiermacher upon the Dead, and tried to imitate the art with which this learned preacher pointed his Spinozist ideas of life and death without appearing in open contradiction with the Christian symbolism and dogma. In his distress Marklin came to Strauss and confided to him, in the deepest confidence, all his sorrows and bitterness. The congregation to which he preached was a large and intelligent one, and soon began to see the conflict in the conscience of their favorite preacher.

Strauss was much more tranquil, though not less changed. He had shed, like trees in winter, the religious ideas of infancy and youth. The dreamy mysticism of Boehm and the mystic naturalism of Schelling had run the same course with the religious ideas; all were dried up. The electric spark does not pass through our nerves with such rapidity as those ideas had passed through the fibres of the quick intelligence of the young vicar. The thought of Hegel opened unknown vistas to his reason. The essence of religion and the essence of philosophy are the same, except that that which in philosophy presents itself as idea, in religion presents itself as image. From this belief the passage to another profound conviction was inevitable, that which converts religion into philosophy, accommodating as far as possible the ancient dogmas to the new principles. Thus his soul remained in complete serenity. He had abandoned faith, and did not think of abandoning the priesthood. He had entered into modern science, and did not trouble himself about the death of the old religion. He lived in a comfortable village, and his congregation gave him no care. He followed the external practice and the religious observances of the very church he was undermining with his pen and

destroying with his books. This situation might appear to him a safe one, but it was not clear or moral. The vicar of error, the priest of a lie, the preacher of sophistry, he lived quietly and satisfied with himself, contented with his ministry and with his work. He therefore advised his scrupulous colleague not to torment himself like the personage of the ancient comedy. If the existence of the god of darkness was repugnant to him, being a relic of the Persian theogony and the Oriental dualism, he proposed to him to substitute for the classic word "devil" the vulgar word "evil." His conscience accepted these doctrines in the profound conviction that it was necessary to hold in reserve the highest ideas for the aristocracy of intelligence, and to leave only a part, and a small part, of the truth for the people. Such a theory is contrary to all science and all morality. Truth is eternal in all spheres, and should be the heritage of all intelligences. To give to some truth and to others error, to keep the former upon the eminences where the sun comes and the others in the valley of death and darkness, is to create castes; the one born to pleasure and the other to pain; the former called to the pure idea, the latter solely to sentiment, as in the nations governed by the ancient theocracies of the East. And this fundamental error can only lead, through successive applications, to the establishment of a religious theocracy permitted to think, and a populace permitted only to believe; an aristocracy destined to direct, and a populace destined to obey; an aristocracy to guard the sacred books, the hieratic language, and a populace guarding only its ignorance and its slavery; an aristocracy issuing from the head and the thought of Brahma for the holy religious ministry, and a populace issuing from his feet to live perpetually in the fields, with manual labor for their only occupation, and ignorance for the only horizon of their souls. Such theories were a horrible retrogression in science, and assisted a not less detestable reaction in politics. Nevertheless, the man who entertained them passed from his humble village vicarage to the place of professor of theology in Tübingen, a position also essentially religious. In Tübingen he wrote with the greatest care his most important work, which has given to his name imperishable fame, the *Life of Jesus*. When paganism was approaching its decadence, and the temples were being deserted, and faith was nearing extinction among the ancient peoples, and the humanitarian sentiment of the Stoics was making its way not only into the conscience but into the laws, and the Judean and Alexandrine ideas of Christianity were breaking the barriers of faith as the Germanic people further on were to break down the barriers of the empire, there arose again into great vogue,

freezing the veins of the ancient believers and of those who still adored the Hellenic altars, the ideas of the Greek philosophy, long ago divulged, which interpreted dogmas materially, and regarded the gods as men, raised to apotheosis in the gratitude of ages, from Zeus, who presided over creation and swelled the clouds and brandished the lightning, to the humble Pan, dispersed in the life of the fields and forests. A terrible anguish was awakened by these interpretations among those who had intrusted their hopes, their lives and deaths, the inspirations of their hearts, the light of their science, the bones of their ancestors, the cradle and the education of their children, to the gods of paganism, to those who had triumphed with Themistocles and Scipio, those who had sung with Pindar and Virgil, had carved the marbles with the chisel of Phidias, who had spoken with the mouth of Demosthenes and Plato, and on whose lips, parted by the serene smile of immortality, had dwelt for ages the great inspirations which sustained life and thwarted death among the greatest and most glorious people of history.

Something like this happened when Strauss's book appeared. Devoured by some, read by a few, its circulation was impeded by the mass of theological and critical science which filled it, and the tiresome method in which it was composed, bringing forward the contradictions between the gospels in reference to the same narrative, especially when the subject was supernatural and miraculous, noticing the insufficiency of the rationalist explanation and the falsity of the orthodox explanation, and then proceeding to his own, which tended principally to show that the person of Christ and the life of Christ have arisen gradually in imaginations excited by the new faith, and extended among the Christian churches with all the literary accessories and artistic tints of the genuine legend. The common opinion at once inferred that Strauss denied the existence of Christ. No such audacity had been attempted in the eighteenth century. We can imagine, then, the painful impression produced, if not by the restricted reading, by the wide publicity of the book. He had suppressed Christ from history, the Redeemer of man who had broken the fetters of the slave, the Lord of Heaven who had illuminated the conscience of generations, the eternal and perfect Model of morality in life, the Crucified, who from His cross opens His arms as if to embrace the human race, and who is the line of separation between two ages—the old age of religious feudalism, of privilege, of policy, of the absolute empire, and this age of ours which through countless struggles and failures and continual reactions has realized the three great essential ideas, lib-

erty, equality, and fraternity, which have issued from the stream of blood poured from the veins of Christ upon the sublime altar of Calvary.

Strauss himself mentions the incidental causes which determined the publication of his book. At that time, in 1835, there were three explanations given of the gospels. Some believed all the miracles as certain and complete—a belief which his reason rejected. Others believed that every thing in the gospels had come to pass naturally, but that omissions of the apostles had given to the narrative a legendary and miraculous aspect—an interpretation which appeared to him forced. Others regarded all these narratives as mere phantasmagoria and imposture—a charge repugnant to his conscience. The method followed with the ancient dogmas appeared to him a useful one in the interpretation of the Christian ones. No one to-day believes that the pagan dogmas are strictly true, as Herodotus believed, nor that they have a natural and historical explanation, as Euhemerus believed, nor that they are due to the perversion and the inspiration of Satan, as the fathers of the church thought in their zeal. We all regard them as myths born of the pious faith of the people and the rich fancy of poets, who neither wished to deceive nor believed themselves deceived. Thus the candid, innocent faith of the early apostles and the early Christians originated the evangelical narratives, and are a sufficient explanation to-day of the ease with which they were believed and propagated through the world.

Strauss says that thirty years at least intervened between the death of Christ and the writing of the gospels. The one which might appear the most legitimate, the fourth, as dictated by a person who was an actual witness of the life of Christ, appeared uncertain and visionary in the opinion of Strauss, having some resemblance to the Alexandrian ideas, with a certain Gnostic character, giving him to suspect that it had been the work of a forger resolved to represent himself as the disciple whom Jesus loved, the apostle St. John. Christ at his first appearance was a disciple of the ascetic John the Baptist, becoming afterward the Messiah through the universal hope and the ingenuous faith of those times. But Christ raised the moral law above the Mosaic, as Socrates had raised the voice of the human conscience above the voice of the pagan gods. Christianity thus had its birth in the religious hope of the coming of the Messiah, and in the belief that this Messiah was Jesus. At a time when the Messianic hopes were at their height, the Messiah appeared naturally and logically.

But in truth none of these interpretations satisfactorily explain one most important

fact. Why did Christ and Christ alone appear as the Messiah? Why did those around Him see in Him and in no other this supernatural character? Why is this especial moment of history and no other the providential moment of redemption? Why did this Messianic hope, narrow and national, which had arisen among a privileged people, become the human hope common to all peoples? An ebullition of ideas served as the soul and motive power of the life of Jesus, according to Strauss; but the ideas would not have grown of themselves if they had not been personified in a man. Why was there no other? Why had this man not come before? Why did He not come later? Two great historical characters have been often compared, Socrates and Jesus; but what a difference! Socrates was a philosopher, and Christ a Redeemer. Socrates inhabited the region of ancient thought, Greece, and the wise, learned, and cultivated city of Athens. Christ dwelt in a region little known and esteemed, the ancient Judæa, and the conquered city Jerusalem. Socrates had for his pupils the most brilliant men of history—Xenophon, soldier and historian of the first rank, Plato, the most poetic of philosophers and most philosophical of poets; Christ, the obscurest disciples. Socrates and Christ both gave their lives for their idea. The first lived four centuries before the second, in an epoch of greater faith, and yet he left no trace in history, because while Socrates remains confined to the heights of science, as a single master who excites and originates a single movement in philosophy, Christ takes possession of Greeks, of Jews, and Romans. He descends to the slave gang and rises to the throne of the Cæsars. He unites the idea of Rome with that of Athens, the idea of Jerusalem with that of Alexandria. He transforms the ancient world and educates the new. He takes the systems of philosophers and popularizes them. He pauses before the barbarians, subjugates and transforms them, raising altars which last ages of ages, as well in Asia, home of all the gods, as in young America, where have sprung forth the most advanced institutions of the latest times; and no one can yet foresee the epoch in which His name shall cease to be the initial letter of the highest civilization on the planet.

The truth is that spirits which are closed to great historic inspirations can never comprehend this miracle. He alone reduced the most abstruse and divine ideas to the simple food of the people. He alone descended from the heights of metaphysics to the hovel of the slave to bring him the sentiment of his moral dignity and certainty of redemption. He alone preached the essentially democratic dogma of religious liberty. He alone could in His sermon on the mount

touch even the intelligence of the oppressed and the humble. He alone could fuse all castes together in humanity. He alone could bring together in the religious law all peoples, giving them as one Father, one King, and one Lord our God who is in heaven.

Strauss neglected in his work the point which should have been most essential—the origin of Christianity, the supreme and critical epoch in which the doctrine arose. Liberty and the republic had died in Rome. The philosophers of Greece had been converted, with the Stoics, into practical moralists. Jerusalem, which always endeavored to preserve its God apart from the world, experienced the desire of the Sadducees to give Him in communion to all nations and make Him known to all the world. The deserts were filled with saints, with ascetics and hermits, who clamorously demanded the dew of Heaven for their desolate, thirsting souls. In Egypt, wherever there passed a conqueror, a tribune, or a poet, the people asked if this was he they hoped for. Alexandria brought together the ideas of the East and West, as if to form a new dogma. The Ebionites and Essenes were scattered about Jerusalem, making public profession of poverty, with the presentiment of the rich renovation of the spirit. The Gnostics brought in vague echoes of the Oriental religions, reflections of the early twilight of the religious conscience. And all this crisis was collected and personified in a youth of the most benighted region, the most oppressed people, the divine Youth who annihilated religious caste and gave His life for the two grandest ideas of future civilization, for the moral liberty of our souls and religious equality before God for all men.

Beside this work of redemption, of what importance are historical accidents? Strauss had written his book for theologians and not for the laity; but the laity read it as well as theologians, professors and the profane, and it produced a great scandal. His chair at Tübingen was violently taken from him, in contempt of that liberty of thought to which the Germans have always been so devoted. Thousands of pamphlets and books were written to refute him, to abuse and execrate him. The most furious demanded that he should be expelled from Germany. The most moderate reproached him, as my friend Mr. Cherbuliez gracefully mentions, with not having written in Latin. The party of Zurich wished to make him some compensation for all these annoyances by offering him a professorship in that city, which had always been an open school to the Germans. A petition, signed by more than forty thousand of the inhabitants, prevented the theologian from accepting this tranquil retirement, and overturned the government which had offered it to him. The more violent grew the vehemence of the

opposition, the sturdier grew Strauss in his assertions. In the first edition of the *Life of Jesus* he says nothing clearly as to his ideas in regard to the legitimacy of the fourth gospel, in the second he throws doubt upon this legitimacy, and in the third he resolutely refutes it. At first he showed a certain serenity and self-possession. Afterward he gave himself up to all the wrath of those times of the Reformation when Henry the Eighth, in his peculiar Latin, in a certain noisy controversy, called Luther *Cacasus*.

The truth is that Germany in respect to this book contradicted its proverbial liberty of thought. In the course of the contest Strauss completely deserted his religious faith, and renounced historical Christianity. In his work on dogmatism this transformation is most clearly seen. He studies in it the fundamental dogmas and beliefs which have sprung from the Bible and gospels, as they have been developed in the fathers of the church, transformed in modern philosophy, converted into rationalist ideas and universal laws, drawing from all the conclusion that one sole personality, no matter how superior it may appear, could never unite the attributes given by the church to Christ, and that only the human race in its totality could unite and concentrate them; that the individual sins, and that humanity is immaculate; the individual errs, and humanity is infallible; the individual withers, decays, and humanity is progressive; the individual dies, humanity is immortal; the individual succumbs often in his contest with error, and humanity accomplishes the miracle of subjugating contrary forces in history; the individual is limited, and humanity is the daughter of the invisible Father, God, and the invisible mother, nature. It is the reunion, like the Word, of the finite with the infinite, of the accidental with the eternal; it descends to the abyss and is transfigured to the heavens, like the Christ of tradition, because body and spirit, organism and ideas, rise above nations, above races, continents, and seas; above the world, above the planets even, to be identified with the eternal, through means of its luminous and absolute ideas.

"NOBODY BUT JANE ROSSITUR."

TO be, as he was, more than half in love with Marjorie was only to share the condition of a dozen other young gentlemen of his own age and tastes. The only wonder was that he was not wholly in love with her, the young men who were wholly in love with her being so greatly in the majority. It was so natural—indeed, so unavoidable—that Marjorie should win love and admiration, that swains without number should sigh

at her little feet, that she should be praised for almost every thing she did or said, that even women should like her, though she was such a formidable rival. General adoration was the gift her fairy godmother had certainly bestowed upon her in her baptism, wherein she had been made the prettiest, the most charming, the most fortunate, of young maidens. As to her being fortunate, she had always been favored by fortune. Her life had scarcely known a cloud. She had been born a beauty; she had been born an heiress—a sort of princess, indeed; she had been an only child, with no younger or older sisters or brothers to divide her triumphs or the affections showered upon her. Then, again, she had inherited a grandmother, a positive fairy of a grandmother, rich, generous, affectionate—a grandmother who had been a beauty herself, and who adored the girl for reproducing her own charms, springing from the ashes of her own lost youth, a consoling, graceful young phoenix. Grandmamma Marchmont had, in fact, taken possession of Marjorie from her earliest years. She had controlled her education, chosen her companions, selected her dresses and finery—indeed, had made her her chief object in life. When she had not been with the child at her parents' home, she had been enjoying her at her own delightful house. The one establishment had been as much home to Marjorie as the other.

So it was quite to be expected that, having regulated all else appertaining to her, she should make up her mind to regulate the most important event of her existence. It was nothing more than natural that she should look round among the lovers, and, after mature deliberation, decide that though all were well enough in their way, the prince for her princess was not among them.

"When Marjorie is married," she said to herself, with dignity, "she must be not only married, but mated. There must be no inequalities."

But she was far too gracious and lofty an old lady to be at all in a hurry about the matter. There was not an atom of vulgar haste about her. She let the lovers come and go, and gave both herself and Marjorie time. She looked about gravely still, and even while weighing each suitor in the balance and finding many wanting, would rather have perished in unimpaired stateiness than have slighted the least among them.

It was not until Marjorie Marchmont was twenty that Tyrrel appeared—Mr. Steven Tyrrel—who up to that time had been improving his opportunities upon his father's fabulous estate upon one of the most fabulously wealthy and beautiful of the West India Islands. I use the term "fabulous" because the usual description of both estate and island sounded more like a bit of tropical romance than any thing quite real and

to be relied upon. But it was to be relied upon, nevertheless; and taking all things into consideration, Mr. Steven Tyrrel was as fortune-favored a young man as Marjorie Marchmont was a young woman. The whole Marchmont family were at grandmamma's sea-side house when he first appeared among them. They had been there about a week when he came, with a letter of introduction from his mother, whom the old lady had known as a girl, and who had been a favorite with her; and on reading this letter and examining the bearer, the charming, dignified old woman felt that her previous discretion had not been in vain. This tall, slender young fellow, with his large dark eyes, with his romantic tropical style of beauty, with his graceful air and almost peculiarly novel grace of speech and manner, was at least as faultless physically as her young princess, and in the matters of birth and fortune she knew that the balance was an even one.

He remained with them, and proved a very pleasant addition to their circle. Naturally he began by admiring Marjorie. She was a pearl-skinned, dove-eyed beauty, and he had seen very few fair women. He seemed to regard her with a gentle, deferential wonder. In fact, there was about the young man a kind of grave *naïveté* indescribably attractive in its way. He had not lived the ordinary society life of the generality of young men. He had not learned to be worldly. He had been something not unlike a prince in his far-away home, and a certain half-unconscious princely way of following his own impulses clung to him. But his impulses were never ignoble ones. Sometimes they were whimsical, often they were very unlike the impulses of other people, and now and then they were a trifle astonishing to sober experienced persons, but they were never selfish or unchivalric ones. He had no small motives, no petty vanities; indeed, for so well-favored and lucky a young fellow, he was quite a wonder in his unconsciousness of himself and his numerous gifts.

"Is he a rajah, or a pasha, or the shah-in-shah himself, Miss Marjorie?" said a worldly-wise old friend of the family, after his first meeting with him. "What a gorgeous young potentate he is, to be sure, and how he throws the rest of us into the shade! Even that young hero, Malcolm, whose costume and beauty are usually dazzling, pales beside him, and sinks into comparative insignificance. Does he wear a turban when he is at home, and a crooked cimeter blazing with diamonds, and has he shown a dignified desire to execute any of your waiters yet when they have dared to be inattentive?"

"Grandmamma's waiters never are inattentive, Mr. Ruysland," said Miss Marjorie, with the prettiest possible, but at the same

time the most uncalled-for, of blushes. Really, you know, there was no reason why she should color and thus evade the light satire of her old friend.

Mr. Sidney Ruysland was an old friend. He had known Marjorie Marchmont from her childhood, and had been very fond of her even in the days of her pinafores and primers, and so, perhaps for this reason, felt himself privileged to be fond of her now. He himself did not belong to the order resplendent, and though he was rather a favorite of the elder Mrs. Marchmont's, she never regarded him as upon the aspirant list. He was very much older than Marjorie, being, indeed, one of those old young men one occasionally meets in good society, and who are often exceedingly agreeable, because they have left the follies of youth in the background. He was rather tall, rather pale; his fine forehead was slightly bald. He had a soft voice and a good manner, and was prone to clever satire.

There was no commonplace envy in his feeling toward the new arrival; he might regard the youth and physical beauty and Fortunatus purse with some private wistfulness, but he was amiably ready to admire their possessor and congratulate him upon his good luck.

"Why should we depreciate Aladdin?" he said. "Let us rather admire him, since the genii have found him worthy to own their magic lamp and the many good things accompanying its possession. In our secret heart we may wish that we also were lamp-owners; but since we are not—" And he shrugged his shoulders, and looked at Marjorie with a resigned smile.

As I have said, Mr. Steven Tyrrel followed the example of many less illustrious young men in falling half in love with Marjorie. He showed his admiration in divers ways. He sang with her and danced with her; he obeyed all her gentle behests, and placed himself entirely at her service when they were together at any party of pleasure; he laid at her feet certain rich offerings, which he presented in his mother's name, and altogether he was on the verge of drifting pleasantly into a natural though not dangerous emotion, when there appeared on the scene of action the commonplace young woman whose name forms part of my title.

She came in autumn—Jane Rossitur—and she came unexpectedly: at least her arrival was an unexpected event to Steven Tyrrel; the rest seemed to take it quite as a matter of course. Returning by the shore one morning after taking his usual plunge in the sea, he came suddenly upon Jane Rossitur sitting on an upturned boat, her lap full of shells and sea-weed, and her hat lying on the sands at her feet. Almost immediately she heard him, and turned her head over her shoulder toward him, and

then he saw what manner of young person she was, and his first mental exclamation was the following incongruous one:

"How unlike Marjorie Marchmont!" though perhaps it was not so incongruous after all, considering the fact that his mind had been wandering toward Marjorie as he strolled along. She was as unlike Marjorie Marchmont as day is unlike night, as winter is unlike summer, as—well, as unlike her as it is possible for two girls to be unlike each other. She was not a beauty at all; you would never have thought for an instant of calling her "pretty," and there were very few persons, and these only persons of sensitive and poetic temperament, who would have seen that she was what she was—a sweet, strange creature. She had a soft, clear, dark skin, a rare color, not a noticeable feature but her translucent green-gray eyes, and she was slight and odd and small. Just this was Jane Rossitur; and just this much Tyrrel saw in the moment that she lifted her face as he passed; and perhaps because the accidental encounter was a surprise, her quiet look impressed itself upon him. It was odd that a young lady should be out and apparently enjoying herself so very early in the morning.

He certainly did not think of the possibility of her being a new arrival at the house, and so when he saw her again she was a surprise to him once more. A visit to the neighboring town kept him out all day, and when he returned in the evening dinner was over, and the ladies were taking tea in the drawing-room. Ruysland was there and two or three of his colleagues, and the first object that met Tyrrel's eyes as he walked into the room was the stray young woman sitting at a side-table behind the tea-service, and talking serenely to old Mrs. Marchmont. So very calm and composed was her air that she really looked as if she might have been pouring out tea in the same place every evening for the previous six months. She had done it before, it was evident, and expected to do it often enough again, and every body was used to seeing her do it. Even old Mrs. Marchmont, who was usually so punctilious, seemed to forget at the moment that to Tyrrel at least she was a stranger.

"I dare say Mr. Tyrrel will take a cup of tea, Jane," she said.

Tyrrel bit his lip, feeling awkward enough; but the cup of tea was poured out and handed to him with such undisturbed self-possession that he was set at ease almost immediately. He even recovered himself sufficiently to undertake a fresh examination of the girl. But he only saw what he had seen before—a dark soft skin, a rare color, and eyes with an actual tint of green in their clear gray. And as to her dress—well, to tell the truth, he recognized it as

one of Marjorie's, and saw that it had been furbished and trimmed to suit the more insignificant figure; and may I add that he quite warmed toward the wearer in consequence of the discovery.

He made his way to Marjorie as early as possible, and put his question to her very frankly. Who was the young lady who had poured out his tea—the strange young lady whom he had not met before, and to whom Mrs. Marchmont had forgotten to present him?

Marjorie opened her large pretty eyes in some surprise. She glanced round the room questioningly. A strange young lady? There were no strangers here. Oh dear! to be sure! How stupid and rude they must have appeared to him! She begged pardon. He must mean Jane Rossitur—there was nobody but Jane Rossitur, and somehow they were all so used to her that they felt as if every one who came to the house must know her as well as they did themselves. How annoyed grandmamma would be when she remembered her neglect!

Tyrrel held Marjorie's fan in his hand, and he opened and shut it slowly.

"Nobody but Jane Rossitur," he repeated, half to himself. "I wonder how she likes being 'nobody but Jane Rossitur?'"

A look of alarm fell upon Marjorie's fair face. She would not have said an unkind or slighting thing for the world; it would have cut her to her gentle, generous heart if it had ever occurred to her that she had been cruel to her poor relation; but the fact was that Jane Rossitur was not the individual to make an important personage of herself.

"Oh, please don't misunderstand me," she said, in genuine distress. "I do not think we are unkind to her. I am sure Jane herself knows that—that we do not mean to be. It was very careless of me to speak in that way, but, you see, she is quite one of us. You must let me introduce you at once. You will like her very much. She is very nice indeed."

That was the beginning of it, and my task it is to show what the end was, and how oddly and inconsistently the elder Mrs. Marchmont's really well laid plans were upset. How is it that people are invariably inconsistent? that "the best laid schemes o' mice an' men gang" so "aft a-gley?" How is it that the matches we regard as being made in heaven are so rarely consummated on earth? Flora, who was so plainly made for Browne, marries Smythe, to the discomfiture of all her relatives; Jones, who was born to make Amelia happy, elopes with Miss Robinson, who is neither so rich nor so beautiful; Adonis falls at the feet of a commonplace creature, whose rivals declare her to have no merit whatever; Aurelia, the dazzling and statuesque, surrenders her youth

and beauty to little Carrots, who is (her lovers say) an odious, vulgar little dandy totally unworthy of her.

But to return to my story. In the plenitude of his good fortune and happiness Tyrrel was quite moved by the presence of a girl who was a poor relation, who poured out tea for the visitors as if she was used to no other excitement, who was obliged to be grateful for Marjorie's cast-off gowns, who was, in fact, "nobody but Jane Rossitur." He heard all about her before that first evening came to a close. She was a very distant relation indeed—a fourth or fifth cousin, whose family was not even respectably well off. Her father was a dubious sort of individual, and her mother was a silly, characterless woman, whose half dozen daughters were none the better for her existence. Old Mrs. Marchmont, who had no patience with the stock, had educated Jane for a governess or companion, and during her holidays, or when she was out of situation, the girl came to her patroness and made herself as useful as possible. If there had been no Marjorie, it is not unlikely that her position might have been a different one, but the old lady's passion for the girl who was a beauty left the girl who was not a beauty rather out in the cold, though she was not by any means unkindly treated.

When Tyrrel came and took possession of her, Jane Rossitur accepted his attentions a little shyly at first. She was not used to such honor, and at the outset would almost rather have been left alone. But it would have been impossible that she should resist such genuine friendliness long. There was something winning in the young fellow's beauty, and the eagerness in his dark eyes touched her. She forgot her troubles and annoyances, and began to be happy. She laughed and talked and brightened, her oddly colored eyes sparkled, and she made a witty speech or so. Sidney Ruysland glanced across the room at her and smiled.

"There are all sorts of possibilities in that girl, and Tyrrel is just the youngster to draw them out. Look at her eyes!" he said to Marjorie.

Marjorie looked as she was bidden.

"They are very queer and big and bright," she said. "What color are they?"

"Olive-green at present," was the answer. "And a rare tint it is. Eyes of that color have always that rare shape, too, and those long black lashes. I wonder how it is that nature so seldom bestows them upon a woman who is actually a beauty? Perhaps it is a merciful dispensation. It would be too much all at once."

"Are they so very pretty, then?" asked Miss Marjorie, demurely. "I must tell Jane that you think so. I do not believe she has ever been specially proud of them."

"—a beauty herself, you observe,

but it was not exactly pleasant to bear even this pin scratch from some sources. Her own brown velvet orbs were lovely indeed, but just at this moment she could not help wishing innocently that they had been olive-green instead.

After that night matters took a whimsical turn. Jane Rossitur was surprised to find that she had always one companion. She did not find it easy to understand such a state of affairs either, being better used to that probably wholesome if natural neglect to which ordinary and portionless girls are usually fated when in the presence of those more fortunate. Instead of joining pretty Marjorie's court, the enchanted prince contracted a habit of attaching himself to her own humble service. He took his tea standing near her side-table, he made her talk, he met her in her morning walks, he showed the gentlest possible consideration for her in every trifle.

"Indeed, if I was any body but Jane Rossitur, I should think he had fallen in love with me," she said to herself once, half indignantly. In truth, her sentiments during the first few weeks of their acquaintance were of a rather undecided and mixed description. When he was with her, his deference, his sweet temper, his almost boyish way of appealing to her, his charm of manner, invariably softened her heart, and caused her to relent in her resolutions, but when she was alone, and thought the matter over sensibly, she felt a little irritated at times. Life had been such an easy matter to him, she told herself, that he was full of caprices, and his fancy for her was nothing but a caprice. He knew that he could turn from herself to Marjorie when the whim seized him, and so for the time he was amusing himself with her. Then, again, perhaps his inexperience had something to do with it. He did not know that such a fancy would attract attention.

But she had not hit upon the truth at all. Caprice had nothing to do with the matter, unless it was the caprice of fate. The heart of the young man had simply been appealed to in a new way. Marjorie's rose and white and gold and brown had aroused in him an admiring wonder, but Jane Rossitur had touched a finer chord. She might be nobody but Jane Rossitur, but Jane Rossitur in her turned gown had an individuality of her own.

"I like to talk to her," said the prince to Ruysland. "I like to watch her. I am never tired of her. Sometimes when her eyes shine so, and the color comes into her cheeks, as it does when she is pleased, I think I should like to take her little hand and kiss it."

Mr. Ruysland did not look at all displeased or shocked, though he was a fastidious gentleman enough. He smiled with a placidity

which might almost have been interpreted into approval of his companion's enthusiasm.

"To take her little hand and kiss it," he said. "Ah! I don't wonder. I have experienced the same temptation myself, though it was not Miss Rossitur who tempted me; and I suppose I ought to blush at the confession, since the days of roseate youth are past for me."

"It is a temptation that is hard to resist," said Tyrrel, ingenuously, and he even sighed slightly, for he was by no means blind to certain difficulties that appeared in his path now and then, and puzzled him greatly. He was not sufficiently conscious of his own importance to see that they only meant that Jane Rossitur was a very sensible, sensitive, proud young woman, and knew her place.

There came a time, however, when he received a suggestion at least. This was on the night of Marjorie's birthday. Marjorie's birthday was celebrated with great pomp and ceremony, and always had been. In her childhood it had been a fête day, of which she was the small heroine, and upon whose happy occurrence fabulous dolls and much-gilded books and numerous stores of bonbons were brought to light; in these days it was pretty much the same thing, but the gifts were more imposing, the birthday party was not over and the guests in bed at twelve, and the cake was not the great attraction of the festivities. Marjorie had her party on this occasion, and the usual gifts were laid at her charming feet with the usual lavishness, and she had her wonderful birthday toilet, which almost made a young goddess of her, and in the fullness of her heart she gave Jane Rossitur a very pretty dress indeed, and gave it with a very pretty, affectionate speech. And in this dress Jane Rossitur made her appearance, and awakened in Tyrrel new enthusiasm. The stuff of which the costume was made was of Indian manufacture. It was thin silken gauze, black, and with a fanciful figure embroidered upon it with gold thread; it floated like a dusky cloud, and it had an odor of strange flowers and fragrant woods; and with a bouquet of scarlet and white in her hand, and a trail of some scarlet-budded vine in her hair, Jane Rossitur looked even less like the generality of girls than usual.

"You are looking very well indeed, Jane," commented old Mrs. Marchmont. "That Indian gauze was a happy thought of Marjorie's. It seems to suit you exactly. She said it would the moment she caught sight of it lying in my trunk. My brother Felix brought it from Madras years ago, and there has never been a complexion among us that it was precisely the thing for." And yet notwithstanding this gracious praise, and the fact that she must have known the jus-

tice of it herself, Tyrrel had a fancy that Jane did not look quite as bright this evening as was customary with her. When on first seeing him she looked up and smiled and nodded, he imagined that there was a sort of shadow in her eyes; and amidst all the gayety of the festivities, the dancing and music and general high spirits, this little shadow was there still, though she was evidently doing her best to add to the entertainment of the guests. The gayety of said festivities was at its height when the dowager stopped Marjorie on her way across the room, with a question.

"Where is Jane?" she asked.

"I am not sure," Marjorie answered, "but I fancy she is somewhere with Mr. Tyrrel, grandmamma."

"With Mr. Tyrrel! It really appears to me that she is very fond of Mr. Tyrrel's society of late. It does not look well."

"Ah! grandmamma," said Marjorie, opening her pretty eyes and blushing most incomprehensibly, "I am sure it is Mr. Tyrrel who is fond of her society. I have thought so often. And—and why should it not look well?"

"My dear," returned the dowager, grandly, "you don't understand. You know nothing of the world; but Jane Rossitur ought to have more sense. You are a child."

"I am a year older than Jane, grandmamma, and Jane is twenty, though, of course, I know Jane is far more clever than I can ever hope to be. Jane is *very* clever" (naïvely).

"My dear, that is nonsense" (majestically). "Run away to your dancing; but if you see Jane, send her to me."

If she had known the whole truth, it is likely that she would have been even less pleased than she was. She was not the first person who had missed Jane Rossitur from the bright throng. Mr. Steven Tyrrel had missed her first, and having missed her, had, with his usual ingenuous impulsiveness, gone to look for her. He made his way through several rooms below without finding her, and then he thought of the library, which had not been thrown open to the guests. If, as he fancied, she was a little depressed and out of spirits, she might have run up stairs to have a few quiet moments in the library. So he insinuated himself up the staircase, where dangerous young-women, whose intentions were strictly business-like, sat in picturesque poses, ostensibly because it was so nice and cool, really for private reasons of their own, which might include the one that a pretty girl, sitting upon a low, unconventional seat in a quiet nook, and lifting her eyes to meet a tall companion's, is ten times more effective than a young lady in a crowd, who can scarcely venture to be charmingly confidential at all, for fear of the scathing observations of Mrs. and the Misses Grundy, who have been

blooming as wall-flowers all through the evening's entertainment.

Opening the door of the library, Tyrrel found what he was in search of, and found something more too. There was no light in the room but moonlight, and the moonlight, streaming in through the window, fell softly upon the gold and black drapery of a small figure crouching rather desolately and suggestively in a large cushioned chair, and hiding its face upon the arm.

Jane Rossitur looked up quickly. She made a very transparent effort to recover herself. She had no fancy for being detected in any self-indulgent weakness.

"Oh, it is you, Mr. Tyrrel," she said, rising in a moment. "I suppose I am wanted, and Mrs. Marchmont sent you to look for me. I was a little tired, and came here to rest in the dark."

Tyrrel came to her side in positive trepidation. She stood up, pretending to smile at him coolly, but the moonlight convicted her. There were tears glistening upon her cheeks and lashes. He could not stand it at all, and her proud effort to seem careless made it all the worse.

"Miss Rossitur," he said, with a rueful solemnity that was half reproachful, "you have been—yes, you have been crying."

This accusation, made in such an unexpected manner, had an odd effect upon Jane Rossitur. With the moisture still undried upon her cheeks, she laughed—laughed in defiance of it; but it was a queer, short, hysterical little laugh, it must be admitted, and the next moment she found it necessary to dash away a fresh drop with her hand.

"Crying!" she answered. "Well, yes; but you might have pretended not to know. Girls cry for every thing: I think we like it. I may have been crying because my dress was not becoming."

"But you could not have been" (with all the enthusiasm of inexperience): "you must know how—how beautiful it makes you."

"Beautiful!" she echoed, her laugh a dubious one again. "You have been talking to Marjorie, Mr. Tyrrel."

"No," he protested; "I do not say such things to Miss Marchmont."

"Then" (rather curtly) "don't say them to me."

He was dumfounded. He had never seen her in so strange a mood before. She was excited and unstrung, and her voice trembled even as she made this abrupt speech. And yet he could not see how he had hurt her.

"I beg pardon," he said, humbly; and then she surprised him more than ever, for she sat down in her chair again suddenly, and he saw the tears running down her cheeks.

"I do not know what you think of me," she exclaimed; "and I can not say I do not

care, for I do care. You are always so good to me that I care very much. Please give me credit for not always being so foolish. I can scarcely say how it happens that I am so nervous to-night. Yes, I can," she broke out, vehemently, "and I will tell you, and try to shame myself. It is not that I am nervous; it is—it is all envy."

"Envy!" more bewildered and disturbed still.

"Yes, envy. I am envious, and it makes me wretched. You do not know how wicked we women can be sometimes. I despise myself when I think of it, but I am envious of Marjorie—even pretty, soft-hearted, generous Marjorie, who is the best friend I have."

She clasped her hands upon the chair arm and looked up at him quite appealingly.

"Don't answer me," she said. "Just let me tell you. I want to tell somebody who will not be too hard upon me. She is so pretty, you see. She always has been so pretty and bright and good and rich. She has every thing fortune can bring, and it is so natural that people should fall down and worship before her. I do not think she has a fault; she is unlike less fortunate people even in that. She has been adored and caressed and admired since she was a day old, and yet it has not spoiled her. It would have been the ruin of me. And all to-day I have been watching her and admiring her and seeing others admire her, until I could not help thinking it was scarcely fair that she should have every thing and I nothing. I am not pretty or rich, and I am sure I am not good. I am not even very respectable. I am not liked very much by any body. I am nobody but Jane Rossitur."

As I have already said, he had been just drifting into an easy, summery sort of affection for Marjorie, when Jane Rossitur crossed his path and stopped him; but I am afraid that I must confess that even had this affection been a stronger sentiment than it was, he could hardly have met Jane Rossitur's penitent, uplifted eyes at this moment unmoved. He had actually fallen madly in love with the girl, and was prepared to do any thing unexpected and impassioned. "Nobody but Jane Rossitur!" He made a quick step toward her, flinging out both his dark, slight, nervous hands in a strange, graceful gesture of appeal, his eyes burning, and how soon all might have been over there is no knowing; but just as he moved, the door was pushed open, and Jane moved too.

"Jane," said an incisive old voice. "Yes, you are here. My dear, I want you down stairs." The dowager had come to find them.

When Jane re-appeared in the dancing-room, Marjorie was the first to see her, and Marjorie's fair face fell.

"Oh," she exclaimed, *sotto voce*. "How sorry I am!"

"Sorry?" repeated the ubiquitous Ruysland. "And why?"

The brown eyes dropped in some pretty confusion. "I am sorry that I let grandmamma leave the room. If I had only known in time!"

Ruysland looked amused but mystified.

"May I ask—" he began.

"Ah," said Marjorie, "don't you see I am afraid she has spoiled it all? Mr. Tyrrel and Jane were together in the library."

He was a daring fellow, this Ruysland. A light flashed into his eyes as he bent over her.

"What?" he said, "are you so generous, Marjorie?"

"Generous?" she echoed. "Why should you call me generous?"

"I thought," he ventured—"I thought that the prince was for the princess only; and here I find him bestowing his princely smiles upon a lesser light, and the princess deigns to look on and smile."

"I," faltered the royal young person—"I—you have made a mistake. I do not want the prince, Mr. Ruysland, thank you. It is you who are generous to give him to me without asking his consent." But though she spoke almost proudly, she did not raise her eyes, but kept them down, as if she rather feared to trust herself.

It was very odd, thought Tyrrel, that Jane's time was so fully occupied during the next few days. He could not get a word with her unless in Mrs. Marchmont's presence. The old lady seemed always near her, and always on the point of giving her something to do. Jane herself was grave and silent. Tyrrel even found her a little unresponsive. She seemed to hold herself under restraint, and kept her eyes fixed upon her work whenever it was possible. Certainly she was changed from the impetuous, frank creature she had been during that brief interview in the library. Tyrrel grew restive and dissatisfied. He wanted to see her in such a warm and girlish mood again; he wanted to finish what he had begun, and there was always their majestic old hostess between them. So it went on for a week, and then one morning at breakfast Mrs. Marchmont spoke to the girl across the table, with a gracious air.

"As you go to-day, Jane," she said, "you had better not tire yourself with packing. Barnet will attend to your things. You will be tired enough by the time you reach your journey's end."

"To-day?" exclaimed Marjorie. "How is it you did not tell me, Jane? What a mysterious way of doing things, grandmamma!" And her face wore a pretty look of surprised vexation.

"Mrs. Maxwell's letter only reached us by

this morning's delivery," said Mrs. Marchmont. "They have been called away unexpectedly, and she wishes Jane to accompany them; so there is no time to lose."

Jane said nothing. She drank her coffee composedly, and after breakfast disappeared immediately, thereby driving Tyrrel to the verge of distraction. She might be going to the other end of the world with these people—and to-day! If she went without giving him the opportunity to speak, he felt that he should never forgive Mrs. Marchmont, for he should be sure the fault was hers, though he could not have told why. He was standing by the window, staring out at the dull sky, and raging inwardly, when a hand touched his shoulder lightly. It was no less a person than pretty Marjorie, with her cheeks on fire.

"Mr. Tyrrel," she said, softly, but in a great hurry, "Jane has gone out to walk on the beach. She can not have gone far." And having made this significant remark, this odd young beauty beat a retreat that looked as if she was frightened.

Ten minutes after, Mr. Tyrrel had made his way along the shore to a certain corner where a certain boat was turned upside down, and a young person was sitting on it alone, and gazing absently seaward. This young person recognized him with a start when he stood close by her.

"You almost frightened me," she said, smiling.

"You have quite frightened me," he answered, impulsively. "What does this mean?"

She still smiled, but not bravely. He looked down at her in such piteous reproach.

"Nothing new," she answered. "I have only found another situation, and am going to Lausanne for a few years."

There was a full minute's silence, in which he gazed down at her, and she pretended to be occupied with the fringe of her shawl. Then suddenly he sat down by her side and caught both her hands at once.

"Janie," he said, and the little word sounded quite passionate. The rare color on her fine dark skin deepened to coral tint. Perhaps nobody had ever made a diminutive of her name before. "Janie" was an actual revealing.

"Well?" she said, her voice belying the willfulness of her words. "What do you want?"

"A great deal," he answered—"everything: love and happiness. You, Janie, and nothing less, dear."

It was so impassioned and tender that she was overcome. She was a proud young woman, and had been very determined to hold herself aloof at the outset. She had rebelled against his kindness, and had once or twice tried not to be agreeable; but he had fallen in love with her, nevertheless. In love with her—nobody but Jane Rossitur.

She could no more have doubted him than she could have doubted that her own heart was beating.

"I thought it was Marjorie," she whispered. "It ought to have been Marjorie."

"It is you," he cried, "you only." And he lifted her hands and kissed them eagerly again and again. "Janie, let me see your eyes."

When they returned home Jane had a marvel of a West Indian ring on her finger, and Tyrrel marched at once into the parlor to have an interview with old Mrs. Marchmont. Jane went up stairs to her bedroom, and in ten minutes Marjorie came knocking at the door. When it was opened to her, she stood on the threshold, radiant—almost more radiant than one would have fancied she need be.

"Come in," said Jane, tingling all over.

She came in, and gave Jane a gentle yet half-excited embrace.

"You are not going to Lausanne?" she said.

"No, I think not."

"Oh, Jane, what—what a darling you are!"

And then next minute Jane found herself seated on a chair, with the princess at her feet, and the blonde head hidden upon her lap.

"He has been in love with you from the first moment he saw you," Marjorie was saying, "and I shall always like him for it. I was afraid at the very beginning, before you came, that—at least not that, exactly, but—

Well, you know how grandmamma sets her mind upon a thing, Jane, and—and I did not want him to—"

"Did not want him to do what, dear?" interposed Jane, a faint light breaking in upon her.

"I," faltered Marjorie—"I have always been fond of—of Mr. Ruysland, but he thought that Mr. Tyrrel might make me care for him in the end, and I was half afraid of grandmamma, and now you have made it all easy. Last night Mr. Ruysland proposed to me, and I said yes, Jane."

Mrs. Marchmont received two shocks that day, but she was too thoroughly a well-bred and well-poised old dowager not to bear them with dignity when they came.

"You have disappointed me, Marjorie, my dear," she said to the royal young culprit, in her most majestic manner, "but I suppose old people must make up their minds to being disappointed by the young. You must marry whom you please, of course. The days of forced matches are over."

"Oh, grandmamma dear," cried Marjorie, in her sweetest tone of appeal, "you are not angry with me? Sidney—"

"Don't call him 'Sidney' before me yet, my love," was the stately reply. "It is not pleasant to me. But you may kiss me; and I am not angry, only disappointed."

But she never quite forgave Jane Rossiter, even after that young woman was Jane Tyrrel, and had ripened into a social power, and was unanimously voted the most bewitching and unique young woman of her day.

THE FIRST CENTURY OF THE REPUBLIC.

[Seventh Paper.]

AGRICULTURAL PROGRESS.

THE early colonists of the United States were largely agriculturists, or became so within a very few years after their arrival. A hundred and fifty years before our Independence, agriculture had already a promising foot-hold in several places within our present domain; a full century before the same date in our history the settlements were quite widely extended, nearly all the useful domestic animals and cultivated plants of Europe had been tried on our soil, and most of those we now have were already in successful use.

New and peculiar problems were presented to the new settlers. In the New World they found every thing new. The wild plants were new to them, and the good or bad qualities of each could only be learned by experience, for whether a plant was to be a valuable forage plant or a pestilent weed could not be foretold. Their crops as well as their flocks were subject to ravages by new enemies. Emigrants from near-

ly every part of Europe brought with them the useful plants they had known at home. But from whatever country they came, and wherever they settled here, they found a climate unlike any they had known before. In the North they encountered a most trying climate, where an almost arctic winter was followed by a semi-tropical summer; the severity of the winter prevented the success of some of the crops which flourished well during summer, while the drier air, clearer sky, and more fervid sun of summer proved unpropitious to others. The warmer parts, too, were unlike the warmer parts of Europe. As a consequence, the adaptability of each crop to our climate had to be tried for itself in each locality. This great experiment went on until one by one these questions were settled. Some crops, after repeated failures, were abandoned, and others found their appropriate localities. Hemp, indigo, rice, cotton, madder, millet, spelt, lentils, lucern, sainfoin, etc., were tried and failed in New England, as did other crops

in the Southern colonies. Not only the plants of Europe, but many from Asia and the East Indies, were tried, including such spices as cinnamon, also various commercial plants. Some of these crops, on experiment, failed entirely. Others flourished after a fashion, but proved unprofitable; others flourished with peculiar luxuriance, and with characters unchanged; and still others, under the new conditions, assumed new characters or excellences. Before the war of the Revolution these trials had been made along or near the coast from Maine to Texas, and so completely had this century and a half of experiments solved the great problems of adaptation, acclimation (and often naturalization), that not a single important species of domestic animal has been profitably introduced since, and but one plant, *sorghum*, since added is of sufficient importance to be recognized in our official statistics.

The agriculture of most civilized countries is based on the rearing and use of certain domestic animals, and these in turn depend on the pastures and meadows. The only exception to this is where the cultivation of commercial plants greatly predominates over all other crops. The forage grasses used in Europe were practically indigenous there, and were such as ages of cultivation or use had adapted to the conditions there found. In Great Britain, and perhaps also throughout Northern Europe, the actual cultivation of their native grasses only became common toward the close of the last century. Before that they knew little or nothing of seeding lands to grass, and their pastures and meadows were fostered rather than cultivated. Such cultivation, however, had sprung up in the colonies much earlier, and from dire necessity. Of nearly 300 species of grasses now known to be indigenous to some part of the United States, very few indeed seem well adapted to cultivation. Perhaps more than nine-tenths of the forage of to-day in the cultivated parts of this country is furnished by plants introduced. How and why the artificial production of pastures and meadows and the cultivation of the true grasses sprung up in the American colonies north of the Chesapeake, how the grasses which we derived from Europe, half wild, were caught and tamed, as it were, and sent back for cultivation, is an interesting chapter in the history of American agriculture in colonial times, but it requires more space than we can give it in this review, and is only alluded to because of its relation to stock-raising, to be noticed later.

Agriculture as an *art* had reached nearly as high a point a hundred years ago as it occupies to-day, but agriculture as a *science* has nearly its whole history in the century we are to consider. Science belongs to no

particular nation; and thus it is that we can not consider the agricultural progress of the United States entirely independent of that of other lands: it forms too intimate a part of the agricultural progress of the age.

The century is especially characterized in history by mechanical invention and by the growth of the so-called natural sciences, these two being intimately related; and it is through them that all the greater changes have occurred.

The mechanical progress of the century has been so fully treated in previous papers that its relations to agriculture will in this be treated only incidentally; but all improvements in tillage, in planting, in harvesting, in preparing for market, and in transportation are related to the subject under consideration.

The "Centennial of Chemistry" was celebrated in both Europe and America the last year. The specific branch of that science, agricultural chemistry, belongs properly to this century only. Through its influence have come more philosophical theories of the rotation of crops, of the nature and use of manures; and the whole commerce in and manufacture of "commercial fertilizers" is the direct result of this science. It has, moreover, thrown great light on the nature of the soil and its tillage, on draining and irrigation, on the nutrition and fattening of animals, and the production of wool, flesh, butter, and cheese. Moreover, chemistry, in its extensive applications in various manufacturing processes, has introduced new uses for agricultural products as raw material.

The biological sciences have aided in their way. The laws of vegetable and animal growth are better understood, and by the application of this knowledge old varieties and breeds are improved with more ease and certainty, and new ones are made at pleasure for specific uses.

In noting our agricultural progress along the three ways indicated, that produced by mechanical invention comes naturally first, but the three classes of improvements are parallel, and each blends with the other along nearly the entire course.

The first and most obvious aid of mechanical invention has been to lessen the amount of human labor required to produce a given amount of agricultural product. For many of the processes new machines have been devised, and in those cases where old kinds of implements or tools have remained in use, they have been improved in quality, and usually cheapened in price. The simpler tools of a century ago were made mostly on the farms where they were to be used, or by the neighboring mechanic. They were usually heavy and costly to use, that is, costly in labor. With the specialization of labor,

and the use of special machinery for the purpose, the manufacture of agricultural implements has become a great industry, the last national census enumerating over 2000 establishments, the value of whose products for that year amounted to over \$50,000,000, the value of the product in 1850 having been less than \$7,000,000. The value of the farming implements in use on the farms in 1870 was about \$337,000,000, while in 1850 it was only about \$152,000,000. These figures of manufacture and use at these two periods indicate extraordinary progress in agricultural operations in those twenty years.

This will be more apparent if we consider, in a general way, the different processes. First, as regards the implements of tillage, we may say that either old ones have been improved or new ones devised. Scarcely one remains in its old state. Some of the improvements economize power, others material, and others time; and what the aggregate cheapening of labor in tillage actually is it is impossible to say. A single laborer can certainly till more than twice the acreage, and with some crops three, four, or five times as much. Beginning with the improvement in hoes and simple tools, then passing to iron or steel plows, cultivators, horse-hoes, pulverizers, crushers, etc., the entire process of tillage has been modified, and animal power performs much that was then done by human muscle. Steam tillage is on trial, or at least steam plowing is, but is not yet common enough to be considered more than a limited experiment.

Drilling machines for planting certain crops were used to a limited extent before the Revolution. In Eliot's "Fifth Essay on Field Husbandry," published in 1754, he says:

"Mr. Tull's Wheat Drill is a wonderfull Invention, but it being the first invented of that Kind, no Wonder if it be intricate, as indeed it is, and consists of more Wheels and other Parts than there is really any Need of. This I was very sensible of all along, but knew not how to mend it. Therefore I applied myself to the Reverend Mr. Clap, President of Yale College, and desired him for the regard he had for the Publick and to me that he would apply his mathematical Learning and mechanical Genius in that Affair; which he did to so good Purpose that this new modelled Drill can be made for the fourth Part of what Mr. Tull's will cost."

We find that a drill for spreading manure was soon afterward devised, and various drills have been in use ever since. The history of the above drill has been repeated in numerous machines. The more intricate and expensive affair of Europe has been simplified and cheapened here, and thus brought into quicker use. The threshing-machine and reaper were both undoubtedly invented in Great Britain, but in America they were simplified, cheapened, and, to use an Americanism, were made *handier*, hence more practical. Although drills thus

early came into use, nearly all the planting was done by hand until less than forty years ago, particularly for the cereals. Now drills or sowers of some kind are in almost universal use on the larger farms.

The improvement for harvesting has been much greater than for either tillage or planting. Previous to 1850 the scythe and sickle were the almost universal tools for cutting, and the common use of the modern reaper and mower dates back but about twenty years. Labor has always been dearer here than in Europe, hence the sickle was never so much used as was the scythe. As to what its capacity was here we have no precise data. Experiments and estimates published by the Highland Agricultural Society in Scotland in 1844, and approvingly quoted by standard authorities on British agriculture later, give "the average quantities of ground reaped by seven persons, on an average of ten hours' work," as one to one and a half acres of wheat, and two to three acres of oats and barley. (A *bandwin* of reapers consists usually of seven persons, who cut, bind, and stook the grain.) By the use of the cradle in this country, one and a half acres of wheat was not a large day's work to be cut by one man, raked, bound, and stooked by two others, but this was doubtless above the average. With hay, two acres per day is a reasonably large amount. At a recent meeting of a certain State Board of Agriculture, in a discussion concerning hay, the belief was concurred in that "hired labor with a scythe mows much less than one and a half acres per day per man on average." It is safe to say that a man with team of horses and modern mower or reaper will average about six times as much as with a scythe. Under the best conditions more is done (we hear of fifteen or twenty acres sometimes), but the *average* would be not far from this estimate. With our hay crop nearly every step in the process has been changed. The horse-rake came into general use before the reaper, the tedder and horse-fork later. A century ago all the processes were by hand labor; now the only labor performed in the old way is pitching on the load, loading, hauling, and stowing or stacking, and each of these is done with improved tools.

To obtain the most profitable yield of hay or grain, it must be cut and secured at just the right time, hence with most crops this has always been considered the most critical period, and the labor then required brings the highest wages. If cut too early, it is immature; if too late, it deteriorates or wastes. Moreover, it is then especially subject to damage by unfavorable weather. Taking all these into account, it is seen that the actual gain to agriculture by the use of the various harvesting machines can not be measured by merely noting the relative

areas operated on by a man in a given time by the old methods compared with the new.

With the great crops of cotton, Indian corn, potatoes, and tobacco there has been no such great advance. With cotton, the nature of the crop and the prolonged harvest forbid hope for much improvement, and a similar condition exists in the case of tobacco. With potatoes and Indian corn there have been many attempts, with but very moderate success as yet.

Intimately connected with the harvest is the preparation for market; and in this the progress, as a whole, has been even more marked than in either of the processes already noticed. The most illustrious example is seen in the cotton crop. In no other case has the cultivation of a great staple by people of European civilization depended for its success upon the solution of a simple and single mechanical problem. We hear of cotton being planted in our colonies as early as 1621, and again, in the Carolinas, in 1666, and during the century after the last date it is often spoken of. It was tried over and again along nearly the whole extent of the colonies. Eliot, in his "Second Essay on Field Husbandry," published in 1749, tells of his experiments with it in Connecticut. It appears to have been, however, a rather rare garden plant until just after the close of the Revolutionary war, when it was introduced anew, and soon after that its field cultivation began. But its production was entirely limited to the means of getting it ready for market. Hand labor was expensive; and so long as a laborer could prepare but a single "pound per day" there could be no great breadth of culture, no matter how fertile and cheap the soil, how favorable the climate, or how complete the means of tillage. The invention of the cotton-gin in 1793 placed it on the same level with other field products. Since then the rapid increase of its production is one of the marvels of the century. A single generation saw the crop grow from nothing to be the great commercial plant of the world, constituting, some years, five-sixths of our entire agricultural exports. The relations of this growth to the civilization and prosperity of many countries, and especially its relations to our own social and political history, furnish perhaps the most romantic chapter in the history of agriculture.

Threshing-machines for our cereals were practically unknown here before the present century. We infer from the journals of that day that they came into somewhat common use in Great Britain between 1810 and 1820; their universal use there was still later by some years, the flail continuing to be a common implement down to 1850.

The dearness of labor and other reasons caused the flail to be used relatively less in

this country than in Europe, yet it was not a rare implement by any means down to 1830 or later. Grain was, however, usually trodden out with horses, or threshed by dragging over it a great roller armed with large wooden pins. This was an approved implement, and received the official recommendation of at least one agricultural society as late as 1816, and the writer has seen it in use as late as 1835. In the better farming regions of the Middle States, early in the present century, eight to twelve bushels of wheat per day were considered a good average for a man to thresh with a flail. Threshing was largely done in the winter, and where horses were used to tread out the grain, twenty-three to thirty bushels per day for three horses and a man and boy were common results. The average was perhaps not much above the lowest figures here given. To illustrate: in a specific case in 1826, on one farm in a prosperous and old farming region, 1300 bushels of wheat were threshed, the grain winnowed, and the straw drawn from the barn to a neighboring field, in twelve weeks, two men and five horses performing the work. This was considered, in that neighborhood, good work. Before 1825 threshing-machines were in very rare use in this country, but between that and 1835 their use spread rapidly, and before 1840 comparatively little of the cereal grains was threshed by other means. For cleaning the grain the hand fan was in extensive use in 1776, but fanning-mills came in common use long before threshing-machines did. The first threshing-machines merely threshed, next separators were added, and then "cleaners;" and now the grain is threshed and cleaned for market by one operation. Horses were the universal power applied until quite lately. Now steam-power is extensively used, particularly in the Western States and in California. Horse-power, however, is still in general use.

What the possible capacity of the modern thresher is, when working under the most favorable conditions, although an interesting question, is not the one we have to consider here, but rather what is the average of good work, or work that can be commonly hoped for by good farmers. The larger machines are mostly employed in doing custom work, and time is lost in passing from farm to farm, and in the delays which are unavoidable in work affected by so many conditions. A steam-thresher, under such conditions as they have in California, will thresh, in actual practice, from 40,000 to 100,000 bushels of grain in a "season" of three months. With such a machine, operated by a gang of eighteen hands, whose combined wages last year (1874) would amount to forty-three dollars per day, 2000 bushels of wheat per day is fair work. A recent agricultural journal states of the act-

nal practice that the "full capacity of such a machine is 1500 sacks a day, the average work about 1000, holding over two bushels each." This means that the grain is threshed, cleaned, put in sacks, and the sacks piled up ready for removal by cars or team, and amounts to over a hundred bushels per day per man. Vastly larger figures are cited for short periods under exceptionally favorable conditions. The agricultural papers of the same State mention incidentally, as a local news item, a horse-power machine which averaged 1500 bushels of wheat per day for thirty-one successive days, moving on twenty-eight different farms in that time, and of another (also horse-power) which, the last year (1874), threshed and cleaned 80,400 bushels in fifty-two days, of which 11,300 bushels were threshed in five and a half days.

The effect of these improved methods is best seen by noting the total saving of the several processes. A hundred years ago, to cut a hundred bushels of wheat required about three days' work (which could not be delegated to other power); to bind and stook it, four days; to thresh and clean it, five days, which, with the other processes between the standing grain and the merchantable product, would amount to some fifteen days' actual manual (and mostly very hard) labor for each hundred bushels. The average was doubtless more than this, that is, a day's labor would not get more than six or seven bushels of grain through these processes.

The president of an agricultural society in California in 1866 stated that on his farm that year 40,318 bushels of grain (three-fourths of it wheat) were harvested, threshed, cleaned for the market, and stored in the granaries in thirty-six days, including all delays, with an average of twenty-two hands. This is an average of about fifty bushels per man per day for the entire crop. Much larger figures are reported in other cases of later date; but the exact data are not at hand.

While such progress has not marked the gathering and preparing of *all* the crops, yet it has extended to so many of them that all the more laborious processes have been revolutionized.

It must be borne in mind that mechanical invention has not only aided agriculture, but that in turn it has been stimulated by the wants of agriculture, and some of the most profitable patents have been in this direction, and we get a vivid idea of the demand and supply of new methods and appliances in the fact that the Patent-office issues about twelve hundred patents per year relating to agriculture.

It is through the aids of mechanical invention, including the means of transportation, that what is known as "the Great

West" has been so rapidly settled and its crops made accessible to the world.

That soils became exhausted by cropping, and that the exhaustion could be checked by manuring, were facts well enough known from remote antiquity: the philosophical reason why was left for agricultural chemistry to discover. So soon as chemical analysis became established on a reasonably sure foundation, and chemistry began to assume the character of an exact science, practical applications to agriculture began to follow. Chemical experiments relating to this art had been made earlier by Arthur Young and others, but agricultural chemistry, as the science we now know it, began with Sir Humphrey Davy. He first lectured before the English Board of Agriculture in 1802. He experimented on guano, phosphates, and various other manures, and analyzed them. He lectured again before the Board of Agriculture in 1812, and these lectures furnished the basis of his *Elements of Agricultural Chemistry*, published in 1813. This work was extensively read, and was translated and printed in several languages. During the next thirty years there were numerous experimenters, and it was a period rich in discoveries in chemistry. Sprengel made many analyses of the ashes of plants about 1832, and then came the works of Johnston, Mülder, and others; but it was left to Liebig to bring order out of the great mass of experiment and theory which had accumulated, and to really place agricultural chemistry on its present foundation. His *Chemistry in its Applications to Agriculture and Physiology* appeared in 1840, and soon after Boussingault published his *Économie Rurale*. Johnston published his *Lectures on the Applications of Chemistry and Geology to Agriculture* in 1844, since which time works on this department of science have been particularly numerous. While the science has had most of its development in Europe, America has not been without its workers, and the later researches of Professor Johnson have been republished in Europe in the English, German, and Russian languages.

"The art of manuring" was a favorite theme in olden times, and it was an art brought to high perfection; but it followed experience only. With the aid of chemistry the art assumed the features of a science. Manures known before were used to better advantage, rare ones brought into greater prominence, and new ones devised. The introduction of turnips and clover into extensive cultivation in England about the time of the American Revolution, and the great rise in rents soon after, produced a radical change in the systems of rotation and tillage, and the discoveries in chemistry came in at just the right time to supplement this. Bones had long been used, but

their special merits were pointed out by Davy, and soon their use became very extensive. Then followed the manufacture of superphosphates. To show what great and speedy changes were wrought through these means, and where mechanical invention had but little to do with it, a single illustration may be given. A light-house, known as the Dunston Pillar, was built on the Lincoln Heath, in Lincolnshire, about the middle of the last century. This was said to be the only land light-house known. It was built to guide travelers over the barren and dreary waste, and it long fulfilled its useful purpose. This pillar, no longer a light-house, now stands in the midst of a fertile and wealthy farming region, where all the land is in high cultivation. For twenty-five years no barren moors have been in sight even from its top. Turnips and phosphates were the principal means through which this great change came. The abundance of fertile soil and its cheapness, and the cost of labor, in this country, while inducing the use of improved implements and machines earlier than in Europe, hindered rather than accelerated the use of chemical aids. It was easier to break new land, particularly if it was prairie, than it was to renovate the old. For a long while bones were extensively exported from this country to England, but for the last twenty-five years the use of fertilizers has been increasing, until now it has reached immense proportions.

The history of the use of guano is somewhat similar to that of the phosphates. This material has been in use as a manure on the western side of South America for centuries, and from time to time its merits were spoken of in European publications.* Its use, however, remained local until it was prominently brought into notice by the modern agricultural chemists. How early it was brought to Europe can not now be ascertained. Sir Humphrey Davy experimented with it as early as 1805; but it was not until after the recommendations of Liebig that it began to be an article of commerce. A few casks were imported into England in 1840 "as an experiment." It was followed by 2000 tons the next year, and in sixteen years its aggregated sales in Great Britain were reported at 100,000,000 of dollars. Its use began in this country somewhat later, the aggregate imports previous to 1850 amounting to less than 30,000 tons. At present it is a vast commerce, regulated by special national treaties, employing hun-

dreds of ships and millions of capital in its transportation.

Along with the importation of guano and the development of beds of mineral manures and their preparation, comes the manufacture of "commercial fertilizers," one of the most rapidly-growing of our industries. This manufacture is of very modern growth in this country, but at the last census more than four millions of capital were employed in the manufacture, and the value of the product amounted to \$6,000,000 for that year. The official estimates place the present product several times higher. Gypsum, which was not included in the above estimate, was used sparingly in colonial times, but to most farmers it was then an unheard-of substance. It was prominently brought into notice by Benjamin Franklin, after his return from France, but its rapid spread kept pace with that of the cultivation of clover between 1810 and 1830. At the last census there were 321 mills, the value of the ground product amounting to about \$2,500,000, a part of which, however, is applied to other uses in the arts.

From the nature of the case, the actual value of these new aids to American agriculture can not be shown statistically. For obvious reasons, their greatest effect is as yet seen only in the older States and in the South. Throughout the North, where the farm-yard is, and perhaps always will be, the great source of farm fertilizers, these commercial manures come in as an auxiliary; but farther south, and in those regions where the cattle roam the fields throughout the year, preventing farm-yard accumulations to any considerable extent, the case is quite different. As cotton and tobacco, the two great commercial crops, have been heretofore cultivated, exhaustion was inevitable. The history of a region comprised, of necessity, first the settlement, then its rise and wealth during the increasing growth of the crop, then a period of prosperity of longer or shorter duration, regulated by the original fertility of the soil, and finally the inevitable decline. In actual history, many great plantations became so completely impoverished by cropping with tobacco that they were abandoned and returned to forest again, and more to sparsely peopled, impoverished places. The exhaustion by cotton-growing was similar, although not always so complete. The necessity of new lands for this crop when it was "king," and the relations of this necessity to political events, are familiar to every student of our history, while its relations to fertilizers was generally ignored. Here, as in Southern Europe, "great political and social events had their foundation in the dunghill."

The theory and largely the practice of

* In *The Art of Metals*, written "in the kingdom of Peru, in the West Indies, in the year 1640," translated and published in London in 1674, it is said that "out of the Islands of the South Sea, not far from the City of Arica, they fetch earth called *Guano*," etc. And then follows a description, and the statement that it is used for manure, and that the fields are "put in heart thereby for 100 years after."

tobacco and cotton cultivation are now changed, and we see no reason why, by the new methods, the profitable fertility of the soil may not be maintained indefinitely. Official reports in Georgia estimate that "the planters of that State pay over \$10,000,000 for fertilizers" annually; and single towns in the Connecticut Valley, where tobacco is the leading crop, in addition to the home fertilizers, pay from \$30,000 to \$50,000 a year for those from outside sources.

To follow up this subject in its relations to the price of real estate, to vegetable or "market" farming near our cities, to other manufactures whose waste products are utilized, to the great question of the use of sewage and its relations to public health, would lead us entirely beyond the limits of this paper.

Draining and irrigation, although strictly mechanical processes, have been the subjects of much chemical investigation. Thorough under-draining was practiced to some extent long ago, but has only come into extensive use during the last sixty or seventy years even in Great Britain. In this country its use is more modern. Noah Webster, in an agricultural address published in 1818, speaks of "the art of draining wet lands, which is now in its infancy in this country." John Johnston, a Scottish farmer still living near Geneva, New York, was the first in the United States to use tiles, about 1835, making the tiles by hand after Scotch models. The few under-drains made earlier, as indeed many made since, were of stone. John Delafield, a neighbor of Mr. Johnston, and a man noted for his interest in agriculture, imported a tile machine in 1848, the first one in this country. The practice is now common enough, but there are no statistics to show the amount of land drained.

Irrigation has only come into any considerable use in those Western regions where the rain-fall is insufficient for all the purposes of agriculture. It is as yet carried on, for the most part, on a small scale and by private capital. Vast schemes are discussed or projected, but we must leave their results to the future.

We have already alluded to the class of improvements introduced through or aided by the biological sciences. We have already said that a hundred years ago all our *species* of field crops, except sorghum, were already in cultivation here. While this is true, the number of *varieties* of these crops then was less. A neighborhood would know perhaps three or four varieties of each species, rarely more. About that time many farmers began to grow more kinds, in order that if one failed because of a bad season, others might succeed. Old varieties were slowly improved by careful selection of seed, but the occurrence of new ones de-

pended on accident, or on causes not then understood. Late in the last century and early in this the facts relating to the production of new varieties of cultivated plants began to be studied by new methods, and, through the observations and experiments of botanists and gardeners rather than by farmers, the laws came to be better understood. As a result of this knowledge, varieties are now multiplied almost at pleasure, and the kinds in cultivation, or at least known, amount to hundreds or even thousands for each species. As an example, we may mention potatoes. Deane, in his *New England Farmer*, a dictionary which professes to contain "a compendious account" of "the Art of Husbandry as practiced to the greatest Advantage in this Country," published at Boston in 1790, says, "No longer ago than the year 1740 we had but one sort, a small reddish-colored potato, of so rank a taste that it was scarcely eatable." He then enumerates twelve varieties known up to the date of writing, which had originated in various countries, some in the Old World. The paucity of kinds was often spoken of by writers before the Revolution. Guided by the knowledge since gained, a single American experimenter claims to have produced and tested 6000 different varieties. Other crops have a similar but not quite so striking a history. Several hundred varieties of wheat were grown and tried by one farmer in the Genesee Valley all in thirty years. This has given so ample means of selection, of choosing just the best kind for each soil and condition, that there is doubtless a great actual increase in production due to it, but its most obvious effect is to give us a choice as to quality. With fruits this application of science has had even more remarkable results than with grains.

Although but few field *crops* have been introduced since 1776, this is not true of field *weeds*. Some which actually came earlier only became numerous and troublesome later, and others were then introduced. Several local traditions exist in the New England and Middle States of weeds introduced by the British armies and their allies during that war, which have spread and maintained a foot-hold ever since. On the other hand, it is questionable if science has aided in the suppression of weeds except in a very general way.

Columbus, on his second voyage to America, brought various kinds of domestic animals with him, and importations have been frequent nearly ever since. In our own colonies there were many importations, and from several countries, from the north of Europe direct and from Southern Europe by way of the Spanish-American colonies. The live stock in existence at the time of the Revolution was the mongrel progeny of

these numerous importations. There is no question but that the domestic animals introduced from Europe rapidly deteriorated here. Various travelers have borne testimony to this, and indeed it was to be expected. The pastures of Europe were such as fostering care for ages had made them, and, as already said, of peculiarly nutritious grasses. The early colonists found only crude grasses, and no natural meadows better than the salt-marshes near the coast or the coarse sedges by some of the streams. The pasturage in the forests was meagre. In the winter, straw, corn stalks, or in places wild marsh hay and the *browse* of the woods, were all the miserable animals had. Spring usually found the flock or herd reduced in numbers, poor, and weak. Too often the farmer's first work of the spring morning was to assist the weakened creatures to rise to their feet, and several native plants had reputation for strengthening cattle so that they could get up alone when weakened by the winter's starvation. The colonists early learned to plant grass seed from Europe, and to plant corn for the animals. Turnips, so valuable in the north of Europe, were of little value here. In the South they did not flourish well; in the North they grew well enough, but being very watery in their nature, and the winters being so cold, they froze very readily, and thus their value was greatly diminished. Maize was made to take their place, and sometimes beans were sparingly cultivated; but with this crop, again, we had to learn by experience and disappointment. The field bean of Europe did not thrive well here. It struggled for cultivation for more than a century, and was finally abandoned as a field crop. Other kinds of beans, however, partially took its place. Clover was introduced from England quite early last century. Eliot speaks in its praise as early as 1747, but for some reason it did not come into common use until sixty or seventy years later. It is, therefore, no wonder that all kinds of live stock deteriorated, that they fell an easy prey to the wolves, and that they only began to thrive successfully after so long experiment and so bitter experience. It must be remembered, too, that the laws of breeding were not then well understood; but special attention was given to this practical question during the last half of the last century. Sebright published about 1773, and Bakewell's experiments were then in full progress; and although he died without giving the secret of his successes to the world, the results were seen and many of the conditions known. In this period the breeding of all kinds of animals received special attention, and while the more scientific problems were being solved abroad, the colonists here had solved those of forage, acclimation, and adaptation.

Several of the more valued breeds of neat cattle were established early in the Old World, and improved during the period spoken of. Pedigrees began to be carefully looked after. The first volume of the *English Short-horn Herd-Book* appeared in 1822, but its pedigrees began at about this period, or a little earlier. Only thirty animals are recorded that flourished in 1780 and earlier; and while the blood of unrecorded animals afterward came in, for present purposes the pedigrees of all the thousands of thoroughbred short-horns date back to about that time, theoretically at least. Precisely when the first importations of this breed were made to this country is uncertain. It is now believed that they occurred very soon after the Revolutionary war, and there are traditions of several importations before 1800. Soon after that date importations began in earnest, and have gone on ever since. The first volume of the *American Short-horn Herd-Book* was published in 1846, the thirteenth last year, and in them are recorded some 33,000 pedigrees. Certain strains of this breed have thrived peculiarly well here, and the sale of one herd, September 10, 1873, at New York Mills, was doubtless the most extraordinary cattle sale that has ever taken place any where. At this sale 109 head sold for about \$382,000, or an average of over \$3500 per head, the higher prices being \$40,600 for a cow, and several sold for over \$20,000 each, a calf but five months old selling for \$27,000. The Devons were also introduced early, and previous to 1840 were imported more abundantly than the short-horns, and have perhaps had as wide an influence on the improvement of American cattle as the last-named breed, or even a wider. Now all the more distinguished breeds of Europe are successfully bred here, and some five or six of the more numerous or important have American herd-books now published.

The effect of all this has been to enormously elevate the quality of American cattle; and so completely has the mongrel or "native" stock been improved through these that in certain agricultural societies where premiums are offered for the best "natives" it is found that all that are offered as such are, in fact, "grades," having had an infusion of better blood within three or four generations. Even the Spanish cattle of Texas and California are being rapidly changed and improved through and by these better breeds.

The history of American horses is in most respects similar to that of the cattle. There was at first deterioration, but in a less degree, then a slow improvement through selection and better feeding, then a more rapid improvement through better breeding and the importation of better stock. The race of trotters is peculiarly American. It

originated here, and is here found in its greatest development. It appears to have followed and been caused by the introduction and improvement in light carriages. The thorough-breds of Europe, the race-horse and the hunter, are essentially *running* horses. For American uses trotters were needed; various causes tended to make them popular, and in the last fifty years the breed has been made. It has a large infusion of the English thorough-bred in it, yet few noted trotters are thorough-breds. The gait and speed are in part the result of training, and are in part hereditary. There has been a constantly augmenting speed and a great increase in the number of horses that are fast trotters. But a few years ago the speed of a mile in two and a half minutes was unheard of; now perhaps 500 or 600 horses are known to have trotted a mile in that time.

There is no question but that, as a whole, the quality of American horses has greatly improved in the hundred years. It was believed that the great increase of railroads would diminish the number required, but, as a fact, the reverse is true.

American sheep before 1776 were all coarse-wooled and mostly very inferior animals. In Europe the fine-wooled breeds were shut up in Spain, and various causes prevented the exportation of the English improved coarse-wooled breeds. Eliot, in his "First Essay" (1747), says: "A better *Breed of Sheep* is what we want. The *English Breed of Cotswold Sheep* can not be obtained, or at least without great Difficulty: for Wool and live Sheep are contraband Goods, which all Strangers are prohibited from carrying out on Pain of having the right Hand cut off." Before 1800 there were a few importations of improved coarse-wooled sheep, and very many importations since. Merino sheep were carried into Saxony from Spain in 1765, into France about 1776, and England about 1790. Three merinoes were brought into the United States in 1793, but the person to whom they were presented not knowing their value, they were eaten for mutton. In 1801 or 1802 a few more came, and there were several small importations from Spain and France before 1815. The Saxon merino was introduced in 1824. Various causes led to wild speculation more than once in fine-wooled sheep in the United States, but they have increased now to many millions, and some of the most noted flocks of the world have been or are here. Individual animals have sold as high as \$10,000 and even \$14,000. Both for fineness of fibre and weight of fleece the American wool is celebrated, and the finest fibre yet attained was from sheep bred in Western Pennsylvania about 1850. Since that time weight of fleece rather than excessive fineness has been bred for. The great pastures of Texas

and California at home, and of Australia and South America, are now in competition in the markets of the world, but the wool produced in some of the older States, particularly in the Ohio Basin, is especially sought after by the manufacturers of the finer goods.

The statistics of live stock in the United States as given in the last census are confessedly very imperfect, hence no numbers are here quoted except the aggregate value, which was estimated as amounting to upward of \$1,500,000,000.

Incidental to this branch of our subject, we may mention an American invention, the cheese-factory system. This was first put in operation in 1851 by Mr. Jesse Williams, in Oneida County, New York. Down to April, 1860, twenty-one factories had been started. Then the increase was so rapid that by the end of 1866 there had been 500 factories erected in the State of New York alone, and the capital incidentally employed in the farms and stock amounted to at least \$40,000,000. In 1870 there were over 1300 factories in operation in the country, producing about 55,000 tons of cheese. The system is still growing here, and has extended to foreign countries.

The great improvements that have taken place in transportation, which make it possible for the wheat of Iowa and California to compete in the English markets with that raised on the Atlantic sea-board, and which place Iowa in competition with New England, have operated to *specialize* farming. The large farmer of to-day raises fewer kinds on his farm than did the small farmer of the last century. This specialization allows the use of the higher appliances and the use of capital as the former system could not. The true farms have doubtless grown in size, on the average. The early settlers of necessity could till but small farms. The tax lists of Long Island for years between 1675 and 1685 show that in nine English towns the average land-holding was about twenty-two acres, and in the five Dutch towns about thirty-seven acres, or for the whole fourteen towns it was twenty-five and one-third acres, and at that time over ninety per cent. of the tax-payers were land-holders. The national census of 1870 enumerates 2,660,000 farms, only six and a half per cent. of which were of less than ten acres, and more than half of the whole number contained over fifty acres. The cash value of the farms, implements, and live stock was placed at upward of \$11,000,000,000, and the total estimated value of all the farm productions at about \$2,448,000,000. Of the 12,500,000 persons "engaged in all classes of occupations," 6,000,000 were engaged in agriculture. We have absolutely no statistics

of the agriculture of the colonies at the time of the Revolution; therefore the actual figures of progress can not be given, and we refrain from estimates.

Agricultural newspapers, societies, schools, and literature hardly had an existence before 1776. Less than forty newspapers were then published in the colonies, none of them agricultural. In 1870 there were ninety-three agricultural and horticultural newspapers and periodicals, with an aggregate annual issue of 21,500,000 copies.

Agricultural societies were organized just after the Revolution; exhibitions or "fairs" began between 1810 and 1820. It is believed that there are now 2000 agricultural societies, clubs, and boards of agriculture organized and in operation. Their annual "reports" amount to very many volumes. A few tracts and essays, which altogether would make but a single small volume, were the entire special agricultural literature the colonies produced. The agricultural literature of to-day is confusing by its quantity and variety.

Agricultural professorships were established in Europe some time last century, and the first agricultural school began in 1799. In this country, Samuel L. Mitchill was made "Professor of Chemistry and Agriculture" in Columbia College, New York, in 1791, but there is no record that he gave special instruction in agriculture. In various colleges professors of general chemistry treated more or less of agricultural chemistry. After special preparation for the office, John P. Norton was appointed "Professor of Agricultural Chemistry and Vegetable and Animal Physiology" in Yale College in 1846, perhaps the first actual professor of agriculture in an American college. His instruction began in 1847, since which time numerous other similar professorships have been established.

Agricultural schools and colleges were talked of for many years, and a few made an actual or nominal beginning before 1850, and several before 1860. In 1862 Congress appropriated certain lands to establish or aid schools in the various States, "without excluding other studies," to "teach such branches of learning as are related to agriculture and the mechanic arts." Stimulated by this, and aided by private and State aid, about forty schools are now in existence, trying in various ways to fulfill the purposes for which they were established. The most of them are recent, and they are mainly important, in this account of progress, because of what they indicate rather than what they have yet accomplished. A few of the older ones have, however, already had considerable influence, and all are ready for the coming century's work.

WILLIAM H. BREWER.

NEW HAVEN, CONNECTICUT.

VOL. L.—No. 300.—58

KATY.

SHE had lived with us so long—as length of service counts here—that we felt as if we owned Katy; and we did, if ownership comes by right of discovery.

It was as if she had been left on our doorstep, like any other foundling, and we had taken her in, cared for her, and loved and trusted her for six long, faithful years; living in the hope, as I used to tell mother, that the bond might "continue the same unto my life's end, Amen," like the pious desire in the catechism.

She came to our door one dark, wet night in March, half sick, utterly hopeless, asking for work. She had been in the country but a few weeks; came with her mother to spy out the land, and get things "sittled like" before sending for the remainder of the family.

"Siven childer, miss, an' no father to one o' thim," she said.

They had exhausted their small stock of money, and not being able to replenish by picking up gold on the highway, as they expected to do, Mrs. Brice was forced to white-wash and do general charring, and Katy came to us—a chance blessing.

I shall never forget her pathetic tone, when she said, "I work stronger than I look, miss."

It was bright and warm in the hall, making the outside darkness blacker by the contrast, and I hadn't the heart to say no.

Mother insisted it was the soft eyes and sweet voice that won me, more than any promise held out by Katy's self-commendations. And it may be, for she was neat and pretty in her seventeen-year-old freshness. Besides, we wanted just such a trim little maid. And I was justified; for she prospered in the brightness of our quiet life, and repaid a thousandfold our trust in her. I really had come to look upon her as much of a fixture in the family as mother or myself; so I was pretty well stunned one morning when a faint, meek voice, which I should not have known for Katy's only that she was busy in the corner, her back toward me, dusting the little fineries in her nice, dainty way.

"I want to be married, Miss Mary."

"Why, Katy Brice! I am ashamed of you," I said, severely. "Perhaps others may want to be married, but I don't think it modest to say so."

"But, ye see, miss, I have the chance," with an emphasis that, in another, might have passed for sarcasm, for I was sufficiently Katy's senior to stand in her estimation as an "ould maid," reasonably beyond such youthful frivolities.

"But what upon earth put marriage into your head? Don't you have trouble enough?"

"Yes'm," said meek Katy. "But Jerry Burke an' me are sort o' coosins, an' I'm wake like, ye know, Miss Mary. An' Jerry he thought we'd best git married. He's forehanded, an' has a bit of money in the bank; an' he says I'll not have to work so hard, an' it will be me own house-work; an' so it will, ye know, miss."

"Yes. And you believe all this blarney," said I. "He won't let you wash your hands in cold water. I dare say not, if, according to the story, you choose to find fire to warm it."

But it was all lost on Katy, the only response being, "Would the mistress object, do ye think?"

"Much good it will do her if she does! But have you any other wise reason besides being 'wake,' you foolish girl?"

"Well, ye see, Jerry an' me we mit at Bridget Mooney's last Saturday was two weeks. Me mother knew his father in the ould country; in Limerick it was. She seed Jerry when he was a lad, an' she thinks he's a nice boy; an', ye see, he likes me. Wud you and the mistress come to the widdin', then, miss? It's but a step to St. Mary's, an' it don't look like stormin' the night."

And this was the whole story! Our modest little maid had in two weeks been wooed and won, and was to be married "the night."

We excused the bride elect from further duty on her wedding-day, and she set about her trousseau, and preparing for the entertainment after the ceremony.

"Jerry bought a fine cake at the baker's, just round the corner. I've it up stairs in me bidroom, miss. Wud ye come up an' see if ye think it's nice? An' wud the mistress let me cut a bit of mince-pie, just for Jerry? He's that fond of it!"

I gave an unlimited order on the larder, and a set of spoons that had served us as faithfully as Katy; and then, with a sinking heart, went to carry the news and the invitation to mother.

"You ought to be ashamed of yourself to encourage the child in such folly! You are old enough to know better, if she isn't. Send Katy to me. I'll stop this nonsense!" was the pleasant reception that awaited the story that had been softened and cushioned to meet the occasion.

But when was wise counsel ever taken, or when did intermeddling avail in a love affair? Certainly not this time, for at the hour appointed we crossed the street to St. Mary's, and found the bridal party in a dimly lighted passage in the rear of the church, awaiting the convenience of Father Rooney, who, as informed by the sexton, "was havin' dinner company, and couldn't come to wunst," and we bided his time. I looked around at my companions. Here was Katy's mother, a stalwart Irishwoman, clad

in the blanket-shawl and alpaca hood dear to the mothers of Erin. She was offering good advice to a friend suffering from "cowld," and giving the rules for making a posset, which she called "fite fay." As it was Mrs. Brice's panacea for most bodily ills, and had been advised for my taking many times, I recognized the delectable compound as white whey.

Katy herself was bright and neat in a green stuff dress that had been dedicated to St. Patrick a few months before. Her hair, "done by the drisser" in a multitude of puffings and frizzings, was surmounted by a white tinsel wreath that glittered in the light of one gas jet, and did its best to spoil the looks of our little maid, who, in her plain print dress and natural wavy hair, always looked refined and pretty.

The party of the first part was sitting in a dark corner with two or three of his friends, and I could not make him out clearly until we were summoned to await his reverence at the altar, and it was too late to snatch Katy from her doom. He was by no means a young "boy," being at least fifteen years beyond our twenty-three-year-old Katy. He was coarse and stupid and shamefaced, with his hair plastered down almost to his red-rimmed, sheepish eyes, and with an upper lip so short that his teeth were always on view. Indeed, in every way and altogether a bad subject. I looked on and listened in a half-dazed way to the very brief service that gave Katy her sentence for life. Once before I had witnessed a marriage in St. Mary's. Then it was a matter of daylight and candles, flowers and incense, gorgeous vestments and many priests and much ceremony. We were bowed by obsequious ushers through the wide front doorway. But we were poor folk, and this was another affair. One impatient priest, anxious to get through with the bother and return to his guests, was accounted sufficient for us.

The good father had evidently been having a jovial time over his dinner, and wasted but little of it on us. As a matter of habit, he gave a brief preachment of good advice after the ceremony, culminating in, "And if you have children (God grant you may!), mind your duty to the Church," etc. After which a hasty blessing, the lights turned out, and we groped our way back through the dark passage as we came in.

I recrossed the street with a heavy heart, the wedding train slowly filing down the basement steps to eat the pink and green sugared cake, the mince-pie for the groom's special delectation, and to drink a pitcher of beer from the "widdy's" in the next street, a contribution from a thoughtful guest toward the general hilarity.

The rejoicings were of a quiet and orderly sort, as they were likely to be with Mother Brice to the fore; and at ten o'clock Katy

came up stairs to say good-by, and, with tears and smiles mingling, took mother's lecture, consisting of equal parts of good advice and solemn warning.

"Oh, you foolish girl! how do you expect ever to get along with that great lazy-looking fellow? I am disappointed in you, Katy. But go along; be good-natured, keep your house clean, and remember we are your friends."

"Yes'm," said Katy. "Thank ye, ma'am. Indeed, I feel as if it was goin' from home I am. God keep ye in good health, Miss Mary!" and Katy vanished from our sight.

The revelers below followed, and we could hear the laughing and chaffing that broke in upon the quietness of the night as they followed Mr. and Mrs. Burke to their new home.

We saw but little of Katy during the year following her marriage, and the wear and tear of trying to make good her place in the household had, I fear, hardened my heart toward all of her kind, and nearly blotted out all remembrance of our bright little Irish girl, when a modest knock at the sitting-room door one morning was followed, in response to my invitation to "come," by what seemed to be a ghost of our Katy. It was not only the change, but the character of it, that shocked me. The beautiful hair, that seems to thrive best under neglect—the wavy, glossy Irish hair, so long and abundant—was uncombed and twisted in a rough ball on the back of her neck, with locks straggling to her waist. But worse than all else was the pervading and reckless untidiness of her dress and person. The inevitable blanket-shawl was secured by a hair-pin, and the whole toilet finished off by a soiled woolen hood. Father Rooney's pious nuptial wish had been fulfilled, and Katy's misery was crowned with a baby in every way a repetition of its mother's unwholesomeness and squalor. Before I could give expression to my astonishment, Katy's sweet voice, which had alone escaped the general wreck, broke in with,

"An' how have ye been since, Miss Mary?"

"You may well say 'since,' you poor child, for you look as if every thing gone before might be blotted out," said I. "And now tell me the trouble."

"Well, ye see, miss, Jerry is out of work, because of the strikes, an' he have been mostly since. Men are so wake, ye know, miss! An' then it wasn't pleasant an' warm most times when he'd come home, an' wid me sick and poorly. Ye cudn't expect but he'd rather stay at the corner, where his friends made him welcome, an' it was light an' cheerful like. The boys all like Jerry, an' treated him finely. An' ye cudn't blame him for stayin', cud ye, miss?"

"You mean he is a poor shiftless fellow, who drinks up all he earns, and leaves you

and the baby to freeze and starve. That's about the English of it, isn't it, Katy?"

"Jerry don't mean to be bad, Miss Mary. But oh, men are so quare! An' I came to see if you or the mistress cudn't do somethin' for the poor lad. They are puttin' men to work at the Cintral Park, an' I hear, if I can git a letter to one of the owners, maybe I'd git a job for Jerry. I'm doin' it unbeknownst, for I don't want him to be disappointed if I fail. Cud ye git me a line from one of yer friends, do ye think? Ye see, I'm not strong, an' I've sich an imprission about me heart! An' oh! Miss Mary, I'm so tired wid waitin' an' hopin'!" And poor Katy utterly broke down, and sobbed as hysterically as a fine lady.

I took the baby with a shudder I could scarcely hide, and seating its mother in the big Shaker chair, called for something to strengthen and revive the poor girl, making an effort at the same time to turn her mind from her troubles.

"What is the baby's name, Katy?" I asked.

"Anastasia. Do you like it, Miss Mary? I wanted to call her for you, but, ye see, she fell on St. Anastasia's Day, an' Father Rooney said it would bring her good luck. Poor baby! It is a big name for a little one; but I can call her 'Stasia, ye know. But will ye git me the letter, if ye please, miss? Maybe if Jerry cud git work he'd be pleasanter and stay at home more. I don't think he means to be bad; but men can't bear trouble."

Mother, who had administered a warm and comforting drink to Katy, had refrained from any reference to her own foresight, although I knew the trouble she had to keep quiet, for "I knew how it would turn out," and "I said so at the time, you remember," are my dear mother's weak points. She did permit herself to fire this small shot:

"I am afraid, Katy, you didn't better yourself when you changed situations, and left us to do house-work for Mr. Burke."

Katy looked at mother for a minute as if recognizing the spirit of the remark, and then, with a deep sigh,

"But ye can niver tell how things are goin' to be till ye try thim. Bridget Mooney told me it was bad luck to marry a man if the first letter of his name was the same as yer own. Bridget said,

'If ye change the name and not the letter,
Ye change for worse and not for better.'

An' maybe Bridget was right. But if Jerry's name had been Kelly, I don't think it wud have differed: do you, ma'am?"

Katy and the baby both refreshed, she began to get herself in shape to go back to her forlorn home, encouraged and brightened by the promise of a letter from somebody "to one of the owners of the Park" that

was to do such wonders for that hopeless scamp of a Jerry. Two or three months passed without our hearing whether he had been appointed on the Park staff or not, for we respected Katy's unwillingness to reveal her exact whereabouts.

"Fifteen hundred an' something Third Avenyer. I disremember the rest of it, Miss Mary, an' anyways I wudn't like ye to come," she said, in reply to inquiries in that direction. So, as I said, for two or three months we did not hear from Katy or her troubles. At the end of that time, however, I was summoned by her successor to "come to the kitchen a minute, wud ye, plaze," and, going, found our poor Katy Burke, so wasted and pale I might have passed her without recognition. Her face was half hidden in a shawl, which covered her head in lieu of the woolen hood, her dress torn and soiled; and with a voice broken and tremulous, she said:

"Don't be frightened, miss, but I came in sich a hurry. I'd no time to look for me things. I wanted to tell ye—for I don't know what may befall me—that I think I'm gittin' poorly. The wakeness grows on me greatly, an' me heart bates that quick like! I look strong, Jerry says, but I can't do a turn of work, me breath troubles me that much. And then the poor little 'Stasia! An' oh, dear Miss Mary, there's another to come soon!"

"Well, well, Katy, don't cry. If we get married we must take what is sent," said I, in the egotism of my spinster philosophy. "Never mind now. We will see to 'Stasia, and send something to keep the little girl warm. And now come up stairs and see mother; she will comfort you more than I can."

"No, please, miss; not to-day. Ye see, Jerry has had trouble again. The boy is doin' nothing, an' he falls into bad ways. The drink crazes him, or he wud niver have hurt me. I'm sure he didn't intind it; but I don't want the mistress to see it."

Katy had been sitting in the shade, but now I saw "it" meant a severe cut on the cheek, and a livid mark under the right eye.

What could be done? If we had been rich, it would have been an easy thing to pension Katy and take her away from her hard fate. Indeed, I said as much to her.

"Leave Jerry, Miss Mary! Ye can niver think it! What for? Poor lad, it is hard for himself as well!" she cried, horror-stricken at the thought. "Yankee gintlemin don't bate their wives much, an' ye're not used to it; but I'd niver think of leavin' Jerry for that! No, no; he'll git work, an' then he'll drop his bad ways, an' stay home an' be good to 'Stasia an' me. He knows how to be good when he leaves the drink. It's no trouble to Jerry to be good. Oh no, Miss Mary!"

"True, loyal wife," I thought; but I said, "You are a foolish girl, Katy Burke, to look for any good in a man who abuses you as Jerry does. I would like to see a man offer to—"

"Well, miss," interrupted Katy, "there's no danger; it isn't for the likes of ye. But it is hard when ye're tryin' to do the best, an' ye're hungry an' cold altogether. I don't want to complain, for there's them as is worse off than meself. Praise God for my good friends!"

Once more, aided and comforted, Katy dropped out of sight, and so long a time passed without hearing from her we consoled ourselves with the hope that she had reached the peace and quiet she was so sure of "some time."

I think it was about six months after this visit that I received a note dated St. Peter's Hospital, and signed "Mother Paula," setting forth that a young woman in the lying-in ward, who was very ill, had expressed a desire to see me. "If you have any wish to comply with her request, it will be necessary to come at once, as she may not live beyond the day."

I was beside Katy's bed before the hour was ended in which I had received the summons, and was greeted with a smile so sweet, so self-forgetting, so like our Katy of old time, I could only hide my eyes and try to keep back the useless tears.

But Katy's eyes were dry and full of "exceeding peace," and her pinched face purified and almost beatified by suffering.

"Don't fret and cry now, Miss Mary, for ye see it has all come right. But do ye think ye cud find Jerry? Ye see, I was took so suddent! an' the poor lad hadn't come home. Oh, he'll feel bad, Jerry will, when he knows it. The Sisters will take little 'Stasia; but the baby will go wid me, thanks be to God! May He bless you and the mistress dear. It's good ye're not married, Miss Mary."

"Don't think of me, Katy. What can I do for you, you poor child?"

"Nothing, thank ye, miss; I have every thing. But if it wudn't trouble ye too much, I'd take it kindly if ye'd see little 'Stasia sometimes; an' oh, don't let her forget her poor mother!"

And this was the end. Katy died during the night—"she was glad to go," the nurse said.

The next morning Mr. Jerry Burke came to the hospital, and with many tears and lamentations howled out his grief over Katy's quiet bed; and in a voice husky with woe asserted his right to the remains of "me wife."

They had "a beautiful wake," one of the neighbors told me, "wid plenty of candlea, an' a fine breastplate, an' every thing nice an' dacent, miss. Only Jerry felt that

crushed he tuck a little more'n was good for him, an' he cudn't come to the funeral nixt day. Poor Jerry!"

I had missed the chief mourner, and asking an explanation, learned that the absence was unavoidable unless the funer-

al had been postponed for sixty days. I counted twenty-three carriages following the hearse that carried our sacrificed Katy to her rest. And it was a great comfort to Mother Brice that "no lady cud have had a purtier buryin'!"

MISS ANGEL.

BY ANNE THACKERAY.

CHAPTER XX.

FROM GOLDEN SQUARE.

WHAT is a mood? Whence does it come? Why does it overwhelm us with its strange stupidities? Here we sit quietly in our chairs, and what adventures are ours! What comings and goings! What momentary emotion and curious changes and conflicts! Armies of thought sweep past; experience, memory, hope, are all ranged in battle-array. Sometimes the two fight from daybreak until sunset, and on into the night; nor is it, perhaps, till the morning that we know which army has retreated and to which the field belongs. For a time some such battle was raging in Angelica's heart as she sat quite quiet upon the couch; then came silence and the deadness of humiliation. Some sudden hatred and indignation had come over Miss Angel, like a dry east wind parching her very soul. She had not deserved this, she said. She had been sincere; she had not sought her own advantage in all this; and it was hard to be humiliated.

Who is it that says that when hate begins to take the place of love, the hatred is the greater in proportion as the love was great. In such hatred it is hard to believe, except as a strange distorted mood. To Angelica it came as a punishment for other things—for the gentle vanities and infidelities which had brought her to this pass, which had led her on to overrate her own worth and judgment, and that perhaps of the persons whom she honored with her regard.

It is Goethe who says that those who will not forgive themselves for small faults are persons who overrate their own importance. Angelica of late had had many excuses for overrating herself, and perhaps for this very reason suffered more acutely than she might have done at another time from the mistake she had made.

Young, ardent, reckless; how was she to realize to herself the calm imperturbability of a nature which was not a passionate one or quickly responsive to things that were not tangible, and to which it was unaccustomed?

The determination to which Mr. Reynolds came was one which in the end, perhaps, was

best for all, for Angelica herself and for others, but the wisdom of his judgment could only be measured by time. Perhaps it was some dim unacknowledged consciousness of the truth, of his own want of earnestness, which made him mistrust his sentiment for Miss Angel, its strength and power of endurance.

He walked away moderately satisfied with the part he had played. Angel sat quite still, as I have said, looking into the gathering dusk, watching the lights fade. They changed from blue twilight into gray and dimmest shadow; chill, cold, silent, the spring evening gathered round her, and her white face and figure faded into its darkness.

Fate is kind sometimes with unexpected blessings, that seem all the brighter when they come in hours of twilight. Open a door into a room full of sorrowful shames and regrets. Flash the light of a candle upon all these vapors and dismal consternations. There have been sounds of voices on the stairs; there have been exclamations and thumpings and summonings. Some one is calling out her name eagerly, and the noise comes nearer, and the light starts into the room, and somehow Angel, out of her twilight shame, suddenly finds herself in light, in love, infolded in two trembling arms that hold her tight close to a shabby old beating heart. She is blessed almost before she knows who it is that has come. She feels she is safe, scarce knowing how security has come to her—safe upon her father's heart, with the benediction of his tender faith upon her. She knows all this almost before she has realized that it is he.

She had not even heard the footsteps traveling up stairs, so engrossed had she been by her dreary present. That present is over, changed in the twinkling of an eye. She gives a wild, happy cry; tears fill her eyes; a sudden flood of ease flows to her heart; the heavy load seems uplifted as she clasps and clings to the old man, sobbing, and at peace once more.

In after-years that moment came back to her again, and that meeting, and the thought of her dim, despairing loneliness, and of the father's love outside the closed door, of that faithful blessing (never absent, indeed, in its tender infallibility), coming

nearer and nearer to its expression at the time when she needed its comfort.

It may be our blessing as well as our punishment that the *now* is not all with us as we hold it, nor the moment all over that is past. It is never quite too late to remember, never quite too late to love, although the heart no longer throbs that we might have warmed, the arms are laid low that would have opened to us. But who shall say that time and place are to be a limit to the intangible spirit of love and reconciliation, and that new-found trust and long-delayed gratitude may not mean more than we imagine in our lonely and silenced regret?

John Joseph was not alone. The porters were carrying up his trunk, with the great cords and padlocks. It contained a cheese, among other treasures, and a goat-skin waistcoat (a present from his sister-in-law), and some linen for Angelica's own wear, and a peasant's hat and bodice from Coire, that Miss Angel had wished for.

Behind the hair trunk, and holding by Antonio's hand, came a little person of some ten years' experience, climbing the stairs, with dark observant eyes, with a shy, ingenuous, round face.

This was a little orphan cousin of Angelica's, little Rosa, from Uncle Michael's farm, who had been dispatched to keep house with her grand relations in London.

Old John had a liking for the little creature, who put him in mind of his own Angelica at her age, and he had brought her off without much pressing; he only stipulated that Michael should pay her traveling expenses as far as Lyons. "Couldn't we walk, Uncle John?" said little Rosa, anxiously. But Uncle John told her she should come in a coach with horses and postilions. What would Angelica say if they were to arrive all in rags and covered with dust? They might have come in rags, in sackcloth and ashes. Angelica had no words wherewith to bid them welcome; they were come home—that was enough. How had Antonio known they were arriving? What fortunate chance had sent him to meet them? The fortunate chance was that Antonio, being anxious about Miss Angel's woe-begone looks an hour before, had walked back by the winding street at the square corner (that street which led so often to her house), and he had been standing outside at the windows when old Kauffman, shaken by his long journey, agitated, suspicious, fearing murder and I know not what dangers, drove up in a hired coach. The first person he saw was Antonio, with folded arms, standing upon the pavement. He could scarcely believe in his good fortune. Was *this* the house, *this* Angelica's palace? The tall windows opened upon iron rails, carved and bent into shape as iron railings used to be in those days. The door was also ornamented with delicate

tracery, and on either side a narrow window let the light into the flagged hall, where a black-and-white pavement had been laid down by some former inhabitant. The place is little changed. Only yesterday we crossed the quaint little square, with its bare trees. The drifting clouds shone with city lights and gleams. The old houses stand in rows. They are turned to quaint uses—schools of arms, societies, little day-schools for children, foreign tables d'hôte; a "supreme council" rules in a ground-floor parlor. Italian *courriers* congregate in the corner house, by which Zucchi used to pass on his way to the flagged hall. There are old shops for china and wooden carving in the adjoining streets. In one of the houses M. R. tells me of a lawyer's office, where a painting by Miss Kauffman still graces the panel of the chimney. Perhaps that may have been the house where Zucchi lodged, and the painting may have been a gift to the faithful friend. The faithful friend was made happy to-night by the sight of the happiness of the people he was interested in. They had a little impromptu feast in the studio. The lamp was lighted, the table was spread; old Kauffman produced his cheese, and would have had Angelica's servants join them at supper if she had not laughed the proposal off. Lord Henry happened to call in late, on his way to some card-party in Berkeley Square. He stared at the homely gathering, at the old man, at the little girl, half asleep, swinging her weary legs, with her head against Antonio's shoulder.

He tried to enter into his usual sentimental vein of talk with the mistress of the house, but she was naturally absorbed, and had no scruples in letting him see that he was in the way. He went off annoyed by his reception.

"That one there appears to have something wrong in the head," said old John Joseph, as Lord Henry walked away. "I spoke to him three times, and he did not answer, but examined me as if I were an ox. These English people seem stupid and dull of comprehension."

"They are clever enough," said Antonio, with a sneer, "and insolent enough at times to require a lesson." His vexation woke up little sleepy Rosa. The child raised her head, and looked round the room with blinking eyes.

"You will love some of them, father, when you know them better. Don't believe cross old Antonio," said Angelica, "nor let us think of any body but ourselves to-night." She rose from the table and came round to where Antonio was sitting.

"Look at this child; she is half asleep," said Antonio, softening, as he usually did at Miss Angel's approach. "Come, Rosa; I will put you into your little bed."

"Give her to me, Antonio," said Angel; and then she opened her arms, and little Rosa nestled into them with languid childish trust. The two men got up from the table and followed Miss Angel into the adjoining room, where Marianna had made up the little bed in a corner. Old Kauffman began uncording Rosa's box. Angel sat down on the bedside, smiling, with a happy, grateful heart. Mr. Reynolds was far from her mind, as little Rosa slept, with her head hanging warm against her shoulder. The little thing woke up when Miss Angel undressed her, but she was soon dreaming again, unconscious of the strange new world into which she had come from her green home in the valley.

That was tranquil happiness; and all the next days were happy, and seemed as if they were old days come back. Antonio spent most of them in Golden Square; he was going away soon, he said, and returning to his work near Windsor. He had many messages for Angelica from his friends there, from Dr. Starr and his six daughters.

"They say your room is always ready in their house; you are never to go any where else. It is a most agreeable house to live in. The six young ladies are charming. Their lamps are well trimmed," said Antonio, smiling.

"I can not spare her yet," said John Joseph, confidentially, when Angelica had left the room. "But I am too tender a father to oppose her good. I shall resign myself to a new separation when my child is summoned to the sovereign court. Then she shall stay with your friends. I feel sometimes as though I were a foolish old man, and out of place in this brilliant circle. That lord came again this morning with the Lady Embassadress. Their manner was extraordinary, but I would not for worlds that Angelica should know it. They are her patrons; they must be humored by us."

One day Angelica found her father looking very much excited. Antonio was also in the room, but he seemed annoyed.

"A friend had been there," said old Joseph, triumphant; "one whose friendship might be worth much to them all—one who—"

"It is that man from Venice," said Antonio. "I do not see how any of us can profit by his coming."

"I shall be very glad to see him," said Miss Angel, laughing, and sitting down at her easel. "Was he nice, father? Was he glad to see us established in our splendor?"

"He is coming again," said Zucchi. "You will be able to ask him any questions you choose. Your father made him as welcome as if he had been a son of the house."

"And does he not make others welcome too?" said Angelica, looking round reproachfully.

Antonio shrugged his shoulders. "John Joseph knows well enough who is useful to him," he said.

When Count de Horn called again, as ill luck would have it, Antonio was still there, and more than usually sarcastic. Angelica looked at him and shook her head to try and stop his rudeness to her guest, whom she was really glad to see. Antonio marched off in a rage.

M. De Horn seemed to notice nothing, but went on praising picture after picture. He even suggested one, of which the subject was to be a Cupid, with the motto "*Garde à vous.*" Angelica actually executed this.

"We hope the Count will purchase the study," said old Kauffman.

Antonio afterward said he should not be surprised if he did; it was a most vulgar and commonplace composition.

Angelica nearly stamped with vexation. "Nothing pleases you that I do."

"Many things please me that you do, but you want me to compliment your vanity from morning to night," said Zucchi, trembling with vexation, upsetting a table in his wrath, and making himself generally odious.

Miss Angel's vanity was of a less excusable nature than good old John Joseph's reflected self-laudations. He became very pious about this time, and used to frequent the little Catholic chapel near Manchester Square, and return thanks to Heaven for Angelica's success—for her patrons those lords, this valuable Count, their friend—for her talents, for his own repose and happiness. He used to come back rather cross, and scold little Rosa, or the man-servant, or Angel if she came to meet him, or Antonio if he began to sermonize.

Antonio bore the old man's vexatious moods with admirable temper. He was charming to any one young and helpless, or to old and dependent people. To successful people, however, to his equals and superiors, Antonio was, it must be confessed, perfectly odious at times.

CHAPTER XXI.

THOSE WHO ARE ABLE TO RULE IN THE CITY.

HAPPY as he was, and proud of Angelica and of her brilliant success, and delighted as he might be by the accounts of her popularity, Kauffman, as he confessed, felt very forlorn in the strange London world into which he had penetrated, and even as if Angelica was no longer the same little Angel he had been accustomed to. At first he tried to conceal this feeling: for a week after his arrival, and on the following Tuesday, Wednesday, Thursday, he concealed it; on Friday his depression became too evident

for Angel not to guess with her quick wits that something was amiss. The old man spent much of his time in her studio, received her guests with the old well-known formula, but, alas, here even his trump cards, the Cardinal and the Bishop of Como, seemed to have lost their potency.

Angelica used to find it difficult at times to impress English customs upon old John Joseph, whose familiarity and obsequiousness were sometimes a little trying to her friends. She was not one of those who dwell upon the faults of the people they love, but it was impossible to be blind to the small social difficulties that arose from time to time.

People stared at the old fellow, as Lord Henry had done, some ignored him, some turned away or cut his stories short. Lady W. was barely civil to him, and if they had not had that one quarrel already, Angelica would have spoken to her on the subject. But, as it was, she dared risk no more scenes, for she did not feel in herself the strength to withstand unkind words and feelings from the person to whom she owed so much. Miss Reynolds, who had persisted in her visits, was the one person willing to listen while old Kauffman recounted the present and past glories of Angelica's career. Alas! none were to compare to these present honors, and yet were they happier now than in the old wandering days when they knew not from hour to hour what would befall them? But people strive for something apart from happiness, and must not complain if success does not always bring those consolations which belong to less prosperous times.

Old Kauffman felt the want of definite occupation, which is almost a necessary to us all, when sunshine (that best of occupations) fails. He visited the sights most diligently. Little Rosa of the dark eyes was his companion in his walks; with her he went to see Zucchi in his lodging in Soho. There were some sights as well unseen. Little Rosa shuddered every time she passed the blackened heads over Temple Bar. One day they met two carts with seven men going to be hanged at Tyburn.

Miss Angel was never in her life more grateful to any body than to De Horn one day when he gave an order for some designs for her father to make.

De Horn came more and more constantly, but often as he came, he was never entirely at his ease. He would stand, or sit, or talk, apparently without effort, but nothing seemed spontaneous. He never appeared quite to belong to the society in which he was, or even to care to do so. He used to have strange fits of abstraction, during which he seemed to lose the thread of what was going on. One day, instead of walking up stairs into Angelica's studio, he wandered

down into the kitchens below, to the utter amazement of the man and the cook. On another occasion he clambered up to the hanging board of his own coach. He was very kind but capricious to his servants and dependents. He had come from Venice by way of Vienna and Paris, and was now established in rooms in St. James's. He did not entertain, but his splendid equipage and liveries gave him notoriety, and his good looks and elaborate courtesy made him popular, especially with women; men were a little shy of him. He had fought a duel or two; he played cards, as every body else did; he never drank any wine. His riding was unrivaled, and it was really a fine sight to see him mounted on one of Lord W.'s spirited chargers, and galloping round and round the stable-yard. His dancing was also said to be unequalled. He had already engaged Miss Angel for a couple of sets at Lady W.'s great ball, to which every one was looking forward.

De Horn was a tall and distinguished-looking man, with a thoughtful countenance. His keen eyes seemed to read the unspoken minds of those with whom he came in contact. It was true that he knew something of the world; he could read men and women to a certain point, measure their short-comings and their vanities with a curious quickness of apprehension, but that was all. There is a far wider science of human nature, of which scarcely the first lessons had reached him. To understand people's good and generous qualities, to know their best and highest nature, we must be in some measure tuned to meet them.

De Horn, full of his own plans and selfish interests, was incapable of understanding the noble and generous emotions of others. He had found out Lady W.; he had discovered Angelica's vanity, her vague romance and want of judgment; he was aware of Lady Diana's temper and morbid suspicions; but in each one of these women a counterbalancing strength of good purpose existed which he counted as nothing, but which was in truth the secret key to their natures. He did not realize the true-hearted perceptions of Diana, the sudden, impulsive, blind sincerity of nature in our Kauffman.

Nobody knew very much about De Horn, although every body was talking about him. Angelica used to meet him constantly. She was always glad to see him in the room when she entered. Dr. Burney was giving his musical parties at that time. Angelica used to go there, and De Horn rarely missed one, although he seemed not to care for literary society as a rule, and used to look with an odd expression at the tea-table and the six-weeks-old dish of baked pears which the company systematically rejected. The pears might be indifferent, but the company was of the best; and Dr. Burney, with his

sword and court dress, would come in from the Duke of Cumberland's, bringing a flavor of highest social refinement.

De Horn sometimes spoke of life in Sweden, of his home near Stockholm, and of the parties there, with a certain well-bred reserve. Angelica was much interested by the few words he let drop one day concerning his picture-galleries.

"Had he pictures? What pictures?" asked Angelica.

"I trust before long that I may be able to answer your question by pointing to some now in your studio, madam," he said, with the slow foreign accent. "What charm can those of the old men have for us compared to that which your work must ever exercise?"

This was the style of conversation that Angelica did not object to, though common-sense made her reply. "I can imagine that a friend's work may have its own interest; but the old men, as you call them, Count," said Miss Angel, coquettishly, "have their own wonderful gifts, which we can not hope to follow or repeat. What pictures have you? Are they of the Italian school?"

"Yes, yes," said the Count, absently. "Your Hobbema painted a very fine portrait of my father—"

Angelica looked puzzled. The Count suddenly began to laugh, and said, "Forgive my distractions, madam, since you are the cause of them. What were we talking about?"

"We are talking about Dr. Johnson, Count," said one of the Misses Burney, who did not wish Angelica to monopolize their lion. "He is expected here presently. Have you ever met him?"

"An old man—something like this," said the Count, taking a few steps and changing his face. It was a curiously effective piece of mimicry, and the result was so striking that every body exclaimed, and began to entreat De Horn to perform some other characters. Angelica was scarcely pleased when he suddenly looked at his watch and darted across the room in imitation of Lord W.'s peculiar manner.

"No, no, no! Lord W. is the kindest man, the best of creatures," she cried. "I can not bear to see him imitated."

"And yet you yourself have painted his portrait," said De Horn, reproachfully, immediately returning to her side. His looks seemed to say, "I only did it to please you. I hate the whole thing." In vain they all begged for further specimens of his power. He took leave at the first pause in the conversation. Miss Burney came and sat down in the place he had left vacant. "What an actor that man is!" the little lady said; "I wonder whether good judges would agree with me. And yet, oddly enough, it seemed to me for the first time that he was not

acting to-night when he performed those characters."

"I do not know what you mean," said Angelica. "He is a very kind friend and an excellent critic."

The Swede's criticisms were very consoling to the poor little artist, shivering from Antonio's last sermon. He praised Angelica because it suited him to do so, and when he stood absorbed before her easel and exclaimed, "Good Heavens, what genius!" he scarcely looked at the picture, but at the blushing artist.

"There is a man of worth," old John Joseph would cry, rubbing his hands. "My Angel, has he given you an order? Have you asked him the full price? Remember to ask a good price from those who can pay, to whom gold is nothing."

"I can not agree with you there," Antonio would say. "A picture is worth its own value. I can not endure that your daughter should sell her dignity with her work, and change her price according to the bidder."

Old John Joseph was getting very impatient of Antonio's expostulations.

"Ché, ché, ché!" he said, angrily; "keep thy hand in thy empty pocket if it pleases thee, Antonio. Thou comest with thy croak, croak, like a bird of ill omen. Go, my Angel; trouble not thyself. She looks quite pale and worn, and it is all thy doing, Antonio; thou art robbing her of her beauty and freshness."

And, sure enough, Angel suddenly began to cry.

"Yes," she said, "you wound me, you pain me; you say we are bad people, that my work is worthless, that I make money by false pretense, by defrauding other people—you, Antonio, to whom we have always tried to show kindness and affection. Why do you do it? Why do you mistrust old friends, and give us nothing but pain by your coming?"

Her irritation was caused, had Antonio but known it, by very different things; but, as people do, she vented it upon Antonio, patient and silent enough now, and cut to the heart by her fierce attack. If he had but known it, never did she feel more trust in him, never more secret longing for his help and wish for his approval, than as she stood there, reproachful, with angry looks and white quivering lips. De Horn's attentions had brought back the impression of Mr. Reynolds's cruel behavior. She was to meet him also that evening at Lady W.'s ball. Her heart was heavy with irritated foreboding. She childishly poured the suppressed annoyance of the moment upon poor Antonio. The mood had been gathering; the storm now broke.

"Is this the way you venture to speak to me?" cried Antonio, also in the wrong, and

angry. "You two, who owe me a thousand benefits! Not of money, perhaps—that has not been mine to give—but is care nothing? Are anxious thought and fatigue and weariness in your service nothing? And now you, John Joseph, reproach me with my empty pocket, and forget all. You, Angelica, say that all my long fidelity and truth-speaking have given you nothing but pain. You shall be spared that pain in future. I leave you to your own infatuated vanity, to your worldly associates. Do you think I am blind? Do you think I do not see what is passing before my eyes, the baits thrown out to riches, to rank, to all unworthy objects? I don't know how much I have loved you, Angelica. Henceforth I leave you, and shall turn my thoughts away from your life and your interests. If you are sorry some day, that old fox, John Joseph, can come and tell me so."

And exit Antonio, banging the door.

"Oh, father!" cried Angel, falling back into a chair, and covering her eyes.

"Tch, tch!" said old John Joseph; "it is nothing, nothing, I tell you. He is insupportable with his jealousy. He will come back soon enough, on all fours, to ask our pardon. Insolent calumniator. Old fox!—did you hear, Angel, what he called me?"

This happened on the very afternoon of the day when Lady W.'s great ball was to be given. Angel, who had been looking forward to it with childish eagerness, now suddenly seemed to turn indifferent—to hate the very notion of dancing with a heavy heart. When the moment came to get ready she reluctantly followed little Rosa, who had run in to remind her that it was time. The scene with Zucchi had troubled Angelica greatly. She felt that he had been in earnest, and that he was really gone, whatever her father might say.

"Cousin Angel, are you not longing to look at your dress?" said little Rosa. "Uncle and I have put it out upon the bed for you for a surprise. Come, come;" and she took one of the listless hands and tried to drag her up from her seat.

It was even a greater event to little Rosa that Angelica should go to this great ball than to Angelica herself. "Will there be any body so grand as you?" said the little thing, looking delightedly at the dress that was spread out upon the bed.

Angelica's bedroom was a great dark room, with a red paper, and one or two dark old-fashioned pieces of furniture which had been left by the last inhabitant, a melancholy old bachelor who had died there. One door opened into the studio, through which little Rosa now came again, carefully carrying the tall lamp which the woman-servant had just brought up. Upon the bed lay the beautiful white brocade ready to put on, white satin shoes pointing their toes,

and the fan already prepared to flaunt. Angelica had painted it herself with her favorite theme of shepherds and pipes and mausoleums. How Miss Angel had enjoyed making her preparations, and now—

"You are not looking," said the little girl. To please her, the young painter bent over the dress. A tear fell on the sleeve of the silver brocade, making a little stain.

"Oh, cousin!" said little Rosa, horror-stricken.

"A brocade trimmed with pearls and tears, child—that is a new fashion," said Angelica, smiling sadly; and then she sat down listlessly by the side of the bed. She was a little stunned somehow, and scarcely could have told you what had happened or why her tears were falling. After a few minutes she roused herself, and began to get ready, with the help of her kind little tire-woman. She felt so strangely; it seemed to her as if she had received a dull blow, and the effects were still upon her. Listless, ashamed, provoked, indignant, she had never looked less handsome than to-night. She talked on to little tiptoe Rosa; she patiently turned and twirled before old John Joseph's admiring eyes; he held the Roman lamp on high to see her more plainly. Her dress of white brocade was a present from Lord Essex, who had brought the stuff with such evident pleasure and kindness that Angelica had not known how to refuse the gift, and she had had it made up for the great occasion.

It would have been more becoming to her than the celebrated rose-bud dress, had she been in equal spirits. White is the natural color for all young women, that in which they look their best, but Angelica's best to-night was a sad and absent best.

Lady Diana had good-naturedly sent her own carriage and man-servant to fetch her friend and the brocade.

"Heaven bless thee, my child!" said John Joseph, with great solemnity, when the carriage was announced. "Be good and happy, and continue to recompense your old father for all his long sacrifices. They seem to him as nothing when you are honored and esteemed according to your merit." And then she drove off in the dark, and a page was turned over forever in her life.

CHAPTER XXII.

"MUSICIANS WAITING—ENTER SERVANTS."

LADY W. had not spared thought and trouble to make her ball go off with all brilliancy of wax and fire, of minuet and country-dance, of beauty dressed to best advantage, and music playing in time to dignified graces; servants without number were standing about the doors displaying their masters' gold-braided, ambitious, and bright-

colored liveries. De Horn's green lackeys were conspicuous among them; they carried wands in their hands, and wore huge nose-gays. The park was lighted by torches, lamps were hanging along the avenues that led to the house. A crowd stood outside the iron gates, cheering occasionally as the long names and the splendors and persons belonging to each came driving up. I think people were less *blasé* then than they are now, and thought more seriously upon certain subjects. Dancing, for instance, and powdering and postures took up a great deal of time; so did conversation and correspondence—of all of which exercises our own generation seems somewhat impatient, as it hurries on its way, curtailing with small ceremony.

Miss Angel started in her grand equipage to take her part in all the state ceremonies, and her father put on his old cloak and prepared to follow into the crowd, to have the glory of seeing his child pass into the paradise of lords. The Princess of Brunswick was to be there and other great personages. Little Rosa begged so hard to be allowed to go too that, as it was a fine November night, shining with many stars, and crossed by no chill winds, the old man consented to it, and the little girl started, clinging to his hand, and dancing with delight along the pavement. I suppose to one or two people present or in the crowd within or without every ball is delightful; certainly little Rosa in her outer darkness was as happy as any of the splendid and lighted-up ladies within—far happier than Angel herself, who had come in a strange and depressed state of mind.

By degrees (it often happens after depression), her spirits rose wildly. If a new gown, plenty of music, smooth polished floors, admiration, and half a dozen persons at her elbow could make her happy, these elements were not wanting. Antonio was gone, Mr. Reynolds had left her, but all these vanities remained. People talk of fleeting worldliness; it seemed to be the one thing that she could count upon. Friendship left her in a fury; love made a speech, and walked out of the room; but here were faithful frivolity and vanities unchanging; here were partners and compliments; here was De Horn unremitting in courteous attention. Since other things were not for her, she would take what she could hold. Was Frivolity a divine goddess, after all? was this to be the experience of her life—to find divinity in one thing after another? At times during that eventful evening Miss Angel's laughter and spirits were almost wild, but at others she drooped. There was anxiety in the air; the secret feelings of the last few months seemed mingling with the scene before her. Almost the first person she saw as she came into the room was Mr. Reynolds,

talking to one of the beautiful Ladies Waldegrave. He came up to her, held out his hand with a gentle deprecating look. She hardly knew how to respond; there was a dazzle of lights before her eyes, of music in her ears. She turned away quickly, and just realized the fact that Lady Diana, who was in crimson, and looking greatly bored, was beckoning to her to come and stand by her side.

From their corner the two ladies could see into the great dining-room; it had been decorated and turned into a dancing hall. An arch had been opened into the little octagon room, Miss Angel's late retreat.

Her bedroom had been transformed into a retiring boudoir, with lamps and low divans; almost all the windows were unshuttered, and the lights on the terrace without, and the shouts of the by-standers, seemed to make a fiery circle and outer incantation to the glittering magic within. There is a picture by Stothard of a court ball in those days, delicately and charmingly indicated. There is a sweeping and measured calm in all the brilliancy, a high-bred grace and composure. Lady W.'s ball was remarkable for this mixture of brightness and grave restraining sense of high dignity present.

The country-dances were performed with great spirit. Angelica danced twice with M. De Horn, who came and reminded her that she was promised as she stood by Lady Di. De Horn's dancing was celebrated for its excellence. He was stately, composed, graceful, moving his long limbs with a sort of careless ease. When dancing, he seemed quite different from the somewhat conscious person he appeared under ordinary circumstances. His ear for music must have been remarkable; and the whole glittering set of country-dancers seemed to be inspirited and kept to the measure by this one man's performance. They swayed and bowed and stamped their high heels; the swords swung, the gentlemen's gold embroideries, which they shared with their lackeys, twinkled; the stately lady figures rose and sank, and pointed their satin toes. De Horn among them all, in his black and silver, seemed to beat his own time and to keep the music itself in measure. Angelica made no secret of her pleasure in his performance. When excellence reaches a certain point, even dancing becomes a fine art, and ceases to be a personal display to real artistic natures. Perhaps this may have been a small fine art, but it was all in all for the moment; and when De Horn's glance sought Angelica's after one of their complicated evolutions, she gave a bright and unqualified look of approval and interest.

Mr. Reynolds was still standing not far off, and he saw her glance, and then he looked down at his shoe buckles, feeling as if he had no right to watch Angelica's expres-

sions or movements any more. That look seemed to tell him he had been right; to absolve his conscience. She was a ghost to him—that beautiful living woman, with the light of youth in her eyes, of interest and fine intelligence. When the dance was over, De Horn conducted her back to her place by Lady Di. He remained by her side, not talking exactly, for he was a *personnage muet*, and depended more upon his legs than his wits for the favor he received from the world. He stood keeping guard over Angelica's talk with every body else, and putting in a word every now and then more or less to the purpose.

"What a stupid man De Horn is!" said Lady Di once, when he had moved away, called off by some acquaintance.

"Do you think so?" said the Kauffman. "I think the man is a very good specimen of a human being." She spoke lightly, but she felt any thing but gay and unconcerned.

Was it magnetism and force of will by which De Horn made his way? It was some curious power he had of making others half interested, half afraid. Angelica dimly felt that she was in danger. He still seemed with her, even when she was talking to others. Goethe tells Eckermann about attractive and repulsive powers belonging to human beings as they walk in mysteries. It must have been some magnetic powers in De Horn which imposed upon so many.

As the handsome couple stood side by side they commanded a view of the brilliant company in the blazing hall and on the staircase drawn up to receive the Princess of Brunswick and the Duke of Cumberland, who had arrived in state. The heads bend in long line, the courtesies vie in depth and sweep: the procession sweeps on, the buzz of voices rises afresh.

Two people begin talking in the crowd of the *Daily Courant*, a newspaper which has just come out.

"Its news is not of the latest," says one of the speakers, turning to De Horn; "it announces Count de Horn's expected arrival in London *via* Paris and Dover. It is three months after date in its intelligence."

"Is he coming?" said De Horn, with a start.

"He—who?" said the other, and De Horn seemed suddenly to remember to burst out laughing.

Angelica, preoccupied as she was, could not help wondering at the agitation this little incident seemed to produce in her partner. He presently asked her if she did not feel the heat. Would she not come nearer an open window?

"Are you ill? Pray do not think of me," she said, for she saw that he was deadly pale. But he would not leave her. He seemed to detain her, by more force of will

to keep her apart from the rest of the company.

He began talking as he had never done before. "Ah! that you were in my own rank of life!" he said once. "But what matters rank or difficulty where there is wit and courage and true love?"

She became more and more uneasy as his manner grew more free. He followed her every where, from room to room, into the supper-room at last, where he handed some refreshment she had asked for across a table, saying, "Let me serve you, madam. You are fortunate people here in this country, where you have no vexing restrictions, as with us. Before I left Sweden a friend of mine was brought before the magistrates for having taken a cup of chocolate in her box at the play. She was condemned to a week's imprisonment and a heavy fine."

"Is it possible?" cried Angelica. "I should be sorry to pay such a price for a cup of chocolate!" (Alas! poor woman, she had to pay a heavier price than this for that which Count de Horn was now handing to her.)

"Our sumptuary laws are of extraordinary severity," cried the Count. "I myself have, I fear—" He broke off abruptly. "Will you come back to the dancing-room?" he said, and he looked at her with one of those strange, uncertain glances.

As De Horn's agitation grew, Angelica felt her own insensibly increase. She became more and more afraid, and once when he had been called away by one of the Princess of Brunswick's attendant pages, she precipitately engaged herself to Lord W., who happened to be standing near.

But fate seemed to interfere. Lady W. came up with a "No, W., you must not dance with Kauffman. I know how much you would like to do so, but there is the Princess of Brunswick waiting to be taken in to supper. Here is Count de Horn, who will, I am sure, supply your place."

She was gone, and once more Angelica found her fingers in the grasp of the very hand she was trying to avoid. His fingers held hers so strangely, closing with a firm light pressure, that she seemed unable to resist. "Here is a seat by the window," she said, trying to avoid him, and with a sort of smile she withdrew her hand in an unconcerned way, talking of something else all the while. But again she happened to meet the look of his strange penetrating eyes as she glanced up. It seemed to her as if his glance held her as firmly as his closing fingers.

Old John Joseph was in the crowd outside, and had managed to creep with little Rosa through the barriers. They reached a window at last from whence they could see into the ball-room. As they stood on the terrace of the garden, they saw, to their

delight, Angelica go by in her brilliance, escorted by this magnificent squire.

"How white she looks, uncle!" said little Rosa. "Is she frightened, all alone?"

"She is not all alone; that great signor is talking to her," said John Joseph. "Praised be Heaven that I see my child honored as she deserves; all are acknowledging her rights. See, Rosa, they are looking for her; she receives a message; she is led across. Rosa, it is one of the Princess's pages who has been sent for her," cried old John Joseph, creeping up closer and closer to the window, and trampling the flower bed, to behold the apotheosis of his Angel as she is conducted to the great chair where the Princess is sitting in state.

"People are coming this way. Come quick," whispers little Rosa, pulling at his coat tails. They are a timid pair, and the burst of voices frightens them, and the two creep off carefully and unperceived, slide along the rails, and come out away into the street.

They find their way home, through dark moon-lit streets, to the house where the tired servants are sleeping.

Soon little Rosa, too, is dreaming of moonlight and of music.

Old John Joseph lights his pipe, and sits down contentedly in the great chair in the parlor, waiting until Angel should return. He opens the window to hear her first summons. Long, warm, dark hours pass, and he nods sleepily in his place, all wrapped in his cloak. The open window lets in the first light of dawn; the birds begin to chirp crisply in the chill serenity.

The dawning light shines upon the ball and upon the dancers, still untiringly pursuing their mazes. It shines upon a woman who has come out from the hot glaring room, with its straining music and oppressive scent of burning wax, into the dim gray garden, where the trees just rustle in the dawn, and the sparrows are whistling their early chorus with fresh precision.

All that night Angelica had felt unnaturally wound up, excited, agitated. This dim cool light seemed to call her back to rest, to tranquil mind, to reality of heart and feeling. Her dress gleamed white among shadows. Some silver cloud was drifting overhead.

Some one saw her go from the room, and came pursuing her steps. It seemed impossible to avoid De Horn, who now followed her along the twilight path. "Why do you come?" she cried, exasperated. "Do not you see that I would avoid you?"

"Why do I come?" said De Horn. "Madam, I have much to say to you. My happiness, my liberty, my life, are in your hands. I have had news to-night, news that overwhelms me. I am in dire disgrace. My

estates and my life may be forfeit. You alone can save me, save me from despair."

Angelica turned her wondering looks. She saw he was in earnest; he looked ghastly.

"The Queen would listen to *you*," he cried. "Did you not see the Princess smile as she gave you her Majesty's message and summons to Windsor? Your influence would save me," he repeated.

"Indeed, I will do any thing," faltered Angelica, greatly moved. "But you overrate; you entirely mistake."

"I do not overrate any thing," he said, approaching his anxious face to hers; and through the dim twilight his great black eyes gleamed, and as the light increased she saw more plainly the lines of care and almost terror in his face. Then, before she could prevent him, he fell upon his knees, and caught hold of her skirts with his two hands as he spoke.

"You have influence upon all whom you approach. You could obtain grace for your husband," he cried, "if not for me. Oh, Angel, be that which you are, a generous and noble-hearted woman! Give me my life. I love you to distraction; you see it, you know it. If you have one womanly feeling, one pitiful thought for a wretch in torment, you could save me, you alone." And he struck his breast, with one hand still holding to her dress.

"Oh! no, no," said Angel, doubting, not knowing how to answer, how to escape.

He went on passionately entreating, warming as he continued, and she, bewildered, excited, let him go on—listened with rising agitation, melted as she listened, grew interested against her own conviction, and suddenly the spell of the moment, the passionate petition, her own yielding nature, all overcame her. Some wave seemed to flow over her head, and it seemed to her as if it was no new thing, but as if that voice had been pleading and pleading from the very beginning of life, as if all her coldness and indifference were cruelty and selfishness, and as if some conviction had come to her that he *must* be saved at any price—she alone must save him.

Suddenly, very quietly, she yielded, agreed to every thing. She would marry him if he really wished it—meet him at the little Catholic chapel out of Manchester Square as he entreated. He could hardly believe her as she spoke. She would keep the secret; and as she said so he seized her hand and kissed it again and again.

If any one were to suspect his marriage—such were the laws of Sweden, De Horn assured her—he would be immediately carried off, imprisoned perhaps for life; "but you, my treasure, my Angel of deliverance, under the shadow of your pure wings I shall be safe." He seemed again overpowered, and for a moment Angelica lost courage.

But she made no opposition when De Horn seized her hand and pulled Lady W.'s little ring off her finger.

"I must leave you," he said; "they are coming; but this is a pledge of your truth and goodness. You dare not fail me now." Though his words were harsh, his looks were melting; they seemed to appeal to her very heart. She could not speak, but bent her head in assent. When she looked up, De Horn was hastily escaping along a shadowy path; for one instant he stopped and pointed toward the house from whence a whole stream of dancers now issued.

The sun rose over the houses, a glittering stream of gold fell upon Angelica in her silver dress. As she turned to meet the company she seemed on fire, advancing radiant and excited. How much are omens worth?

Poor Angel! hitherto people had reproached her with lightness of nature. Henceforward the burden of life lay heavy enough to satisfy her most envious detractors.

CHAPTER XXIII.

I MIGHT FORGET MY WEAKER LOT.

ANGELICA had little knowledge of character. She was too much absorbed in her own impressions to receive very definite images of the minds of the people she lived among. She could scarcely understand how events appeared to them. For some hours she lay still upon her bed, living over and over again the strange experiences that had come to her. It seemed to her as if she alone were concerned in all. Then at last she fell into a deep sleep, from which all emotion, all fear, all regret had passed away. She only awakened to hear her father's voice softly calling her from the room outside.

"Angelica, Angelica, my child!"

"Yes, father," answered Angel, with a sigh, awakening.

The door was locked, and she did not unclose it.

"I hear that Zucchi is in town preparing for a journey to Italy," said old Kauffman through the chink. "Will you come with me, Angelica, and bid farewell to that misguided young man?"

"I am tired, father," said Angelica; "can not he come and see us as usual?"

"I have been at his lodgings," continued old Kauffman, mysteriously. "I can not persuade him to come, Angelica. You, my child, have more influence than I over that hog-headed youth. Haste! haste! dress thyself, and come with thy old father. I want to hear of last night. What did they say to thee?—they did not ask after thy old father, Angelica?"

"I can not go out; I am busy this morning," said Angel from within. She had now

risen, and was coming and going about the room.

She was determined not to be absent that morning. De Horn might come; a message might come. What was this strange new state of mind in which she did not dare to face her father? She found that she dreaded meeting him. The thought of seeing Antonio also frightened her: she felt as if he would read her very heart in one glance.

Old Kauffman was surprised that his daughter should venture to be obstinate. His temper had been ruffled by Zucchi's reception. He had already visited him that morning. The young man was busy packing, winding up his affairs, seeing to many details. Old Kauffman's reproachful reconciliation rather bored him than otherwise. Zucchi was preoccupied, depressed by his father's death, hurrying to his brothers and sisters. Old Kauffman, with his martyr-like airs, vexed him. His moral aphorisms about resignation, his long descriptions of his own household prosperity and elevation, were not calculated to put Antonio into better spirits. Old Kauffman perceived that something was amiss. And so he had determined that Angelica must come herself to the rescue. But Angelica is also obstinate, will not open, and calls out from time to time, "I am coming, father. Dear father, do not knock so loud. Let me dress in peace."

"Do I disturb your peace? Is this the way you speak to your father?" shouts the old fellow, more and more irate and vexed by every moment's delay. "After my years of care, of self-denial, after the education I have bestowed upon you, with efforts scarcely to be told," he says, raising his voice, for he hears footsteps approaching, and is glad of an audience to his wrongs, "is this the way to treat your father, whose long sacrifices came to the very notice of the Lord Cardinal? Ungrateful child, where is your obedience? Why do you refuse to accompany me on this visit of reconciliation and farewell?"

Then he looked round to see who had come in, and what the effect of his eloquence had been upon the visitor—was it Antonio, after all? Antonio at that moment was far away in spirit. Could Angelica have seen his heart as it was then, it might have added a pang to the moment. How bitterly did he reproach himself afterward for his indifference and failure at this critical time! Some phase had come over him. Weariness of waiting, conviction of the hopelessness of his dreams; for the first time vivid personal preoccupations had come to separate him from Angelica's interests. It was not Antonio but De Horn who walked in upon Kauffman's recriminations. He found him with his long blue coat tails flying, and his nose against Angelica's panel.

"Ungrateful child!" the old father shouts with renewed eloquence. "What an example for thy little innocent cousin Rosa, my dead brother's only daughter—a legacy to our tenderness;" and then Angelica from within hears a second voice and a change of tone in old John Joseph. Her heart beats faster than ever. It is De Horn already come. Come—for what? Her trembling fingers tangle the strings. She can hardly fasten her dress, pin on the great flapping cap, beneath which her eyes shine so brightly; hook the band round her waist: somehow or other she is ready at last, she flings open her window for a breath of air, and then with shaking hands unlocks her door and comes forth. The studio is all full of sunshine. It is late in the morning and the sun is high.

De Horn bows low as she appears. He is standing in the window with her father.

Old Kauffman had been for the last few minutes escorting the Count from portfolio to portfolio, exhibiting Angelica's performances with a running commentary of his own, diving into portfolios, and all the while secretly calculating the possible sum to which De Horn would go for orders. "Here is your Excellency's own suggestion, *Garte à fous*" (so he pronounced it), "rendered by my naughty inspired one. That one, possessed with such gifts of Heaven, should prove rebellious to her father's expressed desire, is indeed a lesson to all." Then seeing Angelica's worn looks, "Thou art pale, my child. Why didst thou not tell me thou wert tired?" said old Kauffman, with real tenderness, hurrying up to her and taking her listless hand.

"'Tis nothing, father, only last night's excitement," she answered.

Then she stood silent. She could not look at the Count, but turned her head away.

He advanced slowly, and was silent for an instant.

"I came, madam, according to our appointment, to invite you to visit Lord Henry's gallery of pictures," said De Horn, at last, with a keen, expressive glance, which made Angelica's cheeks blush crimson.

"Ah, now she is looking better," said old Kauffman, eagerly. "Go, my child, go with his Excellency. Why didst thou not explain? A walk will do thee good. I will return to that ingrate. Where is the sketch for her Majesty's portrait, Angelica? The Count is anxious to see it. We think of representing the Queen as Venus awakening the sleeping arts of England. The idea seems to me worthy of our great Dante himself."

Then he went on talking of the ball, of the Princess, of the brilliant scene of his Angel's triumph the night before; then he said he should delay no longer, but return

at once to Zucchi at his lodging. "It is better to forget the past; Antonio is a young man who owes almost every thing to our protection; he has proved himself an ingrate, but that is no reason to give him up altogether," said old Kauffman. Angelica did not hear a word he said. She saw him put on his cloak, look about in the corner of the room for his stick, take his three-cornered hat, and go off, calling to little Rosa, who was at play down below. Angelica, in her state of suppressed excitement and nervousness, was terrified to be alone with De Horn, and longed for some other explanation, some greater certainty. She tried to forget every thing in the present. The present—it was this unknown person, so familiar already. The present—it was in her own beating heart, in her studio with the pictures in every corner, the dreams, and the allegories, and the fanciful bedizenments of the truth.

People are sometimes distraught and driven on by unaccountable impulses. These two people seemed possessed; it is impossible to say what was real, what was mere illusion, in their relation. "I have brought you back your ring," said the Count, quickly. "Come, there is no time to be lost. I have made all arrangements. Will you come?" he repeated, and he took both her hands, and looked at her with his deep eyes.

"Do you remember the day we first met?" De Horn continued, gazing at her fixedly. "Some strange presentiment drew me in your steps. I followed you in my gondola; I watched you as you passed from picture to picture in the Doge's palace. Angelica, from the first moment I knew you, I had a presentiment how it would end; even when you left Venice, I knew I should see you again."

"Lady Diana had a presentiment too, I suppose," said Angelica, recovering a little, and speaking with a gentle laugh.

De Horn turned white, then black. "I was mad. I am in earnest now," he said. Then eagerly, "Don't delay, pray do not delay! The time is running short; the priest is waiting. You have promised; you, Angelica, are not of those who deceive."

"I hope not," said she, clasping her hands.

Angelica went stubbornly into her room, dressed herself, pulled on her silk hood; the broad frills fell over her face. Then she came out, and returned to the studio, where De Horn was waiting, gazing at her picture: he sprang forward with two long strides. "Are you ready?" he said. "My good Angel! my preserver! my idol!" So he called her. His love-making was somewhat to order, somewhat mechanical, so she afterward felt. At the time she was in a state of such strange excitement that she did not very clearly know what he said. She only

knew that this was some one who was grateful for her favors, some one in trouble whom she could serve; that by serving him she best served herself.

Here was a protector able and willing to help her. Henceforth she should have her own standing-place in the world; no longer to be tossed to and fro by variable tides, no longer to be dependent upon the chance favors of fashion, of patrons, upon their humors and fancies. She should have some one to turn to whose right it would be to defend her, some one noble, generous, gentle, the prince of her wildest dreams. People might blame: let them blame; she had a *right*, as other women had, to be loved, to give happiness, and to receive it. Who should dare interfere?

Little Rosa saw them as they started, and came running up. "Uncle did not take me with him. May I come with you, cousin?" she asked, taking Angel's hand.

Angelica held the little fingers tight in hers for an instant, and looked up at De Horn, who shook his head impatiently. "Go back, child," she answered, with a soft kiss; "I shall not be long away from you." She remembered the words afterward, and they seemed to her significant.

The child looked up, wondering, as they walked away along the sunshiny pavement; then they and their shadows crossed the angle of the square and disappeared behind the railings—the light drifting figure, the tall black man with his sword and his cocked hat.

De Horn appeared impassive as usual, but secretly he was in a fume of impatience. They were not safe until they had reached the church. They walked quickly and in silence. Angelica scarcely knew how to speak to him; once she felt inclined to turn back. They were passing the house where Zucchi lodged; some scarce controllable impulse made her stop; but as she hesitated she looked in her companion's face, and that one glance showed her it was too late. He pulled her hand through his arm, and she knew that she was glad it was too late.

Every body knows how strangely all the things that people have been and felt and loved sometimes, almost from very vividness, seem to lose their separate existence in our mind. The images grow confused, and we know what we fear and hope without realizing why or how. Angelica was in some such state as she hurried on with De Horn.

The people along the street made way for them as they hastened past. No one seemed to notice them particularly; she saw the common story of every day—the fish-wives shouting their wares, the coaches rolling, the windows opening and shutting; they too met a ghastly procession on its way to Tyburn, with a crowd hurrying along. De Horn turned pale, drew her closer to him,

and hurried away down a side street. They stopped at last at the low doorway in a passage out of Spanish Place. Afterward Angelica remembered that a great carriage went by just then; as it passed she saw the harness glittering in the sun.

CHAPTER XXIV.

SIGN.

IN supreme moments of life people notice many things unconnected with the circumstance that is impending. Angel ever after remembered the stupid little details of that morning's walk, and the sight of glittering harness in the sunshine would give her some odd feeling of mingled shame and regret; so did the swing of a curtain at times when it took a certain fold. De Horn held up the old curtain that swung before the chapel door, and she walked in with her hand still upon his arm. It was a warm sunshiny morning, the streaks of dusty light reached to the altar, where a priest was standing with an open book, and the two chorister boys were in attendance. Nowadays such a thing could not be; even then it was scarcely possible; but chance and opportunity had helped De Horn. He had met the priest, perhaps the only man in London who would have served his purpose, and his evil genius had not failed him yet.

The ceremony began, and Angel finds herself before the altar, looking at the darkened picture of Mary Mediatrix with the stabbed heart in flames. And the priest reads on, and the words of fate echo through the chapel, and the dream is dreamed out—a dream of blessing, a dream of prayer, a dream of peace never to be fulfilled. The whole thing seems so real, and is so baseless a fabric, a semblance only of what might have been so true for both these people. The prayers beat against the walls with chill echoes; the little choristers swing their incense; outside in the street the people are passing on their daily business. A woman, seeing the door open, comes in and kneels in a quiet corner of the chapel; the Count started and looked round uneasily, hearing footsteps; then, re-assured, he turned his dark eyes, not without some expression of feeling, upon the bent head by his side. And then the priest's voice ceases at last, and the boys give a parting swing to their censers. It is over; the blessing is spoken in Latin, reluctantly enough and inefficaciously enough to vindicate the power of all true benedictions.

"You have yet to sign," said the priest, hoarsely. He was an oldish man, and seemed ill and scarce able to stand. More than once his voice had faltered as he read the service. He came slowly down the steps of

the altar, and led the way to the vestry. There, after taking off his robe and slipping on his common daily vestment, he fetched a great book from a closet, and made them sign—*Charles de Horn, Angelica Kauffman*—in the ruled place in the long column.

Angelica, incautious, incomplete, loving-hearted, went on acting in this dream as if it were all a reality, and looked up smiling, with her eyes full of tears. "You see I have done as you wished," she said. And the stranger she had so imprudently trusted, forgetting for one instant that it was but a semblance of a shadow, broke out into some vehement and almost tender protestations of affection and unalterable fidelity.

Then he turned, still holding her hand, and whispered something to the priest, and slipped some money into his palm. The priest seemed to demur, to ask for something more.

De Horn looked vexed. Angelica was still absorbed and not very observant.

"Have you a purse?" said De Horn to her; "in my agitation I have forgotten mine."

Angelica fumbled in her pocket, and put her little purse with its hard-earned guineas into his hand with a low laugh.

"I did not know it cost so much to get married," she said, gayly.

"This is an unusual marriage," the priest replied, knitting his brows; "the fees are very heavy, and there may be more to pay."

Then arm in arm the new-married pair walked down the aisle in silence; there was no triumph of music and friendship to escort them, but they heeded it not, and they came to the doorway where the curtain was swinging. Again De Horn lifted it for his bride to pass under, and stepped back into the shadow as he did so. She, with her radiant, beaming face, stepped out into the sunshiny street, and at that moment, by some strange chance, a lady crossing the road, followed by her footman, came face to face with the new-made bride. Some chances happen so strangely that one scarce can call them chances. They seem as though they were results following some secret law. Angelica stopped, turned white, then crimson.

"You, Angelica! I am in good luck to meet you," cried Lady Diana, for it was she. "What, have you been confessing to your priest? Why do you look so amazed, child?"

"How did—how came you here?" faltered Angelica.

"I have a cousin living in Manchester Square. Lady W. set me down just now, and the day was so fine that I determined to walk home," said Diana, smiling. "I did not expect to find such good company along the road."

Lady Diana seemed to take it for granted that Angelica would walk back with her, and began to move onward at an easy pace.

Angelica lingered and looked round anxiously and bewildered. De Horn had not come out. What would he wish? what ought she to do? She hardly knew what to do; she was little used to acts of deception. Lady Diana remembered afterward how strange her manner had been.

"Could you—could you wait here?" said Angelica. "Don't—don't come in with me. I will—My confessor." She pushed against the leather curtain and rushed into the chapel again, trembling lest Diana should follow. The place was quite empty now, no one was praying or being married at the altar, all the lights were out. De Horn was not there. She crossed, calling him once or twice gently, and reached the door of the vestry, where they had signed the papers a few minutes before. As she came along Angelica heard voices, those of De Horn and the priest who had married them. Were they angry? Surely she heard wrongly?

"If you dare," said De Horn; but as she opened the door she found herself almost in his arms. "Is she gone, my Angel?" he cried, in a different tone.

"Lady Diana is waiting. Shall I tell her? Oh, may I tell her all?" said Angelica, imploringly.

"Not now, not now," he answered, turning pale. "Do you know that my very life may be forfeited if you do not keep my secret?" Then he gently put her away. "Go back now," he said; "go with her; it will prevent suspicion. I will make my arrangements; leave all to me. I shall follow you to Windsor. As soon as it is safe for me to speak, the whole world shall be aware of my happiness. Go now, Angel of my life. She might suspect if you delay," he said, in some agitation, as he led her gently toward the door, and infolded her once more; then somehow Angel found herself alone, quite alone, in the dim chapel once more, with a strange sinking of heart. She heard Lady Di's straggling footsteps coming in search of her.

"Is he gone?" said Lady Di, slipping her hand into her friend's arm.

"He?" faltered Angelica. "What do you mean?"

"Did you not tell me that you were looking for your confessor?" said the other lady. "Ah, child, I fear that for some people there are many things to confess after a ball," and she smiled, and then sighed a little sadly. Then, as they came away, she went on talking more seriously, saying that for her part she was glad to have been born a Protestant in a Protestant country. "I could not endure," she said, "to feel myself in the bondage of another person's will; perhaps that is why I remained protesting," she said, "neglected, but free."

Angelica scarcely listened as Lady Di talked on; it was with difficulty she could bring

herself to answer. No wonder that she was absorbed in her own affairs. She had thrown herself into her part with all her fervor of nature; this strange future did not frighten her, although her heart beat with some vague alarm. Should she be able to do her duty by her husband? She was not afraid, nor did she fear for her father. Surely, surely, she should be able to make his happiness still. Was it not her special gift to make those happy whom she loved? Where had Lady Diana wandered in her talk?

"Dear Angelica," she was saying, "you must forgive me now if I say something to you which has often been upon my lips. There is one person who frightens me for you—one person who haunts your steps. I could not help noticing his manner the night of our ball. There is something about that man—something false, believe me. I would not trust him with any one or any thing I prized."

"How suspicious people are!" cried Angelica, firing up strangely, "how uncharitable in their judgments! What has Count de Horn done to you or me but kindness? How, how can you speak so cruelly?" All her pent-up agitation broke into tears of excitement. Lady Diana was not a little indignant with her for her childishness.

"You are perfectly absurd," said that plain-spoken lady. "I have little patience, as you know, with affectation. What is Count de Horn to you or to me that we should quarrel about him?" They had reached the door of Angelica's own house by this time. Wearied out and overexcited, the poor bride pulled the bell, and, when her servant came, rushed in without a word, without bidding her friend farewell, brushing past her father on the stair, and once more ran into her own room and locked herself in, in a passion of tears and excitement.

But this storm did not last long. In an hour she had recovered, and came out and joined her two friends. She might be silent to them of what had passed, but she would condescend to no small deceptions, so she determined. Yes, she had been crying. "Never mind, father," she repeated, clinging to him for an instant, "it is no real trouble affects me. I know not," she added, "whether it is happiness or sorrow." She said this with the old familiar action, and holding his arm. She had never been sweeter than at that moment. Her grace, her tranquillity, her gentle bright emotion, unconsciously re-assured him. Little Rosa caught some hidden gayety from her cousin's manner. "How pretty you look, Cousin Angel, in your white dress!" said the child; "but the winter is come, you will not be able to wear it any more."

Whatever poor Angelica may have shown of feeling that day, it is certain that her

bridegroom never lost his composure. He actually called as usual that afternoon, and finding some company present, played a part as if nothing had happened, and, to Angelica's dismay, went away without even a look, leaving Lord Henry discoursing upon the beauty of wax-work and its superiority to marble. Rossi describes De Horn's perfect calm through all this deception. This man's interested feeling was so mixed up and complicated with real respect and admiration that it would have required a far more diffident and suspicious person than my poor heroine to distinguish the false from the true in all that had happened. De Horn's part with her was not all acted; that was the difficulty. Others found him out, because with them he was but a performer; with her he was as sincere as it was possible for a man of his nature to be. It was an unlucky fate that brought this half-developed mind, with its unscrupulous instincts, into contact with an impressionable, fanciful nature, ready to fill up gaps, to paint its own colors upon the clouds, to trust implicitly, to fear no evil, and to shirk the realities of life.

The weather broke suddenly after this last sunshiny November day. Angelica could not go out. The wind tossed the clouds, and heaped dull palls over Golden Square. The light scarce sufficed for the painter's work. John Joseph, too, seemed ailing, and required all her spare time. A week went by utterly uneventful and silent, as Angelica nursed her father and tended him. At times every thing that had happened seemed to pass from her mind. It was not, could not be true, she sometimes thought, as the days went by. She heard nothing more of De Horn. Except for the ring upon her finger she might have thought it all a dream, as she sat listening to every step, starting at every post and scrap of paper.

One stormy day Marianna brought in a letter which had been left at the door.

It was blotted with ink and with rain, and oddly spelled. Angelica herself wrote a pretty and delicately lined handwriting, and she was a little disappointed by the look of the clumsy manuscript.

"Wait, my idol," it said. "The time is not yet come. You will be summoned to the Queen in a day or two. This I have on good authority. Then will be the moment to disclose our marriage. I shall join you at Windsor. Yours till death, DE HORN."

This was all—a mere scrap to exist upon; but Angelica was of a bright and hopeful disposition. She thought well of life on the whole, and though all was uncertain, and the skies clouded, and the winds rose, and though winter had suddenly broke in upon her warm sunshine and tranquillity, she hoped on, and wove her fancy pieces, and

secretly enjoyed her dignities. A countess! What would old John Joseph say when she told him? He would surely, surely forgive the deception. One day she could not help asking him if he should like her to marry a high court gentleman, and live among the great.

"Eh! my child, who can say? Nothing is impossible," said the old man. "But my little Angelica will have to take her old father with her," said the old man, fondly. "That is, when she goes for good. At present I am best at home."

"We must never separate—never, father," cried she, flinging herself into his arms.

When the summons to Windsor actually came—as De Horn had predicted it would—old Kauffman was not equal to the journey, and Angelica set off very reluctantly alone. She left him with little Rosa in attendance. If only Antonio had been there to cheer him, she might have minded less.

Antonio was far away. He had traveled rapidly, and was already at his journey's end, thoughtfully pacing a sweet and tranquil sunshine as it flowed along a high terraced walk. From the high battlemented terrace he could look down into a walled garden, with the great pots and the citron and pomegranate trees. Some lemons still

hung to the branches, burning like gold. Some aromatic scent still perfumed the air.

Sounds came from the rippling plain beyond the villa. Oxen were dragging their sweet-savored loads. Some sound of voices, of the reed a village Pan was piping to his flock, came floating across the melting Campagna and along the terrace. Antonio, as he walked, could fancy a slight figure drifting—almost hear a gay voice echoing for a moment more clearly than the shepherd's pipe. Should he find her in that little pavilion at the terrace end? He went up to it, opened the door, and looked in, almost expecting to meet the glad flash of the azure he loved better even than those Italian skies. There was no one in the little arched pavilion, only the beauties from its casements spread afar all the wonders of Italy rippling to the fragrant horizon. It was all lovely in its dimness, this shadowy land of ilex and of cypress, of tender light and delicate echo. Meanwhile Angelica, muffled in John Joseph's own cloak, hooded, snooded, shodden with fur, is slowly traveling along the snowy English lanes that lead to Windsor, to the great castle sumptuous on its hill, to the old straggling city of gables, and of the quaint memorials belonging to our grotesque and fire-warmed land.

Editor's Easy Chair.

THIS is the three hundredth number of *Harper's Magazine*, the last number of its twenty-fifth year. With June it begins its twenty-sixth year and its fifty-first volume. Those of its friends who have the early numbers still recognize the familiar exterior, for that has never changed. The little cherub, its good genius, still sits up aloft bestriding the world in sign of the universal sympathy to which he appeals, and blowing his rainbow bubbles in token of the bright and pleasant way in which he seeks to entertain the world. The little ministers at his side still scatter the flowers of wit and romance and wisdom which for a quarter of a century have been dropping from their hands; and we like to believe that the well-known yellow cover, with its blithe and airy figures, has come to seem to many and many a reader and friend not the sere aspect of encroaching age, but the sunny brightness of perpetual freshness and morning.

But when the old friend and associate of three hundred numbers of the Magazine turns to the earliest numbers, he seems to open into another world. Certainly it is not even to his eye to-day's familiar page of *Harper*, for in the first number the only illustrations are pictures of the busts of three historians, Prescott, Alison, and Macaulay, and five prints of "Fashions" for early summer. These are all. And no student of the *Bazar*, we may be very sure, would care to appear this year in the fashions of that long-lost June. The grave editor says, in speaking of his great theme, "There is a decided tendency

in fashion this season to depart from simplicity in dress, and to adopt the extreme ornamental elegance of the Middle Ages." Had the grave editor taken down the learned work of Mrs. Stone, would he have supposed that the "decided tendency" which he remarked was peculiar to his own age? Or would the reader of to-day turn from the vision of Broadway or of the gay world any where to the modest costumes of our earliest number, and imagine that "the extreme ornamental elegance of the Middle Ages" was gone forever? The "straw hats for promenade" of a quarter of a century ago were almost crownless, and had very broad flat rims, and the hair was braided low and massively over the ears. And here is the "straw bonnet" of that remote period. The lady who wears it has the air of one irreproachably *comme il faut*. But the boys in the streets would laugh at her to-day. The bonnet, indeed, resembles a "calash," such as the ladies of Cranford may have worn, and the Yankee ladies did wear, forty and fifty years ago. It is, however, longer, and diminishes behind, and there is a cluster of flowers at the side. But the lovely head is quite hidden in it, and the eyes have some protection from the sun, which the members of Mr. Bergh's society wish for the eyes of eighteen hundred and seventy-five, under the jaunty and "keck" hats of to-day.

The literary repast of that first number had the beginning of Lever's *Maurice Tiernay*, and Mrs. Marsh's *Lettice Arnold*, and *Lizzie Liah* as its chief dishes. But with these v

sketches of travel and biography, the little essays and poems and miscellany, which have never failed upon this table, spread profusely for three hundred feasts. We learn from these faithful pages that Mr. Bryant had just published his *Letters of a Traveler*, and Bayard Taylor his *El Dorado*, a book which is praised for its picturesque beauty and chaste simplicity. In France the republicans had just elected Eugene Sue to the Assembly, and four-fifths of the army votes were cast for him. Louis Napoleon was President of the Republic; and the editor says of him that in his adroit and dangerous manner he is advancing with rapid strides toward absolutism—"that personal domination independent of the constitution which is the evident aim of all his efforts and all his hopes." He adds that as Louis Napoleon has been outvoted, he will undoubtedly be willing to try force. Then, with hearty American faith, the editor exclaims: "In any event, we do not believe it will be found possible to overthrow republicanism in France." The editor, unlike his brethren of to-day, was capable of being mistaken.

In England Prince Arthur was just born, and it had been decided that an iron building should be erected in Hyde Park for an industrial exhibition in 1851. Captain Perry and Sir John Ross were about sailing in search of Sir John Franklin. Wordsworth and Bowles—Byron's Bowles—had recently died, and due notice was taken of them in the Magazine. And Madame Tussaud, whose name is famous from the wax-works, was also just dead, at the age of ninety. Ebenezer Elliott, the Corn-law Rhymers, had published his last volume, and Mr. Browning's *Christmas-Eve and Easter-Day* had appeared, and the *Roman*, by Sydney Yendys—the pseudonym of Sydney Dobell. Mr. Bruce's *History of Greek Literature* and the first two volumes of Charles Merivale's *History of the Romans under the Empire* were also among the new books. In Parliament the education bill of Mr. Fox was warmly opposed by Lord Arundel, of an old Catholic family, on the ground that it provided only for secular education, and that secular education is essentially atheistic. The Editor's Department is not fully furnished in this first number. The Table, which stood there for a long time, and was considered by the giddy to be the monthly sermon of the Magazine, had not yet appeared; the Monthly Record of Events and the Literary Notices were there, but not the Scientific Record, although polite attention was paid to scientific progress. The Monthly Record was not yet complete and thorough as it has now become, and the Drawer was not yet opened—that Drawer into which fun from every part of the country now flows as naturally as water runs down hill. Nor, as yet, was the Easy Chair. When, at last, it was wheeled into the place it has so long occupied, its first occupant was one of the most delightful of American writers, whose *Reveries of a Bachelor* and *Dream Life*, appearing soon after the issue of the first number of *Harper*, were the most popular books of the time. They were "devoured" by young men and maidens all over the country, who found in them their own dreams and visions, their hopes and despairs of the heart, the dominant emotion of youth, expressed with a tender grace and delicate delicacy which gave the books the value

of poems. There were many who hailed the sweet and contemplative genius of the writer as the natural successor of that of Irving; nor has his successor in the Easy Chair ever felt the force and character of his predecessor's influence more than in the earnestness with which a famous belle—under a hallucination as to personal identity—whispered to him, "Oh, Mr. Easy Chair, when your *Reveries* was published I thought I had never read any thing so delightful; but your *Dream Life* is heaven itself!"

Through all these twenty-five years and these three hundred numbers it is a very pleasant thought that the bonds between the Magazine and its readers have been constantly strengthening, and that it turns toward its half century with a firmer hold upon the public than ever. It has seen many and many companions spring up around it, some of whom have fallen asleep, while others are wide awake, and running their race joyously. The old *Graham* and the *International* and *Putnam*—to much of whose estate the *Atlantic* has fallen heir—were the most popular of its early compeers. They are all gone, and the younger born are prosperous and enterprising, and furnish with *Harper* a monthly feast which to the reader of *Graham's Magazine* thirty years ago would seem miraculous for its variety and excellence. During all this time, too, the general character of this periodical has not essentially changed. It has, of course, immensely improved, and it is, we may say, equally of course, very much better to-day than ever before, simply because the resources of a magazine to-day are so very much greater than they were twenty-five years ago. And if the general character is much the same, whatever the advance in development may be, it is because the original conception of what a magazine in America should be was so felicitous and accurate. The immense success and popularity of the Monthly prove it.

One of the binding principles of its composition was and is that it shall not be controversial. It addresses an enormous public which is of very various and decided opinion upon all the great questions that admit of warm controversy, and which has many and many organs playing the favorite controversial tune in every key. But this public has a common ground of interest in the Elysian fields beyond debate, and in them the Magazine leads its reader to wander, and by those still waters to recline. There is no partisanship and no bigotry and no school in a tale of love, or a sketch of daring adventure, or in the music of noble poems. The politician, the bigot, the controversialist, in any sphere except that of good manners or some passionless point of scientific research, finds no welcome and no place in these pages. Only what Addison called the minor morals and manners are discussed here—the tea-table proprieties, as some cynic calls them. But Addison did not mind the size of his texts. He knew that the least of them led to the truth, as all roads lead to Rome.

Nor has the Magazine any reason to regret that it has faithfully observed the principles upon which it was founded. While great questions and immense interests have engaged the public attention during all its life, and have been discussed and decided and adjourned, it has still found its diocese enlarging, and its efforts to deserve friends rewarded by increasing friendship.

Happily its youth is immortal. Time can not wither it, for its sources are forever freshly renewed. It has spoken of itself, for this is its birthday. And in sitting down it begs respectfully to pledge its old friends and companions, and to hope that all who are entering upon their twenty-sixth year may do so with the same happy prospects that smile upon *Harper*.

Among the most interesting events in the editorial career is the reception of letters from innumerable correspondents, near and far, laden with counsel as to the editorial conduct of affairs. Poor Thackeray complained in his mirthful way of the oppression on the part of authors who came to offer their little contributions. They insisted upon stating the circumstances under which the article had been composed, and upon entering into general biographical details, and upon presenting the leanness of the family purse and the ill health of many relations, when all that the harassed editor wished to know was whether the proposed paper was interesting and available. How often in the life of this Magazine must not the excellent and devoted editor have verified this story of Thackeray's by his own experience! How many minutes, hours, days—yes, weeks—of priceless time, never to be recovered, has he not consumed in reading the difficult manuscript which recorded the fact that the writer's hands were cramped with cruel rheumatism, as if the interest and value of the contribution were thereby enhanced; or in listening to a piteous and touching tale of poverty and suffering, which should certainly have commended the suppliant to a charitable retreat, but failed to commend the story or essay which it prefaced to publication.

This is a text upon which the Easy Chair has preached more than one little sermon, but the present exhortation is somewhat different. It relates to the opportunity enjoyed by all editors of becoming familiar with the humane disposition of their fellow-creatures as shown in the willingness to attend to duties not strictly their own. The editor, opening his mail, reads that "Aristides" is surprised and mortified that such a story or sketch as he has just read in the columns under the editor's control should have escaped, as of course it must have escaped, his Argus eye, and so have slipped in to deform the otherwise admirable contents of the last number. "Aristides" hopes not to have another occasion of calling the editor's attention to such a slip. Then "A Subscriber of Twenty Years" must really say that he thinks the editor's common-sense must have nodded when he expressed such sentiments as are found upon page — of No. — of a work which until now has been always the most welcome visitor at the "Subscriber's" house. "Araminta," also, wishes to know how her friend—unknown, indeed, but none the less esteemed—the editor of so justly popular a publication, could have admitted a tale of such doubtful morality, *to say the very least*, as the "Millennial Wash-Tub" in a recent issue. And "Pacifcus" writes merely to say that of all silly and stupid performances ever palmed upon a long-suffering public, the serial now running through successive numbers is the silliest and stupidest, and wishes to know why it can not be stopped at once, and the space filled with something more interesting

and attractive. "Index" demands to know how the editor can justify his consistency in last year describing a great movement for humanity as tweedle-dum, while he now refers to the very same as tweedle-dee. And "Torquemada" threatens to hold him up to public scorn if he does not confess the wretched sophistry by which he is leading innocent readers to various kinds of perdition.

These letters and all of their kind say but one thing, and the energetic correspondents would at once see it if the letters were collected in a book and shown to them. They all say, "We could manage your business in this and that detail very much better than you do yourself." And how true the remark probably is! That is the sting of it. When the lawyer, or the merchant, or the mechanic, or any other person with nothing to do comes into the editorial room to squander a part of the day, and finds the functionary with his hand buried in his hair, or with moody eyes intently downcast, how little those lazy visitors know that the melancholy editor is reflecting with remorse upon the fact that the world overflows with people who could do his work so much better than he does himself! Are other persons in their various vocations kindly reminded of the same great truth? Does "Aristides" write to Mr. Stewart that he is amazed to know that such wretched muslin could be found upon his counters as the last yard that his wife bought? Does an old customer write to Mr. Astor that he could make very much better investments than he does, and to Mr. Vanderbilt that his last railroad bargain is excessively stupid? If these gentlemen make mistakes, they undoubtedly discover it; but do they find it out by the representation of some anonymous friend?

There lies the moral, "Aristides" and ancient "Subscriber," and young "Araminta" and "Index," and "Pacifcus" and "Torquemada," and all the illustrious host of censure. When the editor finds that the public is leaving him, he begins to consider the reason. But the public shows its disposition in one infallible way. It declines to buy the wares. It is not by a letter here and there, pro and con, but by signs which he instinctively reads, and which are not written, that he knows the movement of the public mind. The essay which "Huxley" writes to condemn, "Darwin" hastens to write that he approves. The story which "Middlemarch" declares to be mawkish, "Corinne" insists is "too lovely." The sketch "Zeno" stigmatizes as a marvel of stupidity, "Epicurus" commends as exceptionally brilliant. As the kind correspondent seats himself to ask if the serial which he does not like may not be discontinued, let him remember that six other correspondents are seating themselves to ask if another serial as fascinating may be expected to follow it. The editor's letters, indeed, answer each other. If the excellent writers knew it, they would perhaps spare their pains and the editor's time. Yet meanwhile the great aggregate of which they are parts, but not representatives, has a movement of its own which it is the editor's duty to comprehend. It may be wise for him to yield to it or withstand it, but he studies it in signs more accurate and significant than the chance letters that flutter into his basket.

The Easy Chair speaks for its editorial brethren.

ren, not for itself, for its withers are unwrung by correspondence. Such as comes to it is of so wise and gentle a censure that it is but a pleasure to read. Thus "Clio" writes: "Dear Mr. Easy Chair,—Don't you think you ought to have been more precise in your remarks upon costume or dress a month or two ago, and not have left us to suppose that you did not know the proper designation of Mr. Forster to be the Right Honorable, not because he is a member of Parliament, but of the Privy Council? You gave the impression of supposing that members of Parliament had some especial honorary title which you said was not Honorable, but implied that it was something else. I am so solicitous that you should not be misunderstood upon so serious a point that I am confident you will pardon my presumption." Could any correspondent be more delicate, any suggestion more airy? The Easy Chair answers "Clio" here and now that if in saying that Honorable is not the proper title of a member of Parliament it gave the impression that some other was, that impression was correct. A member of Parliament who is not a member of the Privy Council is known as M.P.

If editors could receive only such letters! If the strain of any addressed to the Easy Chair is harsher, it instantly assumes that the missive is meant for the responsible editor, and hands it over accordingly.

THIS is the centennial year of Concord, Lexington, and Bunker Hill, the opening of the Revolution, and the first paper in this number of the Magazine is a complete and thorough story of the great day of the 19th of April, 1775, at Concord, in Massachusetts. In June is the anniversary of Bunker Hill, and that of the other famous battles of the Revolution will rapidly follow. The Magazine has already, some months since, begun the erection of a centennial monument of the true glories of America in the series of papers recounting the progress of a hundred years in every department of the national life. These papers, carefully prepared by experts and scholars, are well worthy the attention of the country, and no nobler or more comprehensive contributions will be made to the centennial year. The great exhibition at Philadelphia will show results and contrasts, but these papers trace the progress of change and improvement step by step.

The celebrations of the battles and the exhibitions and the pictures, such as these papers present, will turn the national mind to the contemplation of times and men which had become somewhat obscured in later days. In every way this will be most useful, for this country is fortunate in its traditions of that time; and the characters and career of its public men, the tone of public and of private life, are all texts that the youth of to-day and the men of every age to-day may well ponder. The celebrations began at Salem, whither a British force was sent in the early spring of 1775 to destroy military stores. As the troops marched toward Salem, the minute-men, commanded by Timothy Pickering, took up a bridge, and the British commander, seeing his design discovered and the provincials ready to receive him, retired in good order. This was one of several expeditions sent out by General Gage for the purpose of destroy-

ing material of war, the last and most famous of which is described by Mr. Hudson in his article. At Concord and at Lexington there will be a celebration upon the 19th of April. Concord erects a statue of the Minute-man of the Revolution on the spot where Isaac Davis fell in "the first organized resistance to British aggression," and Lexington dedicates statues of Hancock and Adams. Bunker Hill already has its tall gray shaft, which "meets the sun in his coming," as Webster said fifty years ago, when in the presence of Lafayette the corner-stone was laid.

These three famous fields are all in one county, which may well be proud this year. But this year and the six following years furnish in their centennial memories reason for the pride of all America, and they furnish warning and inspiration too. Nothing is more wholesome than for a people to be reminded of a noble ancestry and of their illustrious deeds. America has had an immense heritage, a boundless opportunity. How has she used them? How is she using them? Is the present worthy of the past? Is the promise fairly fulfilled? Have Sam Adams and George Washington left a line of equal descendants? Are we faithful to the great and glorious memories of this year '75, and do we show our faith by our works? These are the centennial questions which every true son of Revolutionary sires will earnestly ask himself.

A HUNDRED or two years ago when, as Mrs. Barbauld said, the highest ambition of women was "to please," and when, as Charles Lamb said, the theme of every novel or story of fine society was "the undivided pursuit of lawless gallantry," it may well be supposed that Lady Clara Vere de Vere found that time did not hang heavy on her hands. But as the world rolls on, the remorseless spirit of the age challenges the traditions which seem to so many minds wise and sacred merely because they are old, and among them that which assumes an elegant and ornamental idleness to be a woman's true career. Yet a bad practice is not good because it is hoary, nor an injustice just because its tyranny is ancient. Nothing is more amusing than the argument that a proposed step forward must be unwise because it was never taken before. "Who ever heard of such a thing?" exclaims old Conservatism; and that it is "without precedent" is conclusive in many minds against what shall itself presently become one of the most honored and majestic of precedents.

The great lesson of history is courage. If the argument which Conservatism urges so warmly to-day had been accepted as conclusive a century or five centuries ago, the world would have been paralyzed. It is easy to comprehend from similar experience in our own times how the solid, "sensible," well-to-do sentiment of the English county of Bedfordshire must have lifted eyes and hands of amazement over the queer vagaries of that amiable but visionary gentleman, John Howard. It is all very well, quoth respectable public opinion, to sentimentalize about jails and the sufferings of prisoners; but felons are not angels, and if men break the laws they must be made to smart for it. There is no knowing where this kind of meddling may end. If Mr. Howard insists upon his whim, he will be sure to develop a mawkish sympathy for malefactors, and the com-

mission of crime will come to be considered a passport to comfort at the public expense. We had better make the consequences of crime so disagreeable that nobody will care to risk encountering them. This is the natural strain of the spirit that likes to call itself conservative, and by way of frightening people from committing crimes, it hung them for cutting down a cherry-tree and for stealing a loaf of bread.

But John Howard, like Sir Samuel Romilly a little later, did not think that wrongs were any more tolerable because they were called the bulwarks of society, and were said to be founded in natural justice and the reason of things, nor, on the other hand, was he afraid to undertake to remedy them because such efforts were derided as sentimental and visionary. The highest wisdom yet applied to human conduct, the golden rule, happens to be pure sentiment, and reason and logic are very feeble motive powers in comparison with it. John Howard was a country gentleman much addicted to reading the Bible and studying his thermometer: a mild kind of White of Selborne, his neighbors probably thought, until he was made high sheriff of his county. Then he saw what English jails were, and he resolved that they should be so no longer. Within a year he had personally inspected almost every jail in England, and found that they were physical and moral pest-houses—dens of inconceivable suffering and nurseries of the most loathsome crime. In one jail he found a cell so foul that the wretched inmate prayed to be hung. Howard shut himself into the dreadful place, that he might know what it was, and remained until he almost sank under the exposure. When such a man spoke, England must listen, and prison reform began with him.

John Howard's story is but an illustration of the methods in which real reforms are accomplished. To some person the work to be done seems to be the great work of the world, and he is absorbed in it with the sublime enthusiasm which is known as fanaticism. His reform is his one idea, and it is the men of one idea who have been among the chief benefactors of the race. The work that John Howard began, the improvement of prisons and hospitals, was an individual and voluntary work. But, like all such, it kindled many a generous heart and produced wide and incalculable results. It was nearly forty years after he began to visit the jails that Elizabeth Fry found in Newgate prison, in London, the wrongs of the old system, and from that moment her life was consecrated to the reform, as his had been, and she too traveled through various countries in Europe to extend her plans of improvement. Elizabeth Fry was a Quaker, and the Quakers had always asserted the practical equality of the sexes in many kinds of activity that are usually confined to men, so that she, although a woman of family and wealth and refinement, was not held to have "unsphered" herself by her humane labor and devotion. In our own time Florence Nightingale has shown the same intrepid will and self-reliance, and, like Grace Darling and Ida Lewis, has quietly vindicated her right to do what she had the inspiration and capacity to do.

And since Conservatism itself, carried forward by increasing wisdom, no longer insists that Mrs. Barbauld summed up the Whole Duty of Wom-

an in exhorting her "to please," Mrs. Fry and Florence Nightingale have certainly suggested a way by which the De Veres every where can prevent time from hanging heavy on their hands. And here among ourselves the path is made smooth for them by their own friends and associates. Early in the spring a meeting was held at the Association Hall in New York, at which Mr. Bryant was chairman, and at which three well-known and respected citizens, the Rev. Drs. William Adams and Henry C. Potter and Chief Justice Daly, spoke. It was the annual meeting of the State Charities Aid Association, a society which had its origin in the same impulse that inspired Howard and Mrs. Fry and Florence Nightingale. It is a voluntary association to insure a more faithful and efficient administration of the pauper system of New York, and also to improve or change the system itself by intelligent legislation. Its machinery is very simple, consisting of voluntary visiting committees in the various counties and towns for the purpose, in concerted action with the local official authorities, of visiting the public charitable institutions and the poor who are relieved by charity. These committees, composed of men and women of every sect, are in correspondence with a central association in the city of New York, and they are now twenty-seven in number, extending from Suffolk County, at the eastern end of Long Island, to Ithaca and Geneseo, in the western part of the State.

The work already done would be the amplest justification of the formation of the association, were it only the exposure of abuses which it has made. For the task of Howard and Mrs. Fry must be constantly renewed. If hospitals and prisons are to be kept free from terrible abuses, it must be by constant interest and attention. The Aid Society sprang from the personal observation by ladies of some shameful details in the management of certain neighboring public charities. Their interest awakened, they soon aroused others, and once embarked in the work, they began the most thorough and careful study of the whole subject, searching the experience of other countries, and throwing light upon the whole melancholy and menacing problem of pauperism. At the December meeting Dr. Elisha Harris told the story of "Margaret," the result of his own personal investigations. It is the tale of the consequences of the neglect of one poor little pauper child. The report says:

"Her name was 'Margaret.' Perhaps an orphan, perhaps abandoned by her parents, this poor little girl was left adrift in one of the villages of the Upper Hudson. There was no almshouse in the place; but she was a subject of out-door relief, probably receiving occasionally food and clothing from the officials, but never educated, and never kindly sheltered in a home. She became the mother of a long race of criminals and paupers, and her progeny has cursed the county ever since. The county records show *two hundred* of her descendants who have been criminals. In one single generation of her unhappy line there were twenty children; of these, three died in infancy and seventeen survived to maturity. Of the seventeen, nine served in the State-prisons for high crimes an aggregate term of fifty years, while the others were frequent inmates of jails and penitentiaries and almshouses! Of the 623 descendants from this unhappy girl, who was left on the village streets and abandoned in her childhood, a great number have been idiots, imbeciles, drunkards, lunatics, paupers, and prostitutes; but 200 of the more vigorous are on record as criminals. It is estimated that this neglected little child has thus cost the county authorities, in the effects she has transmitted, at least

one hundred thousand dollars in the expense and care of criminals and paupers, besides the untold damage she has inflicted on property and public morals. When we think of the multitude of wretched beings she has left upon the earth, of the suffering, degradation, ignorance, and crime that one child has thus transmitted, of the evil she has caused to thousands of innocent families, and the loss to the community, we can all feebly appreciate the importance to the public of the care and education of a single pauper child."

The inquiries of the society disclose that all abuses have not yet been corrected, and that the millennium will still be a little delayed. The reports from various parts of the State show that in many poor-house hospitals the sick and insane are sadly neglected, and that there is not adequate public provision for the chronic insane. In many of the poor-houses the harmless insane live in cells, and suffer from cold and hunger. The visitors of one hospital saw dinner served to thirty-two insane patients. It consisted of one table-spoonful of fish, including bones and skin, and one potato for each person. Water spilled in the same room froze upon the floor. The report states that this was at "the notorious Flatbush Insane Asylum, in Kings County," and adds that the State Commissioner of Lunacy in his last report gives the sworn testimony of the attendants that for several weeks the patients were in a half-starved condition. For such an abuse and such unspeakable suffering the only hope of remedy is precisely the humane interest, inspection, and publication of a voluntary association of neighbors and citizens, such as the visiting committees of the Charities Aid.

The same personal observation of the management of jails has already in some instances produced very great improvements. In Richmond County, where young boys were formerly sent to jail for misdemeanors, and were locked in with criminals who passed their time in corrupting them, the boys are now sent to the reformatories. The women, who were formerly separated from the men by a wooden partition full of cracks and holes, are now removed from them by a solid wall. The inmates, who formerly passed the

whole day in idleness, are now to be made to work, and all prisoners committed for sixty days or more are now sent to the penitentiary in a neighboring county. Some of the magistrates, mindful of the old dodge of ten-pins for nine-pins, have sentenced many culprits for fifty-nine days, to evade the contract made by the supervisors with the penitentiary. The advantage of the contract is that it secures work for the two months' prisoners, and saves the tax-payers of the county a very considerable sum. For although by the magisterial evasions only thirty-five prisoners were sent from the county to the penitentiary, their board at the jail for their full terms would have cost the tax-payers \$2912, while at the penitentiary it would cost them only \$968 50, making a saving to the county of \$1943 50.

Indeed, the experience of the society thus far proves the old truth that humanity, decency, intelligence, and care are more inexpensive and profitable than carelessness, ignorance, and cruelty. And here is a work to which many and many a clever young woman, full of energy and intelligence and ennui, listless and sad for something to do, may most wisely and most easily devote herself. The Easy Chair has received many a touching appeal from generous-hearted and educated women "out of work," and it offers them this counsel, that in their various neighborhoods they should organize committees who will undertake this work of visitation in correspondence with the central committee—a work which so many admirable women, with various other responsibilities, are already successfully doing. Read in the light of the report of the Charities Aid, how freshly significant are the familiar lines,

"Clara, Clara Vere de Vere,
If Time be heavy on your hands,
Are there no beggars at your gate,
Nor any poor about your lands?
Oh! teach the orphan boy to read,
Or teach the orphan girl to sew,
Pray Heaven for a human heart,
And let the foolish yeoman go."

Editor's Literary Record.

NO publication of modern times has produced so remarkable an effect, none has accomplished to so wonderful a degree the purpose of its author, as Mr. GLADSTONE's essay on *The Vatican Decrees in their Bearing on Civil Allegiance* (Harper and Brothers). These decrees had been abundantly discussed before, but chiefly, so far as English-speaking people are concerned, by men outside the Roman Catholic communion, and but imperfectly acquainted, if at all, with the mental conditions of its lay members. Mr. Gladstone appreciated himself that radical difference of sentiment which prevails in the Romish Church, and which really separates its communicants more radically than the different branches of the Protestant Church are separated by their variations in church form and order, or, in Roman Catholic phrase, in "discipline and regimen," and his unpardonable sin consists in the fact that his publication compelled the Anglican Catholics to perceive themselves, and even to expose to the world, these variations in

essential spirit and doctrine, which they had theretofore successfully cloaked under a unity of worship and organization. Like the Siamese Twins, these two parties are bound together in the body, and for that very reason are all the more alien in the spirit. Of this effect of Mr. Gladstone's pamphlet the reply of JOHN HENRY NEWMAN, D.D., affords a striking illustration—*A Letter addressed to His Grace the Duke of Norfolk* (Catholic Publication Society). If Mr. Gladstone's ecclesiastical predilections afford him an insight into the Roman Catholic mind, Dr. Newman's history familiarizes him with the Protestant mind. Originally a member of the Church of England, he has never lost the intellectual independence which nature conferred and early education developed. Thus his pamphlet, which aims apparently to render the doctrine of papal infallibility somewhat more endurable to the Protestant world, is itself so imbued with a Protestant spirit that it can hardly be regarded as other than a very dangerous document by Father Beckx,

if not by Pius IX. himself. If they are able to agree to no other statement in Mr. Gladstone's rejoinder, they must in their inmost souls agree with his declaration, "In this apology there is to me a strong undeniable smack of Protestantism." In two ways does this appear—in Dr. Newman's exaltation of the rights of private conscience, and in the minimum degree of authority which he attaches to papal utterances, and the interpretations by which he shears them of all their significance, and renders them dangerless because unmeaning. Conscience, according to Dr. Newman, is the divine law written in our hearts. It is not the product of education or experience, but is innate, the revelation of God's will to each man. "Though it may suffer refraction into the intellectual medium of each, it is not thereby so affected as to lose its character of being the Divine Law, but still it has, as such, the prerogative of commanding obedience." And he quotes with approval the words of Cardinal Gousset, "It is never lawful to go against our conscience." In the particular issues between Pope and conscience, not only supposable, but actual in history, he takes ground that not only has in it a "smack of Protestantism," but is Protestant all over. He puts the conscience first, the Pope afterward. To be sufficiently explicit he adduces imaginary instances, and replies to his own questioning that even an uninstructed and erroneous conscience takes the precedence over priest or Pope; and finally he sums all up in the pregnant remark, "Certainly, if I am obliged to bring religion into after-dinner toasts (which, indeed, does not seem quite the thing), I shall drink—to the Pope, if you please—still, to conscience first and to the Pope afterward." Not even Dr. Newman's specious reasoning and admirable rhetoric can make such a declaration appear otherwise than in flat contradiction to the condemnation, in the Pope's Syllabus, of the liberty of conscience. Certainly Mr. Gladstone is right in saying that "if we had Dr. Newman for Pope we should be tolerably safe, so merciful and genial would be his rule." But we have not Dr. Newman for Pope, and there would have to be a revolution in the Roman hierarchy, in comparison with which the Reformation would be a mere religious *émeute*, before he could be Pope, or, we might even say, cardinal. While he thus exalts conscience, he stops little short of deposing the Pope. The Syllabus, according to him, is not an authoritative document; it binds no one; it is not even papal in its origin or authority. This document, which has convulsed all Europe, and almost revolutionized its political complexion, which has produced a greater effect than any state paper within the current century, if not within the past three or four centuries, is "nothing more than a digest of certain errors, made by an anonymous writer," a mere index to previous allocutions and decrees, with no more binding force (the illustration is Dr. Newman's, not ours) than a lawyer's brief of legal authorities. The liberty of speech and press which the Pope condemns is only that unbridled license which Blackstone equally condemns, "the liberty of every one to give public utterance, in every possible shape, by every possible channel, without any let or hinderance from God or man, to all his notions *whatsoever*." (The italics are the author's.) The exclusiveness of the Catholic re-

ligion, called for by the Syllabus, applies only to Spain, and there only in consequence of treaty stipulations, and it only means that "the Pope does not think it expedient for every state from this time forth to tolerate every sect of religion on its territory, and to disestablish the Church at once." The papal condemnation of the declaration "that the Roman pontiff can and ought to come to terms with progress, liberalism, and the new civilization" only means what every liberal thinker means when he says there is an "irrepressible conflict" between liberalism and the papacy. The papal authority is no exceptional factor in society; it is only that of the legislature over the citizens, of the club over its members, of the physician over his patient, of public opinion over all members of society. We do not wonder, on reading Dr. Newman's pamphlet, that its author is in bad odor in Rome; we only wonder that his book is not put on the *Index Expurgatorius*.

If Dr. Newman's had been the only response which Mr. Gladstone's pamphlet called forth, he could have served his cause in no better way than by binding the two together for general circulation. But it has elicited over twenty, of which Dr. Newman's and Archbishop Manning's are the most important. To the criticisms of these responses Mr. Gladstone addresses himself in a second pamphlet, which bears the significant title, itself an argument in a word, of *Vaticanism* (Harper and Brothers). If his first publication awakened, as it is said to have done, poignant regret that such a lion had been provoked by a seeming breach of faith on the part of leading Romish political leaders, his reply will awaken more poignant regret that the aroused lion was not left without a reply. Mr. Gladstone finds no fault with the Roman Catholic religion; he makes no attack on the Church; he does not even question the actual loyalty of the Roman Catholic subjects of Great Britain; he simply undertakes to expose the claims of Vaticanism, to show to the Anglo-Catholics to what the modern claims of the Jesuit faction in the Church conduct them, and to elicit within the communion just such utterances as that of Dr. John Henry Newman. He aims to make it clear that "the Vatican Decrees do, in the strictest sense, establish for the Pope a supreme command over loyalty and civil duty," while he concedes that "to the vast majority of Roman Catholics they are, and in all likelihood will long, in their carefully enveloped meaning, remain, practically unknown." The present danger to England and to this country is slight. But the educative powers of Rome are nearly all imbued with Vaticanism. As this generation passes away, and another rises to take its place, the doctrine of religious absolutism will become more wide-spread and more pronounced. This is the danger which Mr. Gladstone apprehends; and it is to be escaped, he believes, only upon the condition that its movements are carefully watched and their bases faithfully and unflinchingly exposed. The substance of Mr. Gladstone's second pamphlet may be comprised in two propositions, the truth of which he undertakes to demonstrate, namely, first, that Rome—that is, the Pope and his confidential advisers—has "reproduced for active service those doctrines of former times, termed by me 'rusty tools,' which she was fondly thought

to have disused;" second, that "the Pope now claims, with plenary authority, from every convert and member of his Church, that he shall place his loyalty and civil duty at the mercy of another, that other being himself." An illustration of both these propositions is furnished by the teaching of Rome respecting marriage—an illustration the more effective because it comes home to every man, and with even greater power to every woman and child. "It is distinctly taught," says Mr. Gladstone, "that with marriage the state has nothing to do, that it may safely rely upon the Church, that civil marriage in the eyes of the Church is only concubinage, and that the state, by the use of worldly compulsion, prevents the two concubinary parties from repenting and abandoning their guilty relation to each other." "It is true," he adds, "that the two hundred thousand non-Roman marriages which are annually celebrated in England do not at present fall under the foul epithets of Rome." But this depends upon the mere will and pleasure of the Pope, who can by a word, if Vaticanism be sound doctrine, convert every marriage subsequently celebrated in that country, or this, according to Protestant rites, into what the Pope himself entitles "filthy concubinage." If these are strong words, they are borrowed from Vatican authority. No wonder that Dr. Newman evades this charge by the simple but scarcely honest expedient of declaring that he can not understand what Mr. Gladstone means. It is, indeed, the strength of Mr. Gladstone's two pamphlets that without vituperation or abuse, or even heat or vehemence, he simply unveils the full meaning and points out the full force of Vaticanism, sustains his exposure of its significance and effect by ample citations from its own authoritative declarations, and then leaves its disciples to make what they can of the doctrine. That the laity generally believe in this last and ripest fruit of hierarchical absolutism he does not assert; he even takes pains to deny. He simply points out to them what they are called to believe; he simply speaks "of what they suffer, not of what they do."

We have already far transcended the ordinary limits within which we are accustomed to confine ourselves in reviewing such publications. But no publication of the present century, except the Vatican Decrees themselves, has produced an effect comparable with that which it appears certain will be produced on the religious and political life of England and the United States by the unpretentious but significant pamphlets of Mr. Gladstone and Dr. Newman. No man can understand the present, or prepare himself to meet intelligently the issues of the future, who does not get some insight into this remarkable controversy. It only remains to add that both writers are masters of their mother-tongue, and their courteous bearing, the entire absence of all venom from their pages, and their often eloquent rhetoric, no less than the importance of their theme, render their essays, in a literary point of view, models of controversial literature.

Mr. THOMAS HIGGINSON, in his *Young Folk's History of the United States* (Lee and Shepard), has achieved one of the most difficult tasks which an author ever sets himself. He has undertaken to narrate the history of the United States from the days of the mound-builders to those of Gen-

eral Grant in a volume of 350 pages. Such compends are proverbially dull reading. They usually contain the most barren statements of what are regarded the essential facts of history. The life of the people, which is the essential fact, is not described. Mr. Higginson has pursued directly the opposite course. "In writing," he says, "I have adopted two plain rules—to omit all names and dates not really needful, and to make liberal use of the familiar traits and incidents of every day." The consequence is that he has prepared a volume which will render history, at least the history of their own country, attractive reading to the young folks; and while the student of these pages will probably not be able to pass with credit an average school examination, he will obtain a greater advantage in the interest awakened in historical study, and the inclination aroused to pursue it further in larger works. Not only the young people, however, will find this an interesting and useful volume: while we are not prepared to agree with a generally caustic critic who says that "it contains all of United States history that the average citizen requires in order to go through life comfortably and creditably," it is certainly true that busy men, who have little time or perhaps inclination for a careful study even of their own country, will find in this brief but general survey enough to enable them to understand the general course of the past and to read appreciatively more elaborate accounts of particular episodes and eras. Mr. Higginson has wisely deviated in one important respect from the old-time histories, namely, by devoting less space to the events of war, and more to the affairs of peace. The book is quite elaborately illustrated—too elaborately, indeed. The imaginary pictures (and they constitute a majority) would have been better omitted, and the space thus given to the artist occupied by the author. An appendix contains a complete and very useful list of books for further study, and the volume is furnished with a good index. It should be added that Mr. Higginson writes on controversial points, such as the Mexican war and our civil war, with great calmness and with judicial impartiality, though with no pretense at indifference and no lack of moral earnestness.

BRIEFER NOTICES.

No modern author has done more to exalt home life than Miss MULOCK; her last volume ought to serve in many a home a sacred purpose, by affording the most delightful of home recreations, that of music. *Songs of Youth* (Harper and Brothers) consists of forty-two poems, most of them by Miss Mulock, arranged to music from various sources. The editor is unknown in this country as a musician, and her musical contributions in this volume have been a delightful surprise to us—like the revelation of a new charm in an old friend. Collections of parlor music are common, commendable collections are very rare. The music in this volume is not too difficult for amateurs, and even young amateurs, to sing with satisfaction to themselves and even enjoyment to others. Some of the simplest are the best; we should much like to hear "Row, row, cheerly row," on the river in the moonlight next summer. The Swedish melodies, of which there are quite a number, are quaint and very pretty, and will be quite new to the American

public; indeed, there are a great many young ladies who will be surprised to know that music was ever born out of Italy. The words of the songs are in delightful contrast with the sentimental inanities which form the staple of parlor singers; they are simple but not silly, tender but not sentimental, earnest but not passionate, plaintive but not despondent; and, so far as our examination has gone, without an exception lyrical. For practical use in the home circle we know of no book to compare with this.

Professor C. K. ADAMS, in his *Democracy and Monarchy in France* (Henry Holt and Co.), has impaired if not destroyed the value of his work by his bitter and unconcealed prejudices. Napoleon the Great is not so simple a character as either Mr. Lanfrey, on the one hand, or Mr. J. S. C. Abbott, on the other, would have us believe—he was neither a saint nor a devil. Mr. Adams is unable to see any thing whatever worthy of commendation in the first Napoleon. To apply the moral code to his life, he tells us, is simply absurd—as absurd as to apply it to the deeds of children who have not yet any discrimination of right and wrong or of truth and falsehood; admits that he was never guilty of peculation, but charges his honesty to his ambition, and asserts that his profound knowledge of human nature led him to take nothing for himself, while he gave unbounded opportunities to his subordinates; describes somewhat graphically the immense contribution levied upon Italy by the French army, but forgets how the example was followed by Germany in the case of France, how all war is nothing but a gigantic spoliation. Unable to comprehend Napoleon, he is equally unable to comprehend Napoleonism—a transition state from the absolutism of the past to the democracy of the future, and combining, as all such transitions do, much of the evil as well as something of the good of both systems. The student who has an independent familiarity with French history will find in these lectures suggestive and instructive reading, but we should not advise any one to depend on them for his knowledge of the present condition or his anticipations of the future probabilities of France.

The object of the author of *Africa* (Henry Holt and Co.) is to compile in one volume a history of explorations and adventures in that comparatively unknown land from the days of Herodotus to those of Livingstone. The book will be useful to two classes of readers: those who have not the time or inclination to read the larger works from which this is compiled, and those who, having read the works of individual travelers—Du Chailu, Baker, Schweinfurth, Livingstone—desire, for the better comprehension of their reading, to get a comprehensive survey of the whole ground, or some general knowledge of the works of other explorers than those whose productions they are studying. We notice some serious inaccuracies in the book, which indicate haste or carelessness in the compilation. Fetichism is certainly not the “wearing of a charm;” and if the editor had read the appendix to *Ismailia*, he would not have fallen into the blunder involved in the statement that Sir Samuel Baker has succeeded in putting down the slave-trade in the whole territory annexed by him to the Khedive's dominions.

We can heartily commend the title of *A Rambling Story*, by MARY COWDEN CLARK (Roberts

Brothers). It is very rambling. He who takes it up will be likely to read, or at least to glance, it through, and then be vexed at himself for spending so much time to so little advantage. The hero rambles every where—in England, Wales, Switzerland, Italy—and every where comes across the heroine. We begin with an impossible adventure in some unknown woods, in some unknown place, somewhere in England evidently, where the hero stumbles across an unoccupied cottage, finds a table, “spread with a snow-white cloth of fine damask,” upon which lay fruits, coffee, delicate bread, and cakes, of which— But to do justice to the style of this story we must be allowed to quote a paragraph. “I sat down to the table as to a feast. The dainty wheaten bread seemed proffered by kindly looks; the glowing fruit suggested a fair white hand lurking among it and helping me with lavish courtesy; the coffee was cold, but its tawny juice was a welcome draught, as I inwardly toasted her who had caused me to find its refreshment awaiting me.” The unknown, who has stolen out of the cottage, is heroine to the hero; and from this forest scene to the adventure with the Italian banditti, nothing is wanting, in this rambling story, of the necessary materials for a modern operetta—except the music.

The best story on our table is *The Story of Valentine and his Brother*, by MRS. OLIPHANT (Harper and Brothers). It is long, as most of Mrs. Oliphant's stories are, but it does not drag, as some of them do, and it is novel in construction, as most of them are not. In brief, it possesses few of the faults and most of the excellences of that excellent story-teller, and ranks among the best of the productions of her fertile and facile pen. Valentine and his brother are twins, the father a man of noble blood, the mother a gypsy woman, to whom civilization is an irksome bondage, and who, when the twins are born, slips away from the servitude society imposes on her, carrying the children with her. Conscience tardily brings her to a sense of her injustice, and she stealthily returns Valentine to the father's care, or rather to that of his parents, Lord and Lady Eskside; Dick she keeps herself. The story follows the fortunes of the two, the same in birth, so widely separated in culture. It is characteristically a book of pleasant characters; even the wild gypsy woman is not repulsively painted.—*Mistress Judith*, by C. C. FRASER-TYTTER (Henry Holt and Co.), is a pathetic story, curious and original in construction, sorrowful in its ending, graphic in its pictures. Parson Ingrey and his house, Master and Mistress Hurst and their home, the village school, Trotter's end, these are all pictures which abide in our memory like those of actual and familiar scenes and personages.—*Hope Meredith*, by ELIZA TABOR, and *The Blossoming of an Aloe*, by MRS. CASHEL HOEY (Harper and Brothers), are both novels of more than ordinary merit. The former is strong in characterization; the latter is one of Mrs. Hoey's best stories, and is at once interesting and natural, except in the title, which is the only bit of affectation in it.—*Safely Married* (Harper and Brothers) begins where most novels end, with a marriage. The elfin wife, the distraught husband, the gentle Angela (well named), the maiden biographer, Miss Hammond, with the “villain,” Edgar Ramsay, are the principal characters

of this story, which has two positive attractions, of themselves no mean recommendation—it is short and simple. In addition to this, it is dramatic, and even highly wrought; and though some of the incidents in other hands would seem too melodramatic to be natural, they do not produce

this impression in the author's skillful narration. The substructure of the story is one common to both fiction and the drama of real life: it is the story of Elsie's finding her true soul in an experience of bitter sorrow, the fruit of her own willful and wayward temper.

Editor's Scientific Record.

SUMMARY OF SCIENTIFIC PROGRESS.

OUR astronomical record begins with a list of two new members of the solar system, *i. e.*, asteroids Nos. 141 and 142, discovered respectively by Paul Henry at Paris and J. Palisa at Pola, Austria, and comets (1875) Nos. I. and II., discovered respectively by Holden at Washington and by Stephan at Marseilles. Of these comets the first is the famous Encke's comet, whose motions were for a long time supposed to be retarded by an ethereal medium; the latter is the comet known as Winnecke's, whose short period of revolution entitles it to special distinction.

The continuation of the great star charts begun by the Paris Observatory, and generally known as Chacornac's, has been undertaken by Leverrier, who recently presented to the Paris Academy the first of the seventy maps that will complete the work. Astronomers will be pleased to learn that the donation of seven thousand dollars made by the banker Bischofsheim to the Paris Observatory for the purpose of securing a new meridian instrument has at length been paid into the hands of the maker (Eichens) as a first installment of the full price.

The expeditions for the observations in India and Siam of the total eclipse of the sun have already arrived at their destinations, and valuable results are anticipated, owing to the unusually long duration of the totality.

The gold medal of the Royal Astronomical Society has been awarded to Professor D'Arrest, of Copenhagen, for his researches among the nebulae.

We are now in possession of accurate information from all the American parties for the observation of the transit of Venus. At Pekin Professor Watson and Professor Young observed through a cloudy sky the first and second contacts, and made forty-four photographs during the first part of the transit. Operations were then interrupted by clouds until about an hour before the end, when the photographic work was resumed, and fifty more pictures taken. The third and fourth contacts were also observed, and measures of cusps taken with the double-image micrometer.

The first contact was sixty-eight seconds later and the second contact was seventy-five seconds later than the computed times, while the third and fourth contacts were forty-three and sixty-five seconds earlier than the predictions. This indicates for the solar diameter a smaller value than the one used in the predictions, and agrees nearly with that deduced by Leverrier from previous transits.

It was pointed out by Mr. Hill, of the American Nautical Almanac office, in his memoir on the transit, that the English predictions would be "considerably in error," on account of the adoption of an apparent diameter for the sun

which was deduced from meridian observations only, and we may note that nearly all the English observers have reported an error in the neighborhood of two minutes in their predicted times of first contact. It seems to be finally settled, if indeed there was any doubt about it previously, that different apparent diameters must be used for the sun in reducing meridian observations, and for such observations as eclipses and transits of the inferior planets. This is quite analogous to the fact that the moon's diameter from occultations is considerably smaller than that derived from meridian observations. Professor Watson also notes certain evidences of an atmosphere surrounding Venus, and from his observations at third contact obtains an approximate value for its depth.

The American party at Kerguelen Land, under Lieutenant-Commanders Ryan and Train, has been only partially successful. Neither of the internal contacts was observed, but some photographs were taken. The English party on the same island observed the ingress and egress, the latter observation being satisfactory. All the English photographs were poor. The day was generally cloudy, but enough have been secured to compensate the observers for their devotion, as this station is peculiarly valuable. From the party at Chatham Island, under Assistant Edwin Smith, of the Coast Survey, we learn that nothing valuable in the way of observations of the transit could be obtained, on account of clouds. It must be remembered, however, that each of the parties has made important geographical, magnetic, and other determinations, and that no one of our expeditions will return without completing its work of this kind, which work has a value quite independent of its bearing on the main question of the sun's parallax.

On the whole, the success has been marked; and although only one party (Professor Watson's) observed *all* the contacts, and although only one (Professor Peters's) obtained a very complete set of photographs, yet the *ensemble* of the observations of the Americans alone would suffice for an extremely accurate determination of the parallax.

The experience gained in these expeditions will be turned to good account in 1876 and in 1882, in which years transits of Mercury and Venus occur, both being visible in America. The reports of all the parties indicate satisfaction with the apparatus provided for them; and in the matter of photographic arrangements the American outfits were particularly good, both theoretically and practically, and this perfection reflects great credit on the gentlemen who had these preparations in charge. The highest testimonial has been offered by the Transit of Venus Commission to Dr. Henry Draper as an

acknowledgment of his great (and gratuitous) services in perfecting the practical details of the photographic processes—a charge for which he was peculiarly fitted by his long experience in such researches.

Detailed accounts of the physical phenomena of the transit will not be available for some time; but we note the remarkable observations of Janssen in Japan and De la Gye at Campbell Island, which declare Venus to have been seen projected against the sun's corona while yet some distance from the sun's disk. Preliminary reports indicate that Professor Watson's account of the atmosphere of Venus will be corroborated by several good observers. It may likewise be noted that the question as to the existence of a satellite to Venus is now finally settled in the negative.

We desire to call the attention of astronomers to the ephemeris of twelve close circumpolar stars for 1875 published in the *Monthly Notices of the Royal Astronomical Society* for January, 1875, by Professor Pritchard, Director of the Oxford Observatory.

These are selected for the determination of the azimuthal error of meridian instruments, and their use will be a convenience to observers, and a step in advance in observatory work. Leverrier has presented to the French Academy of Sciences an account of his researches on the theories of the eight principal planets, which he has now perfected. His tables of Saturn are nearly completed, and the tables of Uranus and Neptune will be constructed as soon as the theory is compared with observations. Thus in a few years M. Leverrier will have presented to astronomy the theories and the tables of all the major planets, the whole forming a larger contribution to theoretical astronomy than it is given to a less industrious astronomer than M. Leverrier to make.

Encke's comet was detected with the great refractor of the Naval Observatory on January 26 by Professor Holden and Mr. Tuttle, and with the Marseilles reflector by Stephan on January 27. It is extremely faint, and was not to be seen by small instruments. The theory of this comet, on which Encke spent so much labor, is in a surprising state of perfection, Von Asten's ephemeris being in error less than 15 seconds of arc. Winnecke's comet has also been successfully sought for, and observed at the Harvard College Observatory. Mr. Burnham, of Chicago, the industrious observer of double stars, has given a new proof of his assiduity in the discovery of a companion to β Leporis, which is a very difficult object. Mr. Burnham's six-inch equatorial bids fair to become as famous as Mr. Dawes's eight-inch.

In *Physics* some noteworthy papers have appeared. Among these may be mentioned Professor Nipher's elaborate investigation upon the mechanical work done by a muscle before exhaustion, the data given being more accurately determined than those published by him three or four years ago, and adopted as a basis for calculation by Professor Haughton, of Dublin.—Cornu's description of a new measuring instrument for minute quantities, called a reflection lever, which consists of a beam like a balance beam standing on four points, two on the line where the knife edge is usually placed, the other two at

the ends of the beam, all four being accurately in one plane. To the centre of the beam is attached transversely a mirror, by means of which any displacement from the horizontal may be detected and measured by the reflected image of a distant scale. The readings are made with a telescope.—Terquem's historical note, in which he calls attention to the fact that the generally received notion that Faraday was the first to liquefy the gases is incorrect, since Guyton de Morveau in 1799 liquefied ammonia gas in a bath of calcium chloride and snow.—Lubarsch's paper on fluorescence, in which he concludes from his investigations (1) that for each fluorescent substance there are only certain rays of light causing fluorescence; (2) that the color of the fluorescent light depends on the rays of incidence, and follows Stokes's law; and (3) that the most refrangible fluorescent rays produced by sunlight correspond to that place in the spectrum where the liquid shows its maximum of absorption, providing its fluorescence proves a simple one when examined by prismatic analysis of the linear spectrum.—Riche and Bardy's, upon the sources of illumination utilizable in photography, in which they give the results of their examination of eight different sources of light, viz., the oxyhydrogen light, the Drummond or lime light, zinc burning in oxygen, magnesium in air, a current of nitric oxide gas burning in a globe of carbon disulphide vapor, a jet of nitric oxide on a test tube containing carbon disulphide, a jet of oxygen on the same, and a jet of oxygen on a test tube containing sulphur. The eight lights were photographically intense in the order above mentioned, the last being eight times as strong as the first.—Cornu's valuable paper on the velocity of light, in which he gives the results of the new measurements made between the Paris Observatory and the tower of Montlher, twenty-three kilometers distant, under the direction of the council of the observatory. As a mean of 504 experiments, he finds the velocity of light *in vacuo* to be 300,400 kilometers, or 186,700 English miles, with a probable error below one-thousandth in relative value. This gives for the solar parallax, as found by the equation of light, 8.878", and by the phenomena of aberration, 8.881".—Lockyer's paper before the Royal Society upon his new map of the solar spectrum, the portion now presented being that extending from wavelengths 39 to 41. It is constructed on four times the scale of Angstrom's "Spectre Normale," the number of lines being increased—over this, which contains but 39—to 518; of which 416 have been actually identified, and the largest number of these, 163, assigned to cerium.—Huggins's note on the spectrum of Coggia's comet, which presented in the spectroscope three distinct spectra: (1) a continuous spectrum coming from the light of the nucleus; (2) a spectrum consisting of bright bands; and (3) a continuous spectrum accompanying the gaseous spectrum on the coma, and representing almost entirely the light of the tail.—Pole's experimental determination of the change in the pitch of a note which takes place when the sounding body is moving: a repetition of the experiment of Buys-Ballot. He used for the purpose locomotive whistles, and concludes that the most common interval by which the tone is lowered

when two trains pass each other is a third, either major or minor, corresponding to a speed for each of between thirty-five and forty miles an hour.—Tyndall's communication to the Royal Society on acoustic reversibility, in which he discusses the curious results obtained at Villejuif and Montlhéry in 1822, when cannonading at the latter station was heard at the former, but not the reverse, and concludes that Montlhéry must have been surrounded by a highly diacoustic atmosphere, while Villejuif was in an atmosphere acoustically opaque. He supports this position by ingenious experimental evidence.—Mercadier's, upon the law of the influence of the variation of the dimensions of a tuning-fork upon its vibrations, in which he shows that the number of vibrations is independent of the breadth, is directly proportional to the thickness, and is inversely proportional to the square of the length. From these laws it becomes possible to calculate within one or two per cent. the dimensions of a fork necessary to give any required number of vibrations.—Guthrie's curious paper upon hydrates (or hydrated salts) formed at a low temperature, which he calls cryohydrates. He shows, contrary to the generally received opinion, that the minimum temperature attainable by mixing ice with a salt is very independent of the ratio of the two, and of their temperature, and of the state of division of the ice. The temperature of a mixture of ice and a salt is as constant and precise as the melting-point of ice. He observes that the cryohydrates of the nine salts which potassium, sodium, and ammonium severally form with chlorine, bromine, and iodine are formed at temperatures ranging from -28° to -11° . Thirty-five salts were examined in this way, and it was found that the temperature at which the cryohydrate is formed is precisely that obtained by mixing the given salt with ice.—Edlund's complete paper on the nature of electricity, in which he maintains with great ability the theory that electricity is identical with the luminiferous ether, and in which he deduces most, if not all, electrical phenomena from this supposition.—And Mixter's note, calling attention to the remarkable increase in length of the spark of the Holtz machine by placing a minute gas jet between the balls affording the sparks. In this way the spark which before was less than ten inches became more than twelve, a brass ball having only a trifling influence of the same sort. In this connection may be mentioned the large Gramme magneto-electric machine recently received from Paris by the University of Pennsylvania, at Philadelphia, and which gives very remarkable results when used for producing the electric light.

The *Chemistry* of the month has been active, as is usual during the winter. Michaelis and Wagner have shown that while two bodies having the empirical constitution of ethyl sulphite are known, yet only one of these is the true sulphurous ether, as proved by its mode of preparation. In this latter compound the ethyl groups are both united to the thionyl by oxygen, and hence the sulphur in the radical must be a tetrad. Zimmermann has made a similar research on ethyl phosphite, and comes to the conclusion that phosphorous acid is a trihydroxyl derivative of phosphorus, and that in the ether neither of the ethyl groups is directly united to

the phosphorus, since in that case ethyl-phosphinic acid would appear as a decomposition product. From this theoretical position the author proceeded to prepare tri-sodium phosphite, which he obtained only as a thick sirup, but in which the ratio of the phosphorus and the sodium could be determined.—Terreil has proposed a new method of producing pure nickel salts on a commercial scale without the employment of either hydrogen sulphide or ammonia. His process consists of four operations: 1st, solution of the nickel in acid; 2d, precipitation of the copper by iron; 3d, peroxidation of the iron, and transformation of the metals into sulphates; and 4th, precipitation of the iron by barium carbonate and crystallization of the pure nickel sulphate.—Godeffroy has discovered that cesium salts give precipitates readily with quite a number of metallic chlorides, thus making the reaction with antimonous chloride previously observed by him quite general. The reaction he has observed with chlorides of the following metals, all the precipitates being crystalline: iron, bismuth, zinc, cadmium, mercury, copper, manganese, and nickel. Rubidium salts behave similarly.—Wagner and Saytzeff have succeeded in synthetically producing a new amyl alcohol. Of the eight isomeric amyl alcohols pointed out by theory, four are primary, three are secondary, and one is tertiary. Of these, again, five were previously known; the new one now discovered is the sixth. It is di-ethyl-carbinol, of course a secondary alcohol, and is produced by the action of zinc-ethyl on ethyl formate, the reaction being foreseen by theory before it was realized as fact.—Bender has analyzed the gas given off by apples when they are exposed to the air in a finely divided state. The experiment was made on gas prepared by heating the apples, cut in small pieces, in a flask filled with water from which the air had been previously expelled by boiling. At 60° gas bubbles appeared, and became rapid at 100° . Four apples yielded about 100 cubic centimeters of gas, composed in the first experiment of 40.20 per cent. of carbonic acid, 0.43 per cent. of oxygen, and 59.37 per cent. of nitrogen. In subsequent trials more care was taken to exclude the air, and the gas collected consisted of 31.07 per cent. of carbonic acid and 68.93 per cent. of nitrogen. The author thinks the carbonic acid the result of a continuous fermentation going on within the mass.—Kreusler has negatived the assertion of Raoult that pure cane sugar in aqueous solution, without the presence of air or ferments, but solely by the action of light, became inverted and yielded glucose. Solutions of various strengths were sealed up *in vacuo* and were exposed to direct sunlight whenever possible for eleven months. Not a trace of glucose could be detected. In presence of air, however, some glucose is formed; and to this fact the author attributes the results obtained by Raoult.—Vogel has continued his researches on the effect of coloring matters on the sensitiveness of collodion to the various rays of the spectrum, and now concludes that the action of the coloring matter may be quite different, according to the nature of the silver salt employed. Naphthalin red, used with silver bromide and silver chloride, gives both increased sensitiveness to yellow rays; while fuchsin acts very differently, being with silver bromide in complete

accordance with its absorption spectrum—which is similar to that of naphthalin red—but giving to silver chloride but little increased delicacy for yellow rays, but much for the violet ones. The same fact he has observed to be true of certain colorless bodies; morphine, for example, increasing the delicacy of silver iodo-bromide not only for the blue and violet, but also for the green, while silver bromide is completely unaffected by it. Hence, to produce the effect he at first described, three things are necessary: 1st, the coloring matter must optically absorb the identical color which the collodion is to be made sensitive to; 2d, it must unite with any free bromine or iodine; and 3d, it must not decompose silver nitrate, since in that case it would injure the preparation of the plates. The so-called night-blue, for example, possesses the first and third conditions, but fails on the second. It has no action, therefore, on the sensitiveness to light of different colors of silver salts.—Hofmann has examined a new red coloring matter, brought into commerce within a few months under the name of eosin. It has an exceedingly rich tint, recalling that of rosaniline, but inclining more to a garnet red. In mass it is a brown powder with a greenish metallic lustre. Upon investigation it proved to be a bromine-derivative of one of the remarkably fluorescent bodies discovered by Baeyer, and called fluorescein, obtained by the action of phthalic oxide upon resorcin. Its composition proved it to be a phthalein of dibromoresorcin, and this was confirmed by its successful synthesis, by the action of bromine on fluorescein.—The crude acids of the native petroleum of Wallachia have been examined by Hell and Medinger. The second run of the still yields to caustic soda an acid which, after solution in water and treatment with sulphuric acid, collects as an oil on the surface, and is called "mineral oil" by the workmen. This is a mixture of several acids, probably homologous, but their separation is exceedingly difficult. An ethyl-ether of one was finally obtained, whose saponification yielded the acid as a colorless liquid of specific gravity 0.982. It is a weak acid, its sodium and potassium salts being of the consistency of soft soap. It is a fatty acid, but does not belong to either of the three series of fatty acids now known.—Carey Lea has published a valuable modification of the usual iron test for hydrocyanic acid. If a little uranic acetate be added to a solution of a ferrous salt, there is thrown down in presence of a soluble cyanide a purple precipitate. One five-thousandth of a grain of hydrocyanic acid gives, when thus treated, a perfectly distinct reaction. He also recommends the use of ammonio-ferric citrate, in connection with ferrous salts, in the Prussian-blue test. In this way one two-thousandth of a grain of potassic cyanide may be detected, a delicacy far greater than has been claimed for this test.—Gautier has effected an important synthesis likely to prove of practical value. He has succeeded in uniting two molecules of dextrose by abstracting from them a molecule of water, thus forming a substance having the composition of the compound sugars. The result was accomplished by the action of hydrochloric acid gas on the dextrose dissolved in absolute alcohol. A substance was obtained which was more analogous to gum and dextrin than to sugar in appearance and

taste, but which yielded again a simple sugar on heating, though this appeared not to be dextrose again, but to be analogous to, if not identical with, inosite.

Mineralogy.—A new mineral, as yet imperfectly described, has been found at the Clara mine in the Black Forest, and hence termed *clarite*. Its constituents are copper, antimony, arsenic, and sulphur, or the same as for tetrahedrite, from which it differs, however, in crystalline form.

The active mineralogist of Saxony, August Frenzel, has described another new species under the name of *wapplerite*. It is a hydrous arseniate of lime, containing some magnesia, and is closely related to pharmacolite. It occurs in crusts, but also in crystals with monoclinic habit. Its locality is Joachimsthal, in Saxony.

According to Knop, *koppite* is a new mineral standing near pyrochlore, although its character seems somewhat doubtful. It is found in a granular limestone near Schelingen, Kaiserstuhlgebirge, in Baden. It looks much like pyrochlore, but seems to differ from it most in the absence of fluorine, as also of thorium and titanous acids.

Ethnology.—The Alaska Commercial Company has presented to the National Museum at Washington eight mummies from a cave in the Aleutian Islands. They resemble very much in form those from Peru, being doubled up with the knees close to the chin, and wrapped in skins. They were formerly hung up in the cave, like hams in a smoke-house; but the loops decaying, they were all found lying on the floor. The patriarch, in addition to his skin wrapping, is in a wooden frame resembling a hay-rack in a stable, and has a hoop like a cheese-box around the bottom of his frame. One of the small children has a little frame somewhat like that of the patriarch.

A communication made by Dr. Prunières (de Marvejols) before the meeting of the French Association for the Advancement of Science, at Lille, treated of the curious artificial perforations common among the neolithic skulls of the Lozère. These perforations vary, in the pieces exhibited, from an inch to an inch and a quarter in diameter. Near the perforated skulls were found rings of cranial bone, which seemed to be designed as amulets. These were evidently worked with flint tools. The men of the polished stone age practiced trepanning; for if some of the skulls appear to have been perforated after death, others were treated during life, and the patients had lived for years afterward. One skull presented three perforations made near each other upon a line fore and aft. There is no distinction of age, the excisions occurring upon infants as well as upon adults. The motive of this strange custom was either medical or superstitious. They probably attributed disease to supernatural agencies. The evil spirit escaped through the opening made by the sorcerer, who wrapped the operation in a shroud of mystery by preserving the detached piece as a precious relic. From the appearance of these facts reported by the learned archæologist of Lozère, he said that a new light had been shed upon the intellectual state of man in the polished stone age. It explained his religious conceptions, and confirmed the discovery of the figure of a goddess in the

caverns of Baye (Marne). M. Broca remarked that perforated skulls were also found at the last-named station. Among the skulls dug up by General Faidherbe were found two in the same condition. Dr. Chil, from the Canary Islands, said that perforated skulls had been found in the ancient burial-places of his country. Notice was also called to an example from the grotto of Lorde, upon which M. Hamy and M. Chaplain-Duparc gave some interesting details. A similarly perforated or trepanned skull was found by Mr. E. G. Squier among some ancient Peruvian crania collected by him.

The Rev. A. H. Sayce, M.A., has read a paper before the Society of Biblical Archæology of London on "Human Sacrifices among the Babylonians." The evidences of this awful rite "are found in two Accadian tablets, one of which declares the immolation to have a vicarious efficacy, especially in the case of children when offered as atonements for the sins of their parents." The Palestine Exploration Fund report the most cheering progress in their work, especially as to the identification of new sites and the examination of former investigations.

Microscopy.—Professor Leidy has recently called attention to the parasite that lives in the proboscis of the house fly, a thread-worm—*Filaria muscæ*—first discovered by the well-known naturalist Mr. H. J. Carter in the house fly of India. Dr. Leidy found it in numbers from one to three in about one fly in five. Dr. Diesing has referred the parasite to a new genus, with the name *Habronema muscæ*. The singular position in which the worm lives suggests that there are many unsuspected places we may have to search in to find the parents or offspring of our own parasites. In a communication to the French Academy in November last, M. Duval, calling attention to a former paper in the *Journal de l'Anatomie*, September, 1874, states that he has found a means of explaining both the doctrines of the panspermists and the heterogenists. The explanation lies simply in the statement that he has discovered that the various so-called minute organisms (such as ferments) are simply one and the same organism, which has the power of becoming differently developed. He asserts that he has proved by experiment that the transformation of yeasts is possible, and that the specificity of action of different ferments is a purely relative phenomenon, dependent rather upon the composition or the state of the media than upon the proper constitution of these same organisms.

A paper of some interest on the *sphæraphides* in plants appears in the *Monthly Microscopical Journal* for December, 1874. The author states that in *Urtica dioica*, *U. urens*, and *Parietaria diffusa* the leaf blades are studded with sphæraphides about $\frac{1}{32}$ of an inch in diameter, composed mainly of carbonate of lime; smaller forms, with projecting crystalline points, and composed of oxalate of lime, occur in the fibro-vascular bundles of the leaf; the same two kinds abound in the leaf and pith of *Humulus lupulus*.

In a paper read at a late meeting of the Zoological Society, Professor Gulliver stated that in the mammalia, the largest red corpuscles of the blood are those of the two elephants, the two-toed sloth, and the walrus. In the human subject the corpuscles are exceeded in size by those of only eight or nine exotic mammalia, and not

equaled in size by the corpuscles of any British animals of the class. And this fact, independently of its physiological interest, may prove important in medico-legal inquiries, since by it alone, as Dr. Joseph G. Richardson states (and as we have already noticed in this journal), he has correctly distinguished dried stains of human blood from those of the ox and sheep. M. Onimus, in a recent communication to the Société de Biologie of Paris, states that by electrifying the eggs of the frog the development of those which are in connection with the negative pole will be accelerated, while the hatching of those in connection with the positive pole will be either retarded or stopped. In an abstract of a paper by Dr. Hollis on "What is a Bacterium?" in the January number of the *Monthly Microscopical Journal*, the limitations we should place on the term Bacteria are summed up: 1. They strictly form part of the vegetable kingdom. 2. The name ought to be restricted to those minute rod-like hyaline bodies, *B. termo* and *B. lineolata* of Cohn, with a more or less rapid to-and-fro motion. 3. We must always associate the presence of true Bacteria (especially the *B. termo*) with putrefactive or analogous changes in organic liquids. In a paper read before the Royal Society, November 26, 1874, by Professor C. Wyville Thompson, the origin of the calcareous formation known as "globigerina ooze" is attributed to surface organisms, as advocated by the late Professor Baily, of West Point, and others; and in partial proof that all the organisms entering into its composition are dead, the statement was made that "there are never spines on the globigerinæ from the bottom, even in the shallowest water." This is a mistake, as the spinous globigerinæ were quite abundant in the soundings from the Gulf of Campeche made during the summer of 1874, during the cruise of the United States steam-ship *Fortune*, from depths of between 64 and 210 fathoms. It is a remarkable fact that all of the original articles of the last (January, 1875) number of the *Monthly Microscopical Journal*, of London, are contributed from the United States, and in the same number we find the proceedings of the new Memphis Microscopical Society. The perfection of objectives is yet far from being attained, as we now have Mr. Toller, with his new system $\frac{1}{2}$, surpassing the best work hitherto even with his $\frac{3}{8}$; and Messrs. Powell and Leland at a recent soirée of the Royal Microscopical Society exhibited a $\frac{1}{4}$ and $\frac{1}{8}$ on a new formula, the first resolving *Amphipleura pellucida*, and the other showing *Pleurosigma angulatum* $\times 4000$, under the most difficult test of direct light, in a remarkably magnificent manner, the heads standing out like minute spheres. At the same meeting Messrs. Beck exhibited a large microscope in solid silver, fitted with every conceivable piece of apparatus, all in silver. This luxurious work of art, intended for an American microscopist, cost some £500.

Zoology.—In a memoir on the geographical distribution of insects in New Hampshire, Mr. Scudder refers to the striking variety in its animal life, owing to the alpine peaks of the White Mountains. "Its northern and southern portions belong to distinct continental faunas; above the forest growth of its colder region rise some of the highest elevations east of the Rocky Mountains, and these bleak altitudes support a vegeta-

tion and an assemblage of animals intimately resembling those of Labrador and Greenland, while sixty miles to the south flourish animals characteristic of sub-tropical climes." Representatives of four faunas—the Alleghanian, Canadian, and a sub-alpine and alpine—are found within the State limits. A map showing the distribution of the two first-named faunas, and another of the alpine and sub-alpine districts of the White Mountains, accompany the paper, which is extracted from the first volume of the final report on the geology of New Hampshire.

The anatomy of the common mussel (*Mytilus edulis*) has been re-examined by M. Sabbatier, of France, while the development of the cuttle-fishes has been studied with great thoroughness by M. Ussow, a Russian naturalist. He has examined the structure of the female sexual organs of several species of cephalopods, together with the mode of formation of the ova, and in four species traced the embryonal development from the fecundation of the egg up to the complete development of the young.

Although the anatomy of the earth-worm has been studied with great minuteness by Claparède, new discoveries regarding the circulation of the blood and the nervous and generative systems in some forms have been made by M. Perrier.

The metamorphoses of the itch mite and other acarians have been studied by M. Mégnin, and for his results the author received a prize offered by the French Academy.

The mode of development of the newt, frog, slow-worm, and lizard, as well as the snakes, has been studied by Mr. Tomes, and an abstract of his conclusions read at a late meeting of the Royal Society of London.

The new year begins in *Ornithology* with a bulky octavo volume by Dr. E. Coues, entitled *Birds of the Northwest: a Hand-Book of the Ornithology of the Region drained by the Missouri River and its Tributaries*. It is one of the miscellaneous publications of Hayden's Geological Survey of the Territories. It consists of detailed tables of the synonymy, with quite full remarks on the history of each species. It also contains a monograph of the North American *Laridae* (gulls), and of the North American *Columbidae* and *Podicipidae*, i. e., the loons and other diving birds.

A new scheme of the arrangement of the mammalia has been brought forward by Alfonse Milne-Edwards.

In a recent prize work on the fauna of the southern regions of the globe by M. Alphonse Milne-Edwards, illustrated by one hundred and seventy-five plates, the author discusses in one part the animals of the antarctic regions. He examines the value of the characters on which ornithologists have based specific differences, and shows that some pretended species should be regarded as only local races or even individual varieties. He does not adopt the hypothesis that the diversity of zoological types is due to the influence of surrounding conditions, though he acknowledges that animals may gradually acquire differential characters which they may transmit to their descendants, thus constituting fixed secondary species incapable of breeding together. The work gained the Bordin prize of 8000 francs. M. Harting, of Utrecht, has gained a prize of 2000 francs for his researches

in synthetic morphology on the artificial production of some organic calcareous formations. M. Marey has received a prize of 10,000 francs for his works on the circulation of the blood, animal mechanics, and other subjects. MM. Pouchet, Perrier, and Samson and Deshayes have also received prizes from the French Academy for zoological and physiological works. In this way the French people honor their scientific men, and encourage original research.

Agriculture and Rural Economy.—A very encouraging indication of the progress of agricultural science is to be found in the establishment of new experiment stations, of which several are lately announced. In Belgium the "Association pour le Fondation de Stations Agricoles," a society of agriculturists and others, was, some time since, successful in establishing a station in connection with the agricultural school at Gembloux. The same society has decided to found another station at Gand. For the support of this, as of the one at Gembloux, large appropriations have been made by the government.

The association of manufacturers of alcoholic spirits in Germany have organized an experiment station at Berlin for scientific investigations relating to their branch of industry. Somewhat over 8000 thalers (about \$2200 gold) have been pledged for the purpose, of which 1100 thalers is the sum of the first of a series of annual subscriptions.

The beer-brewing interest is also laboring to secure the aid of science, and a station for the purpose is already in operation in connection with the agricultural school at Weihenstephan, in Bavaria. Investigations of water, barley, malt, hops, and other materials, as well as of instruments used in beer-making, the carrying out of theoretical studies, and the giving of advice useful in this branch of manufacture, are to constitute the labor of the station.

Among the most valuable of later investigations are those on the nutrition of animals. During the past fifteen years some hundreds of feeding experiments have been made with oxen, cows, sheep, goats, horses, swine, and other animals. Among the questions investigated have been the effect of fodder upon milk production, the digestibility of various food materials, and the functions of the ingredients of the food, such as albuminoids, carbo-hydrates, and fats, in the formation of flesh and fat, and in the production of animal heat and muscular force.

The lately opened guano deposits in the province of Tarapacá, in Southern Peru, appear, from the inspectors' report to the Peruvian government, to contain guano not only in immense quantities, but also of remarkably good quality. One sample contained 12.15 per cent. soluble phosphoric acid, 14.67 total phosphoric acid, and 15.67 per cent. actual ammonia. Fourteen of the best samples averaged 9.52 soluble phosphoric acid, 15.31 total phosphoric acid, and 10.82 actual ammonia.

In the department of *Engineering* it is of interest in our monthly summary to record the fact that the fortunes of the East River Bridge, New York, have been transferred into other hands. The new Board of Directors has already had several meetings, at which questions of future policy and the prospects of the enterprise were fully discussed. The indications for

the speedy completion of the work were probably never more favorable than at the present time. It was declared that prices have so materially declined that the iron and trestle work will cost less than fifty per cent. of the original estimates, while in addition to this the severity of the present winter, by blocking the river with ice and seriously impeding its ferriage, has influenced a very general public opinion in its favor. Some \$5,000,000 have already been expended upon it, and the completion of the work will require yet \$8,000,000. The recent suggestion of the importance of a permanent bridge across the Niagara River at Lewiston, New York—which, by-the-way, will have to be effected in the face of great natural difficulties—has called forth a proposition from Messrs. Clarke, Reeves, and Co. to undertake the work as soon as a proper company shall be formed for that purpose. Their proposition looks to the building of a single-span bridge, with a span of 600 feet. The structure is designed for a double-track railway 120 feet above the level of the river, and for a carriage-way beneath this road a distance of 75 feet. The estimated cost is \$800,000. The construction of a canal from Lake Michigan to the Mississippi River has of late been strongly advocated. Its supporters urge in its behalf that it would greatly lessen the cost of conveying the produce of the Upper Mississippi Valley to the sea-board, declaring, moreover, that one-half the present cost of transportation is incurred in sending it by rail across the narrow belt of land between the river and the lake.

In *Technology* we note that the stated annual meeting of the American Iron and Steel Association was held in Philadelphia on the 11th of February last, under the presidency of Mr. Samuel J. Reeves. The most important feature of the meeting was the presentation of the report of the secretary, Mr. James M. Swank, which, as usual, contained a very thorough review of the condition of the iron trade, and much valuable statistical matter. From this report we present the following abstracts as bearing upon the present state of our iron industries:

Of 696 completed furnace stacks in the country, 472 had reported to the association up to the 10th of last February their condition on the 1st of January last. Of these 472 stacks 260 were then in blast, and 212 were out of blast. In addition to these 212 out of blast, 87 of the 260 then in blast were announced to be blown out in January. This would give on the 1st of February 249 furnaces out of blast, 223 in blast, and 224 to be heard from. Of these non-reporting furnaces it is safe to assume that one-half were out of blast on the 1st of February. Fully one-half of all the furnaces in the country were therefore out of blast on the 1st of February—a degree of depression not previously reached since the beginning of the panic.

Our total product of rails in 1874 is estimated at 450,000 net tons; importation, 100,000 tons.

The production of Bessemer steel in the United States since 1867 is given as follows:

Years.	Tons.	Years.	Tons.
1867.....	8,000	1871.....	45,000
1868.....	8,500	1872.....	110,500
1869.....	12,000	1873.....	157,000
1870.....	40,000	1874 (estimated).	175,000

There are eight Bessemer steel and steel-rail

establishments in this country which are now in operation, and two others are being built.

Returns of the production of pig-iron in the United States in 1874 indicate that it aggregated about 1,900,000 tons net, or about two-thirds of the product of the years 1873 and 1872. Of this amount Pennsylvania, with 262 stacks, makes nearly one-half.

At the last meeting of the Massachusetts Institute of Technology, Mr. George Woods, of Cambridge, Massachusetts, the well-known organ-maker, described his new process for drying lumber and other materials in a natural and rapid manner. The usual method has been to force a current of air through a room heated to about 150° F.; the ventilation in this must necessarily be imperfect, and the drying unequal, as currents will inevitably be established, causing some portions to dry before others, and a consequent shrinkage and springing of the wood; the surface will dry first, with shrinkage, and the interior parts afterward, with a different shrinkage, causing inequalities in the wood. He exhibited several specimens of black-walnut, dried by the old and by his process, showing the curved edges and irregular surfaces in the former, and the perfectly straight outlines and uniformity of texture in the latter. In the usual drying-rooms the steam-pipes are carried under the lumber, and the air forced to pass over it. Thus the outside is always dried first, and the internal air may be so damp and so soon saturated with moisture as not to affect the interior parts. He uses steam-pipes arranged in the same manner underneath the lumber, but the moisture which is driven by the heat into the room, instead of being carried off by the ventilating current, with great consequent loss of heat, is condensed by the cold of water constantly running in pipes through the chamber; the condensed moisture runs down the pipes into a grooved channel below, by which it flows out of the chamber. Thus the moisture is gradually, uniformly, and constantly withdrawn from the wood, which dries regularly, without strain on the outside or cracking on the inside. He saves three-quarters of the time required, and all his heat, which in ordinary rooms passes off with the ventilation; and the moisture, once out, can not get back, as it may in the usual processes. This method is applicable to laundries, to the drying of cloths and wools in factories, and to any material, organic or inorganic, which requires to be dried speedily and uniformly. He has taken 136 gallons of water in seven days from 9000 feet of lumber, as follows: the wood was walnut and cherry, mostly one and one and a half, with some two inches thick; on the third day after the steam was let on the water came away at the rate of a gallon in forty minutes, till, on the seventh, 136 gallons had been drawn off, and the water ceased running, which indicated that the process was completed; the lumber was found thoroughly dried, and was at once cut up for use. The process is natural and simple, being merely the removal of the moisture of the air by condensation, after it has been driven from the material by heat, the moisture being removed as fast as expelled, and not left to be slowly evaporated and in a measure re-absorbed. This practical invention is claimed to be of value for the following reasons: the great saving of time, the thor-

oughness and uniformity of the drying, the naturalness and simplicity of the operations, the less amount of heat required (none being lost by ventilation), the absence of checking, warping, or splitting of the material, its indication of the point when the material is dry, and its inexpensive character.

The United States Patent-office is about pub-

lishing complete alphabetical and subject-matter indices of all patents issued from the office from 1790 to 1873 inclusive. These indices will consist of two sets of three volumes each, and will be of the greatest service to the inventors of the country, of whom a large proportion are from the ranks of the engineering and mechanical trades and professions.

Editor's Historical Record.

POLITICAL.

OUR Record is closed on the 22d of March.—Congress adjourned March 4. The House, February 28, rejected the Tariff and Tax Bill reported by the Committee of Ways and Means, and adopted Mr. Dawes's substitute, taxing whiskey ninety cents a gallon, tobacco twenty-four cents a pound, cigars six dollars a thousand, increasing the duty on sugar and molasses twenty-five per cent., and restoring the duty of ten per cent. on woolens, iron, and steel. The new bill was passed by the Senate March 2.

The Civil Rights Bill was passed by the Senate February 27, and signed by the President March 1.—The House, February 27, passed the Force Bill, the suspension of *habeas corpus* being limited to Louisiana, Arkansas, Mississippi, and Alabama.—The Louisiana compromise resolutions—recognizing the Kellogg government and recommending the restoration of seats in the Legislature to the members entitled to them—were passed by the House March 1.—On the 2d the House rejected a resolution to reinstate Brooks as Governor of Arkansas, and passed, 149 to 80, a resolution declaring against interference by the general government with the government of that State.

By an amendment to the Post-office Appropriation Bill, introduced during the closing hours of the session, Congress voted its members the franking privilege until December 1, 1875, and doubled the rates of postage for the people on transient newspapers and periodicals and parcels of merchandise.

The Senate bill for the admission of Colorado as a State was passed by the House March 8.

The Senate of the Forty-fourth Congress met in extra session March 5. Action on the admission of Pinchback as Senator from Louisiana was postponed.—Godlove S. Orth was confirmed as minister to Austria, and Horace Maynard as minister to Turkey.—The new treaty with Belgium was ratified March 10. The Hawaiian treaty was ratified March 18.

Congress having failed to make any appropriation to carry out civil service reform, President Grant has abandoned the system.

The New Hampshire State election, March 9, was so close that it will have to be decided by the State Legislature, in which the Republicans have a majority.

The French Assembly, February 24, by a vote of 448 to 241, passed the bill for the organization of the Senate. The Senators are to be elected by colleges composed of Deputies of the Assembly, Councilors-General, Councilors of Arrondissements, and delegates from municipalities. Senators representing departments and colonies

are to sit nine years, one-third of their number being elected every three years. Those chosen by the Assembly are irremovable. On the 25th the Public Powers Bill was passed, the clause implying a recognition of the republic being adopted by a vote of 483 to 262.

M. Buffet, March 1, was elected President of the French Assembly.

The new French cabinet is announced as follows: M. Buffet, Minister of the Interior; M. Dufaure, Minister of Justice; M. Leon Say, Minister of Finance; M. Wallon, Minister of Public Instruction; Vicomte de Meaux, of the Right, Minister of Agriculture; Duc Decazes, Minister of Foreign Affairs; General De Cissey, Minister of War; Admiral De Montaignac, Minister of the Marine; M. Caillaux, Minister of Public Works. The Duc d'Audiffret-Pasquier succeeds M. Buffet as President of the Assembly.

John Mitchel was re-elected to Parliament from Tipperary, but died March 20, soon after the election.

The Convention between Spain and the United States for the settlement of the *Virginius* affair was signed March 5.

A new ecclesiastical bill has been introduced into the Prussian Diet, receiving its first reading March 16. It withdraws state grants from Roman Catholic bishops, and deprives the priest of any share in the administration of local church property.

DISASTERS.

February 25.—The wall of an adjoining building fell upon and broke through the roof of St. Andrew's Church, New York city, while religious services were being held. By the falling bricks, and as a result of the panic which followed, five persons were killed and thirty wounded.

March 4.—Telegram from London announced the wreck of the steamer *Gothenburg* on one of the Fourneau Islands, in Bass's Straits, between Van Diemen's Land and Australia. Of one hundred and ten persons on board, only twenty-two are reported saved.

OBITUARY.

March 2.—In Washington, D. C., General Lorenzo Thomas, U.S.A., in his seventy-second year.

March 13.—In New York, William J. Hays, the animal painter, in his forty-fifth year.

February 22.—In England, Sir Charles Lyell, the eminent geologist, aged seventy-eight years.

March 7.—In London, England, Sir Arthur Helps, the author of *Friends in Council*, aged fifty-nine years.—In France, Claude Louis Mathieu, an eminent astronomer, in his ninety-second year.

Editor's Drawer.

ILLINOIS is just now in such a ferment about a bishop that the following is not malapropos. We are indebted for it to a correspondent who has heretofore sent us anecdotes of the late Bishop Whitehouse. During one of his sermons he undertook to illustrate a point by telling the congregation how he had once been lost on the prairies of Illinois, and had wandered for a long time, weary and almost hopeless. At last he saw a light, and made his way slowly toward it, shouting for help. "Just as I thought I could go no farther," said the bishop, "and was about sinking down in despair, the door of a cabin opened before me, and *the long-looked-for 'Sucker'* came." The unintentional pun brought down the house.

ONE of the last as well as one of the neatest hits made by General Butler, just before the close of the last session in Congress, occurred during the famous "dead-lock" fight on the Civil Rights Bill. The question of adjournment was under consideration, and General Butler had stepped over to Mr. Randall's desk for a private consultation. Butler favored a Sunday session. Randall opposed.

"Bad as I am, I have some respect for God's day," said the Democrat, "and I don't think it proper to hold a session of Congress on that day."

"Oh, pshaw!" responded Butler, "don't the Bible say that it is lawful to pull your ox or ass out of a pit on the Sabbath-day? You have seventy-three asses on your side of this House that I want to get out of this ditch to-morrow, and I think I am engaged in a holy work."

"Don't do it, Butler," pleaded Sam. "I have some respect for you that I don't want to lose. I expect some day to meet you in a better world."

"You'll be there, as you are here," retorted Butler, quick as thought—"a member of the *Lower House*."

THE "peertness" as well as pertness of the New England maiden who waiteth at table was nicely illustrated last winter at Haverhill, Massachusetts. On the morning after Mr. Bret Harte had lectured in that place, he entered the breakfast-room of the hotel, and on taking a seat at the table was approached by a plump, fine-looking girl, who served things, and who, with a kindly smile beaming from her ruddy face, leaned over his shoulder and blandly inquired, "Tea or coffee, beefsteak or pork? *Was the lecture LARGELY attended last evening, Mr. Harte?*" Mr. Harte courteously replied that it was, and in subdued tones intimated a preference for porcine sustentation, and the cup that cheers, etc., etc. Didn't know what she was about? Well, *rather*.

IN the early days of Ontario County, New York, lived one Miller, from whom "Miller's Corners," near Bloomfield, took its name. He had been a blacksmith, and had brought along his tools, but designed to give his attention mainly to farming. But there were so many calls upon his mechanical skill that, without stopping to build a shop, he extemporized a forge, cut down a tree, placed his anvil on the stump, and went to work. One day a man on horseback, with plow-irons strapped across his saddle, who

had made his way from the south part of Canadaigua, encountered Harvey Hecock at the Oliver Chapin School-house Corners, and inquired the way to Miller's blacksmith shop. Hecock replied, "You are in the shop now, but it is three miles to the anvil!"

OF the many juvenile funniments that bubble up and seek for publicity through the types the following of a little New Hampshire girl—quite mature at six—is not bad. She went into a store where her father was lounging, and slyly approaching him, said, "Papa, won't you buy me a new dress?"

"Well, I'll see; I'll speak to your mother about it."

A sad look came over the little maiden's face, until looking up with a smile into the paternal eyes, she said, "Well, papa, if you do speak to mamma about it, touch her easy, or she may want it herself!"

He bought it—for the daughter.

PLOWING made easy is what the American farmer wants, and the wits of the Yankee inventor have at last soared to the comfortable solution of the problem. It goes forth to the public as a "shade attachment for plows," and consists of an umbrella so fitted that the man at the plow is screened from the heat of the sun. The legal and formal description, as filed at the Patent-office, is as follows: "A cranked arm is secured in a socket by means of a set screw, and is free to revolve in a horizontal plane. The outer end of the crank is jointed, and provided with an adjusting brace, whereby it may be inclined and secured at any desired angle. A suitable socket at the upper end of the arm holds the umbrella handle, retaining the same by a simple spring catch."

IN a recent number of the Drawer we reproduced a few "Ulster stories, after the manner of Dean Ramsay." Below are a few from the notes of M. De Ménage, a French wit who flourished two hundred and fifty years ago:

A butcher who was on his death-bed said to his wife, "If I die, Françoise, you must marry our shop-boy. He is a good young man, and the business can not be carried on without a man to look after it."

"I have been thinking about that already," said his wife.

WHEN the tower of the church of Carmes was struck by lightning, Father André said, "God has been very merciful to these good fathers of Carmes in not sacrificing to His justice any thing else than their bell-tower; if the lightning had struck the kitchen, the chances are every one of them would have been killed!"

A GASCON who had a quarrel with the Bishop of Bazas swore that he would never again pray within the diocese. Long afterward, in crossing a river in the neighborhood, he was overtaken by a severe hurricane. The boatman at last told him despairingly that nothing further could be done to keep the boat afloat, and that he had

better recommend himself to the mercy of God. "Are you sure," said the Gascon, "that we are beyond the diocese of Bazas?"

A JUDGE in whose court was a great deal of noise exclaimed, "Officers! call silence in the court. It is a strange thing that this noise can not be put a stop to. I have decided I do not know how many cases without having heard them!"

Two rather intrusive acquaintances of M. G—— determined to take him by surprise by going uninvited to spend a week with him. They had just arrived, and in talking of their journey one of them remarked to their host that they had passed through some beautiful corn fields on their way. "*You will see some much finer ones on your way back to-morrow,*" replied the host.

A FEW days since a very pretty young married woman, during a dinner-table discussion on Churchmanship, opened the eyes of the company and demolished her husband by expressing, as her opinion, that "the only difference between the ritualists and Romanists was in the fact that the latter *burned insects.*"

At a recent revival meeting held at Bad Axe, Michigan, a young gentleman concluded a fervent address by saying, "I wish to be a friend to the friendless, a father to the fatherless, and a widow to the widowless."

THE following poem, from Sir Francis Wortley's *Characters and Elegies*, published in 1646, is worthy of reproduction in the Drawer:

Coblers are call'd Translators, so are we
(And may be well call'd so), we so agree:
They rip the Soale first from the upper leather,
Then steepe, then stretch, then patch all up together.
We rip, we steep, we stretch, and take great paines;
They with their fingers worke, we with our Braines.
They trade in old shooes, as we doe in feet,
To make the fancy and the Language meete.
We make all smooth (as they doe), and take care,
What is too short, to patch; too large, to pare:
When they have done, then to the club they goe,
And spend their gettings; doe we not doe so?
Coblers are often poore, yet merrie blades;
Translators rarely rich, yet cheerfull lads.
Who thinkes he wants, he is in plenty poore;
Give me the Coblers wealth, Ile ask no more.

THERE is in Virginia a venerable, capable, but somewhat eccentric man, who is serving his second term in one of the judicial circuits of that State. Although a lawyer, he has dabbled in medicine, and is the inventor of two proprietary medicines. Some time ago he presented to the Methodist church in the town where he resides a fine copy of the Bible, with this inscription in large gilt letters: "Presented by Judge ——, Proprietor of ——'s Magic Relief and Water of Life." The old gentleman said the Bible would furnish relief for diseases of the mind, and he wanted them to know where they could get their bodies cured. A very good and permanent card.

WE find in a late number of the *New Zealand Herald* a touching incident in illustration of the great present dearth of respectable dress-making hands in that colony. It seems that a well-to-do settler near Auckland was lately attacked by an

illness which his medical attendant declared must terminate fatally, so severe were the symptoms. After lying in an apparently hopeless state for some days, he suddenly took a turn for the better, and, thanks to a strong constitution, made a rapid recovery. Not long after he had returned to business he was much startled, on opening an account presented at his office, to find himself charged with a full set of widow's weeds of an elaborately complete description. A domestic explanation naturally followed, and his wife reminded him that he had always made it a special desire that the fact of their having emigrated to a colony should never prevent her dressing as a lady. "And the dress-makers here, you know," she added, "have matters so entirely in their own hands that they generally keep you waiting for months for any thing new. So when I was told that you could not possibly recover, I ordered what I knew you would wish me to wear beforehand; and now the things have only just come home."

The bill was promptly settled. Whether the husband was consoled for the outlay by the thought that his provident wife had the things ready by her is a question that is left open to conjecture.

HE was an Irishman, and took the obviously economical view of the subject. It was on the train from New York to New Haven. The conductor on reaching him said, with brevity and blandness, "Ticket?"

"Well, begorra," answered the Irish party, "I guess I've made a bit of a mishtake. I wanted to go to Easthampton, Massachusetts, and I have bought a ticket for Easthampton, Connecticut."

"Why didn't you buy the right ticket?" said the conductor.

"Well, I saw the two of them, but the one to Easthampton, Connecticut, was *the cheapest*, and so I bought that one."

It was cheaper by \$1 05, but y^e conductor squeezed it out of Patrick.

THE story of the "old salt" at a fishermen's feast in an Ulster sea-port (told in the March number of *Harper*), reminds me of a similar incident, *mutatis mutandis*—that is, "with a little variation"—that happened in the even tenor of the way of the old Dutch landlord who "kept tavern" in my native village in the good old times when such modern inventions as butter-knives, silver forks, and clean plates for each "course" of meats were unknown, at least in that corner of the world.

One morning this worthy "Wirth" was aroused from a dreamy reverie behind the bar-room stove by the arrival of a traveler—a rare apparition to his household—whose dress and manner indicated that he hailed from "der city." It was near noon, and the stranger made known his wants by calling for feed for his horse and dinner for himself. As the tall Dutch clock in the corner struck twelve he was conducted into a back-room which served the double purpose of dining-room and kitchen, and took his seat with the boarders—they were not called "guests" then—consisting of the village school-master, the farrier, the store-keeper's "clerk," and several farm hands who hired out in the neighborhood, and who, being "to the manner born," contented-

ly ate their food of flesh, greens, and pastry off one and the same plate in the primitive style. The landlord and his two buxom daughters did duty as waiters; the carving was performed by "every man for himself," with his own knife and fork. The meal proceeded quietly until the first "course" was dispatched, when the stranger astonished the natives by calling for a clean plate, knife, and fork preparatory to changing his ham and egg diet for a cut of roast beef. They were handed to him, however, without remark, although not without a dumfounded stare from the landlord, and again things went along as usual, until the stranger, having disposed of the substantials, and feeling inclined to finish off with a slice of pie, called for another clean plate with knife and fork accompaniments. This was more than the saturnine landlord, with his home-bred notions, could stand. He rushed up to the stranger, leaned over his shoulder, and looking him—not square, but sideways—in the face, said,

"I likes to aks you yust one queshn."

"Well, what is it?" was the somewhat surprised response of the stranger.

"Vy, I vants to know uf you got barditions in your pelly?"

This is not so bad:

The Board of Health of Washington wanted its pay raised. It appeared before the House Committee on Appropriations during the last session, and the reasons it offered for the proposed increase and the principles upon which it based its demand were about as well defined as the ideas of a young student of theology at the Fairfax Seminary who was once asked what he proposed to do when ordained. "Do? Do? Damfino. Preach the Gospel, I s'pose."

SPEAKER Blaine tells this:

A fellow in a Maine village went and died. They put the corpse on ice, and the funeral in due time assembled about him in subdued grief. The minister began the service, and presently the corpse came to himself, gave a yawn and a little shiver, and said, in an irritable voice, "Put some wood on that—stove."

The funeral subsided.

IN Mr. Baring-Gould's latest work, *Yorkshire Oddities, Incidents, and Strange Events*, lately published in London, is the following amusing paragraph, showing how a Yorkshire butcher narrated his courtship:

"It's a queer thing, Sir, hoo things turns oot sometimes. Noo it war a queer thing hoo I chanced to wed. I war i' Leeds once, an' I'd na mair thowts aboot marryin' na mair 'an nowt; an' I war just goin' doon t' street, tha knaws, Sir, when I met wi' my wife—that's her 'at's my wife noo, tha knaws. I'd kenned her afore, a piece back; soa shoo comes oop to me, an' shoo ses, 'Why, James, lad, is that thee?' 'Ay,' I ses, 'it is awever.' 'Weel, James,' ses she, 'what's ta doin' wi' thysen noo?' 'Why,' I ses, 'I's joost gotten me a new hoose.' Soa wi' that she ses, 'Then I lay, James, if tha's gettin' a new hoose, tha'll be wantin' a hoosekeeper.' Soa I ses to her, ses I, 'Tha ma coom and be t' wife if ta likes; tha mawn't be t' hoosekeeper, tha knaws, but tha ma coom an' be t' wife.' And

soa shoo ses, 'I ain't partikler. I don't mind if I do.' So we never had na mair to do aboot t' job."

I asked him if he ever had found occasion to regret such an expeditious way of settling the matter. He shook his head, and said:

"Noa, Sir, niver. Shoo's made a rare good wife. But shoo's her mawgrums a' times. But what women ain't got 'em? They're all on 'em maggots i' their heads or tempers. Tha sees, Sir, when a bone were took out o' t' side o' Adam to make a wife for 'm, 't were hot weather, an' a blew-bottle settled on t' rib. When shoo's i' her tantrums, ses I to her, 'Ma dear,' ses I, 'I wish thy great-great-grand-ancestress hed chanced to be made i' winter.'"

When he was married he took his wife a trip to Bolton, and spent a week on his honey-moon tour. As soon as he was returned home the first thing he did was to put his wife into the scales and weigh her. Then the butcher took out his account-book and divided the expenses of the marriage and wedding tour by the weight of the wife.

"Eh, lass!" said he, "thou'st cost me fourteenpence-ha'-penny a pound. Thou'st the dearest piece o' meat that iver I bought."

He was going to York with his son, a boy of eighteen. He took a ticket for himself and a half one for the boy. When the train drew near to York the ticket collector came round, and exclaimed at this half ticket, "Where's the child?"

"Here," said the butcher, pointing to the tall, awkward youth.

"What do you mean?" asked the indignant ticket collector. "He ain't a child; he's a young man!"

"Ah! so he is, now," answered the butcher, "but that's thy fault, not mine. I know when we got in at Wakefield he were nobbut a bairn; but tha'st been goin' so confounded slow that he's growed sin' we started!"

James was at one time not well off. He had a brother, Tom, who had some money. Now James happened to hear that his brother was very ill, and as they had not latterly been very good friends, he was afraid lest, if Tom died, he would not leave him his money. So he immediately set off to his brother's house, and on his arrival found him ill in bed. He went up to the room in which his brother lay, and began,

"Weel, Tommy, an' hoo art a?"

"Oah, James!" said Tom, "I's vara bad. I think I's boun' to dee."

"Eh!" said James; "well, mebbe tha'll out-live me, Tommy; I nobbut feels vara middlin' mysen. I hain't felt weel for a long while, an' I war just thinkin', Tommy, o' sendin' to Mr. Smith, t' lawyer, to mak' me a bit o' a will, tha knaws. Hast a made thy will, Tommy?"

"Noa," said Tom, "I hain't; but I war thinkin' wi' thee, James, o' sendin' for lawyer Smith. Noo hoo wast a thinkin' o' makin' thy will, James?"

"Weel, tha knaws, Tommy," said James, "mebbe thou an' me hain't lately been vara partiklers; but I war thinkin' it ever owt ta be, 'Let by-gones be by-gones,' an' soa I was thinkin' o' leavin' my bit o' brass to thee. Noo, Tommy, hoo wast a thinkin' o' leavin' thy money?"

"Why," said Tommy, "as thou'st been sa

good as to leave thy money to me, I think it wadn't be rest if I didn't do t' same by thee, an' leave thee my money."

"Weel," said James, "I think you couldn't do better; and soa let's send for Mr. Smith to mak' our wills, and I think mebbe, Tommy, *thou'd better ha' thy will made fust.*"

So these two men sent for the lawyer to make their wills. Tommy's was first made, and a very few days after he died. His money then came to James, who in reality was not ill in the least, but had only pretended to be so.

THE modesty of Chicago people, especially in boasting of their wonderful city, is said to be equal if not beyond that of St. Louis or Milwaukee. As illustrated by a resident of the "Garden City," it was as follows:

Before the great fire two of our city clergy—the Rev. Dr. H——, of St. Paul's, noted for his eloquence, and a brother of goodly height, of St. John's—happened to be journeying to Philadelphia one evening in the cars. They sat behind a Chicago merchant *en route* home. By some means an acquaintance was struck up, and the following colloquy ensued:

"So you live in Chicago?"

"Yes, I do. Big place, big tunnel, and biggest pork market in the world! Besides, we've got elevators, and lum—"

"Yes, and some fine churches?"

"On Wabash Avenue and Michigan some of the finest in the States."

"Eloquent preachers too, have you not?"

"You'd better believe it! None like them! People come all the way from New York and Brooklyn to call 'em."

"Indeed! Have you heard any New York preachers?"

"Well, yes. You see, I went to St. Paul's in the morning, and heard a short man 'bout your size. I s'pose you are both preachers—look like it—yes! Well, of course you wasn't the man."

Tall man from St. John's: "Well, how did you like *him*?" nudging his fellow-preacher.

"Oh, he didn't amount to much."

"Well, where else did you go?"

"Went to St. John's, and heard a tall fellow like you; but of course you wasn't the man."

"And how did you like him?"

"Well, he was worse than t'other fellow! Fact is, *he didn't amount to shucks!*"

The brethren tell this joke on each other.

NEW MEXICO sends its contribution to the Drawer:

Rusty is the name of one of those characters that are common on the frontier—uneducated, earnest, and maladroit. Their conversation is of little interest save for the quaint originality of some of their phrases. The following story is told of him. He was engaged as butcher at Roblero, supplying beef on contract to Fort Selden, on the Rio Grande, New Mexico. One day a particularly fractious steer was to be killed. The animal was secured by a rope thrown over his head, the end passed through a ring in the floor, and held in this position by a Mexican. Rusty, arrayed in a red flannel shirt, advanced, prepared to give the fatal blow. The steer, seeing the red shirt, became excited, and

plunged forward so suddenly and violently as to throw the Mexican down, causing him to lose his hold on the rope. Rusty broke for the fence, and the on-lookers shouted, "Run, Rusty, run!" Rusty ran, and as he climbed the stockade the steer tilted full against it, and narrowly missed catching him. Once upon the other side, and gaining breath, he turned to them with a contemptuous, injured air, and said, "You fellows must think I am a darned fool to throw off on such a race as that!"

A LAWYER in Liberty Street, New York, sends to the Drawer the following literal copy of three bills for milk and washing recently sent to a family in Canada:

Mrs H 2 months milk the 2 quart commenced on the 16 of October there is ten quarts and a pint of odd milk, so that the ten quarts odd will make it even milk and 3 quarts over the odd milk and the first month is 4 cents and the November month is 5 cents a quart there was a Dollar for clothes last week back, there is a Dollar and three shillings this week.

Mrs H too months milk the pint began on the 4th and there was a pint a day for a week before the pints and the odd milk all together makes 13 quarts and a pint And the clothes now and again during the too months counting this week is too dollars leaving one months milk for a dollar and a quarter and the other for a dollar and a half Clothes and milk in all it comes to 5 dollars and 40 cents to the 14 of December.

Mrs H, to months milk, the first month for 8 days there was 3 pints got then the 2 quarts commenced again the 7 of January the 5 pints commenced again, there was 1 quart of odd the to months milk comes to \$6 40 you can make it up yourself, Clothes 1 Dollar

CONCERNING pipes and such: An old silver tobacco-box, said to have belonged to a Pynsent, who left all his estates in Somersetshire to the great Lord Chatham, "from admiration of his talents and patriotism," was engraved with the following lines under a death's-head:

Mens ignis, tubulus corpus, mihi vitæque fumus
Herba penus, clavus fata, suprema cinis.

Which have been rendered:

Of lordly man how humbling is the type,
A fleeting shadow, a tobacco pipe!
His mind the fire, his frame the tube of clay,
His breath the smoke so idly puffed away,
His food the herb that fills the hollow bowl.
Death is the stopper. Ashes end the whole.

THE poetry of the Western editor, if not strictly first class, usually has hanging about it something that arrests attention. In the following, for example, the pride and joy of one just burst into parenthood are told with the proper hurrah:

Ring out, wild bells, and tame ones too—
Ring out the lover's moon!
Ring out the little slippers and socks,
Ring in the bib and spoon!
Ring out the Muse, ring in the nurse;
Ring in the milk and water!
Away with paper, pens, and ink—
My daughter, oh, my daughter!

THE admirable manner and felicitous language in which Mr. Joseph H. Choate, as president of the Union League Club, welcomed the Hon. William E. Forster to the reception given to him by that body gave a fresh instance of his remarkable talent in that direction. And it recalls an anecdote of his distinguished kinsman, Rufus Choate, illustrating the readiness at repartee of that gentleman. In response to a toast

at a dinner given to him in Philadelphia, he gave the following: "Pennsylvania's two most eminent citizens—Benjamin Franklin, of Massachusetts, and Albert Gallatin, of Switzerland."

ALMOST every thing that could be said in poetry has been rhymed at over and over again, but we have now, for the first time in the annals of poesy, a will, written by Mr. John Cooper Grocott, an octogenarian Liverpool solicitor recently deceased. Mr. Grocott was the author of *An Index of Familiar Quotations, Ancient and Modern*, a work which has passed through several editions:

A LAWYER'S WILL.

20th January, 1835.

This is my last Will and Testament:
Read it according to my intent.

My gracious God to me hath giv'n
Store of good things that, under heav'n,
Are giv'n to those "that love the Lord,
And hear and do His sacred Word:"

I therefore give to my dear Wife
All my Estates to keep for life,
Real and Personal, Profits, Rents,
Messuages, Lands, and Tenements.
After her death I give the whole
Unto my Children, one and all,
To take as "Tenants in Common do,"
Not as "Joint Tenants," "per mie—per tout."
May God Almighty bless His Word
To all my "presents from the Lord!"
May He His blessings on them shed
When down in sleep they lay their head!
I give all my "Trust Estates" in fee
To Charlotte, my Wife and Devisee,
To hold to her, on Trusts, the same
As I now hold them in my name;
I give her power to convey the fee,
As fully as though 'twere done by me,
And here declare that from all "charges"
My Wife's Receipts are good dis-charges.
And now, my Wife, my hopes I fix
On thee, my Sole Executrix—
My truest, best, and to the end
My faithful Partner, "Crown," and Friend.

In Witness whereof, I hereunto

My hand and seal have set,

In presence of those whose names below
Subscribe and witness it.

[L. S.]

J. C. G.

This Will was published, sealed, and signed
By the Testator, in his right mind,
In presence of us, who, at his request,
Have written our names these facts to attest,

J. G. D.
J. M.
D. E.

FROM Nebraska we are furnished the following:

Mr. P—— is proprietor of a hotel in one of the populous towns of Illinois. He has a little son, who, when about four years old, picked up various phrases from the boys about the stable and other places that were not always of the most moral character. One day, when he had been using language quite exceptionable, his mother, after giving him a good shaking, said, "Why, Charlie, where do you expect to go when you die if you talk in this way?"

"Well, ma," replied this young son of the West, "I guess I'll go to my funeral."

After that the conversation lagged.

NEWSPAPER men will appreciate the following bit of business in the advertising clerk of a London paper:

Dr. Thomas Hume walked to the office of one of the morning newspapers, and there silently on the counter an announcement of the me friend, together with five shillings,

the usual charge for the insertion of such advertisements. The clerk glanced at the paper, tossed it one side, and said, gruffly, "Seven and six."

"I have frequently," replied Hume, "had occasion to publish these simple notices, and I have never before been charged more than five shillings."

"Simple!" repeated the clerk, without looking up; "he's *universally beloved and deeply regretted!* Seven and six."

Hume produced the additional half crown and laid it deliberately by the others, observing as he did so, with the same solemnity of tone he had used throughout, "Congratulate yourself, Sir, that this is an expense which your executors will never be put to."

CONCERNING going to law on a small matter, the following, from the Latin of Buchanan, may be regarded as sound:

MINIMUM DE MALIS.

Calenus owed a single pound, which yet
With all my dunning I could never get.
Tired of fair words whose falsehood I foresaw,
I lied to Aulus, learned in the law.
He heard my story, bade me "Never fear,
There was no doubt—no case could be more clear;
He'd do the needful in the proper place,
And give his best attention to the case."

And this he may have done, for it appears
To have been his business for the last ten years,
Though on his pains ten times ten pounds bestowed,
Have not acquired that one Calenus owed.

Now, fearful lest this unproductive strife
Consume at once my fortune and my life,
I take the only course I can pursue,
And shun my debtor and my lawyer too.
I've no more hope from promises or laws,
And heartily renounce both debt and cause;
But if with either rogue I've more to do,
I'll surely choose my debtor of the two;
For though I credit not the lies he tells,
At least he gives me what the other sells.

THERE can be no doubt about one thing: when the Indiana man wishes to go to Congress, he let's it be known in the plainest possible way. In the campaign of last fall, Mr. Levi Ferguson, of Pike County, in that State, announced his wishes and hopes in a brief circular, from which we quote a few lines:

To the voters of the Second Congressional District of Indiana:

Inasmuch as I differ from my friend B. F. Rawlins when he says that he thinks the Hon. J. D. Williams had best make the race for Congress alone, I hereby announce myself as a Republican candidate for Congress from this, the Second Indiana District.

My reasons are:

1st. I believe in pluck, and if no other Republican wants to try Uncle 'Jeems' (which seems to be the case), I, for one, am opposed to letting the race go by default.

2d. This seems to be the year for scrub-races, and as neither myself or Williams are fit to go to Congress, I want you to have a chance of two evils to choose the least.

4th. I am better calculated to fill the office with credit to myself and honor to my district.

Perhaps I will not have time to canvass the district, but remember I'm running for Congress.

In conclusion, I want to go to Congress, and am running to give every body a chance between two men. Fellow-citizens, vote for whom you please, but please vote for me.

Yours truly,

LEVI FERGUSON,
of Pike County.

Mr. Ferguson is a "Granger," and stands six feet six inches in his stockings, but he will not rise high enough to catch the Speaker's eye. Mr. Williams was elected.
